The effect of movement is influenced by the relationship of focal-film and object-film distances in the same way that the size of

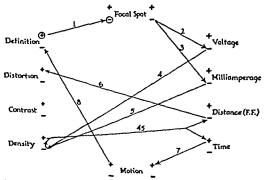

Fig. 3. Increasing definition by decreasing the size of the focal point.

a non-moving object is influenced; thus there may be a magnified distortion of motion. The effect of motion may be lessened by decreasing the object-film distance (trend 14), a procedure that is generally impossible; it may be lessened also by increasing the focal-film distance (trend 13). It is perhaps permissible to state that a decrease in distortion tends to lessen the effect of motion in the roentgenogram.

The patient-motion factor is not simple. It embraces general bodily movements, the movements concerned in respiration and the movements dependent upon the circulatory system. The first and second of these types of movement are ordinarily under voluntary control for such a period of time as is consumed in the roentgenographic examination; but the shorter the time of exposure the less likelihood is there that either of these gross types of movement occur. The movement produced by the heart and blood vessels is not under the control of the patient, and it is this type of movement which has commanded the chief attention in the consideration of technical procedures for the roentgenographic examination of the chest. The precise nature and quantitative values of this last type of motion are not accurately known; presumably, the impact of the beating heart against the lungs and the pulsations in the blood vessels are the chief determinants of its nature and extent. Hence, it would seem that motion of this type would vary in degree in relation to the cycle of the heart beat and would vary in extent in different portions of the lung in accordance with propinguity to the heart and large vessels. It would seem also that the direction and range of the movement may vary in different areas of the lungs and that they might modify the effect of the rate in influencing definition. Wilsey6 states that "Lung tissue speeds vary from a practically stationary condition at the periphery to twenty or more millimeters per second near the apex of the heart." Thus, a time of exposure which would eliminate the effect of motion for one region of the lung need not do so for other regions. McPhedran and Weyl12 in particular, have emphasized the value of synchronizing the time of exposure with definite phases of the cardiac cycle; if the exposure can be made at that phase when the effect of the cardiovascular movement is least (trend 15) it would seem that the effect of the movement could be significantly diminished. Several devices for effecting this synchronization have been perfected, 18, 14 but at present none is generally available.

The probable marked variability of cardiovascular motion in the lungs merits, I believe, considerable emphasis, it is a variability that is almost entirely beyond the roentgenologist's control. The degree of motion must vary between different individuals, must vary in the same individuals at different times, must vary in different parts of the lung at the same time, and must vary in the same portion of the lung at different times.

It is probable that all effect of motion in decreasing definition can be eliminated by employing a sufficiently brief time of exposure To do so, however, may well entual a loss of definition from other factors, as

already considered

2 Increasing definition by decreasing the size of the focal shot used. The size of the focal spot of the x-ray tube exerts a constant control over definition in the roentgenogram This control is based on the geometrical conditions concerned in shadow projection and this variety or aspect of definition has been called either geometrical sharpness or geometrical unsharpness, the latter designa tion is possibly somewhat more descriptive of the condition If a focal spot of infinitesimally small area could be employed. geometrical unsharpness would not occur, but under the existing conditions of producing x rays, the amount of heat generated at the anode necessitates a focal spot of appreciable dimensions, a focal spot of such size occasions a certain amount of geometrical unsharpness or less definition

Geometrical unsharpness may be lessened but it cannot be eliminated. It is diminished as the size of the focal spot is diminished provided the factors of distance are not changed. With a focal spot of constant size it is diminished as the object film distance is decreased and as the focal-film distance

is increased

Figure 3 attempts to present some of the trends that seem to merit attention when one endeavors to increase definition by decreasing the size of the focal spot used (trend 1) As the focal spot is decreased in size, its expacity to dissipate heat is diminished and as a result its capacity to handle voltage and milliamperage is reduced (trends 2 and A decrease in either voltage or milli amperage or both effects a diminution in roentgenographic density (trends 4 and 5), to muntain a satisfactory degree of density a decrease of the focal film distance or an increase in the exposure time or both may be considered (trend 45) If the focal-film distance be decreased, there is an increase in distortion (trend 6), which we have assumed is associated with a decrease in definition If the time of exposure is increased there is a tendency for the factor of movement in the patient to be increased (trend 7) and thereby a decrease in definition to be effected (trend 8). This last tendency seems to be of particular importance, it represents somewhat the reverse of the tendency developed in the analysis ament the control of motion.

If these analyses with respect to definition are valid it would appear that an enhancement of definition by decreasing the effect of motion might be attained only by decreasing the definition dependent upon the focal spot, and that an increase in definition obtained by decreasing the size of the focal spot might be secured only by a decrease in the definition that is dependent upon the movement in the patient. If this implication be true, the important practical consideration is what combination of unsharpness due to motion and unsharpness dependent upon the focal spot leads to the least total unsharpness or best definition Wilsey6 and Bouwers15 have considered this problem at some length Wilsey emphasizes that, whatever size of focal spot is used it should be operated at or near its rated capacity This would seem to be extremely important There is no merit in obtaining a large amount of geometrical unsharpness from a focal spot and not utilizing the full energy capacity of that focal spot for diminishing the exposure time and thereby lessening the effect of motion Wilsey2 states, "to secure the best definition in chest roentgenography, the focal spot must be operating at or near its maximum load capacity This principle governs practically the whole consideration of sharpness in chest roentgenography"

In this consideration the focal spot of the tube has been regarded as a fixed factor except for its size. There are, of course, other variables in connection with it such as its shape and angulation. Any device that would permit the employment of greater energy without involving an increase in the size of the effective focal spot would seem to offer considerable promise toward the attainment of greater roentgenographic definition. The rotting anode suggested by Bouwers¹³ offers intriguing possibilities.

in this connection

3 Decreasing distortion We have regarded magnified distortion as that component of roentgenographic quality which is varied by varying the quantitative relationship between the object film distance and the focal-film distance. The effect of movement, the geometrical unsharpness, and the magnification are all influenced in the same way by these two factors of distance. Distortion cannot be influenced in any other manner than by the manipulation of these factors of distance.

Distortion may be lessened by decreasing the patient-film distance and by increasing the focal-film distance. Since the patient's chest is ordinarily placed as closely as possible to the roentgen-film, the patient-film distance is not subject to any significant degree of diminution. The focal-film distance may, however, be increased to an extent limited only by the capacity of the x-ray apparatus available; this offers the only practical means of lessening the effect of distortion. Distortion cannot be entirely eliminated no matter how great the focal-film distance is made.

Figure 4 indicates certain trends that seem significant when one attempts to decrease distortion by increasing the focal-film distance (trend 1). The intensity of the radiation reaching the roentgen-film decreases rather rapidly as the focal-film distance is increased, so that the roentgenographic density is correspondingly diminished (trend 2). To compensate for this diminution in density, one may consider an increase in voltage, an increase in milliamperage, an increase in the time of exposure or some combination of these (trend 2'). An increase in either milliamperage or voltage tends to necessitate the employment of a larger focal spot (trends 3 and 4) which in turn tends to a decrease in definition (trend 5). An increase in the time of exposure may necessitate a similar trend, but in particular, it tends to aggravate the effect of movement (trend 7) and entail a decrease in definition on that account (trend 8). An increase in voltage tends also to effect a diminution in contrast (trend 6). It would seem that a decrease in distortion might only be attained through a loss in definition, and possibly through a loss in contrast as well.

The importance of distortion as a factor

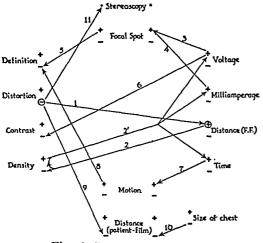

Fig. 4. Decreasing distortion.

in roentgenographic quality diminishes as the size of the chest diminishes; that is, it plays a lesser role in the small chest than in the large one (trends 9 and 10). Although the patient-film distance is not subject to any significant measure of control, the approximation of the chest to the roentgen-film and the size of the chest as determined by the phase of respiration at which the exposure is made, do undoubtedly effect it to some extent. Stereoscopy climinates certain of the disadvantages of distortion (trend 11).

4. Increasing contrast. Contrast in the roentgenogram is governed largely by the type of radiation that reaches and effects the roentgen-film. The type of radiation that reaches the film is determined by the composition of the x-rays engendered at the anode, and by the subtractions from and additions to these rays between the anode and the film. The nature of the x-rays produced at the anode is largely a function of the voltage. As a general rule, contrast is increased by a decrease in voltage, provided the voltage is not reduced below that which is necessary to effect a proper penetration of the patient. The most important other type of radiation that affects the film is the scattered radiation which arises from the patient. Scattered radiation increases the density of the roentgenogram but obscures its contrast; the elimination of scattered radiation increases con-

Figure 5 aims to present some of the trends that seem of consequence when one endeavors to secure an increase in contrast. The chief method which is generally available for increasing contrast is the lowering of the voltage (trend 1). A decrease in voltage tends, however, to produce a decrease in density (trend 2). In seck-

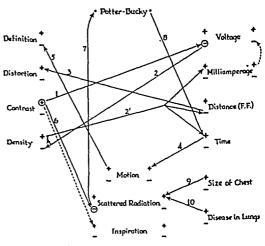

Fig. 5. Increasing contrast.

ing compensation for this decrease in density one may consider an increase in milliamperage, a decrease in the focal-film distance, an increase in the time of exposure or a combination of these (trend 2). A decrease in the focal-film distance tends to effect an increase in distortion (trend 3). An increase in the time of exposure tends to lessen the definition through increasing the factor of motion in the patient (trends 4 and 5). Thus it would seem that the attempt to increase contrast by lowering voltage may result in a loss of definition and an increase in distortion.

Contrast would be increased markedly if scattered radiation could be eliminated or considerably reduced (trend 6). Wilsey found that with the adult chest on the average about fifty-five per cent of the radiation reaching the film was scattered radiation. The chief device available for climinating scattered radiation is the Potter-Bucky diaphragm (trend 7). The employment of this diaphragm, however, tends to necessitate an increase in the time of exposure (trend 8) and hence tends to lead to a decrease in definition by aggravating the effect of motion (trends 4 and 5). Further, the conventional type of Potter-Bucky diaphragm requires for its suitable performance a focal-film distance that is distinctly less than ordinarily used in making roentgenograms of the chest. The amount of scattered radiation increases in general as the thickness of the chest increases (trend 9), and particularly as the density of the structures within the chest increases. The latter is increased mostly by disease (trend 10), such as greatly thickened pleura, pleural effusion, and massive consolidation within the lungs. In cases with very dense lesions, the use of the Potter-Bucky diaphragm may prove of distinct advantage. Wilsey8 has reported obtaining a moderate increase of contrast by employing a Potter-Bucky diaphragm of a special type and by increasing the voltage to avoid an increase in either milliamperage or time.

The amount of secondary radiation may also be lessened by the use of a cone or diaphragm near the x-ray tube. Zintheo16 has reported obtaining definite improvement in roentgenographic quality by the employment of a suitably placed diaphragm.

Contrast is probably influenced to some degree by the depth of inspiration which the patient has at the time of the exposure.

In conclusion, it would seem a reasonable inference that the pursuit of refinement with respect to one element of quality in the roentgenogram of the lungs. leads to a loss of refinement in other determinants of quality. Thus the decision as to what technical procedures to follow in the roentgenographic examination of the lungs resolves itself into the determination of which choices, among those made available by the equipment at hand, offers the greatest good with the least evil.

NOW THEY KNOW HOW IT IS

16

A humorous writer in a New York paper tells us of an amusing incident that hap-pened when Dr. John B. Byrne, chief alienist of Kings County Hospital, and William Penner, head of Greenpoint Hospital, together made a tour of inspection of the Kings insane wards one hot summer's day.

When they finally decided to leave, Dr. Byrne discovered that he had left his passkey in another suit and the doors were made

of steel.

Hammering on the doors was of no

avail, because attendants were inured to such tactics on the part of the patients. The heat was fast becoming intolerable, and the two inspectors were fast becoming indig-

They strode to a window and gesticulated furiously to a passerby, trying to convey their plight to him, but he responded with a shrug and a sympathetic shake of his head, as if to say, "Poor souls."

Oh, yes; they were finally released, but only after a very uncomfortable hour.

THE NEW STATE TUBERCULOSIS HOSPITALS

ROBERT E. PLUNKETT, M.D., Albany

Director Tuberculosis Division, New York State Department of Health

The establishment of three new state tuberculosis hospitals was recommended by the recent State Health Commission only after extensive study by its Tuberculosis Committee of the clinical, epidemiological, and social problems concerned with the disease. It was concluded that in spite of the depression an investment by the State of over four million dollars in three new tuberculosis hospitals would be more than compensated by preventing the further spread of the disease and by providing adequate medical care and segregation for those who already show evidence of clinical tuberculosis. accordance with the Commission's recommendation the legislature of 1931 authorized the establishment of the three new state tuberculosis hospitals to be administered under the jurisdiction of the State Commissioner of Health.

By virtue of many years of actual clinic work in the various counties to be served by these hospitals, the State Department of Health convinced the Committee that a service in collaboration with the practicphysicians throughout the rural counties in this State would produce the most profitable results in the continued fight against tuberculosis. Probably no better example of *esprit de corps* in public health has been witnessed than that prevailing in the relationship between this Department and the physicians in some twenty-seven rural counties. With full realization of the part which the practicing physicians should assume, the foundation of this program has been built upon the hope, as a result of experience, that the joint endeavor of these physicians and the State may in a mutually profitable manner provide a scientific service for the care and treatment of tuberculosis, a complete case finding and follow-up service of all patients and their contacts, and as a by-product of these activities, increasing knowledge of the epidemiological and clinical factors influencing this disease which is still the leading cause of death among young adults. Economically,

tuberculosis still has a profound effect upon society.

To be more specific, the prospectus for these new state tuberculosis hospitals includes professional, educational, and clinical demonstrations and discussions with local physicians. Resident educational facilities for medical students and internes, in cooperation with medical schools, for student nurses, and courses for graduate nurses in hospital and field tuberculosis nursing will be available in each of the hospitals. Clinical, laboratory, epidemiological, and sociological research will be carried on routinely.

Each of the hospitals is being constructed in a geographic and population center of a group of rural counties which will be known as a district. The districts are comparable in size and have an average population of approximately 310,000. Likewise, the morbidity problem is comparable in each of the three districts. The average annual number of resident deaths for the past five years being 129 in the Oneonta district, 123 in the Mount Morris, and 120 in the Ithaca district.

The district farthest east is comprised of the following eight counties: Madison, Chenango, Otsego, Schoharie, Delaware, Greene, Sullivan, and Putnam. The hospital is located approximately one mile from the business center of the city of Oneonta. Contracts were awarded on October 6, 1932 and patients should be received early this fall.

The central district (geographically) is comprised of the following nine counties: Wayne, Seneca, Yates, Cayuga, Schuyler, Chemung, Tompkins, Tioga, and Cortland. The hospital is located approximately three miles from the city of Ithaca on the Trumansburg Highway overlooking Lake Cayuga. Contracts were awarded January 12, 1933. Owing to the bankruptcy of several contractors unusual delays have been experienced with the result that patients will not be received until early in 1936. This hospital has been named the Hermann M. Biggs

Read at the Annual Meeting of the Medical Society of the State of New York, Albany, May 14, 1935 Memorial Hospital in memory of the late Commissioner of Health, a man who was not only a pioneer in tuberculosis control but also for years a distinguished leader in the field of public health.

The third district is comprised of the following seven counties: Orleans, Genesee, Wyoming, Allegany, Steuben, Ontario, and Livingston. The hospital is located in the village of Mount Morris. Contracts were awarded on August 31, 1933 and patients should be received about September 1, 1935.

The cost of constructing and equipping each of these hospitals will be approximately \$1,500,000. Each will have 200 adult beds and a separate fifty bed

children's building.

The hospitals at Oneonta and Ithaca are of the same general plan, with separate wings, or pavilions, for infirmary and semiambulant or ambulant patients, connected by the administrative and clinic building. The Oneonta hospital is a combination of Colonial and Georgian architecture while the Hermann M. Biggs Memorial Hospital is of Old English Cottage style.

The Mount Morris hospital is of the congregate or multistoried type and of

Georgian architecture.

Each hospital will have a complete clinical and pathological laboratory; surgical suite; eye, ear, nose, and throat and dental rooms; a complete outpatient clinical department; adequate x-ray facilities for both outpatient and inpatient study; and rooms for occupational therapy and adult education.

Staff. Each of the hospitals will have a medical superintendent, an assistant superintendent, roentgenologist, and four other physicians. Facilities for housing medical students and internes are also available. Dr. Ralph Horton has been appointed Superintendent of the hospital at Oneonta and Dr. N. Stanley Lincoln, Superintendent of the

hospital at Mount Morris.

Each of the hospitals will have a consulting staff, appointed by the State Commissioner of Health, of six physicians, or other persons scientifically trained in the various specialties. Such consultants will serve a term of office coterminous with that of the State Commissioner of Health and shall, in conjunction with the staff of the hospital, meet at least once each month to consider and discuss appropriate scientific or clinical subjects.

As additional assurance that our patients may receive high grade medical study and treatment, as well as to enhance the professional educational opportunities of these hospitals, it is proposed to engage a special medical consultant, a physician who has had years of experience in the study of diseases of the chest, who shall spend at least one day a month at each hospital receiving and examining all cases which may require special medical or surgical study. In addition, a special consultant in thoracic surgery is being considered.

The major part of the maintenance cost will be met by charging a per diem fee back to the counties, this fee to be estimated on the basis of the average per diem cost per patient in six representative county tuber-culosis sanatoria. In other words, it will cost the counties no more for the care of their patients in one of the state tuberculosis hospitals than in a county tuberculosis institution. For the first year this fee will be approximately \$2.50 per diem. The cost of the clinic program and research studies

will be met by the State.

Admission of patients. Any resident of a county in one of these districts desiring admission may apply to a physician. If further clinical study or treatment for tuberculosis is indicated the physician may apply to the superintendent of the hospital for the patient's admission. Blank forms for such application will be provided gratis by the superintendent to all physicians in the district. If, upon examination, the superintendent is satisfied that such person is a suitable case for study or treatment he shall, if a bed be available, admit him or her to the hospital. A patient may also apply direct to the superintendent of the hospital for admission; and, if found to be a suitable case for study or treatment, may be admitted.

Patients from outside of the district who are able to pay may be admitted. Moreover, the superintendent of any public tuberculosis hospital within the State may apply to one of these State institutions for the transfer of a patient needing special medical or surgical care which his hospital is not equipped to provide. This would relate particularly to surgical cases which may be in need of major operative care. Patients from counties in the districts, however, shall have

preference in being admitted.

Maintenance of patients. The superintendent will be required to make inquiry as to the patient's ability to pay, either in whole or in part, for his care and treatment. If, upon inquiry, it is found that the patient's financial circumstances, or those of his relatives, do not warrant his paying for such care, a bill will be sent monthly to the clerk

of the board of supervisors of the county of which he is a resident. Patients referred for special treatment from any public tuberculosis hospitals become proper charges against the county from which they come at the same rate of pay as patients from the counties within the districts.

Outpatient service. In general, the clinic service, which will be one of the prominent features of the hospital program, will be conducted in a manner comparable to that which has prevailed in the State Department of Health chest clinics for the past sixteen years. The mortality and morbidity problem in each district indicates that about 4,000 routine clinic examinations should be made each year. Case finding or follow-up service for tuberculosis, to be successful, must be brought figuratively to the doorsteps of the physicians and the people. In other words, service commensurate with the need will be made available to each community within the counties of the districts. Naturally, most of these examinations will be concerned with cases and their immediate contacts, but in view of the paucity of knowledge regarding the pathogenesis and spread of tuberculosis, research studies in selected groups—industrial, nursing, school, and others—will be conducted. The chronicity and recrudescent characteristics of tuberculosis, occupation, migration, and other social factors indicate the need for case finding embracing other selected groups. Sir William Osler once said that it is more important to know the type of person having a disease than it is to know the type of disease which a person has. May we not paraphrase that statement and say that it may be more important to know the kind of family in which tuberculosis is a problem than it is to know what kind of patient comes from that family.

The literature reveals, and experience has shown, that the focus of infection of many cases cannot be discovered; nevertheless, it is evident from studies conducted by our department and others that tuberculosis essentially is a family disease. It is expected, therefore, that the problem in these districts will be approached from a family standpoint. Epidemiological investigations and studies will assume a conspicuous part of our service. Although we may not be able to determine the source of infection of each case, it is expected that the contacts of every case will be screened in order that every secondary case may be discovered at the earliest possible moment. The epidemiology of tuberculosis has many points in common with other communicable diseases. In contrast to the acute communicable diseases, the pathogenesis of tuberculosis manifestly makes its epidemiology more complex.

It has long been recognized that it is the early case of tuberculosis which under appropriate conditions has the greatest opportunity for recovery or possible cure. It has been demonstrated in our clinics, as well as by other groups, that intensive study of contacts, plus thorough examination and study of cases referred by practicing physicians, leads to the discovery of an encouraging percentage of cases in the minimal stage of their disease. Although the major part of this case finding program will be carried on in the itinerant clinic program, we hope figuratively to throw away the key of our outpatient service so that the practicing physicians within the district may have constant service available. Obviously, with the complete clinical facilities provided in the hospitals, a more scientific approach to, and more intimate study of selected cases will be possible than heretofore.

Clinical laboratory. One of the most prominent pathologists in the field of tuberculosis will be in charge of the clinical laboratory service. Although his headquarters will be the central hospital at Ithaca, there will be a qualified assistant laboratory director at each of the other hospitals. In addition to routine clinical and epidemiological studies of patients, it is intended that biological, bacteriological, and other research studies will have a prominent place in the laboratory service.

Surgery. Every case will be considered primarily a medical case. The triad of rest, food, and fresh air will make up the basis of our treatment. Auxiliary measures, some

of which are not ordinarily looked upon as surgical procedures, such as artificial pneumothorax, will be used as indicated.

In some localities the pendulum of surgery has swung too far in the treatment of tuberculosis. Experience in this country, as well as in other lands, indicates that it has an important place in the therapeutics of tuberculosis. In this relatively new field of thoracic surgery, much remains learned regarding the indications, contraindications, choice of procedure, and end results. Relatively few surgeons have had the opportunity of becoming proficient in this specialized field. In planning a surgical service, however, the practice has been the same as that followed in all studies relating to the details of the program, namely to consult freely with those who are especially qualified in the various branches of medicine. After intimate consideration of the potentialities of this service it has been recommended that an experienced thoracic surgeon be engaged to assume charge of the major surgery in all of the hospitals. As in the case of the laboratory, the surgeon's

herdquarters will be at Ithrea Living facilities will be available for him at the other institutions so that he may remain at any one of the hospitals to carry on preliminary studies, or after care which are so important in the surgical treatment of diseases of the lungs. A member of the striff of each of the hospitals will be assigned to assist the chief surgeon in carrying out the surgical treatments.

Rehabilitation is a conspicuous part of the treatment afforded by the hospitals. To be most effective, however, it must be sustained by treatment and guidance as a part of the follow up of discharged cases. The case whose sputum is positive or potentially positive, for tubercle bacilli, obviously requires closer supervision and guidance than the sputum negative case In addition, follow up treatment and guidance as indicated from the public health standpoint, and close supervision of all cases of pulmonary tuberculosis following their return to society, are necessary The character of this follow up will be determined not only by the extent and type of pulmonary pathology present but also by conditions in the home, industry, as well as by other environmental factors

Although large sums of money have been spent in treatment, many cases later break down Obviously many circumstraces influence relapse. In spite of the chiracteristics of the disease, there seems to be some evidence that more complete patient education and closer follow-up may result in appreciably fewer breakdowns. The practicing physicians we hope, will assume a conspicuous place in the follow-up studies of discharged patients. The home, industrial and social environment and the activities of these patients must be modified within the bounds of their limited physical capacities.

To summarize, each physician referring a case either for diagnosis or treatment will receive a report of clinical findings and other portinent data in accordance with the procedure in our chest clinic service. Periodic summaries of the clinical status and progress of patients under treatment in the hospitals will be muled

to their family physicians. At the time of a patient's discharge from the hospital a more complete summary, plus detailed recommendations regarding his ability to exercise or work, and the type of medical supervision which may be indicated will be forwarded. In addition, the local health officer will receive appropriate reports relative to the epidemiological problems of the case. Although physicians will be requested to supervise the routine follow up, some cases will require rather more detailed follow-up by our outpatient.

Service is to be the keynote of these state tuberculosis hospitals, service to the physicians, health officers, the families, and the communities. We extend a cordial welcome to every physician, and especially those practicing within the districts, to visit them. During such visits we hope to have the benefit of their advice and counsel. In turn such visits should not be without profit to the physicians.

The triad of tuberculosis—hospital health officer, and the practicing physician—presents a formidable combine in the continued fight against this enemy of the public health—the tubercle bacillus

The program in the district may be likened to a living cell of which the hospital-health officer unit is the nucleus and the practicing physicians the cytoplasin The life of every cell depends upon the vitality of its component parts. We have all witnessed this cell of administrative practice grow and develop for more than fifteen years Although its future life and health seem assured, we are not unmindful of the pitfalls which he ahead The anticipated cooperation between the various groups should make it possible to avoid them to the end that the social and economic stress incident to this communicable disease may be ameliorated materially

Discussion

DR H ST JOHN WILLIAMS Poughkeepsie—Dr Plunkett's paper has explained to us a comprehensive and intensely interesting plan for the study, treatment, and follow up of tuberculosis in New York State The extensiveness and completeness of the equipment and facilities make me, as superintendent of an older hospital, even a little envious But it shows a full familiarity with the problem before us and of all

the ramifications which are so frequently lost sight of in the more immediate need and desire to treat the patient

As an investment in health both from the standpoint of the patient and the community, segregation and treatment in the hospital is but one phase of the problem. The state's program includes *keeping* the patient well and protecting his family and other contacts through education, follow-up and

stomach trouble, autointoxication and high blood pressure for which she had been treated by local physicians for sixteen years. She complained in addition of attacks of dyspnea and palpitation of six months' duration.

Physical examination and laboratory tests including the gastrointestinal series were negative. Blood pressure was 190/100. This patient failed to improve under medical treatment; she lost fifteen pounds, and had frequent attacks which kept her in bed for days or weeks at a time, with nausea, vomiting, and severe precordial pain. After eighteen months treatment she developed an anginal syndrome in addition, and began to carry a cane regularly because of fear of falling.

She was seen first by a psychiatrist two years after her initial visit to the medical department at which time she reported that a general physician had told her her blood pressure was over 200. Blood pressure recorded at this time was 190/100, and pulse 130.

The patient stated that she was perfectly healthy until her marriage which was against her parents' wishes eighteen years ago. Six months following her marriage she had a nervous breakdown and wanted to leave her husband. A general physician advised a pregnancy, and she became pregnant shortly afterwards. She vomited steadily from the first month till the ninth, lost weight, and nearly died when the baby was born. At this time she said she was first told that she had high blood pressure.

She became tense and suffered much from constipation. She said that certain things seemed "to throw her into a spasm," she "didn't know why." She then started her sixteen years' journey from physician to physician. She found herself equally unable to leave her husband or to live with him and he became increasingly inadequate.

Considering this patient's story in terms of predisposing factors to illness many elements are to be evaluated, but there is one point to which for present purposes attention should be called. On the physiological side we have a possible hereditary factor in cardiac disease on the part of the patient's mother. The "pseudohereditary" possibility involving imitation and identification, however, deserves consideration. About six months before the patient's initial visit to the medical clinic, her father from whom she had been estranged since her marriage died of cancer of the stomach. (Incidentally, her father's first stomach operation had coincided with the patient's marriagein which she had both disobeyed and refused to support him-following which her own gastrointestinal complaints began.) After his death she went to care for her mother who was suffering from angina pectoris and high blood pressure from which she died six months before the patient's first visit to the psychiatric clinic. The patient's attacks of dyspnea and palpitation had begun when she went to nurse her mother, and the anginal syndrome, together with nightmares and sleeplessness, after her mother's death concerning which she felt unaccountably guilty.

In the course of treatment the patient revealed further physiological preparation for illness. She complained that her mother was always nervous and sickly and her father could never earn enough money. In her girlhood she had felt herself overpowered, crushed by the personality of an older sister who took the place of the weak and sickly mother, forcing her to give up school and go to work to help support the sick parents. Although the patient tried to make up for this by going to night school she felt it had been a life-long handicap. She was intelligent with high ambitions. Until the illness following her marriage she made more money than any other member of her family and was their main support.

At the age of sixteen she fell in love with a man of whom her parents disapproved. After six years in which she was torn between this man and her parents she married him. She said of this period: "If only there had been someone to advise me. I was nearly crazy. I used to cry myself to sleep every night and wake up with nightmares feeling sure I was going to marry the wrong man, and yet I somehow couldn't help it. I had to get out of the awful home atmosphere although I felt I was losing something irre-The patient was completely unprepared for the marriage relationship, and her early adjustment was further complicated by the fact that she felt guilty for having disobeyed and deserted her parents. Her husband, who was below her socially, made it difficult for her to entertain her friends, made fun of her aspirations and intellectual interests, and after a few difficult weeks began to go with other women. She complained that he was no better than her father in that he could not earn enough money to support her.

This is a patient for whom one would have favored intensive psychotherapy. Because of the limitations imposed by clinic conditions she was seen only ten times during a period of two months. The central problem handled was that of her rage and repressed aggressive tendencies, these being brought into con-

scious relationship with her symptoms; furthermore she gained insight into the meaning of her symptoms. She has remained symptom free for more than two years. [Three years—at this time of printing.] Subsequent to her period of treatment she was seen on follow-up visits at intervals of two and four months, and then every six months. On each of these occasions the blood pressure registered 130-135/80-85.

The patient stopped attacking and blaming her husband, accepting the fact that she was intellectually superior to him, and began to help him with his work. As a result, although all this happened during the period of our economic depression, he went ahead in business, and the circumstances of the family improved so that she was able to send her daughter to college. The patient says had she had the opportunity of psychiatric help in her "teens" she probably would have married a different man. But she is going to look

at things as they are.

In this case history we have a gastrointestinal picture and an anginal syn-drome of incapacitating severity together with cardiac arrhythmia, tachycardia, and a hypertension of long standing. There was an increasingly acute symptomatology which did not yield to somatic treatment but disappeared rapidly when attention was directed to the underlying emotional disturbance. The fact that this patient has remained well is the more interesting in that her husband himself has not changed very much. Eleven months ago they again suffered serious financial reverses, and he entered on a new love affair to which the patient reacted on a common sense basis rather than by symptom formation. Of course, at present we can say only that the sym-tomatology has been interrupted. But it is important to note that so far as could be ascertained there had been no symptom-free periods during the eighteen years of her illness preceding her psychiatric treatment. It is possible that this patient, like many others, might have been saved eighteen years of invalidism had the meaning of the disease picture been understood earlier in its psychic as well as in its somatic components. In addition, there is the likelihood that had the hypertension been allowed to persist,

secondary organic changes would have taken place in the course of time.

Case II. A married woman, age twenty-eight, of an old New York family, came to the medical clinic in the spring of 1931 complaining of palpitation, shortness of breath, and fainting spells, which were so incapitating that she could scarcely walk two blocks, and was unable to do her housework. The diagnosis was cardiac hypertrophy, mitral stenosis and insufficiency, aortic insufficiency with probable stenosis and chronic myocarditis.

In the patient's personal history the points that stood out were timidity and extreme devotion to her father, she having left school voluntarily in order to work in his store. When the patient was sixteen years old, an uncle died of heart trouble, and a brother died one month later of "heart failure," following an appendectomy. Fifteen months later her father died in her arms of angina pectoris. The next week she became engaged to a man ten years her senior who had been a life-long friend. She was married two years later, and her married life was happy until 1930 when her husband began to stay out late at night and his attitude toward her seemed to change. At this time also she heard of her brother's unfaithfulness to her sister-in-law. This came as a great shock to the patient and increased her worry about her own husband. At the same time a break occurred between her life-long girl friend and this girl's husband.

In 1931 and 1932 the patient began to suffer from dyspnea and palpitation, following which she would shake for hours, as had happened in her first such attack when her father died. On one occasion, sitting at home alone and waiting for her husband who had promised to return at two A.M., an attack of palpitation occurred and she felt as though the walls of the room were closing in on her. She felt as though she were being crushed. She dressed and ran to her mother's house which was a few blocks away and fainted. There her husband found her when he came home at five o'clock in the morning. During the next two months the patient lost sixteen pounds (her weight having been constant at 130 lbs. until then), she was very much depressed, and had many attacks of dyspnea, and palpitation. She was terrified of something but had no idea of what it was. At this point she came for treatment.

Now thinking in terms of this patient's preparation for illness we have the following facts. On the physiological side, there is a possible hereditary and constitutional predisposition in the direction of disease of the cardiovascular system. Furthermore, the

patient had growing pains following her tonsillectomy which may have been the only symptoms of an actual rheumatic fever, and the physiological basis for the rather extensive cardiac involvement present when she first came for treatment. In view of the patient's close association with her father in his attacks, a "pseudohereditary" factor is to be considered also.

As was revealed during the course of the treatment, this patient had been prepared psychologically also for some type of illness. There were both psychic and physiological reasons for the centering of her attention on her heart or to use Connor's phrase: the centering of the patient's fluid anxieties on her heart.

In discussing her symptoms, the patient revealed the fact that the attacks of palpitation and dyspnea and the sense of being smothered occurred only when she was waiting for her husband to come home, or when she saw a pregnant woman, never with physical exertion unless in combination with one of these two factors. (She had several such attacks when she saw pregnant women in the clinic elevator.) In associating on the subject, the patient told of her when menstruation began. thought she was bleeding to death and dared tell no one about it, but the boy friend whom she later married. Her tonsillectomy however, occurred immediately thereafter, and she was again afraid she would bleed to death (a hemorrhage occurred). Furthermore, she fought violently against going under ether, and associates her present dyspnea accompanied by a feeling of the walls closing in upon her, with this experience.

In discussing the episode of the tonsillectomy, the patient experienced an overwhelming sense of terror accompanied by attacks of dyspnea and palpitation, her lips becoming blue. The patient's resentment against her mother and the fear of loss of her mother's affection were discussed. In this connection she recalled her first cardiac attacks associated with her father's death, and the fact that she had immediately replaced her father by her one life-long boy friend who had been "both father and mother" to her, and that now she was about to lose him. She felt he couldn't really leave her when she was so sick. After going over such material as that just indicated the patient became symptom free and remained so for two years without medication and with no definite restriction of diet or activity.

Late in 1933 she came in saying that she had decided that she would like to have a child and wanted to know whether it would be safe for her. She saia: "It's funny, I want one now when we have less money

than we had before, and then I thought we couldn't have one because of lack of money." Before there was time to go into this question in detail she became pregnant accidentally in January 1934. She began to dream of her father and to contrast him in her mind with her husband who still neglected her. At the end of the second month of pregnancy, the father of the patient's best friend died. The patient went to the cemetery, and became very nervous when the body was lowered into the grave. All through the next day she felt nauseated and dyspneic. She had the old sense of walls closing in. All of a sudden she hated being pregnant. Then shortly following an automobile ride an abortion took place, which she said afterwards really relieved her very much, although she feared the return of the same old shaking spells accompanied by dyspnea and palpitation rather paroxysmal in character.

The patient returned and the situation was discussed against the background of the earlier material. She was then examined in the cardiac and gynecological clinics where she was told that she could go ahead with a pregnancy if she desired to take the risk, and if she were willing to spend the last two or three months in bed as might be necessary because of her cardiac condition. When she became pregnant the fear of seeing pregnant women returned and there were some mild attacks of dyspnea, none of these symptoms being of the previous intensity. She was seen once a week for six weeks and has remained symptom free ever since. [Two years—at this time of printing.]

The patient was active (doing all her own work), and completely free from dyspnea and palpitation throughout her pregnancy, and the spontaneous term delivery of a normal boy was without complications. This is the more significant in that her husband's attitude toward her did not change. She herself, however, had become much less dependent on him, and incidentally no longer runs to her mother at the slightest provocation. In other words, this case like the last one, indicates that it is possible to change the patient's attitude toward a situation even where the situation itself cannot be changed. Furthermore, the bringing about of such a change in the patient has distinct advantage over the attitude which says, "well, anyone would be worried, or would be nervous, living in such a situation. We will see that she gets enough sedative to keep her quiet." It is important to realize that the degree to which "perfectly normal" worries react disastrously, or produce symptoms, in the physical sphere, can be definitely decreased with careful handling of the underlying

emotional problems. This is particularly important of course, when an actual organic

lesion is present

Case III \ mutuel Germin lewish wonin, age forty five, was admitted to the wird with a listory of dyspinea, precordial pain and bloody, frothy sputtum mimed atcly before admission I mie does not permit the giving of this patient's history in much detail. There was a possible hereditary and pseudohereditary factor in that the father died at the age of sixty eight of asthma and the mother at the age of thirtynine of heart trouble and gall bladder disease.

With bed rest and digitalis, the patient improved rapidly with a decrease in pulse deficit by the third day. She was discharged three weeks later, the diagnosis being inactive rheumatic heart disease, cardiac msufficiency, mitral stenosis and insufficiency, acrtic insufficiency, chronic auricular fibrillation, and chronic cholecystus. Two weeks liter in spite of continued digitalization she was readmitted, having become dispined and orthopnete, and again brought up pink sputum. She was fibrillating, heart rate was 120, the blood pressure 150/80

The first relevant fact brought out was that her attacks of pulmonary edema were always precipitated by sexual intercourse It seemed almost certain that the attacks were not precipitated by the physical exertion connected with sexual intercouse as (1) the patient could stand a moderate de gree of physical exertion without decompensating and (2) considerable cardiac discomfort would occur without any physical excition when the patient merely sat and thought about intercourse, or became sexually aroused. She had extreme difficulty in discussing these matters and came to the next interview fibrillating with marked tachycardra and dyspuea, confessing for the first time that she had suffered from insommer for fifteen or sixteen years, and usually got up in the middle of the night to do things around the house As the interview proceeded the patient became more cyanotic, the dyspner and tachycardia increasing so that she was scarcely able to speak

She then told the following story When she was about six years old, her father left for America, leaving the family behind in Germany During this time her mother began to cirry on sexual relutions with other men. The patient both knew about it and slept in her mother's room at times witnessing sexual intercourse. It made a 'horrible impression' on her, and she dared tell nobody about it. She was the only one of the children who knew about it and felt that this secret was a heray load. She was terribly afraid of her

mother and even now felt that it was "horrible" to talk about it She said the fear of seeing the physician before the interview, with the accompanying cardiac symptoms, was like this fear of her mother

Her attacks accompanied by bearing down prins she said usually crine at the time of year that her first baby died (she had two children living and well) She always used to go to the cemetery on a certain date but did not go this time, because she always visited her mother's grave at the same time and now felt too guilty to do so Although the patient had previously tried to avoid intercourse at these times, she now tried to overcome her aversion for it. The result was unexpected She started to cry, became terribly angry, striking her husband, and asking him to leave her alone. The patient couldn't understand herself, saying there was absolutely no reason for her to get

In other words, to the patient's great surprise an affect of anger was released, which we may suspect was diverted previously entirely into somitic channels leading to symptom formation. The patient has had no more attracks of pulmonary edemi (she has been followed for more than a year) [Two years—At this time of printing I feels much better generally, is capible of considerable exercise without decompensating (walking 40.50 blocks on a stretch) and has completely recovered from her insomin and almost from her dishke of intercourse.

These case histories taken as typical of groups studied, suggest the importance of adding to the usual diagnostic classification of the cardiovascular diseases some word as to the psychic constellation involved, including an estimate of the psychic as well as of the physiological and anatomical basis of the symptomatology In other words, there is a tendency among internists in the presence of actual cardiovascular damage to assume that the patient's symptoms such as pain, dyspnea, and palpitation, are sufficiently explained on this basis As a matter of fact, the symptomatology may be even more definitely dependent on an emotional factor. and more or less completely eliminated with handling of the emotional problem, even though the organic damage of course persists

It is further noteworthy that in these patients attacks ranging in severity from headaches and dizziness to actual heart failure were precipitated by emotional stimuli. More important than this, attacks were occasioned during psychotherapeutic interviews when the related material was brought up, and the attacks were eliminated in the course of psychotherapy. The fact should be stressed that attacks were occasioned when the related material was brought up and only then, not just by shock or excitement; and were eliminated only when this specific material had been handled psychotherapeutically, not just on the basis of talking out or reassurance.

Someone may comment at this point that in these patients the illness seemed to serve a useful purpose. In the first case the patient's invalidism got her a good deal of attention and was a weapon against her husband. In the second case the patient tried to get her husband's sympathy so that he would not leave her alone so much. It should be pointed out, however, that patients do not get sick merely for such purposes. They get sick because the anxiety (perhaps brought to the surface by these situations) is part of a deep-lying neurotic anxiety or conflict. Few measures can be more injurious to the patient than pointing out to him his secondary illness gain, or attempting to deprive him of it, without any attempt to relieve the primary anxiety or conflict. The attitude "you can't fool me anymore, I'm onto your game" is useful at best with conscious malingerers, but not with these patients. If on the other hand, the primary neurotic problem is relieved as the patient becomes clear as to the emotional significance of his symptoms, the secondary illness gain is no longer important and the patient relinquishes it voluntarily and spontaneously, as happened in all three cases reported.

The fact may be reiterated here that patients in whom the emotional factor is important are not always obvious neurotics. They are often patients who impress themselves and the average physician as perfectly normal human beings. Their symptomatology is not always such as to be suspected because of its manifoldness or its bizarre character. Of course the presence of a full-fledged symptom neurosis in patients with cardiac disease very often definitely limits their response to the medical therapy instituted, but these patients again are more readily recognized. Furthermore, they usually re-

quire much more intensive psychotherapy than the group from among whom the three case histories just presented were taken.

In the patients not so obviously neurotic there are two pictures to which I should like to call attention by way of summary. First, it may be said in general that there seems to be a psychic constellation related to spasm of vessels and often of other musculature and body systems simultaneously, no matter what the organic diagnosis is. Although there is not time to go into the material in detail, this was illustrated in the first case history given where the patient herself spoke of her tendency to spasm. Incidentally, with the conclusion of her treatment there was a marked decrease in her general muscle tension (the effect of which in her face was to make her look several years younger) and a disappearance of her constipation as well as of her hypertension. Second, there seems to be also a psychic constellation predisposing to exaggeration of the syndrome, dyspnea and palpitation, in cardiacs no matter what the physical situation, as illustrated especially in the second case. Physicians are finding it valuable in cardiac patients to analyze the symptom of dyspnea rather carefully instead of taking it at face value because the patient is a cardiac. Whether or not the physician has the impression that the dyspnea and palpitation are out of proportion to the extent of the cardiac damage this symptom is often relieved by psychotherapy.

Evidence has been adduced in the literature to the effect that emotional factors may play a rôle in the development of chronic invalidism or hasten the fatal termination of disease of the cardiovascular system. Whether or not we are justified in saying that psychotherapeutic elimination of such reactions as dyspnea and palpitation exerts a favorable influence on the course of the disease itselt, however, is a question that needs further investigation. Concerning the cases presented we may be justified in assuming definite benefit from the interruption of the hypertension, as well as from the elimination of the sleeplessness and the attacks of dyspnea and pulmonary edema in relation to intercourse, which apparently stood in direct relation to the frequency of the patient's periods of decompensation

In any case, with the relief of such symptoms the patient's incapacitation from his cardiac disease is definitely decreased as well as his fear. We all know that the fear of death which is in the minds of most patients who have been told that they are cardiacs may be a serious complicating factor in their general reaction to their disease and its treatment

Finally, observations in this field are such as to indicate that after an "organic" disease has made its appearance the symptomatology is the more abundant and the more devastating depending on the amount of damined up anxiety present. This fundamental anxiety is an important factor in the duration of any illness (including the tendency to relapse). The handling of this element is one of the major problems of convalescence, certainly of equal importance with restric-

tion of exercise and daily régime Failur to handle it may result in an unnecessar chronic invalidism of the patient

Our success in the treatment of cardivascular disease stands in direct relative to our skill in the diagnosis and treament of the psychic as well as of the somatic component in the disease pictur Furthermore, attention to the psychic component helps and is sometimes essetial in the estimation of the progress the disease process organically considered. Whether the psychic or the somatic profession be considered primary, the reproblem is to treat the patient, second the disease process, and only third it symptom.

RUDYARD KIPLING ON DOCTORS

The death of Rudyard Kipling recalls to some of the medical journals a fine passage in an address he delivered in 1908 at the Middlesex Hospital on "A Doctor's Work" Said Kipling

Every sane human being is agreed that this long drawn fight for time that we call life is one of the most important things in the world It follows therefore, that you who control and oversee this fight and who will reinforce it, must be amongst the most important people in the world Certainly the world will treat you on that basis It has long ago decided that you have no working hours which anybody is bound to respect, and nothing except your extreme bodily iliness will excuse you in its eyes from refusing to help a man who thinks he may need your help at any hour of the day or night Nobody will care whether you are in your bed, or in your bath or at the theatre If any one of the children of imen has a pain or a hirt in him you will be summoned, and, as you know, what little trithty you may have accumulated in your leasure will be dragged out of you again

In all time of flood, fire famine plague, pestilence battle, murder and sudden death it will be required of you that you report for duty at once and go on duty it once, and that you stay on duty until your strength fails you or your consenue releves you, whichever may be the longer period. This is your position—these are some of your obligations—and I do not think that they will grow any lighter. Have you heard of any legislation to limit your output? Have you heard of any bill for an eight hour day for doctors? Do you know of any change in

public opinion which will allow you not attend to a patient when you know that if man never means to pay you? Have you hear any outery against those people who can real afford surgical appliances, and yet eadge rou the hospitals for free advice, a cork leg, or glass eye? I mu afraid you have not It seems be required of you that you must save other It is nowhere laid down that you need say yourselies. That is to say, you belong to the privileged classes. * * * * *

Realizing these things, I do not think I nestretch your patience by talking to you abothe high adeals and lofty ethics of a profession which exacts from its followers the large responsibility and the highest death rate—fit practitioners—of any profession in the worl

PNEUMONIA CONTROL

Six men, representing six importar organizations engaged in promoting it people's health left a meeting in Center Street, New York, the other day, after having made plans for the control organization in New York State Passers is would not have given them a second look-they were quite ordinary looking men Their discussion ruised hope of saving 3,00 lives per year. As they stood a moment of the corner, a siren screamed, and the gacompany's emergency wagon ruished pasto resuscitate an asphyrated victim. On life—much excitement, 3000 lives, in fuss—Burcau of Public Relations—Mee Soc of the State of New York.

FACIAL PARALYSIS

In Acute and Chronic Purulent Otitis Media

CAESAR HIRSCH, M.D., New York City

From the Otological Department of the New York Polyclinic Medical School and Hospital

Peripheral facial paralysis, first described by Charles Bell in 1824, is of not infrequent occurrence in the course of both acute and chronic purulent otitis media. The question, however, whether and when a facial paralysis originating in such a setting calls for a mastoidectomy seems to be still unsettled. This paper attempts to elucidate this question, with particular reference to the following case:

L. H., male, 40 years of age, fell ill with an acute suppurative otitis media in the left ear, after grip with high fever and a spontaneous rupture of the eardrum. The next morning the patient noticed watering in his left eye, and in course of the day the motility of the left angle of the mouth became very much impaired. The pain in the ear had ceased. Because of the facial paralysis the family physician sent the patient to an otologist, who told him that an immediate mastoidectomy was necessary. The same day the patient consulted a second otologist, who also advised an immediate mastoidectomy. The next day, April 3, the patient came to my office. He showed a complete motor facial paralysis on the left side, with disturbance of the salivary secretion, epiphora, and ageusia of the anterior two-thirds of the left half of the tongue; in the left external ear canal, watery pus, exuding under pulsation from a pinheadsized perforation before the hammer-handle; severe reddening and bulging of the posterior part of the tympanic membrane; and tenderness of the left mastoid portion above the tip.

The right eardrum showed no pathology. Whispering voice, right 6 m, left ½ m. No spontaneous nystagmus, no Romberg, no spontaneous past pointing. Caloric reaction within normal range. Temperature 99.6° F., pulse 74. Immediate large myringotomy in form of an arc-like incision throughout the whole posterior part of the eardrum.

Assuming that in this patient we had to deal with a facial paralysis originating in the tympanic cavity, he was treated with drastic diaphoretics, quinine, aspirin phenecetin, caffeine, infrared-light and heat applications. During the next two days no rise in temperature was noted, although there was profuse secretion from the opening of the myringotomy. After two more days there was paling of the left eardrum and diminution of the secretion, but no change in the facial paralysis.

On the seventh day—April 10—a slight improvement in the superior facial branch could be discerned. Four days later the left eardrum closed. Treatment with galvanic current resulted in rapid improvement of the superior branch, and the eye could be nearly closed and wrinkling of the forehead was possible. After two more weeks of treatment only a slight paresis of the oral branch remained, at which time the patient wished to discontinue treatment.

A quite similar case was published by Young¹ in the following words:

A facial paralysis originating in the first days of an acute otitis media cleared up after a fortnight under the treatment with a galvanic current. The point of origin of the neuritis cannot, of course, be determined with certainty. but it is to be borne in mind that the outer wall of the canal containing the facial nerve as it crosses the inner wall of the ear cavity is often almost membranous in thinness and sometimes actually has a hiatus in its bony continuity. This neuritis is analogous to that caused by infectious spreading to the optic nerve from a diseased sphenoidal sinus of a posterior ethmoid cell, as has been suggested by Gallagher2 and others.

The uneventful recovery without operative interference is to be noted in lieu of the fact that some authors regard facial paralysis in acute otitis media as a certain indication for operation.

The facial nerve enters the temporal bone, together with the auditory nerve, through the internal auditory meatus. It separates from the auditory nerve on the bottom of this canal and runs through the Fallopian canal between the transition of the basal to the second turn of the cochlea on one side and the ampulla of the superior circular canal on the other side above the vestibulum to the hiatus of the facial canal. Here it joins the great petrosal superficial nerve and a part of the small petrosal superficial nerve, which enter the temporal bone from the middle cranial fossa and together with them, it torms the genicular ganglion. It then

bends sharply backwards, outwards, and downwards, (superior knee) and runs alongside the medial wall of the tympanic cavity beneath the ampulla of the horizontal semicircular canal and above the oval window into the threshold of the antrum, where it bends again arc-like downwards (inferior knee), runs straight ahead vertically downwards and leaves the temporal bone through the stylomastoid foramen.

Lesions attacking the facial nerve in the tract described may show the following

characters:

1. Peripherally, from the branching off of the chorda tympani: motor paralysis of the whole facial musculature of the affected side (forehead, eye, corner of the mouth).

2. Within the Fallopian canal between chorda tympani and the branching off of the stapedian nerve: complete muscular facial paralysis, ageusia of the anterior two-thirds of the tongue, disturbance of the

salivary secretion.

3. Within the Fallopian canal between the branching off of the stapedian nerve and the genicular ganglion: paralysis of the entire facial muscular system, ageusia of the anterior two-thirds of the tongue, disturbance the salivary secretion (disturbances of the sense of taste-chorda tympani-are more frequent in rheumatic polyneuritis than in the purely otogenous facial paralysis). If there is an affection of the facial nerve without a simultaneous inflammation of the middle ear, hyperacusis arises; instead of hyperacusis we had better speak of dysacusis, because in such a case we deal with a pathologic hypersensitivity to highpitched sound impressions, although we find the acuity of hearing for low-pitched sounds slightly diminished.

4. Between genicular ganglion and internal auditory meatus: paralysis of the whole facial muscular system, no ageusia, disturbance of the salivary secretion, impairment of hearing in the inner car because of the involvement of the auditory nerve. Only if the latter is lacking: hyperacusis. Disturbance of the affective and reflex lacrimal secretion with increase, or in the majority of cases, decrease in quantity.³

5. In lesions outside of the stylo-mastoid foramen, as e.g. through packs of lymphnodes of the neck or through cellulitis (Bezold's mastoiditis), paralysis of isolated branches of the pes anscrinus may originate.

Facial Paralysis in Acute Suppurative Otitis Media

The majority of cases arise in the form

of paralysis of all three branches. The superior branch, however, is often less severely stricken and also heals more rapidly, while the oral branch is the first to be stricken and its paresis lasts the longest.

Presumably the facial nerve is composed of two bundles of fibers, of which the external supplies the inferior part of the face, while the medial bundle goes into the superior muscular groups. The external fibers, which are stricken more often, form a sort of sheath for the internal bundle and thus a measure of protection. They are first attacked by lesions coming from the outside and heal

last.4

Facial paralyses have a propensity for seizing the nerve in its horizontal course on the medial wall of the tympanic cavity, where dehiscences always can be found. Instead of the bony wall of the canal, one finds almost always coarse fibrous tissue. These dehiscences are situated particularly on the inferior internal periphery of the horizontal facial canal. Earlier investigations have shown the author5 that instead of the coarse fibrous tissue we frequently find relatively very thin membranes, which make it easy to understand that even in cases of a slight middle-ear catarrh facial paralysis has been observed. Therefore it is easy to understand that in radical operations under local anesthesia, in which we inject the anesthetic into the tympanic cavity, a transitory facial paralysis lasting some hours may originate. We never see such a facial paralysis in simple mastoidectomies under local anesthesia, because we then never inject the anesthetic into the tympanic cavity. There is always a small gap for the arteria stapedia, a branch of the arteria stylo-mastoidea in the Fallopian canal in the region of the oval window and, besides, there are some other vascular interstices. The infection of the facial nerve may originate in the form of a perincuritis, or neuritis. It is not necessary, however, that the infectious material pass directly via the gaps into the nerve, in the manner of a contact infection. This is demonstrated by cases of facial paralysis in acute non-suppurative otitis media. It is more probable that we have to deal with vasculo-nutritive circulatory disturbances of the vessels in the facial canal, as an edema or collateral hyperemia or a toxic paresis of the vasomotor nerves. Hence the relatively easy and often spontaneous healing which speaks against a far-reaching suppurative disturbance. It will therefore happen that the facial paralysis disappears long before the healing of the suppurative necrotising process in the bone of the middle ear, a fact which also speaks in favor of that opinion. Again, in mastoiditis and suppuration of the retrofacial cells, suppurative neuritis does not always set in, but through lesions of the vasomotor nerves a state of edema or swelling develops. It is, therefore, very probable that many of the so-called rheumatic lesions are the only manifest symptoms of a very slight inflammation of the middle-ear. I would, therefore, suggest that in each case of facial paralysis, also in rheumatic ones, an exact otoscopic examination and functional test be made, because in the rheumatic facial paralyses too, there often occurs the combination of a lesion of the facial and of the auditory nerve. Shambaugh also believes "it is apparently as often the extremely mild acute catarrhal processes as it is the more severe suppurative disease that produces facial paralysis." Moreover, according Shambaugh, "it is the acute processes that affect the nerve."

Facial paralysis is never the result of chronic hyperplastic adhesive middle ear-catarrhs, nor is it often the result of the chronic suppurative otitis media, even when the hyperplastic changes in the mucosa and underlying bone are more conspicuous.⁶ If we see a facial paralysis originating in the very first days of an acute middle ear inflammation, the presumption is in all probability that we have to deal with an inflammation of the facial nerve at the medial wall of the tympanic cavity. We meet with this fact especially in children.

Immediate extensive myringotomy, diaphoretic treatment, together with application of hot air, diathermy, or short waves may make such facial paralysis disappear very soon. Only if in the course of ten to fourteen days no improvement of the facial paralysis takes place, or if the otitis or mastoiditis even changes for the worse, facial paralysis may be an indication for mastoidectomy. In such stubborn cases the facial nerve is mostly not attacked in its horizontal part, but at another favorite place for inflammation, namely at the inferior facial knee underneath the threshold of the antrum where, through a frequently occurring so-called Pogany's cell, there may be a communication to the facial canal.

From recent investigations by Ziegelman⁷ we know "that pneumatic cells may invade the bony canal to a place where they were separated by the contents of the canal by a tissue paper thickness of bones." Ziegelman found these cells in most of his cases at the same place where Pogany had found his cell.

Canuyt⁵ has published a very interesting case pertaining to this category:

A twenty-two year old male, eight days after myringotomy facial paralysis originated. Renewed myringotomy did not bring any improvement; wherefore after three days mastoidectomy. An ostitis was found on the Fallopian canal on the threshold of the aditus ad antrum, which represented the seat of the lesion of the facial nerve. The facial paralysis healed during the healing of the mastoid wound.

Great diagnostic significance was formerly attributed to facial paralysis in connection with tuberculosis of the middle ear. Since we know, however, that facial paralysis occurs not uncommonly in the genuine otitis media acuta, the origination of a facial paralysis in acute otitis media can by no means be decisive for diagnosing tuberculosis.

If facial paralysis occurs in a scarlatinous otitis media it is always a very severe symptom, and in such a case we should be ready to perform an immediate mastoidectomy in order to avoid destroying the facial canal through the necrotising process.

Facial Paralysis in Chronic Otitis Media

We find this relatively, frequently. We have to discriminate between facial paralysis in a chronic otitis media with and without cholesteatoma. In the simple chronic purulent otitis media we meet with similar conditions in the nerve as in the acute otitis media, and our procedure will therefore be alike in either case.

When facial paralysis occurs in a

chronic purulent otitis media with cholesteatoma, it is prognostically very unfavorable, because in a cholesteatoma, erosion or wearing away of the facial canal may take place, whereby the suppurative process may attack the facial nerve directly and suppurative infiltration of the nerve may set in. Cholesteatomatous masses and granulations may strike the canal in the attic in cases in which the eardrum is partly preserved. In such a case, cushions of granulations cover the area where the lesion of the nerve takes place, in the vicinity of the oval window. More often, however, in a cholesteatoma, the facial nerve is stricken in its inferior knee and the transition into its vertical course. In chronic otitis media too, the entire facial nerve is paralyzed, but preeminently and first of all the inferior branch, only later and less intensely the other branches.

In such partial paralysis the prognosis is more favorable. It is typical in these cases that the onset of facial paralysis is not quite sudden and apoplectiform, but is to some extent preceded by prodromal manifestations. During the world war I had occasion to see such a case:

A soldier, aged forty-two, with a chronic of this media on the left side developed convulsions with pain in the area of the inferior branch of the facial nerve. The patient was first treated in the field hospital of his regiment, until after a few days complete facial paralysis with high fever set in.

Radical operation on this patient disclosed a cholesteatoma of about the size of a hen's egg with a perisinous and epidural abscess on the dura of the cerebellum. After removal of the cholesteatoma the facial nerve lay open in its whole vertical course from the threshold of the antrum down to the tip of the mastoid portion. The healing process was uneventful, and by treatment with the galvanic current the facial function was completely restored.

However, in chronic suppuration of the middle ear facial paralysis may occur without having anything to do with the suppuration, and, therefore, may be harmless.

The following case is reported by Ruttin.9

A man with chronic cholesteatomatous suppuration of many years' duration without any findings in the labyrinth and with-

out any other complications was treated by Ruttin for many months without success and, therefore, a radical operation was proposed to the patient. For various reasons the operation did not take place. Following an acute coryza, an acute exacerbation with a profuse pulsating suppuration from the antrum developed and at the same time a homolateral facial paralysis set in. Headache or any other symptoms of a complication were not present. The caloric and rotatory tests were quite normal. Again a radical operation was suggested, but the patient refused it for the time being. Within four weeks the facial paralysis disappeared completely, suppuration ceased, and the tympanic cavity became dry. In this case the facial paralysis might have been a rheumatic one or caused by the acute exacerbation without a simultaneous labyrinthitis.

In this connection Ruttin mentions the case of a physician, who himself suffered from a unilateral chronic otitis media and was suddenly stricken with a homolateral facial paralysis. Ruttin suggested a radical operation. Patient, however, refused it, remarking that this was certainly only a rheumatic facial paralysis; not only he himself, but also his brother and father had had rheumatic facial paralysis on the same side several times. As a matter of fact the facial paralysis in this case soon cleared up.

Benési¹⁶ also reports a case of a woman with chronic otitis media, who was stricken with a homolateral facial paralysis without any exacerbation. Without operation the facial paralysis disappeared after faradization and galvanization.

Such cases, of course, admonish us to be cautious and teach us that also in cases of chronic purulent otitis media with cholesteatoma and facial paralysis, we have to weigh carefully the pros and cons of an operation. In such cases we always have to bear in mind the possibility that we may be dealing with a luetic facial paralysis, and we have to act accordingly.

Facial paralysis in affections of the inner ear interest us within the frame of this paper in so far as they may occur in suppuration of the inner ear, especially in the complicated diffuse purulent labyrinthitis. They need not necessarily vary from the facial paralysis in a middle-ear suppuration. In these cases, too, symptoms of irritation may be observed for a short time in the very beginning. An

exact diagnosis is, therefore, very important. If, for instance, in a chronic cholesteatomatous suppuration of the middle ear, an acute labyrinthitis develops and a facial paralysis sets in, an exact functional test of the facial nerve may reveal a localization of the suppuration. If in such a case we find a complete motor facial paralysis with disturbance of the lacrimation, but without a disturbance of the sense of taste, it would indicate that the lesion of the facial nerve has taken place in the inner ear canal.

From this fact we should be able to conclude that the acute infection has approached this area and that a meningitis is threatening. In such a case, even in the most acute stage of labyrinthitis, an immediate radical operation of the labyrinth with laying open of the inner auditory meatus may be life-saving, and we should not have to wait for the first symptoms of meningitis in the spinal fluid.

In the literature we find a number of cases in which the facial canal was the path on which the suppuration travelled to the endocranium (epidural and brain abscess).11-13

In a case reported by Brieger¹⁴ a fatal meningitis developed via the facial canal three weeks after a mastoidectomy. This case shows that facial paralysis may some time be a warning signal of endocranial complication.

Summary

1. The appearance of a facial paralysis in the course of a suppuration of the middle ear is always to be regarded as a serious symptom.

- 2. If the onset of a facial paralysis in an acute otitis media occurs in the very first days of the inflammation of the middle ear, such a facial paralysis, contrary to the teachings laid down in so many textbooks and handbooks, as a rule does not indicate a mastoidectomy. Only in the event that such a facial paralysis does not clear up in the course of two weeks or so after an extensive myringotomy, or the more if other symptoms arise, it may well become an indication for a mastoidectomy.
- 3. If a facial paralysis develops in the course of an acute purulent otitis media in the third or fourth week, it may have been caused by a lingering mastoiditis and may be an indication for a mastoidectomy.
- 4. Facial paralysis arising in a chronic purulent otitis media without cholesteatoma may clear up without any operation. If other reasons for a radical operation exist, facial paralysis may be a weighty contributory indication for an operation.

5. Facial paralysis in a chronic purulent otitis media with cholesteatoma is an indication for an immediate radical operation.

6. Facial paralysis originating in an existing purulent otitis media with acute labyrinthitis may be an indication for a labyrinthectomy, in order to prevent a threatening meningitis, provided we are able to locate the focus of the facial paralysis in the internal auditory meatus.

NOTICE OF EXAMINATION

A competitive examination will be held in May for the position of Director of the New York State Psychiatric Institute and Hospital, Department of Mental Hygiene; salary \$6,000 per year, with \$3,000 added in lieu of maintenance, less deduction for pen-

sion purposes. Further details and application forms may be obtained from the Examinations Division, State Dept. of Civil Service, Albany, N. Y. All applications must be returned or postmarked not later than May 15.

EDITORIALS

Danger Ahead: Go Slow!

The Supreme Court's nullification of a large part of the national Administration's legislative program speaks more eloquently than words against haste and emotionalism in the formulation of laws NRA cost the country millions in bureaucratic expenditure only to be swept into the discard. The AAA has been prononnced dead but the enormous sum of half a billion dollars must still be paid out to discharge obligations contracted under it Even if the Social Security Act withstands the test of constitutionality, there is no certainty that it will achieve its aims Some observers predict that it will on the contrary increase unemployment by spurring greater mechanization of industry to avoid payroll taxes

As far as Albany is concerned, the experience of Washington in the past year should act as a sharp check on ill considered legislative innovation Unbiased critics have pointed out that the state unemployment laws are carelessly framed and madequately financed, with little likelihood of surviving a severe depression Now it is proposed to add to the statute books a measure that is not merely of doubtful efficacy but outspokenly vicious The Mandelbaum Compulsory Health Insurance Act defies sound theory and experience in its mexact actuarial basis, its combination of cash and medical benefits and the excessive power it places in the hands of politically designated ad-

In Europe obligatory prepayment for sickness gave a tremendous impetus to malingering and hypochondria, with the result that costs have far exceeded early estimates That Americans are not immune to similar weaknesses is clearly shown by the findings of the Research Staff of the New York State Commission on State Aid to Municipal Subdivisions All over the state a dole seeking population is developing as a result of easily obtainable relief Enactment of the Mandelhaum Health Insurance Act, with its cash benefits and medical aid to wage earners who are well able to provide for themselves, would complete the pauperization of a large section of the public

The tendency to resort to liasty, superficially attractive legislation for the eradication of complex economic flaws is costly to the tax-payer and destructive of orderly social progress Bills like the Mandelbaum Health Insurance Act are statutory murages, depleting the weak (among both individuals and governments) of their scant reserves. The physicians of this state are unalterably opposed to this measure, which sacrifices the medical profession and the quality of medical practice to a cumbersome political bureaucracy serving an invalid concept of medical care

A Fundamental Threat

For the first time in a number of years two acts have been introduced in the Legislature which would legalize the practice of chiropractic in this state. Physicians who remember the strength of the chiropractors' lobby at Albany less than a decade ago will understand how important it is to the public health and to scientific medicine that the Hill bills be promptly and thoroughly quashed.

Assemblyman Hill employs two different devices to destroy the educational defenses of healing. In one bill he simply exempts chiropractic from the existing statutory definition of medical practice. Needless to say, the minute chiropractors were granted this exemption, every other quack cult in the state would clamor for similar privilege—and with equal justice. The Medical Practice Act rests on its definition of medical practice. Any successful attempt to tamper with that definition would bring the whole law down in ruins.

Mr. Hill's other bill is the old chiropractic classic in slightly modified form. New aspirants to this lucrative field would have to spend two years in academic preparation of a sort. For established practitioners the prescribed term of study is reduced—to practically nothing in the case of old-timers, who, parenthetically, are most in need of formal instruction, many of them having been recruited from occupations having no discoverable relationship to the basic medical sciences.

Enactment of either of the Hill measures would undo the great benefits that the public health of this state has enjoyed under the current Medical Practice Act. To some politicians, who profit by the voter's right to commit follies, there is force in the chiropractic argument that the sick be permitted to select their own systems of healing. The medical profession does not gainsay this right. It merely insists that every one who undertakes to diagnose or treat disease by any means should be subjected to the same exhaus-

tive preparation as the physician. There is no obstacle (except knowledge and conscience) to the practice of chiropractic after completion of the regular medical course.

The sole point at issue is whether the minimum standards set by the state for those who purpose to treat the sick shall be respected or destroyed. On this point no thinking person can afford to remain silent. Physicians should enlist all the intelligent laymen of their acquaintance in defense of the existing statutory safeguards against ignorance and incompetence in healing.

Simplified Surgery for Prostatic Hypertrophy

According to the latest available statistics, approximately one-third of all men over sixty years of age suffer from the effects of prostatic hypertrophy. Despite the remarkable advances in the knowledge of prostatic surgery, prostatectomy still remains a formidable procedure, largely because of the poor physical condition of the majority of those afflicted. Consequently urologists have sought less drastic means of affording relief from the distressing symptoms resulting from enlargement of the prostate gland.

In 1884, Lannois suggested castration. The clinical results which followed this operation were very satisfactory but the psychological reaction of the patient coupled with the marked cachexia were more troublesome and alarming than the symptoms of prostatic hypertrophy. Experimental work has shown that the female hormone (folliculin), which is also present in the male, and the hormone Prolan B of the anterior pituitary lobe, are capable of causing a marked increase in the size of the prostate gland when injected into animals. The male sex hormone, on the other hand, regulates the normal development of the gland.

On this basis, Van Cappellan¹ attempted the treatment of prostatic

^{1.} N. Y. STATE J. OF MED. 35:223, 1935.

hypertrophy by injections of the male hormone This procedure, however, must of necessity, be a long drawn out process Niehans offers a simple and more con vincing method of therapy. He reasons that if, in old age, the internal secretion of the testes can be augmented, particularly that emanating from the germinal epithelium, the physiological balance between the male and female hormones and Prolan B will be re established. Utilizing the Stemach II operation, wherein the efferent testicular ducts are ligated, he has succeeded in giving relief to over four hundred sufferers from prostatic hypertrophy Besides the rejuvenating effect of this operation, the circulation is improved and the arterial tension becomes normal Nocturnal frequency and painful straining gradually recede and the bladder can be emptied without effort. In most cases, the residual urine disappears. These results, according to Nichans, last for vears

The beneficial effects of this operation are attributed by Niehans to the forcing of the germinal epithelium hormone through the pores of the tunica albuginea into the general circulation. This viewpoint is, of course, open to question, but the fact remains, nevertheless, that the operation is a simple one. The remarkable results reported warrant an extended trial of the Steinach II for the relief of prostatic hypertrophy, and a thorough check of the claims made for it.

Nasal Accessory Sinusitis

Infections of the nasal accessory sinuses still confront the profession with a problem which is far from solution. It is true that the greatest proportion of cases of acute suppurative sinusitis respond favorably to therapy and in most instances a cure can be obtained. Chronic infections of the sinuses are much more difficult to deal with. The surgery of chronic sinustits, though highly perfected technically, has not yielded the gratifying results which other branches of bone surgery.

have been affording Consequently, there seems to be a trend toward so called conservatism in the treatment of chronic masal accessory sinusitis

This change in attitude has resulted in a reversion to the use of mechanical means of cleansing the nasal passages plus the use of various drugs to reduce inflammation and to promote healing. In connection with the latter, it is of interest to note the work of Fenton and Larselle1 who have studied the effects of drugs applied to the mucosa of the sinuses in cats An inflammatory reaction was induced by the moculation of streptococcus hemolyticus and preparations such as histamine, azochloramid, sodium alum and ephedrine compounds were then brought into contact with the inflamed mucosa

From their observations, practically every preparation acted as an irritant except where its strength was isotonic, despite its efficacy as an antiseptic in vitro. Sodium alum and tannic acid in weak solution reduced the severity of the infection. The newer compounds which resemble ephedrine in their action tended to stimulate the reparative processes.

It will be seen, therefore, that the total abandonment of surgery in favor of medicaments in the treatment of chronic suppurative sinusitis is not to be recommended at the present time in view of the above findings. The symptoms of chronic sinusitis are not accounted for entirely by the local lesion and the systemic effects, plus their mode of production, are understood but little. A middle course must be steered until more is known of the relationship of smus pathology to the organism as a whole

CURRENT COMMENT

FROM THE Saint Louis County Medical Society Bulletin under dite of February 21, 1936, we read that "According to the experience of the American life insurance companies for the year of 1935, it is reported that the death rate from heart disease has declined almost one per cent from the

² Nichans, P Lancet vol 1, No 6, 307, Feb 8,

¹ Fenton R A and Larselle, O Arch Oto-

rate experienced in 1934. This is the first decrease that has been experienced in five years. And what is more noteworthy still is the first decrease in the death rate from cancer in ten years.

"Who caused this decrease? How was it brought about? The answer to the first is, the physicians. The answer to the second is, because they have a many century-old proven practice of medicine, that is constantly being changed to suit the times and to include the new facts that are developed by the doctors. State medicine could not accomplish this, neither could socialization of medicine."

"CIVILIZATION HANGS on scientific medicine, which by its prophylactic practice saves the world from its ailments. Commerce hangs upon civilization, in turn, yet commerce and civilization are both showing appreciation by giving medicine a slap in the face. Question in our minds is whether they know that they are driving us to the wall. It would be most timely if the medical profession were to distribute reprints of the old fable about killing the goose that laid the golden egg."—From editorial comments in *The Bulletin* of the Central Medical Council of Brooklyn, December issue.

THE MILWAUKEE MEDICAL TIMES SUCcinctly states that: "Public health agencies and institutions have a decided advantage in their ability to present statistics to the public. This cannot be so readily done by a medical society because gathering statistics by a government agency is one thing and the compiling of them by a medical society is another. Furthermore it is a costly procedure and an expenditure which would be difficult to justify, for the story of the health of a community can be as effectively told without a myriad of figures. * * The public should know that the basis of all public health programs, whether or not they are sponsored by public health agencies, is the practitioner of medicine; further, that most of the real preventive work, aside from that in contagious diseases, is done by the private practitioner." February 21, 1936.

"A CHECKUP OF THE living quarters of the tubercular poor of New York City shows that they are better than they were ten years ago. That is to say, three families in ten now have central heating; seven out of ten have bathrooms; they all have an average of a half a room more per family. So tenement housing is going ahead at the rate of two and a half rooms every fifty years. This spectacular advance in the show-

ing made by private capital in the housing field ought to stop all the nonsense about public building of tenements for the poor."
—From the editors of *Today* in the issue of February 22, 1936.

ANOTHER COMMENT concerning the relation of the physician in organized medicine and the public health departments to the public health comes from The Weckly Roster and Medical Digest of Philadelphia, to wit: "It is the unquestioned duty of medical organization to cooperate with all departments of public health and to promote such good public health work as should come within the province of the various departments of public health. We must not be unmindful, however, that departments of public health may become overzealous in their activities and it must be understood that every public health department that over-steps its definite functions of sanitation, hygiene, police power, and health propaganda is assuming prerogatives which can not be acceptable to medical organization. The physician must understand and retain the prerogative of treatment and all other prerogatives which are inherent to his personal medical practice.

"The physician is the one individual who by tradition, education, and experience is qualified to care for the mental and physical ills which visit humanity. Therefore all national, state, and municipal policies involving medical care of any character should be formulated only after consultation with and upon the advice of medical organization, in order that the practice of medicine shall be at all times kept under the control of the medical profession." February 22,

1936.

"IT REQUIRES NO great stretch of the imagination to see what would happen if medical care here became a state function. Indeed, the history of state medicine in other countries has given ample demonstrations. German insurance societies have always been used as effective political instruments by whatever party happened to be in power. The same situation exists in England, and only the sheerist optimist could deny that it would not occur here. With annual expenditures of increased millions would come added opportunities for graft. And in the huge administrative personnel rolls lie endless possibilities for patronage. Politics rather than knowledge would be power. Great expectations!"—The Detroit Medical News, February 21, 1936.

WRITING OF "The Doctor and His Hospital," the Bulletin of the Central Medical

Council of Brooklyn states that: "It is the lay board who obtain the charter and run the hospital. If doctors would realize this and olan and act accordingly, they would be spared many a heart ache. Although the hospital appointments of doctors are for the duration of the pleasure of the Board of Directors, in a well-conducted institution appointments to the medical staff are made by the lay board only upon the recommendations of the older members of the medical staff."

The article goes on to speak of the interdependence of doctor and hospital, and of the effect of the upheaval of the World War on medical practice. In concluding it states that, "Only by following true and trained and ethical medical leaders may physicians perform their work most effectively and their patients receive the best possible care. Each physician must take a keen interest in the welfare of his hospital, for he owes it to his patients, to the Board of Directors of the hospital, to himself, and to his colleagues, and to his own family. American medicine is at the crossroads. Either it is going to retain its world leadership or else it will degenerate to the position occupied by medicine in the countries where dictatorship prevails. The innocent sufferer will be the poor and helpless patient."

IN WRITING OF the Medical Economic

Security Administration for St. Louis, the St. Louis County Medical Society Bulletin makes some very pertinent remarks which may well apply to analogous situations of our own. "Those of us who are concerned with stemming the attempts which are being made to institute a form of social security that leaves out of consideration the rights of the medical practitioner, are just as much concerned over the apathy of our colleagues. It is true that our members are busily engaged in relieving human suffering in the practice of their vocation, but it is likewise necessary to not only have confidence, but to cooperate with the machinery that has been set up in this community to assist the people in securing good health security.

IN HIS ADDRESS ON February 12 at the Eighth Annual "Round-the-World-Columbia-Day" ceremonies at Columbia University, New York City, Dean Willard Rappleye said among other things that, "No phase of medical service and education is more important at present, both from the standpoint of the public and of the profession, than the proper training and identification of specialists for, in spite of the large number of physicians who claim to be specialists, there is actually a shortage of properly trained experts to meet the needs of the country."

THREE MILLION SPONGES

The annual report of the New York City Department of Hospitals discloses that at least half the population relies on municipal institutions for medical care. This means that the physicians affiliated with the Department of Hospitals are serving about three million persons without any financial return for their work. It also means that the medical men of Greater New York must look to fewer than half of the city's residents for paying patients, for presumably Dr. Goldwater's report does not include that vast section of the populace which frequents the voluntary hospitals for dispensary and under-cost ward service.

The continuous, increased absorption of patients by public and semi-public institutions will make a secure economic status untenable by the private practitioner unless steps are taken to readjust his relationship to the hospitals, says the New York Medical II'cek. There is no other profession that is asked or expected to make a gift to the community of the services on which it depends for a livelihood. Every other worker in the municipal hospitals, from the Commissioner down to the lowliest orderly, is

paid for his labor. The doctor alone receives no compensation for the essential service that he renders.

Conditions have changed from the early days of the hospital, when only a small percentage of the population sought its aid and the field of private practice was unaffected by institutional activities. The vast volume of work done in municipal hospitals today demands a readjustment of their financial relations with the doctor. It is unjust to expect medical service to go uncompensated when every other form of labor is paid. In view of the growing institutional encroachments on private practice, the profession can no longer afford to work in the hospitals without monetary return.

Last year the common cold cost more than \$5,000,000 in loss of wages. More absences from work are due to it than to any other illness.

omer niness

In view of an eminent doctor's assertion that influenza and alcohol produce the same effect, we are thinking of giving up influenza.—Punch. London.

A Plea For Prevention

Hempstead, N. Y.

To the Editor:

Having read your comments entitled "Syphilis: a Dual Problem," [page 193, Feb. 1 issue] I wish to state that syphilis is so much more of a problem than appears on the surface. If rapid sterilization is to be discarded these cases should be isolated so as not to spread the disease. To control the spread of this disease should be our first consideration.

The fact that syphilis can be practically eliminated as has been done in Sweden, Norway, Denmark, and England, should

stimulate us to accomplish as much.

I hope that in considering this disease, you will study the ways and means of eliminating syphilis as a disease in the United States.

The future will see syphilis as rare a disease as typhoid is today. It would be unfortunate if our State Medical Society should not take a leading place in meeting this great problem.

Very truly yours, E. H. SANITER, M.D.

February 18, 1936

Sickness Prevention Thru Saving by Labor!

565 Park Avenue, New York City.

To the Editor:

If the "old gag"—or calumny against some mythologic rooster—in the first paragraph of your editorial, "Comparisons Are Instructive," [page 270, Feb. 15 issue] had followed the second paragraph to humorously emphasize the absurdity of Dr. Elliott's contention, I'd have more hope for the intellectual integrity of my profession.

Some years ago I learned that trying to stop the errors of my fellows is a thankless

task. Nevertheless, and at the risk of being called "a bear for punishment," I want to express my condemnation of the suggestions and implications contained in this editorial.

History is replete with political spoilsmen and union labor leaders who squeezed more and more revenue out of their subservient followers, by pointing to others who were being bled whiter than they. But, when the medical profession stoops to such specious reasoning, I think it is high time someone should object.

With our profession's lofty heritage of study and intellectual courage, it is a sad spectacle to see the New York State Journal of Medicine reach down to the hod-

carrier for precept.

Far better had you devoted this space to condemning the outrage being perpetrated upon the average wage-earner by his union leaders. If the laborer had the \$100.00 to \$300.00 of his earnings, now taken away from him by his ruthless leaders, to put into better living, he and his family would have better health; which is a legitimate concern of our profession.

Sincerely, Charles B. Slade, M.D.

February 17, 1936

A Correction

Binghamton, N. Y.

To the Editor:

The February 1, 1936, issue of the Journal contained an essay by Dr. Thomas C. Peightal, entitled "Pelvic Infection—Laboratory Aids in Diagnosis and Treatment." The discussion was erroneously attributed to me, when in fact it was opened by Victor W. Bergstrom, M.D., of Binghamton. Will you not correct this error?

Very truly yours
CHARLES J. MARSHALL, M.D.

February 14, 1936

THEY MERIT CAUSTIC CRITICISM

Even the authors of the Caustic Poison Act might be amazed at some of the violations which are prosecuted under the Federal Food and Drug Administration. In the latest published list of judgments under the Act, three of the eight cases reported dealt with toys. One was a balloon outfit which included a dangerous acid to be

used in generating gas for the balloon. Two cases resulted in taking off the market miniature educational chemistry outfits that included dangerous chemicals.

Charles Mayo remarks that what a doctor has under his hat is far more important that what he has in his laboratory.

Annual Meeting

Committee on Arrangements

THE ANNUAL BANQUET

The Annual Banquet of the Medical Society of the State of New York will be held Tuesday excuing, April 28, 1936, at seven o'clock Grand Ballroom, Waldorf-Astoria Hotel

The tickets will be \$5.00, and each ticket will carry a stub entitling the bearer to the Reception and Dance at ten-thirty PM in the Sturlight Roof, Waldorf-Astoria Hotel No admission for the Reception and Dance will be possible without the stub that is part of each Banquet ticket No individual tickets for admission to the Reception and Dance will be issued other than the regular Banquet ticket

Tables are arranged for ten and reservations for tables will begin on April 1 Allotments will be made in the order of receipt of checks, money orders or cash The issue of tickets for the Banquet will be limited to 1000, and no allotment or sale of tickets will be made after the cash reservations have reached 1000

For reservations address the Secretary of the Medical Society of the State of New York, Dr. Duniel S. Dougherty, 2 East 103rd Street, New York, N. Y.

Members desiring to be seated with friends should endeavor to make up their own seating arrangements and send the list of names of guests, with check, to the Secretary

Late reservations are always associated with some embarrassment and the Committee on Seating have great difficulty with this group Please assist the Committee by making reservations early and sending lists of names of guests

CHAS GORDON HEYD, Chairman

Clinic Day

On Thursday, April 30 1936, clinics will be held in all of the hospitals of New York. City, in all specialties of medicine The visiting physician can arrange his time to spend the morning in one institution and the afternoon in another

The subjoined information is provided giving the approximate taxical fare and minutes to reach the designated hospital. The bus, clevated and subway service is also included and employment of these agencies of transportation is suggested where any relatively great distance is to be covered.

At noon on Wednesdry, April 29th, there will be available at the registration booth of the Society, at the Waldorf-Astoria Hotel a list of all of the clinics of the hospitals of New York City The Directory of Hospitals and Medical Schools, however, will be published only in the Journal It is suggested that visiting physicians keep thus list as it will aid them in calculating their time

Admission to the various hospitals will be without cards of admission as all of the hospitals have agreed with the Committee of Ariangements to open their clinics to the visiting physicians

Transportation Guide

Showing the approximate taxicals fare and time required for reaching hospitals from Wildorf Astoria Meter rates will be charged but no extra charge is made for additional prassurgers.

TO THE CHAIRMEN OF ALL COUNTY WORKMEN'S COMPENSATION BOARDS

At a meeting of the Industrial Council of the State Department of Labor held on February 27, a qualified physician was examined on a complaint filed against him that he was referring patients to attorneys and licensed representatives

At this hearing it was revealed that this practice has been developing in certain sections of the State, and the Industrial Council is of the opinion that the practice should be stopped at once. The Council adopted the following resolution and requested that it be promulated throughout the State for the

information of all practising physicians

Whereas, it has always been in violation of the ethics of the medical profession for pliyst crins to recommend to their patients the names of attorneys or licensed representatives to represent their at compensation learnings, be it

Resol.ed, that the Industrial Council hereby expresses its unqualified disapproval of such practice, and recommends that any authorized physician found guilty of this practice be called before the Compensation Board of the County Medical Society for disciplinary action

DAVID J KALISKI, M.D., Chairman

YOUNG TREES TRIM EASIEST

Investigations in Germany show a remarkable difference in the effect of the loss of a limb on old and young persons As reported in a German medical journal, when a limb is amputated during youth, the handicap can be sufficiently mastered Moreover, traumatic neuroses and personal injury neuroses are scarcely ever found in young persons Amputation taking place during the period of involution or senility, when the patient no longer possesses the agility of youth, produces quite different results. The psychic condition is different, optimism and vital energy together with a stern will to overcome the handicap are no longer present In middle aged adults the reaction to the loss of a limb depends largely on idiosyncrasy

Intellectual predisposition of course plays a decisive part in such cases and external factors, such as environment, early training and education, are important. The occupational background enters into the picture Noteworthy are the differing reactions produced by the type of indemnification received for the injury by the patient. When it takes the form of an income the recipient regards the indemnity as insufficient, whereas settlement in a lump sum is seized on as a welcome prize This lump sum settlement has no noticeable influence on the rehabilitation of the crippled person, but the life long income often prevents him from striving with all his energy for the restoration of his working capacity

TO DEMONSTRATE JOHNS HOPKINS LINE TEST AT CONVENTION

An exhibit certain to alouse great interest and attract attention at the coming Convention of the Medical Society of the State of New York, will be the Johns Hopkins line test for Vitamin D potency actually demonstrated in the booth of the Wisconsin Alumni Research Foundation These tests will be conducted continuously by biochemists affiliated with the Foundation

The Steenbock Irradiation Process, which employs ultraviolet rays in order to activate certain food and medical products with vita-

min D will be the main topic in Space 90 Various products such as Viosterol and tradiated milk and foods will be shown the background of the display will demonstrate the laboratory technique employed in conducting the Johns-Hopkins Line Test

By means of this test, the vitamin D products licensed by the Wisconsin Alumin Research Foundation are continually assayed in order to make sure that the vitamin D potencies are uniform, thus facilitating accurate dosare

Society Activities

Malpractice Insurance Committee

The Malpractice Insurance Committee are very happy to bring to the attention of the Membership the communication from Mr. W. T. Maudsley, General Manager of the Yorkshire Insurance Company of London, England. The Yorkshire Insurance Company of London, England, is one of the

largest and most conservative insurance companies in the world. It was organized in 1824, transacts a world wide business, with assets well over \$75,000,000.

> Dr. C. Gordon Heyd, 116, East 53rd Street, NEW YORK.

Dear Sir.

We have your letter of the 26th ulto., and may advise you that the Yorkshire Indemnity Company being entirely owned by ourselves its liabilities will be taken care of by us so long as they exist in the same way as our own liabilities both in the United States and elsewhere.

Yours faithfully,

General Manager

Committee on Legislation

Bulletin No. 6

February 19, 1936

The following bills have been introduced since the issuance of our last regular

hulletin:

Senate Int. 829-Byrne, adds new section 189, Lien Law, by providing for liens of hospitals, physicians, and nurses for care of persons injured as result of negligence of other persons or corporations. Referred to the Judiciary Committee.

Comment: This is identical with one of

the bills that Senator Byrne carried last year, except that it carries an exemption of

\$300 instead of \$1000.

Senate Int. 835-Baldwin, adds new section 21, Vehicle and Traffic Law, for annual physical examinations of chauffeurs, for revoking licenses on failure to pass examination, and for suspension where ailment is temporary. Referred to the Motor Trans-

portation Committee.

Comment: To the legislative committee appointed to investigate motor transportation it has been suggested that chauffeurs should be obliged to pass a physical exami-nation before being licensed. Similar suggestions have been made to the Department of Motor Vehicles, and the commissioner is seriously considering what might be done along this line. Our interest in the bill is that we should be called upon to make the examinations.

Senate Int. 840-Baldwin, amends the Vehicle and Traffic Law, by requiring all license holders to submit to examination for fitness, every four years. Referred to the

Motor Transportation Committee.

Comment: Another bill looking toward the physical examination of drivers of motor vehicles. It is probable that neither of these bills will be enacted this year, but the com-missioner has expressed a desire to discuss the matter with the proper committee of

our Society.

Senate Int. 855-Schwartzwald, amends section 25, repeals 320, Public Health Law, for direct reports to State Health Department or district health officer of certain communicable diseases occurring in districts of less than 50,000 not having a whole-time health officer, or in State institutions or tuberculosis hospitals, and relative to reports by laboratories. Referred to the Health Committee.

Comment: This is a Department of Health measure intended to improve report-

ing service.

Senate Int. 867-Twomey, amends Section 1361, Education Law, relative to pharmacy, by striking out "sale" from provision that article shall not apply to manufacture and sale of proprietary medicine. Referred

to the Education Committee.

Comment: This is intended to close a leak in the Pharmacy Law by which barbituric acid and other allied preparations are at present finding their way to the public without being prescribed by physicians.

Senate Int. 878-McNaboe, adds new subd. 13, section 3-a, new section 421-a, Public Health Law, creating a division of narcotic control, defining its powers and duties, and appropriating \$25,000. Referred

to the Finance Committee.

Comment: The Department of Health was a year ago given authority to exercise some control over the distribution of narcotic drugs. There is no regularly organized bureau and an inadequate appropriation, according to Mr. McNaboe, and his bill is intended to correct that situation.

Senate Int. 898-Wicks, adds now Art. 59, Education Law, for regulating practice of opticians, Referred to the Education

Committee.

Comment: The opticians and the optometrists separated themselves several years ago when the optometrists had enacted a law drafted along the lines of the Medical Practice Act. They are at present proud of their ethical conduct. The opticians have no such regulation and some of their leaders would like to have a legal control exercised over their entire group. They admit that there is much abuse of the public through advertising and unethical practices which should be made illegal.

Senate Int. 909-Kelly, amends section 387, Public Health Law, by requiring commissioner to receive any medical certificate certifying to performance of a postmortem examination and result thereof where original of death certificate shall have been theretofore filed, provided medical certificate is made and signed by physician performing examination. Referred to the Health Com-

mittee.

Comment: This bill did not originate with the Department of Health and we are informed that it is not acceptable to the Department. We haven't had an opportunity to discuss the bill with Mr. Kelly and do not know why there should be the necessity for this extra certification.

Senate Int. 910-Schwartzwald; Assembly Int. 1055—Bush; amends section 202, Mental Hygiene Law, for excepting licensed private institutions from local zoning ordinances and ordinances enacted subsequent to date of licensing. Referred to the Penal Institutions Committee in the Senate and the Health Committee in the Assembly.

Senate Int. 918—Dunkel: Assembly Int. 1134-Milmoe; amends section 1361, Education Law, by providing no manufacturer or wholesaler may sell any drug, medicine, chemical, prescription or poison containing poisonous, deleterious or habit-forming drugs to any person or corporation unless such person or corporation has been duly authorized to sell such drugs, medicines. chemicals, prescriptions or poison at retail. Referred to the Education Committees.

Comment: Originated with the State Association of Pharmacists.

Senate Int. 988—Thompson; Assembly Int. 1170—Potter: adds new section 189, Lien Law, giving public hospitals and private hospitals supported in whole or part by charity, a lien on rights of action, claims or demands of any person receiving treatment and maintenance on account of personal injuries received as result of negligence. Referred to the Judiciary Committees.

Comment: A new hospital lien bill. This bill is quite different from the other two. It provides for a lien for hospitals alone and carries no exemption clause. All awards or settlements are attachable. The lien is to cover reasonable charges for treatment, care and maintenance of the injured person at ward rates.

Senate Int. 1017—Hendel: Assembly Int. 1201—Cariello; adds new section 55-d, Insurance Law, requiring insurance companies to reserve out of proceeds of any life, accident or group life insurance policy, sum not exceeding \$500 for paying funeral expenses. unless undertaker's receipt is presented or proof is given that estate is sufficient to pay such expenses. Referred to the Insurance Committees.

Comment: Senator Hendel is willing to have this bill amended so as to provide that physicians' accounts may take equal standing with the undertakers'. It is Mr. Cariello's bill, however, and we have not had an opportunity to discuss the matter with him.

Senate Int. 1030—Egbert; Assembly Int. 1158—Swartz; amends section 432, Correction Law, by providing qualifications of superintendent of institution for male defective delinquents at Napanoch shall be prescribed by correction commissioner, existing provision requiring him to be a welleducated physician and medical college graduate with five years' institutional ex-perience. Referred to the Penal Institutions Committee.

Comment: Napanoch is so large that it supports a regular medical staff, and inasmuch as the duties of the superintendent are no longer medical but entirely administrative, the Department of Correction feels that the requirement that the superintendent be a physician should be rescinded.

Assembly Int. 988-Miss Byrne, amends group 15, subd. 1, section 3, Workmen's Compensation Law, by including in provisions of the law an intern in a prison, reformatory, insane asylum or hospital maintained by a municipality or other subdivision of the State, Referred to the Labor Committee.

Comment: Includes interns employed in State or municipal hospitals under the provisions of the Workmen's Compensation

Assembly Int. 1026—Breitbart, amends section 940. Criminal Code, to permit bloodgrouping tests of criminals for identification purposes. Referred to the Codes Committee.

Comment: Includes blood-grouping tests with finger printing, photographing, and other procedures employed in the identification of criminals.

Assembly Int. 1151—Allen, reappropriates \$1,000,000 to Department of Agriculture and Markets, to pay indemnities of \$250,000 on account of bovine tuberculosis suppression, \$450,000 for Bang's abortion, \$200,000 for mastitis, and \$100,000 for expenses. Referred to the Ways and Means Committee.

Action on Bills: Senate Int. 12-Buckley -jury duty-lost and tabled (19-19). Senate Int. 233-emergency relief appropriation—passed Senate. Senate Int. 377— Quinn-bringing indigent persons into State -passed Senate. Assembly Int. 136-Taylor-physicians' testimony-passed Assembly. Assembly Int. 836-extending life of TERA to April 1, 1936-to Governor. Assembly Int. 919—E. S. Moran—voluntary health insurance - third reading in Assembly.

Hearings: March 11—Assembly Committee on Labor and Industries-all bills amending the Workmen's Compensation

Law.

Bulletin No. 7

February 26, 1936

Since the issuance of our last bulletin the following bills have been introduced:

Senate Int. 1063—Byrne, amends section 1259, Education Law, for endorsing without examination license to practice medicine of certain graduates of medical schools and colleges in a foreign state or country. Referred to the Education Committee.

Comment: This bill has been radically amended and the new matter now reads: "Notwithstanding the provisions of this article or of any other general or special law, no license or certificate, wherever issued shall be endorsed without examination

as a license to practice medicine in this State unless the holder thereof shall have graduated from a medical school or college registered as maintaining at the time a standard satisfactory to the Department."

Senate Int. 1065—Feld, amends section 1264, Education Law, by permitting revocation or suspension or disciplining of a medical practitioner who has advertised for patronage by means of handbills, posters, circulars, letters, stereopticon slides, motion pictures, radio or newspapers. Referred to the Education Committee.

Comment: This bill was prepared and

introduced at our request.

Senate Int. 1083—Schwartzwald; Assembly Int. 1356—Crews; appropriates \$100,000 for payment of expenses of Labor Department for prevention of silicosis and other dust diseases. Referred to the Finance Committee in the Senate and the Ways and Means Committee in the Assembly.

Comment: Provides an appropriation for the administration of the silicosis law in

case it is enacted.

Senate Int. 1084—Schwartzwald; Assembly Int. 1355—Crews; amends section 3, 15, adds new Art. 4-a, Workmen's Compensation Law; adds new section 222-a, Labor Law, for compensation for silicosis and certain injuries to the respiratory tract resulting from inhalation of harmful dust and for prevention of dust hazard in public works. Referred to the Labor Committees.

Comment: Prepared and submitted by the Department of Labor. It will receive prompt

consideration by the legislators.

Senate Int. 1185—Doyle; Assembly Int. 1375—Piper; repeals Art. 54, adds new Art. 54, Education Law, relative to the practice of optometry. Referred to the Education Committees.

Comment: The optometrists are rewriting their law to make it accord even more completely with our Medical Practice Act than it did before. They are also increasing their requirements. After 1941 a graduate in optometry will present, when applying for State examination, evidence of having completed two years' college preparation and three years in a professional school. Columbia University is the only institution that has a school of optometry at present. There was one in Rochester some years ago but it has been discontinued.

Assembly Int. 1306—Robinson, amends sections 570, 571, 573, 574, 577-b, 690, 691, repeals 577, 577-a, Education Law; adds new section 4-c, Public Health Law, by transferring to the Health Department functions of Education Department in administering medical inspection and health super-

vision of school children, and appropriating \$2,000. Referred to the Ways and Means Committee.

Comment: This bill was not prepared by either the Department of Education or the Department of Health. It is a long bill and difficult to describe adequately in so small a space. We shall be glad to send any person who is interested a copy upon request.

Assembly Int. 1394—W. Schwartz, adds new section 336-a, Public Health Law, for acceptance of Federal allotments of moneys for establishing and maintaining adequate public health services, including training of personnel in counties, health districts, and other municipal subdivisions. Referred to the Health Committee.

Comment: The Federal Social Security Bill carries an appropriation to be given to the states for public health work. This bill is an enabling act making provision for the acceptance and administration of any such tunds as New York State might receive.

Action on Bills: Senate Int. 12—Buckley—jury duty vote reconsidered—passed. Senate Int. 1084—Schwartzwald—Silicosis—reported. Assembly Int. 30—E. F. Moran—jury duty—put over to March 3rd. Assembly Int. 919—E. S. Moran—voluntary health insurance—put over to March 3rd.

Hearings: March 3—Senate Int. 898—Wicks—practice of optician—hearing before Senate Committee on Education.

Special Bulletin

February 28, 1936

The Legislative Committee, in session yesterday, considered the bills that have been introduced since their last conference and took action upon them. You will find below their decision with regard to approval or disapproval. In a few instances it was decided that no action should be taken. You will find a record of that, also:

Approved: Senate Int. 755, Coughlinnurse veterans, reinstatement. Senate Int.
829, Byrne—liens of hospitals, physicians
and nurses. Senate Int. 835, Baldwin—
physical examination chauffeurs (approved
subject to amendment). Senate Int. 840,
Baldwin—exam. of operators of motor vehicles (approved in principle). Senate Int.
855, Schwartzwald—reports of infectious
diseases (approved subject to amendment).
Senate Int. 867, Twomey—manufacture and
sale of proprietary medicine (approved subject to amendment). Senate Int. 918, Dunkel
—sale at wholesale of certain drugs. Senate
Int. 1063, Byrne—licensing of foreign physicians (late print 1334). Senate Int. 1065,
Feld—advertising for patronage by physi-

cians. Senate Int. 1083, Schwartzwald—prevention of silicosis. Senate Int. 1084, Schwartzwald—compensation for silicosis.

Assembly Int. 893, Rossi—examination for color blindness. Assembly Int. 988, Miss Byrne—Workmen's Compensation Law, interns. Assembly Int. 1026, Breitbart—criminals, blood-grouping tests. Assembly Int. 1151, Allen—indemnities, Bang's disease, mastitis, and tuberculosis. Assembly Int. 1306, Robinson—medical inspection of school children to be transferred to Dept. of Health.

Opposed: Senate Int. 878, McNaboe—establishment of division for narcotic control. Senate Int. 898, Wicks—practice of optician. Senate Int. 909, Kelly—death certificates. Senate Int. 1017, Hendel—payment of funeral expenses. Senate Int. 1030, Egbert—qualifications of supt. at Napanoch.

No Action: Senate Int. 800, Esquirol—distribution of damages recovered in negligence action. Senate Int. 830, Byrne—hospital lien bill. Senate Int. 910, Schwartzwald—zoning laws, private institutions. Senate Int. 988, Thompson—hospital lien bill. Senate Int. 765, Esquirol; Assembly Int.

Senate Int. 765, Esquirol; Assembly Int. 920, E. S. Moran, relating to hospitals, has been approved by the Committee.

Again we urge your active cooperation in opposing the several chiropractic bills (Assembly Int. 864, Hill; Assembly Int. 865, Hill). The chiropractors from all sections of the State are flooding the legislators with letters and postal cards urging favorable consideration of their bills, on the ground that they are recognized in forty-two states, and, therefore, can not be so far wrong. They head a number of the postal cards with the exclamation "One Hundred Million Americans Can't Be Wrong!" In all fairness to the legislators, they should have some protests from physicians and physicians' friends from all over the State. So please have as many doctors as possible drop your legislators a line of opposition, or send them a telegram. Here is an opportunity for Auxiliary Societies, where such have been organized. The ladies can solicit protests from their friends.

We are happy to report, since our last bulletin, an increase in the number of comments from county chairmen, but there are still a number to be heard from.

Bulletin No. 8

March 5, 1936

The following bills have been introduced since the issuance of our last regular bulletin:

Senate Int. 1248—Byrne; Assembly Int. 1529—Reoux; adds new section 31-a, Judiciary Law, for appointment by court of

an examining physician in a personal injury action, injured party, however, having right to have his own physician in attendance. Referred to the Judiciary Committees.

Senate Int. 1279—Bontecou; Assembly Int. 1632—Fromer; amends section 156, General Municipal Law, by providing at least one member of a child welfare board must be a World War veteran. Referred to the Cities Committees.

Senate Int. 1316—Dunnigan; Assembly Int. 1613—Sherman; adds new section 337-a, Public Health Law, by providing name of State Tuberculosis Hospital located near Oneonta shall be the Homer Folks Tuberculosis Hospital. Referred to the Health Committees.

Senate Int. 1317—Dunnigan; Assembly Int. 1660—Steingut; for old age assistance, aid to dependent children, assistance to blind, Federal aid for child welfare services, Federal aid for maternal and child health services, care and treatment of crippled children, etc.; imposing additional excise taxes and appropriating \$4,000,000 for Social Welfare Department. Referred to the Finance Committee in the Senate and the Ways and Means Committee in the Assembly.

Comment: This is the social security measure that was drafted by the Governor with the assistance of the Departments of Social Welfare and Health.

Senate Int. 1319—Kelly; Assembly Int. 1629—Dunn; appropriates \$5,000 to Cornell Veterinary College for study of vaccination for prevention and control of Bang's disease in cattle. Referred to the Finance Committee in the Senate and the Ways and Means Committee in the Assembly.

Senate Int. 1345—Feld, adds new Art. 28, General Business Law, for licensing by Secretary of State of all hotels in order to preserve the public health; for inspection by local health authorities; requiring a bond of \$100 for each bed, and appropriating \$50,000. Referred to the Finance Committee.

Senate Int. 1346—Feld, amends sections 13, 13-a, b, c, d, e, Workmen's Compensation Law, relative to liability of employer for medical treatment of injured employees, to selection of authorized physician to authorization of physicians by Commissioner, to recommendation for appointment of licensed physicians, to operation of laboratories and bureaus, and to licensing of medical bureaus, Education Department being substituted for County Medical Society for purposes of certification and recommendation. Referred to the Finance Committee.

Comment: Mr. Feld says this was introduced at the request of some physicians in his district who are dissatisfied with the manner in which the County Workmen's Compensation Committee operates They accuse it of being unfair in its endorsement of physicians for compensation work therefore, suggests that the authority for endorsement be taken from the County Societies and placed with the Department of Education Another exceedingly important feature in the bill is the deletion of that part of last year's Workmen's Compensation Law which regulates practice and collection of fees by hospitals

Senate Int 1389-Feld amends sections 1264, 1265, Education Law for annuling license or disciplining a medical practitioner on proof that physician has employed a person not licensed to practice in this State or has aided in practice of medicine a person not licensed, or has advertised for patronage by means of handbills, motion pictures, radio newspapers or magazines, etc., and relative to hearing of charges Referred to

the Education Committee

This bill carries the advertis-Comment ing prohibitions which we had incorporated

in another bill that was defeated

Senate Int 1393-Thompson, Assembly Int 1731-Potter, amends sections 1250, 1251, 1262, Education Law, for the practice of chiropractic, which is defined to be the adjusting of the human skeleton frame, excluding surgical operations with use of instruments, prescription or use of drugs or medicine, except that x-ray may be used for examination purposes Referred to the Education Committee

Comment A group of chiropractors from Long Island are not satisfied with the chiropractic bill that was introduced in the Assembly by Mr Hill, and Messrs Thompson and Potter have introduced this bill at their

special request

1404-Schwartzwald, As-Senate Int sembly Int 1690—Bush, amends subd 6, section 421, Public Health Law, by defining wholesaler, as applied to narcotic drugs, to be person who supplies others than consumers with narcotic drugs or preparations containing narcotic drugs that he himself has not produced or prepared Referred to the Health Committee

Sente Int 1407-Doyle Judiciary Law, for exempting from jury duty only clergymen, physicians, attorneys, persons belonging to Army, Navy or Marine Corps, active militiamen, police and firemen, officers of vessels, licensed pilots, and holder of an office under United States Referred to the Judiciary Committee

Comment Another jury duty bill Several bills of this character have already been defeated and one is undergoing amendments

Senate Int 1415-Howard, amends sections 13 b, g, 26, Workmen's Compensation Law, by making it a misdemeanor to violate provisions relating to medical care of injured employees and for enforcing claims for medical services or treatment rendered when employer has failed to secure compensation Referred to the Labor Committee Comment This, we are informed, is a

Department of Labor measure

Senate Int 1416-Howard, amends secttion 206, Labor Law, for the filing of physicians' reports in all cases of occupational diseases Referred to the Labor Com-

Comment We are informed that this is

also a Department of Labor measure

Assembly Int 1510-Conway, amends sections 1256, 1259, Education Law, by striking out provision under which a person who has simply declared his intention of becoming a citizen may be admitted to examination to practice medicine Referred to the Education Committee

Comment This bill requires that all who seek licensure to practice medicine in New York State must be citizens of the United States At present the law requires that a person simply declare his intention of be-

coming a citizen

Assembly Int 1539—Goldstein, adds new sections 50 a, b, Correction Law, requiring the keeping of certain records by warden or other institutional head, of persons admitted to prisons, jails or other institutions, and requiring physical examination of person upon admittance Referred to the Penal Institutions Committee

Assembly Int 1545-Parsons, creates temporary commission to study and analyze recreation, recreation activities and affiliated subjects as a means of preventing destruction of child life and juvenile delinquency, curbing criminal tendencies and promoting health standards, and appropriating \$20,000 Referred to the Ways and Means Committee

Assembly Int 1683-Neustein, adds new section 1765, Penal Law, making it a misdemeanor to sell or deal in inaccurate clinical thermometers, and defining maccurreies Referred to the Codes Committee

Assembly Int 1706-Marble, requires Education Department to give a certificate of exemption from examination for the practice of optometry to a person who prior to 1930 served for not less than eight years as technical assistant to an ophthalmologist in this State Referred to the Education Committee

Comment. Introduced by request and at

the request of a single individual who is a very capable technician but who has not the educational qualifications required for licens-

ure in the profession.

Assembly Int. 1719—Neustein, adds new Art. 21-a, Public Health Law, requiring state department to verify clinical thermometer standards at stated intervals, to promulgate requirements, specifications and tolerances, providing for identification of manufacturer and for authority to use New York seal. Referred to the Health Committee.

Assembly Int. 1720—Neustein, adds new section 1765, Penal Law, making it a misdemeanor for any person to sell a clinical thermometer not conforming to requirements prescribed in act. Referred to the

Codes Committee.

Action on bills: Senate Int. 12—Buckley -Jury duty-3rd reading in Assembly. Senate Int. 134—Desmond—testimony, physicians-reported. Senate Int. 220-Schwartzwald-vital statistics-passed Senate. Senate Int. 535—Schwartzwald—Mental Hygiene Law—gaining residence—passed Int. Senate 536—Schwartzwald—Health Law, powers, commissioner—passed Senate. Senate Int. 537—Schwartzwald—transportation, physically handicapped children—reported. Senate Int. 764—Esquirol—voluntary health insurance—amended. Senate Int. 765—Esquirol—conduct of hospitals—recommitted. Senate Int. 855-Schwartzwald —communicable diseases—passed Senate. Senate Int. 1065—Feld—physicians, advertising—recommitted.

Assembly Int. 30—E. F. Moran—jury duty—stricken from calendar. Assembly Int. 919—E. S. Moran, Jr.—voluntary health insurance—amended on 3rd reading. Assembly Int. 920—E. S. Moran, Jr.—conduct of hospitals—amended and recommitted. Assembly Int. 988—Miss Byrne—Workmen's Compensation Law, interns—passed Assembly. Assembly Int. 1158—Swartz—supt. at Napanoch—passed Assembly.

Hearings: March 10—S. Int. 442—Nunan—hours of labor of employees of all hospitals—hearing before Senate Committee on Labor and Industry. All bills relative to reorganization of county government—

Senate Taxation Committee.

March 11—Before Assembly Committee on Labor and Industries: A. Int. 93—Mccaffrey—physical examination, employees. A. Int. 1355—Crews—silicosis. A. Int. 115—Fitzpatrick—state hospital employees, hours. A. Int. 388—Ostertag—state hospital employees, hours. A. Int. 550—Fitzpatrick—state hospital employees, hours. A. Int. 585—Fite—state hospital employees, hours.

The Education Committee in the Assembly will vote on the chiropractic measures before it on Wednesday, March 11. Communicate at once with the members of the Education Committee urgina them to defeat the bills.

Postgraduate Lecture Courses

conducted by

The Committee on Public Health and Medical Education

A course of postgraduate lectures, dealing with subjects of general medicine has been organized for the Sullivan County Medical Society, and started on Wednesday, March 4, with lectures given on each of five consecutive Wednesday evenings thereafter. This course was arranged by Doctor Luther Warren of the Long Island College of Medicine. An outline of the course, giving the dates, speakers, and subjects follows:

All of the lectures are by the faculty of the Long Island College of Medicine.

A course of lectures has been given jointly to the Greene and Columbia County Medical Societies, the meetings being held at Catskill and Hudson, alternately. Doctor Isadore Rosen, Professor of Dermatology and Syphilology in New York Post Graduate Medical School of Columbia University spoke to these societies on Syphilis, on February 18. The general comment was that his lecture was very instructive and practical.

Dr. K. R. McAlpin, of the Presbyterian Hospital, New York City, spoke to these societies on *Pernicious Anemia*, in Hudson, on March 3.

Public Health News

THE CONTROL OF VENEREAL DISEASES AND THE PROBLEM OF PROSTITUTION IN THE CITY OF NEW YORK

REPORT OF A SURCOMMITTER OF THE COMMITTEE ON PUBLIC HEALTH RELATIONS OI THE NEW YORK ACADEMY OF MEDICINE

THE PREVALENCE OF VENEREAL DISEASE

At the meeting of the Conference of Health Officers at Saratoga Springs in June 1935 Governor Lehman called attention to the need of better control of venereal discusses as one of the outstanding public health problems in this state. On the occasion of the recent opening of the Meinhard Health Center in Last Hirlem in New York City. Mayor LaGuardia likewise stressed the importance of this problem. In the light of this statesmanlike attitude on the actif of the Covergner of the State, and on the part of the Governor of the State and the Mayor of the City of New Yorl the facts
published in May 1935 by the United States
Public Health Service on The Frend of
Syphilis and Gonorrhey in the United States assume particular significance and constitute a

call to public action

The study reveals a startling incidence in the prevalence of venereal diseases in the United States On the basis of incidence rates per thousand population based on reports from representative communities in the United States there were during the past year 518 000 new cases of syphilis and 1 037 000 acute cases of gonorrhea or a total of 1555 000 fresh infec tions of venereal diseases. A second million individuals sought treatment for the first time who had passed the early or acute stages of their infection. The average incidence of first time admissions to any qualified medical source for treatment of a venereal disease was found to be 207 per 1000 population per year An in estigation by the American Social Hygiene Association in San Francisco Birmingham Dallas and New Orleans brought out the fact that twice as many individuals seel treatment across drugstore counters as come to a qualified medical source

The highest attack rate for syphilis occurs during the early idult ages sixteen to thirty years I xamination of our draftees during the World War revealed that six per cent of these millions of young men had venereal disease in an active stage. Because of the cumulative increase of the disease incidence with age seven out of every 100 persons in the United States above the age of forty are a potential syphilitic

treatment problem

The important survey of the United States Public Health Service was conducted in forty nine representative communities of the rition Reports were received from 39 000 medical sources charged with the health of approxi mately one fourth of the population. The most astonishing result of the survey is the revelation that seventy per cent of the colossal army of

persons infected with syphilis and one half of those with gonorrhen neglected their treitment until after the disease had reached the late stage Of those who sought treatment during the early stages of syphilis eighty four per cent discon tinued treatment before the disease was rendered noninfections

Annually more than 46 000 cases of syphilis re reported to the City Health Department and no one knows how many more remain unreported The New York State Health Commission in 1932 estimated that nine per cent of the population is or has been infected with syphilis Between five and ten per cent of the adult patients in the public wards of our hospitals are found to have syphilis about hith per cent of the males give a history of having had gonorrhea A study of venereal disease prevalence in New York City in 1928-29 reverled that about one per cent of the population was under treatment by physicians hospitals clinics and other authorized agencies on a specified date Many times this number fail to receive treatment or are madequately treated they may therefore continue to trans mit their infection to others. It was recently estimated by Dr Snow that about 315 000 cases of syphilis many of them still infectious are not under medical supervision thereby present ing the greatest public health problem in New York City

Of the cases of cardiovascular syphilis ad mitted to hospitals sixty six per cent have never received any anti-syphilitic treatment previous to the detection of their cardiovascular involvement It is the experience of our Medical Examiners that syphilis of the cardiovascular system is the commonest cause of sudden death

at certain ages

Approximately forty eight per cent of all the hospital beds in the United States are in his pitals for the mentally seed Syphilis is responsible for cleven per cent of all first admissions to state hospitals for mental diseases or for more than 57,000 hospitalized cases of mental

The past indifference of the public and of our government to the increasing prevalence of these the most widespread of all infectious diseases is due to almost complete ignorance of the problem and of the huge cost with which we are being burdened because of this neglect The public has no conception of the annual expenditures which it is incurring for the prolonged hospitalization and medical care of the many thousands who have been allowed to become permanently crippled or of the colossal social and economic losses involved. The expenditure of a small fraction of this sum would place adequate treatment facilities and professional personnel at the disposal of all patients in the early infectious stages of the disease, eradicate the infection in most instances so that it would not spread to others and ultimately reduce, the present costly load upon our hospitals, insane asylums, and relief agencies.

The ostrich-like attitude of the public and of the press and radio is due in part to the false notion that these diseases are always due to misconduct. It is not realized how widely they are spread to innocent women and children. According to the survey by the United States Public Health Service, approximately 18,000 women of child-bearing age in this country have active syphilis, and will transmit it to their children unless they receive adequate treatment during pregnancy. Gonorrheal eye infections in new born infants is responsible for two-thirds of the blindness in the new born and represents 3.3 per cent of all blindness in this country. Syphilis is also responsible for a great deal of blindness among adults, and congenital syphilis for blindness among children and young adults. Much of the invalidism among young married women is due to gonococcal infections of the pelvic organs. Gonorrheal infection is common among young female children.

THE POSSIBILITIES OF CONTROL

As the first requisite for their control we must eliminate the taboo against public dissemination of information concerning them. Our governmental authorities cannot and will not allocate adequate appropriations to control the spread of these infections unless the public

is fully acquainted with the facts.

The control of tuberculosis, which thirty years ago seemed equally difficult, is today approaching realization. Thirty years ago the mortality from this disease was almost 200 per 100,000 population; today, in some communities it is as low as forty per 100,000. In New York City it was sixty-five in 1934 and for the first nine months of 1935 it was reported at 58.2. The control of venereal diseases, especially of syphilis, is a relatively simpler problem than tuberculosis, for we are in possession of specific methods of curative treatment and know just how much treatment is required in most instances to eliminate the infectiousness of the disease in the early stage. We can prevent the spread of syphilis to others in the community by making adequate treatment available to all infected persons and by persuading them to take enough treatment at least to eliminate the infectiousness of the disease.

It has already been demonstrated in the Scandinavian countries of Europe and in England that this can be done. According to the last report from Denmark (February 1935), there were 4,500 fresh cases of acquired syphilis in Denmark and 3,000 in Copenhagen in 1919; by 1933 the number had fallen to 700 cases in the whole country and 200 in Copenhagen. Swedish data are even more striking. The annual report of the Chief Medical Officer of

the British Ministry of Health states that in England and Wales in 1933, only half as many new cases of syphilis were admitted to the 186 treatment centers as in 1920.

According to the last report the fall continued

in 1934 to a new low record.

The reduction has been accomplished by (1) frank presentation of the facts directly to the public, and (2) free and adequate treatment for all infected persons.

In Denmark and Sweden there is also (3) compulsory treatment for all venereal disease patients who are in an infectious stage of the disease, and (4) punishment for anyone who infects another with venereal disease. The legal provision for compulsory treatment not only brings the patients to the physicians but it keeps them from discontinuing treatment too soon. The punishment for infecting another does not keep patients with venereal disease from having sexual intercourse, but it leads them to take the greatest possible precautionary measures because they know that they may be subject to the law if they infect anyone.

ORGANIZATION OF TREATMENT FACILITIES

Aside from the necessity for the dissemination of information concerning these infectious diseases, we must also face the fact that the present provisions for treatment of infected persons in New York City are woefully inadequate. The inadequacy of many of our clinics and the cost of private care discourage many patients from continuing treatment. With a few exceptions, the clinics of our public and voluntary hospitals pay too little attention to the fact that they deal with infectious diseases and that their patients constitute a potential public health menace. The Venereal Disease clinics in our public hospitals have an inadequate amount of space at their disposal; their personnel is undermanned and often inexperienced; the physicians are unpaid and are too few to supervise the work or to examine and instruct the patients. The treatment received is therefore often inexpertly administered, under conditions which are disagreeable, and very often at hours incon-venient to the patients. As a result the patients become discouraged after a few visits and do not return to the clinic for the completion of their treatment. In parts of the city, such as Harlem, where the load is greatest, the facili-ties are the poorest. Patients who otherwise would accept treatment become discouraged, cease treatment and become spreaders of the infection.

Before progress can be made, the facts must be faced frankly. The present situation is due to several factors, one of which is the division of responsibility between the Departments of Health and Hospitals. In principle, all treatment should be carried out in hospital clinics. Unfortunately, the Department of Hospitals is now so over-taxed by the need for supplementing the crying deficiencies in almost all its activities, that it has found it impossible to devote as yet any adequate share of its resources to this problem. Recent discussions between the two Departments are likely to result in the formulation of a comprehensive plan for

venereal disease control, in which the respective responsibilities will be clearly delineated

Prevention of disease is primarily the con-cern of the Health Department Hospitals should be required to provide adequate freatment facilities in a manner that will hold the patients until they no longer constitute a danger to others In this there need be no conflict with the private practice of medicine, for it is part of any comprehensive plan of control to encourage and help private practitioners to take as large a share as possible of the burden of treatment. There need be no conflict with the voluntary hospitals for they should also be encouraged and helped by the Department of Health to assume an increasing share of the burden But if the spread of infection is to be prevented, all hospitals, clinics, prisons, and reformatories should be required by law to meet the standards of treatment facilities and per-sonnel demanded by the Health Department The existing regulations of the Sanitary Code are not enforced and there is no supervision by the Department of Health The chaotic situation which exists in this community can be corrected, not by lumping along as we have been doing so meffectively, but by placing the primary responsibility for carrying through a comprehensive plan of venereal disease control in the hands of the one agency which is concerned with preventive medicine

The present facilities in our public hospitals can be immediately expanded by establishing inght clinics. The required space and equipment, as well as adequate social service, nursing and medical personnel should be provided to meet the needs of each district of the City All clinics should be preferably within the organization of the existing hospital outpatient departments, when additional space is required, it should be rented in the district or else temporarily provided in one of the health center buildings until such time as adequate space is available within the hospital outpatient department. Voluntary hospitals may be persuaded to take over a share of the burden in each district by offering them free arsenicals and public health nurses for the follow up of their patients in return for an extension of their free work.

It is becoming increasingly difficult to secure voluntary medical personnel for venereal disease clinics, especially for syphilis clinics. The Health Department and some voluntary hospitals have paid the younger physicians who work in the syphilis clinics. The Hospital Department has not had the funds with which to pay physicians, except at the Gouverneur Hospital Provision for payment in all venereal disease clinics is essential Tire dollars is the usual remuneration for a two hour session.

The clinics likewise cunnot expect to obtain the required nurses or social service workers on a voluntary basis. Such personnel is of vital importance for the discovery of sources of infection and the follow up of delinquent pritents. It may even be practical to lend some of the public health nurses to private physicians for similar follow up work in their private practice. Under these circumstances, public health

nurses might serve temporarily under the direction of the private physician

In the registration and follow up of patients, a confidential relationship should be strictly observed, as far as compatible with the public interest, in order to encourage infected persons to utilize the treatment facilities which are provided

These activities—health education regulation and supervision of voluntary hospital clinics, expansion and administration of public hospital clinics and their extramural branches, diagnostic ficilities for early recognition of disease, assistance to private practitioners, etc—must all be coordinated under the direction of one person, a full time director of the Bureau of Venereal Diseases in the Department of Health A salary of \$3000 has been provided for the first time in the present city budget for a part time director for this bureau An adequate salary for a full time director is essential for his administrative and professional responsibilities require a min of high caliber

The magnitude of the present problem is due largely to past neglect. It now constitutes an emergency, the cost of which cannot be met today by the municipality without assistance. It is therefore proposed that a comprehensive program of venereal disease control be financed and administered for two years as a W PA project.

In proposing that the initial responsibility for the program of venereal disease control be centered in the Department of Health, it is understood that the ultimate aim is to transfer all treatment facilities to the Department of Hospitals where they rightly belong, include all extramural branch clinics which might prove to be needed permanently in those sections of the city which are not covered by public or voluntary hospitals. The desirable permanent administration of the several aspects of the problem would become clearer as experience is accumulated during the next few years.

THE PROBLEM OF PROSTITUTION

Annually, about 3500 prostitutes are brought before the Women's Court, of whom the majority are acquitted because of the lack of legal evidence. Since January 1st of last year, all are examined after arraignment and before trial and more than eighty per cent are found to present the clinical manifestations of an infection with syphilis or gonorrhea or both diseases

An inquiry made by the Welfare Council (May 1935) into the present functioning of the Women's Court in relation to the problem of prostitution in New York. City supplies the following pertinent comment on this matter "The number of customers each woman has in the course of a week has been valuously estimated. There may be as many as twenty a day Since, under the present operation of the law, even though amended to read "person" instead of "female' those customers are not taken into custody and examined, the chances of the spread of infection, even conservatively estimated, must be considerable, both to the legitimate contacts which these same men may have, as well as to other illicit ones."

An article in the November 1934 issue of the American Journal of Public Health gives a graphic illustration of the way in which syphilis spreads. The caption of the chart reads as follows: "A physician in a middlewestern city asked the State Health Department to trace the source of infection in 4 cases of fresh syphilis in his practice, all men. An investigation resulted which revealed 19 infections among 25 persons examined. Three of the original 4 men patients were infected by one woman, a prostitute. These men in turn infected 10 other women, 6 of whom were young girls. Four girls infected 4 other men. The fourth man was traced to a different source."

Although we are obliged to conclude that adequate venereal disease treatment of all persons brought before the Women's Court represents only a small fraction of the entire problem of venereal disease control, it nevertheless constitutes one important phase of the problem which cannot be neglected. Much is to be gained in the public interest by segregating all infected prostitutes (who comprise most of the prostitutes who are apprehended) and not releasing them from restraint or parole until they have received an adequate amount of treatment to render them noninfectious.

Special provision for therapy in a general hospital should be provided for young offenders who are still reclaimable socially. They should be sent to Kingston Avenue Hospital or to City Hospital and not allowed, as at present, to become hardened by months of association with socially hopeless women. The hardened offenders should be sent to the House of Detention, part of which should be converted into a hospital for this purpose. For cases which are released on probation there should be an adequate number of probation officers—not one to 200 or 300 as at present. Every case transferred for treatment to a clinic or private physician should be followed up until treatment is concluded. The treatment given in the House of Detention, the Workhouse, and in all prisons or reformatories, should conform to standards laid down by the Department of Health. No convicted prostitute should ever be paroled until rendered noninfectious. The woman placed on probation should not be released until a certificate of adequate treatment has been filed with the Court by the Department of Health.

À strict enforcement of the recently enacted State health statute* will render trial and imprisonment largely unnecessary. The new State Law authorizes forcible hospitalization by health departments of persons infected with venereal disease without court action. An agreement to accept medical treatment in a hospital or clinic until no longer infectious, should be accepted in

most instances in lieu of bringing the offender to trial. If socially reclaimable offenders are then referred to some general hospital, confinement in which will not constitute a stigma, time and opportunity will thereby be provided for the work of the social agencies. Hospitalization might be accepted in lieu of trial even for many chronic offenders. In this manner the Department of Health may relieve the court of a large share of its present burden and work in intimate collaboration with the responsible social agencies.

This plan will not be in any way analogous to the inspection and licensing of prostitutes practiced in some foreign countries. The women who have accepted treatment will not receive any certificate of freedom from venereal infection. A prostitute who has received adequate treatment but who subsequently continues to ply her trade and is again arraigned before the court, should be considered as having exposed herself to renewed infection. She may again accept treatment in a clinic or be hospitalized or be brought to trial. In this manner prostitution will be more effectively discouraged than by the present trial and acquittal method; the police will be relieved of the degrading method of collecting evidence of actual prostitution, and the public will be protected more adequately.

CRITERIA FOR DIAGNOSIS

The magistrates of the Women's Court are often confused by the divergent views of physicians concerning what constitutes evidence of an infectious venercal disease. An authoritative medical opinion is required in order to guide the Court.

The demonstration of the spirochete in syphilis and of the gonococcus in gonorrheal infections is often difficult, even in persons who are still highly infectious. This in especially true in women. Prostitutes and vagrants are continually exposed to infection with venereal diseases, and ultimately most of them become infected. For the protection of the public, it is therefore necessary to formulate clinical criteria upon which the diagnosis may be based with a reasonable degree of accuracy, even in the absence of demonstrable specific organisms.

In women who are arraigned on a charge of prostitution or vagrancy, the following clinical manifestations and laboratory findings should be the criteria for the diagnosis of gonorrhea:

1. The presence of the gonococcus in smears or cultures from the secretions, even when there are no clinical manifestations of the disease, is evidence of gonorrheal infection. 2. Purulent or mucopurulent discharge from the urethra, Skene's glands, Bartholin's glands, cervix or rectum, or any combination of these constitutes

^{*}Laws of New York, 1935—Chapter 587, Section 2. Section 343-0 of such chapter as last amended by chapter 481 of the laws of 1931, is hereby amended to read as follows: Section 343-0 Treatment Required. Every person who, by the examinations as provided for in section 343-m, is found to be suffering from, or infected with any venereal disease, or who is reported to the health officer as suffering from or infected with energed disease, shall be required by the board of health, or the health officer of the health district in which such person resides, to conform to rules and regulations of the state sanitary code, and in the city of New York of the sanitary code of the board of health of said city. Such rules and regulations may provide for the isolation and treatment of persons so infected and the local board or health officer shall in that case define the place and limits of the area within which such persons shall be isolated, and the conditions under which such isolation and treatment shall be terminated. Any of such rules and regulations may be reviewed in the courts and tested as to reasonableness in a proceeding instituted by any person directed to conform therewith pursuant to this article.

reasonable grounds to warrant a tentative diagnosis of gonorrhea, even in the absence of demonst due to the gonorrheal Trichon

conditio With 1 The should be of primary secondary or tertiary active lesions of the skin and mucous membranes, or 2 A positive Was-sermann reaction in women of child-bearing age, and in men and women who have acquired the disease within five years and cannot prove that they have had adequate treatment to elimirate the potentially infectious stage-numely, 20 injections of an arsenical and 20 injections of a heavy metal

SUMMARY OF ESSENTIALS OF COMMUNITY CONTROL

The essential elements of an effective program for the control of venereal disease may be summarized as follows

Public health education

2 Availability of treatment for all infected persons, including an adequate number of hos-

- pital beds for patients requiring such facilities 3 Instruction of general practitioners in approved modern methods of diagnosis, treatment and follow up
- 4 Free diagnostic services for physicians so as to facilitate prompt and early recognition of
- 5 Distribution under suitable control of free arsenicals to private physicians for the treatment of persons unable to pay a full fee
 - 6 Encouragement of reporting by private

physicians of all new cases of venereal disease by exact initials and date of birth of patient, to improve accuracy of registration

7 Cooperation of the public health authorities with private physicians, municipal and voluntary hospitals, outpatient departments and other clinics, so as to enable them to keep patients under control until cured and to bring the source of infection under treatment

8 Assignment of public health nurses to clinics and, upon request, to private physicians for follow up of delinquent nationts and of contacts, and for distribution of health information to infected persons

9 Setting up of standards for venereal dis-ease clinics by the Department of Health in cooperation with proper medical committees

10 Requirement of routine tests for syphilis

in the venercal disease clinics

11 Provision for the detection and treatment of prenatal syphilis

12 Regulation and supervision of treatment and follow up of prostitutes and vagrants legally detained in hospitals, prisons and reformatories or paroled for treatment to clinics or to private physicians

Pneumonia Control Program

LABORATORY SERVICE FOR PNEUMOCOCCUS TYPE DIFFERENTIATION

RUTH GILBERT, M.D., Albany

Irom the Division of Laboratories and Research, New York State Department of Health

Laboratory facilities represent an important part of the foundation on which the program for more adequate treatment and care of pneumonia patients rests. The type of pneumococcus inciting the disease process must be determined before serum therapy can be undertaken Thus, it is essential that laboratory findings be promptly available so that if serum therapy is indicated it can be instituted as early as possible in the course of the infection

New York State is most fortunate in the extent to which liboratory service has been developed Laboratories which meet adequate standards of efficiency are approved upon request by the state commissioner of health In the state outside of New York City which operates under a Sanitary Code of its own, ninety-five laboratories have received approval for the examination of specimens from patients with pneumonia More such laboratories should be available, and it is hoped that in the near future no hospital in the state will be without approved laboratory service and that laboratories in such institutions will provide facilities for the districts in which they are located

Even under present conditions, however, aside from sparsely populated areas, particularly those in mountainous districts, sputum from a pneumonia patient can be sent by motor to an approved laboratory and the findings made available within an hour or two after the physician has collected the specimen If members of the family, a neighbor, or other interested persons appreciate the importance of having specimens from pneumonia prtients examined promptly, probably very few instances will arise in which the physician cannot readily make some arrangements for the transportation of a specimen to the nearest approved laboratory.

Pneumococcus type differentiation according to the Neufeld technic is simple, but in order to insure dependable findings, persons doing the work should have had adequate experience in the procedure and should be handling a considerable number of specimens. Thus, it would seem of particular importance to have directors of approved laboratories assume responsibility for all of the pneumococcus type differentiation which is done officially. Laboratories undertaking this type of work should, of course, arrange to have a competent technician available to make the examination in the evening, and on Sundays and holidays. However, since most of the approved laboratories in New York State provide facilities for hospitals, with few exceptions arrangements have probably already been made for emergency service at any time of day or night.

Methods for financing pneumococcus type differentiation will differ in various locali-Where laboratory service has been established, this problem will be simplified. In districts where provision for it has not as yet been made, members of county medical societies will be in the best position to explain the need for such facilities to boards of supervisors and urge them to contract with the most conveniently located approved laboratory for the examination of specimens from pneumonia patients. Usually supervisors will be found ready to sponsor an activity which they are convinced will be for the benefit of the residents of the county they serve. Thus, appropriate action on the part of the county medical societies is of the utmost importance. Until this can be done, the individual patient could be charged for the examination, or, if his financial status is such that his attending physician feels that this would be a distinct hardship, the cost should be met by the welfare commissioner or similar official. While it would be expected that any laboratory would examine a specimen requiring immediate attention without determining the financial status of the patient, it would seem most unfortunate to throw the burden of charity work on the laboratory rather than on the community where the indigent patient lives. The laboratory with its restricted budget can undertake only a limited amount of work for which it does not receive compensation, without jeopardizing the quality of the service offered.

A pamphlet containing a list of laboratories approved by the state commissioner of health and information concerning the examinations undertaken by them is mailed to licensed physicians annually so that they can determine the location of laboratories which can serve them most conveniently. Information in regard to additional laboratory facilities which may become available in the interim can always be secured from the district state health officers who are kept informed whenever certificates of approval are issued.

Health News published by the State Department of Health reported in its February 3, 1936 issue the following report of cooperation by the Nursing profession in the combined effort to reduce mortality from pneumonia.

First Meeting of the Nursing Advisory Committee on Pneumonia

The Nursing Advisory Committee on Pneumonia, appointed by the New York State Nursing Association at the request of the State Department of Health, met in Albany on January 25 to consider ways in which the work of nurses and nursing organizations may be integrated most effectively in the special statewide program for the control of pneumonia. Three major lines of activity were outlined as follows:

1 Educational Activities: It is planned to carry out a comprehensive program for the education of the entire nursing profession with regard to pneumonia, including general information about the newer methods of treatment and emphasizing in particular the nursing aspects. This objective will be attained through meetings and conferences in the fourteen districts of New York State Nurses Association and through emphasis upon pneumonia in training school curriculums. Special instruction of the public in the prevention of pneumonia and the need for early medical care will be accomplished through home visits and the customary talks by public health nurses.

2. Nursing Care: In so far as possible, each organization rendering bedside care will be encouraged to make arrangement for increased nursing care of pneumonia patients who are seriously ill. It is hoped that provision may be made for two or three daily nursing visits and, if necessary, for twenty-four-hour service.

3. Coordination of Activity: The three New York State nursing organizations will work actively with the State Department of Health in promoting and extending community nursing service, including bedside nursing. Cooperation of the lay sections of these organizations will be sought in order to insure community support.

Adequate nursing care of pneumonia cases is a true public responsibility. That there is great need in this field is evident from a recent survey made by the Metropolitan Life Insurance Company which demonstrated that about fifty per cent of cases dying from pneumonia had received no nursing care whatsoever.

THE ESTABLISHMENT of a carefully selected library dealing with tuberculosis is planned by the Brooklyn Home for Con-sumptives, 240 Kingston avenue Such a library has been contemplated by the institution for several years as an invaluable aid to the medical profession and the public in the further conquest of tuberculosis would be available to all physicians in the community and would be the only one of its kind in Brooklyn Dr Luther I Warren, medical director, and the medical staff will recommend the books to be purch sed

New York County

MORE THAN TWO HUNDRED graduates of the New York University College of Medicine participated in the Alumni Day program at the College on Feb 22 There were demonstrations in the Physiology, Pathology and X-ray departments in addition to the medical papers. Many physicians from upstate attended Dean John Wyckoff announced that next Alumni Day will take place on Washington's Birthday, Feb 22, 1937

THE CLINICAL SECTION of the New York Diabetes Association seeks to present those aspects of diabetes mellitus which are of interest and value to the medical profession in general. The next meeting of this Section will be held on Friday, March 20, at 8 30 PM, in Room 20 (second floor) at the Academy of Medicine, 2 East 103 Street, New York City The meeting will be under the auspices of the Philadelphia Metabolic Association and will be devoted to "Diabetic Acidosis" The program will be as follows (each paper fifteen minutes)

Chemistry of Diabetic Acidosis Walter G Karr, Ph D, University of Pennsylvania Med ical School

Clinical Aspects of Diabetic Acidosis, Joseph T Beardwood Jr, MD Graduate School of

Medicine University of Pennsylvania

Complications Associated with Diabetic Acidosis, Edward S Dillor M D, Philadelphia General Hospital

Freatment of Diabetic Acidosis, Edward L. Bortz, M.D., Graduate School of Medicine, University of Pennsylvania

Discussion will be opened by H O Mosenthal, M D, and Dana W Atchley, M D

All physicians and medical students are cordially invited to attend this meeting

Queens County

THE WORLD'S FAIR PROJECT Committee of the Medical Society of the County of Queens, Inc , met at breakfast in the Jansen Suite of the Waldorf-Astoria Hotel, New York City, on Sunday morning at ten

o'clock, February 2, 1936

The following were guests of the Medical Society: Drs Morris Fishbein, Alec Thomson, Frederic Sondern, John C Bauer, Thomas McGoldrick, Charles Gordon Heyd, Samuel Kopetzky, David Kaliski, Charles Goodrich, Edward C George Baehr, Milton Goodfriend, Marcus Rothschild, John Wyckoff, William Avery Groat, Frederick Wetherell, Joseph O'Gor-man, Clude Burrett, James M Dobbins John L Rice, Mr Thomas R Gardiner and Mr Robert W Highie

The members of the Medical Society's World's Fair Project Committee present Dr James R Reuling, Chairman, Dis Albert L Voltz, Morris S Bender, A W Victor, Carl Boettiger, Edward A Flem-ming, J Paul McHugh

This meeting was held for the purpose of discussing plans for the proposed World's Fair to be held commencing 1939 in Queens

County

Dr James R Reuling, who presided, stated that his Committee had had several meetings and that the Medical Society of the County of Queens, Inc., was actively interested in the World's Fair, possibly to a greater extent than other medical health organizations in the Greater City, because of the fact that the site of the World's Fair is very close to the County Medical building-one of the main entrances to the grounds being less than one thousand feet from the building and one of the subway stations is directly in front of the Society's building

Dr Reuling stated that it was his conviction that medicine should direct the scientific exhibit, and that if medicine promptly took the proper initiative and enlisted the support of commercial organizations, drug and pharmaceutical houses, insurance companies, public health agencies, medical colleges, sanitary engineers and disposal companies, and all other agencies that might be honestly interested in public health, that it might be possible to build a permanent building as a national institute of hygiene and health.

Dr. Reuling introduced Dr. Fishbein, Editor-in-Chief of the Journal of the American Medical Association, who carried on the

discussion.

Dr. Fishbein laid much stress on the Chairman's hope of having a permanent national health and hygiene museum developed as a part of medicine's contribution to the Fair, and suggested the following factors as being extremely important for a realization of such a plan:

Location: Unless medicine asserts itself, when the architects and engineers are given the project of planning for the Fair, the location allotted to any medical building might not be suitable for its needs. Another important fact concerning the site for the proposed permanent medical building, is a location, which, after the Fair, will still have easy access to transportation facilities.

Censorship: Care must be taken that quack exhibits are not permitted in other portions of the Fair. In general, everything must be

under strict control.

Organization: Immense organization is needed for the protection of the health of the employees of the Fair, as well as the protection of the

health of the people in the City.

Keynote: Keynote is important. Dr. Fishbein suggested stressing preventive and curative medicine, as well as diagnosis. He emphasized the fact that quick action is absolutely necessary in securing leading institutions to exhibit, as budgets have to be planned, exhibits designed and a year allowed for the construction of exhibits.

Dr. Fishbein advised that proper representatives of medical organizations should become acquainted with the many angles involved in such a project, and that the profession ought to arrange with the Trustees of the Exposition to have representation on the Board of Trustees, since the final determination of policy takes place with the Trustees.

A main committee on medical exhibits is also important, as is an executive office for the successful management of finances.

A medical advisory committee should be formed. This should include a representative from medical organizations, societies, industries, schools, and chief hospitals. A committee of this kind met once each month for a year and a half during the Chicago Fair.

Because the Medical Society of the County of Queens is starting early, Dr. Fishbein expressed the opinion that this Exposition should be the greatest exposition

of medicine and should offer the best possibility for a permanent building.

[Volume 36

Mr. Robert W. Higbie, one of the five original incorporators of the World's Fair Committee, was the next speaker. He mentioned that the proposed plans for the Fair indicate that from every standpoint, the entire Fair will be one of beauty. The site for the Fair will be a permanent park which contains two hundred more acres than there are in Central Park, New York City. He added that the Fair will leave behind it a park which every person in the State will be proud of.

He mentioned that, as a member of the Board of Directors of the World's Fair Corporation, he will give every possible cooperation, and that the plan of the Medical Society of the County of Queens, Inc., is feasible and desirable. He added that whether it will be possible to get a permanent building on City grounds, he could not affirm, but he believes it to be entirely possible, especially since the Metropolitan Museum of Art is on City property.

He announced that bills have been before the House of Representatives and Senate for an appropriation of Five Million Dollars and that the Chairman of the Finance Committee for the Fair, together with other members of that Board had been appointed.

He suggested that plans be prepared as quickly as possible, but not too hastily, and that he would be glad to examine the plans and offer whatever assistance he could.

The Chairman then called for expression of opinions from other guests present, and expressed his appreciation to the guests for joining this meeting. He offered the facilities of the Medical Society of the County of Queens, Inc., to organized medicine and associated groups for the preliminary work, in order that the progress, study and science of medicine might be properly represented at this World's Fair, and with the ultimate goal of a permanent National Museum of Hygiene and Health.

Following this meeting, Dr. Reuling, in a letter to the President of the Medical Society of the State of New York, requested that a committee of three be appointed for representation of the State Society in cooperation with committees from the county medical societies; such a committee to make a survey and to take preliminary steps for the proper representation of organized medicine at the George Washington's World's Fair.

Westchester County

THE NEW ROCHELLE MEDICAL SOCIETY has voted to accept a program recom-

mended by a special committee calling for the examination this spring of approximately 1,000 school children for tuberculosis This program is to be undertaken cooperatively with the School Medical Service of New Rochelle, the Health Department, the Westchester Tuberculosis and Public Health Association and the Tuberculosis Committee of the County Medical Society

THE WESTCHESTER COUNTY Medical Society's guest speaker at its meeting on February 18 was Dr Alexander Marble of Boston, who presented a paper on "Practical Points in Treatment of Diabetes in Hospital and Home," with special attention to the newer work which he in association with Dr Elliott P Joslin and others, has been doing with insulin

POSTGRADUATE INSTITUTE TO BE HELD IN PHILADELPHIA

From April 20 to 24, there will be staged in Philadelphia a scientific medical session comparable to the Graduate Fortnight of the New York Academy of Medicine that has been so successful in New York State in recent years

The Philadelphia County Medical Society has arranged through its Postgraduate Institute a similar comprehensive presentation

from outstanding authorities

Philadelphia has for centuries been a center of medicine, and this program is in keeping with its fine tradition of medical teaching It should be remembered that since 1717 when John Kearsley began to instruct young men in the practice of medicine, the reputation of this city as a training ground for physicians has been of the finest To Philadelphia are to be credited, the first hospital, the first medical textbook, and the first clinical medical lecture

The medical traditions of Philadelphia guarantee the excellence of the following

Counsel, Medical Society of the State of New York

Malpractice-Plaintiff's Burden of Proof

A case very recently decided in favor of a doctor in one of the New England States well-illustrates the sort of attempts that are frequently made by plaintiffs in malpractice cases to make out a cause of action against a physician without competent expert testimony to establish that any failure to follow proper practice by the defendant caused the injuries in question.*

The plaintiff, a janitor by occupation, received certain injuries while handling a bottle which broke, and was treated for those injuries by Dr. C. He later sued Dr. C. charging him in his complaint with having been unskillful and negligent in the treatment of the wound, as a result of which it was claimed he had suffered permanent injuries. The defendant interposed an answer which was in substance a general denial and a defense of contributory negligence. Upon the trial at the conclusion of all the testimony an application for a directed verdict was made on behalf of the defendant, which was granted by the Court, thereby taking the case from the consideration of the jury.

The ruling was carried up to the highest Court of the State by the plaintiff, and it was by that Court affirmed. Upon considering the case, the Appellate Court was bound to review the facts in the most favorable light to the plaintiff, and the facts, necessarily somewhat distorted adversely to the defendant doctor will be detailed herein at some length.

It seems that while the plaintiff was putting a cap on a bottle, it broke in some manner, and an irregular shaped piece of glass about three inches long penetrated his right hand in a slanting position at about the base of the thumb. On that same day (Thursday), the defendant, Dr. C., was called to attend the plaintiff. When he first saw the patient a particle of glass had been pulled from the hand and thrown away. He probed the wound for further foreign substances then and on a later occasion, and told the patient in the presence of his wife that he was sure there was nothing remaining in the wound. The hand was bandaged and later the same day metal clips were applied to the wound, and some sort of salve was used by the doctor. The patient was told it was not necessary to enter a hospital, and that he probably would be back at work the following Monday. When questioned by the patient's wife as to the extent of the injury Dr. C. stated that the wound was possibly two inches deep but entirely a flesh wound. His first examination included ascertaining that the plaintiff could move his index finger to determine that no tendons had been cut. The doctor, according to the testimony, had assured the patient that "just as long as you move your index finger, there is nothing in the hand, everything is all right."

^{*} Bouffard v. Canby, 198 N. E. 253.

On the next two days, Friday and Saturday, the doctor attended the patient at his office. On Friday the hand was sore and swollen, and the patient was unable to move it. He complained of pain in the wound and in the wrist, and was told to soak the member in hot water to relieve the pain. The next day, the complaints were lack of sleep and swelling of the thumb, index and second fingers, and wrist. The doctor reassured him and gave him a prescription for epsom salts to battle the hand, and a prescription to enable him to sleep. The patient was told not to return on Sunday.

Sunday, the patient complained of further pain and swelling up to the ellow. On Monday, he called the doctor to his home, and then complained of "terrible" pain to the shoulder. The next two days the patient was confined to bed most of the time, and the pain and swelling grew increasingly severe, and extended to the cords of his neck. Dr. C. visiting him on Wednesday assured him that he had no cause for worry, and told the wife, "It is not infectious at all, absolutely

good."

After the Wednesday visit by Dr. C., another doctor, B., was called and took over the care of the patient. Dr. B., according to the testimony, found a septic condition existing, and inoculated the patient. He kept him in bed with applications of steam towels and an electric pad of some sort on the hand for forty-eight hours. The swelling gradually subsided and on the twelfth day of his treatment, Dr. B. had an x-ray taken at a hospital which disclosed a forcign substance imbedded in the hand.

Subsequently he was referred to a specialist who some three months after the original injury removed a piece of glass from the thumb, and performed a surgical repair for a cut tendon and severed nerve. Further operative treatment was undergone some four months later, necessitated by a shortening of the tendon previously repaired.

Upon the trial the plaintiff undertook to prove by a doctor not qualified as a surgeon, that surgical treatment should have been resorted to at the outset. The Court excluded such testimony as by a witness not competent to testify, and no further offer of expert testimony was made on behalf of the plaintiff. The defendant introduced expert testimony that his treatment was in accordance with proper practice, and that the infection and the untoward results were due to the original puncture wound.

It was argued on behalf of the plaintiff, that under the circumstances of the case, he was not obliged to introduce expert testimony to make out a case for the jury. It was claimed that the testimony, taken as a

whole, would warrant the jury finding that the defendant doctor had been guilty of omissions in the care of his patient, which had caused damage.

The Court on appeal, however, rejected those arguments, and ruled that upon the evidence the trial Court had properly directed a verdict in favor of the defendant, saying in part:

The defendant's duty to the plaintiff was to use the care and skill of the ordinary practitioner in the community where he practiced his profession. It is only in exceptional cases that a jury instructed by common knowledge and experience may without the aid of expert medical opinion determine whether the conduct of a physician toward a patient is violative of the special duty which the law imposes as a consequence of this particular relationship.

At the trial in the present action four medical experts testified and all agreed that the injury of the type described by the witnesses would make it highly probable that the original punc-ture of glass would cause infection. There was no evidence that the probe used by the defendant was unsterile, or, if so, that it caused or contributed to the infection. There being no medical evidence other than that the infection followed and developed from the punctured wound, the jury could not have inferred that the infection resulted from the use of unsterile appliances. It is the contention of the plaintiff, as we understand it, that the jury could have found that the defendant knew or should have known of the probability of infection or blood poisoning resulting from the wound and could rightly infer that he did not give the plaintiff proper treatment and attention at a time when, from a layman's point of view, the plaintiff was growing worse. The answer to this position is that the uncontradicted medical testimony was to the effect that the general treatment of the plaintiff by the defendant was in accord with accepted practice, as was that of Dr. B. who adopted a different method. Moreover, the jury by the exercise of common knowledge could not have determined whether it was or was not proper medical practice to go into the wound to mend the severed tendon or nerve during the period of infection, or more specifically while the defendant was in charge of the case. In addition it is to be noted that there was medical testimony to the effect that it would have been improper to operate until after the danger of infection was passed.

Accidental Burn During Diathermy Treatment

A young man who was engaged in iron work, had been struck by a falling boom while at work and was referred to a physician. Examination revealed contusions and bruises of his right leg and torn ligaments of his right knee and also contusions and bruises of his left leg. The doctor attended him daily for a period of about three weeks.

At the end of that time his condition was improved but his right knee was somewhat stiff. Therefore, the doctor advised the patient to undergo diathermy treatments which were administered daily for a period of two weeks, without anything unusual happening. The method employed in administering such treatments was that electrodes of molded tin were applied to his knee and buttocks. Finally during one treatment, while the doctor was standing by, without any warning he saw the patient draw up his knee which put a strain on the wire and pulled the contact clip from the electrode. The clip dropped on his bare leg and caused a spark. The doctor immediately shut off the current and found a small burn about onequarter of an inch in diameter where the wire had touched. He dressed the burn with ointment and bandaged it and the patient continued to return to the doctor for diathermy treatments as before, for another week. The patient was then discharged with the burn nearly healed and apparently giving the patient no discomfort.

The patient brought an action against the doctor in which the charge was made that the defendant had negligently administered diathermy treatment to plaintiff causing him severe injuries. A physical examination made at the request of defendant's counsel some months after the occurrence, showed a small permanent scar about the size of a nickel which was entirely superficial. The case was tried before a Judge without a jury and at the conclusion of all the testimony the Court rendered a verdict in favor of the defendant doctor.

Treatment of Infantile Paralysis

A physician engaged in the general practice of medicine in a rural community received a call to attend a nine year old child.

The Alumni Association of the Long Island College of Medicine, Brooklyn, N. Y., will hold their annual Alumni Day activities on Saturday, April 25.

The program of the day will be as follows:

11 A.M.—In Clinical Hall, Polhemus, Long Island College of Medicine, Dr. Adolph G. De Sanctis, '14, Director of Pediatrics at the Post Graduate Hospital, New York City, will

Upon examination he found the child to be feverish with symptoms of grip and gave a prescription to reduce the fever. Later the same day he was again called to attend the child and obvious signs pointed toward infantile paralysis, namely, stiff neck and slight loss of use of arm. He immediately got in touch with the local health authorities and obtained serum which he administered the same evening by an intramuscular injection in the buttocks. He then left and told the parents he would see the child the next morning.

The next morning he went to make his call upon the patient and was informed by the aunt of the child that the parents had taken the child in an ambulance to New York City.

The doctor was also the local health officer and had not given any authorization for the removal of the patient. The doctor subsequently learned that the trip to New York City consumed about three hours and that the child was taken immediately to a contagious disease hospital and died a few minutes after being admitted to the hospital. A Medical Examiner's autopsy was performed upon the body of the child and the cause of death was given upon the death certificate as acute poliomyelitis.

An action was brought against the doctor by the father of the child in which the charge was made that the defendant failed to promptly discover the true condition of the patient, that she was suffering from infantile paralysis, and undertook to treat her for some other malady and that alleged failure was the cause of the child's death.

The action, however, was never placed upon the calendar by the plaintiff's attorney and after some time had elapsed an application was made to the Court to dismiss the complaint for want of prosecution. The motion was granted and judgment entered in favor of the doctor.

read a paper Appendicitis in Children. Dr. Thomas Brennan, '06, and Dr. Carl Laws will discuss the paper.

12:30 P.M.—Luncheon—at which the Alumni are the guests of The Long Island College Hospital. Dr. William Lippold, '05, will speak on *The Lay of the Profession*. The annual Alumni Association meeting will follow.

7:30 P.M.—The annual Alumni Dinner at the Knights of Columbus Club, Prospect Park West.

The mysterious campaign of propaganda against aluminum cooking utensils has led the British Ministry of Health to make exhaustive experiments, as a result of which they announce that they find no convinc-

ing evidence that aluminum in the amounts in which it is likely to be consumed as a result of the use of aluminum utensils has a harmful effect on the ordinary consumer.

Across the Desk

Don't Miss the Big Show

Doctors and their wives who are coming to New York City in April to attend the convention of the State Society are no doubt discussing what "shows" to see To them we might say Do not miss the biggest and best show of all—the city itself. New York is full of theaters, but it is more theatrical than any of them, it is more come than the comedies, more tragic than the tragedies, more spectacular than the spectacles.

It is amazing how few people in New York State-and even in New York Cityhave taken the trouble to explore their own maryelous town Tolks who would not think of going to Washington without seeing the Smithsonian have never seen the Museum of Natural History-much better in many respects The new planetarium is drawing crowds. Folks who would never dream of going to London, Paris, or Italy without visiting the art galleries have never been inside the Metropolitan Museum of Art Those who "oh" and "ah" over London's zoo at Whipsnade don't have time" to see our splendid display in Bronx Park or the smaller but interesting one at the old arsenal in Central Park

No doubt many a reader is already assuming a rather lofty smile, so we shall not go on to advise him to visit the aquarium and try to outstare the fishes, or to spend hours in the magnificent public library reading some sound and informative book. In fact, the state medical program will furnish about all the solid food that can well be assimulated, and we may be very sure that the visiting doctor and his spouse will plan their spare hours in a holiday or picnic spirit, no matter what advice is given them

A Few of the High Spots

Perhaps the most helpful thing to do, then, is to touch briefly on a few of the high spots, so that they can at least plan their sightseeing forays to make every hour count lirst of all, if you will merely step out of the Waldorf-Astoria, after any daylight session, and look up and down Park Avenue, you will see one of the finest and most striking streets in the world, a boulevard that stirs the admiration of foreign visitors

One block east is the Lexington Avenue

subway, which will take you in twenty minutes to Will Street, and you can see where
your money went and ponder on the chances,
if any, of getting it back You can see the
Stock Exchange, the cavernous canyons of
Brondway and Wall Street, Trinity Church,
St Paul's, and, a few steps cast, the old
Chinatown For lunch, Fraunce's Tavern,
with its historic relies and associations, gives
a picturesque touch. It has a fine museum of
Colonial relies, and the waiters wear Colonial costume. Here Washington bade farewell to his officers after the Revolution.

Another jaunt, which no other city in the world can match, can be taken for a dime on the upper deck of a Fifth Avenue bus It starts from the Empire State Building, so it may well be preceded by a visit to the tower (\$110) The view from there on a clear day or night is never to be forgotten Mounting a bus that says "Riverside Drive," we review scores of luxurious shops, pass the classic Public Library, and at 50th Street we have St Patrick's Cathedral on one hand and, on the other, Rockefeller Center, well worth visiting on the return trip Next we pass St Thomas's Church, and, at 57th St swing west past Carnegie Hall, up Broadway, and over to Riverside Drive At 122d St is the towering Riverside Church, of which Dr Harry Emerson Fosdick is pastor. A little further on is Grant's Tomb and in plain view is the gigantic George Washington Bridge, spanning the Hudson Within a few blocks, to the east, are Columbia University and the Cathedral of St John the Divine

Plays and Restaurants

If our sightseers, returning, alight from the bus at Rockefeller Center they should see the court, with fountains, and the "Gardens of the Nations" Then they have the choice of a score of restaurants in Radio City and near-by side streets, where dinner can be had at a pince to suit any taste or purse. The Runbow Room in the R. C. A building has an excellent dinner with unusual program After dinner, a walk of two blocks westward brings us to Times Square, the center of the theater district, where we are greeted by huge electric signs

calling us to entertainments as varied and colorful as the hues of the rainbow. It is a little too soon to try to present any guide to the Broadway plays, as some will undoubtedly end their runs before the convention, but in an early issue we shall mention various ones worth seeing, as well as musical programs that may be on, and interesting sporting events at Madison Square Garden.

Everyone must eat, and mealtimes may well be used to visit the many luxurious and picturesque restaurants that dot the town from Greenwich Village to Harlem. They range from the magnificence of the best hotels to the transplanted bits of China, Japan, Russia, Armenia, Italy, Germany, Sweden, and France, with their many strange but delicious viands. Some that are worth seeing will also be listed here.

Let's Do This Thing Right

THE BRIGHT YOUNG THINKERS who plan to make everybody well and happy by regimenting the doctors like letter-carriers, and sending them from house to house at the beck of politically appointed managers, should think again. If they aim to end all illness, (another "noble purpose") why not do it right? Why not begin at the beginning? Why not remove the causes of illness? Investigation shows, for one thing, that much of the illness in this country is due to underfeeding. Let the Government take over the entire production and distribution of food, and see to it that everyone has plenty.

Inadequate clothing in cold or wet weather is another prolific cause of illness. Think of the millions of wet feet in March and April. Let the Government take over the clothing and boot and shoe industries and give everyone raincoats, rubbers, flannel undershirts, mittens, ear-muffs and everything needed. Bad housing has long been notoriously insalubrious. Washington is lending money for new and better housing, but it is only a nibble. Tear down all the tenements and put up spacious, light, airy structures. Let the treasury pay for it. Fresh air is splendid for health—take over the entire automobile industry and see that every family has one or two cars. Take over the oil industry, too, to provide the gas.

Nonsensical? Why any more so than the plan to take over the profession and practice of medicine? Why is one plan crazy and the other sane? The schemes mentioned

above are impractical because the industries would never allow them and the people would never pay for them, but state medicine, it is believed, can be put over because the doctors are too few and unorganized to resist, and the financial loss will fall on them. Bills providing for socialized medicine are appearing again in the state legislatures this year. Organized resistance can halt them in their tracks.

The only state medical society that showed any favor for socialized medicine last year was California, and it is a pleasure to record that a reversal of its attitude is now apparent. Recently all licensed physicians in that state were polled on the following question: "Shall the California Medical Association endorse any legislative change in the present system of medical practice?" The replies were: Yes, 1162; No, 1947, or nearly two to one against. "California, here she comes." That makes our phalanx solid.

He Just Won't Disappear

THE OLD FAMILY DOCTOR just won't disappear. Long speeches bemoan his going. only to find that he is still with us, and seems likely to stay. He has been compared to the dodo, extinct, done for; he is "a relic of the horse and buggy days" (like the Constitution); he is "a man who knows less and less about more and more." But we can't get along without him, and we might as well own up to it. His ranks, instead of dwindling away as advertised, have increased, said a Midwest medical observer the other day. In fact, asserted Dr. Thomas Kirkwood, President of the Aesculapian Society of the Wabash Valley, in his inaugural address, the general practitioner is doing by far the greater part of the medical work done in this country, and the nation's health and mortality figures show he is doing it well. He will have to continue to do this work for many years to come.

One reason for it is that he is usually the first to see the emergency cases in medicine and surgery. It is he who must recognize such conditions as diabetic coma, uremic convulsions, coronary accidents, eclampsia, intestinal obstruction, and many others that will readily come to mind. He is first on the scene in our dangerous accidents in the home, the factory, the highway. He treats nearly all the contagious diseases; he treats or supervises the treatment of diabetes,

arthritis, and neuritis; he is the first to see cancer and other malignancies, and the very life of the patient hangs upon his ability to recognize them in their early stages. In short, he is the man on the firing line, the man in the forefront of the battle, and he will go out of date only when disease goes out of date.

Handle the "Starter" with Care

THE NEW ELECTRIC "starter" for hearts that have ceased to beat recalls an incident that occurred in Minnesota about forty years ago. The new starter has a gold-plated electric needle that is inserted in the right auricle, we are told, where there is a group of cells that develop a tiny electric current. This current causes the heart muscle to contract periodically. The needle supplies a similar current, and starts the heart going again, after which, of course, it may continue-and may not. Two hearts, it seems, have already been "resurrected" by the device, and are still going, where otherwise they would have been stilled forever. Forty years ago, in a Minnesota mining town, the company doctors were trying to correct the deformed arm of a miner when the patient suddenly died on the operating table. The doctors, after using every means to resuscitate him, passed a needle between the ribs to the heart in a desperate attempt to stimulate it to action. His wife, who saw it, quickly spread the story that "the doctors could not kill him fast enough with the chloroform, and stuck a knife in his heart."

It is needless to say that such stories are exactly the sort that are quickly and firmly believed by a certain type of mind, and a few years later Dr. C. W. More, of Eveleth, Minn., was called to attend a miner who had shot himself in the mouth, the bullet ranging upward through the roof of the mouth and emerging from the frontal region about two inches above the right eye. The man already had a large hole in the back of his head, received on some previous occasion, so perhaps it is not strange that he was soon up and about, as a bullet passing through his head, here or there, evidently found nothing of importance.

What impressed Dr. More, however, as he tells about it in his state medical journal, was that when he entered the room where the wounded man was gracefully draped on two chairs, with his head over the wood-box

to catch any brains or whatever might exude, he noticed twelve stern-faced men,
scated in two rows of six cach, there to
watch him. It was a self-appointed jury, and
as guns were as common in Minnesota then
as they are today, say, in certain circles in
New York City, Dr. More had the comfortable feeling that twelve guns were ready
to bark if he tried any needle tricks. Human
nature is much the same everywhere, and
perhaps it will be just as well if surgeons
who use the electric starter explain to the
wife (or widow) all about it.

An "American Chamber of Horrors"

LAST SPRING a Pennsylvania newspaper accidentally ran side by side a story saying that "Local lady took Natex year ago-had good health even since. Was only medicine this highly respected German resident ever took that brought permanent, lasting relief," and, in the very next column, a notice of her death two days before. A reproduction of the newspaper page with this damning indictment of patent medicine advertising is one of the illustrations in a new book appropriately entitled American Chamber of Horrors published by Farrar and Rinchart. In this sizzling volume Ruth deForest Lamb gathers from official sources the story of the terrific and well-nigh incredible mass-attack that is being made on the health and even the lives of the American people by medicine and food manufacturers whose operations would make a pirate blush. Piecemeal reports of their doings, as told in the bulletins of the Food and Drug Administration. have been given in these pages from time to time, but individual items afford no adequate idea of the extent of this chicanery. A report of conviction and fine, in fact, gives the public the impression that the rascal has been put out of business, when really he blossoms out gaily under a new name to coin more money out of human suffering.

One curse of the depression has been the fact that newspapers, periodicals, and radio circuits have been driven by the financial pinch to accept quack medical and health advertising which they would not otherwise look at. The Copeland Bill has been so shot to pieces that many believe it worthless to meet the situation. The only remedy in sight is to educate the people, and Miss Ruth Lamb's ruthless and unlamblike exposé deserves the widest circulation. More power to her elbow!

Books

Books for review should be sent directly to the Book Review Department at 1313 Bedford Avenue, Brooklyn, N. Y. Acknowledgment of receipt will be made in these columns and deemed sufficient notification. Selection for review will be based on merit and the interest to our readers.

RECEIVED

Wish and Wisdom. By Joseph Jastrow. Octavo of 394 pages, illustrated. New York, D. Appleton-Century Company, 1935. Cloth, \$3.50.

Since his retirement from active academic teaching of Psychology, Dr. Jastrow has written several popular works on the subject with the hope of popularizing the science. In his latest book, Wish and Wisdom, he attempts to discuss in a popular manner, not the orderly, sane, and reasonable acts of human beings, both as individuals as well as of groups, but the unusual, the obviously illogical and unreasonable, though highly dramatic forms of conduct whose motivation is found in wish and not in reality, in the emotional and not in the intellectual, in the erratic and not in the sound aspects of

behavior. The genesis of various cults, Christian Science, Theosophy, and similar movements, as well as other mass behavior reactions as manifested in the strong beliefs in animal magnetism, phrenology, palmistry, numerology, and kindred abberations of human credulity are traced to their roots.

The book is written in a popular vein, for popular consumption. It leaves one with the feeling that when man had been named Homo Sapiens, the one who had given that scientific designation might well have substituted sap for sapiens. In any event, the book may throw light on the understanding of some of the paradoxical human reactions so prevalent in modern life, particularly in the field of mass psychology. Thus the apparent indifference of the world

at large to the raping of civilization and the replacement of Christianity by paganism in Germany, the rise of Dictatorship from the soil rendered crimson by the blood of the youth of humanity that gave its life to make the world safe for Democracy, the Ayrıan and the Nordic myths the many manifesta tions of brutality and cruelty often misked even by the mantle of philanthropy and charity, and the innumerable acts of obvious prejudice and superstititions, could be better understood after reading this book is a strange creature and his behavior is not the result of reason and justice, but generally the product of instinct and emotion, a territory so well explored by Freud and his pupils This book may open the door for many a thinking person, and lead him to observe more critically the acts of his fellow beings by studying more scientific works on the subject of human behavior and its aberrations

IRVING I SANDS

Methods and Materials of Health Education By Jesse F Wilhams, M D & Fannie B Shaw, M A Duodecimo of 331 pages New York, Thomas Nelson and Sons, 1935

This volume discusses methods of health education and includes observations on the nature and psychology of the child. The authors have included material gathered from authoritative sources.

The work has been so arranged as to render the information easily accessible. The render may employ this book as a text as well as a guide in health projects.

SAMUFL ZWERIING

Oedemes et Congestions Pulmonaires By Drs G Caussade & Andre Tardieu Duodecimo of 266 pages illustrated Paris Felix Alcan, 1934 Paper 25 francs

The authors have produced a very interesting work on edemis and congestions of the lung. The first chapters upon the pathology, the careful analyses of the sputum and the edemas from the clinical point of view are very interesting. It is new to the reviewer to think of small areas of pulmonary edema confined to the apices of the lungs as described by the authors. It would seem that the clinical diagnosis would be very difficult.

From an American point of view the work is marred by two features, one a tendency to divide rather simple conditions into many syndromes. For example, edemas are divided into fulminating, acute, subcute and chronic and each one is carefully described. The other feature which makes the comprehension of the work very difficult for a foreigner is the practice of attaching men's names to different clinical conditions.

This is most unfortunate and makes some parts of the work almost impossible to understand

The emphasis of the authors upon careful chemical and cytological examination of the sputim and the helpful information that can be obtained thereby is one of the valuable features of the book

EDWIN P MAYNARD, JR

International Clinics A quarterly of illustrated clinical lectures and especially prepared original articles on Treatment, Medicine, Surgery, Neurology, etc Volume 2, 45th series, 1935 Edited by Louis Hammin, M D Octavo of 327 pages, illustrated Philadelphia, J B Lippincott Company, 1935 Cloth, \$3.00

The first article is on "Some Observations Dealing with Prognosis in Heart Disease", by Gibson of Oxford, England He considers the various factors under the headings of the usual ethological groups Pneumonokomosis is thoroughly presented with a review of the literature and is an excellent article for reference, written by L U Gardner of Saranne. Other articles deal with Headache, Diagnosis of Perforated Peptic Ulcer, especially considering those cases without frank symptoms, Hemolytic Anemia, Anemias of Pregnancy, Renal Lesions caused by the Staphlococcus and Pyuria in Childhood

The subject of Heart Pain of Organic Origin is very interestingly treated by Hamman of Baltimore He gives his reasons for considering all real angina pectoris to be due to coronary artery disease and ischemia of the myocardium, although clinically heart prin may be observed as a result of (1), excessive demand of work put upon the heart in healthy persons, (2), low diastolic pressure in the aorta as may occur in aortic insufficiency, (3), when the hemoglobin of the blood is greatly reduced and therefore its oxygen carrying capacity diminished and (4), when there is obstruction to the coronary arteries at their opening into the aorta or somewhere along their The author believes that leaving aside these exceptions, heart pain is always due to obstruction in the coronary arteries Among diseases which may be confused with coronary occlusion, he considers pericarditis, pulmonary embolism, rupture of the aorta, and interstitual emphysema

W E McCollow

Parenthood Design or Accident? A Manual of Birth-Control By Michael Fielding, M D Duodecimo of 239 priges, illustrated New York. The Vanguard Press, 1935 Cloth se 50

That this book bears a preface by H G Wells is sufficient to arrest anyone's attention, but, that like other books on the

subject, it is dedicated to Margaret Sanger, makes one wonder whether it has anything original to distinguish it from its

predecessors.

A perusal of its contents leads the reviewer to question the need for the book, especially when the market is already flooded with such books in almost the same language and method of presentation. Whatever the merits of or the need for birth-control in selected cases, one may take issue with certain unqualified statements in the text. For example, do the poor breed worthless individuals? Is birth-control conducive to greater happiness and well-being among children?

As to the methods of contraception, every practitioner knows by this time that there is no fixed or uniform procedure. But will the layman, for whom this book is intended, be in a position to know what method to adopt? Like other books on the subject, this newest addition summarizes the teachings of the Birth Control League, and serves as an additional reminder of its continued activities.

Fractures. By Paul B. Magnuson, M.D. Octavo of 466 pages, illustrated. Philadelphia, J. B. Lippincott Company. [c. 1933.] Cloth, \$5.00.

The author has written this text for the man who first sees the fracture and therefore has omitted much descriptive detail of treatment. The indications are clearly given for operative treatment, but description of operative technique is omitted.

Special fractures such as that of the jaw have been omitted from the text and dele-

gated to the oral surgeon.

Throughout the text there is found an admirable attempt to simplify the treatment without standardization. A certain fondness for special splints (not always simple for the

practitioner) is apparent.

The value of the book is greatest as a reference for the man who wishes to know how to manage a fracture, in a manner which has proven satisfactory to the author and without the confusion that always accompanies technical description of various methods of treatment. It is simple, direct, and should prove a valuable book for the general practitioner or the medical student.

S. POTTER BARTLEY

Useful Drugs. By Robert A. Hatcher, M.D., and Cary Eggleston, M.D. Ninth edition. Duodecimo of 203 pages. Chicago, American Medical Association, 1934. Cloth, \$.60.

This small volume, in its ninth edition, presents in a concise form a selected materia medica for medical students and practitioners limiting itself to drugs and preparations of the U.S.P. which should be familiar to all who practice the healing art. It is consistent with rational prescribing, so

neglected in this era, and offers an array of medicaments of known therapeutic value. Obscure and unimportant drugs have been omitted.

This book might well be used as a guide in teaching materia medica and therapeutics and, as the authors suggest, for examinations on these subjects by state licensing boards. Following a standard of this kind would do much to interest students in these subjects and give them a good foundation in the art of prescribing.

The therapeutic index at the end of the book is of distinct value as a guide for the selection of drugs for various disorders. There are also a few pages devoted to a description of the more commonly used pharmaceutic preparations and a tabulation showing the solubility of substances included in the list of useful drugs.

It is a pleasure to recommend this book and its nominal cost makes it available to all interested in rational prescribing.

Frederick Schroeder

The Kidney in Health and Disease. Edited by Hilding Berglund, M.D., and others. Octavo of 754 pages, illustrated. Philadelphia, Lea & Febiger. 1935. Cloth, \$10.00.

This treatise on the kidney is the best that has come to the attention of the reviewer in many a year. It is not written in the conventional text book form, but instead is a series of authoritative papers upon all phases of the kidney in health and disease. Each chapter is written by an authority in that field. It gives the present state of our knowledge and the gaps yet to be filled by further study.

The chapters by Richards and his associates on "The Nature of Glomerular Function" are fascinating. The study of the secretion of individual glomeruli and tubules reads like a fairy tale, but when it is completed will go far towards rounding out our understanding of kidney physiology.

Longcope's chapter on "Infection by Streptococci in Relation to Recovery and Progress in Nephritis" is a very valuable contribution to our knowledge and fits in well with the newer views on hemorrhagic

nephritis.

It is always interesting to read a paper by Franz Volhard, one of the great men in kidney pathology. His treatment of hypertension, dividing the study into two types, the pale hypertension and the red hypertension, is very interesting and offers interesting avenues for further clinical investigation.

As a reference book the work is invaluable. It offers the latest information on every conceivable phase of kidney study and it gives practical assistance in the treatment of diseases of the kidney.

EDWIN P MANNARD TO

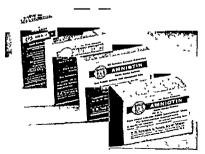

Proved clinical efficacy

SQUIBB ENDOCRINE PRODUCTS have a background of many years of successful and extensive clinical use. New uses of the sex hormones are continually being discovered, such as:

UNDESCENDED TESTES—"Eleven patients from 9 to 23 years of age were under treatment for two to twelve months, and received a total of from 1800 to 14,000 rat units, and increase in size of testes and descent into the scrotum was attained in

ten cases."—Goldman, Stern, and Lapin, Bronx Hospital, N. Y., N. Y. State J. of Med., 36·15 (Jan. 1), 1936.

SENILE VAGINITIS—"The use of an estrogenic substance, Amniotin,² rapidly restores the normal adult epithelium seen during active sex life. . . . Although the vaginal mucosa reverts to the normal senile type, the symptoms do not recur."—Davis, Chicago Lying-In Hospital, Am. J. Obs. & Gyn, Nov., 1935.

- ² FOLLUTEIN—the anterior pituitary-like factor of pregnancy urine in stable form.
- ² AMNIOTIN—the estrus-inducing ovarian follicular hormone. Marketed in three forms: Solution for hypodermic use; Vaginal persaries (suppositories); Oil for oral use.

Literature giving other important uses for these physiologically assayed sex hormone products will gladly be sent upon request to the Professional Service Dept , 745 Fifth Ave , New York.

MANUFACTURING CHEM STS TO THE MEDICAL PROFESSION SINCE 1859

BLUE

GREEN SMOKE

A CLAIM that one cigarette is better because its smoke is green while that from all others is blue—would carry no weight unless it could be proved the green smoke is better for the smoker than blue smoke.

In the same light should be viewed claims of differences in manufacture. Philip Morris are made different—but only Philip Morris have been scientifically proved, because of that difference, to be less irritating than other cigarettes.*

Proc. Soc. Evp. Biol. and Med., 1934, 32, 241-245★ Laryngoscope 1935 XLV, 149-154★ N. Y. State Jour. Med. 1935, 35—No. 11,590★

In Philip Morris cigarettes, only diethylene glycol is used as the hygroscopic agent. To any Doctor who wishes to test the cigarettes for himself, the Philip Morris Company will gladly mail a sufficient sample on request below.**

CHARLES B. TOWNS HOSPITAL

FOR THE EXCLUSIVE TREATMENT OF

ALCOHOLISM and DRUG ADDICTION

This hospital has specialized solely in addictions for over thirty years Our experience has shown us that best results could not be obtained when associated with any other type of case method of treatment has been fully described in the journal of the American Medical Association and other scientific literature. The treatment is a hospital procedure and provides a definite means of eliminating the craving and the toxic products of alcohol and drugs Emphasizing the after care and with appreciation of the seriousness of the alcoholic problem we devote the convalescent period to minimizing the possibility of relapse. In the classification of the City of New York hospitals this institution has been granted a special license by the Commissioner of Hospitals for the exclusive treatment of alcoholic and drug addiction

New York State Journal of Medicine School Service

-because we have filed information and intimate knowledge of schools, you may have us assist you in making a choice for some young member of your family, or a patient's, requiring a particular training or the finer advantages of a private school. We shall be glad to make recommendations to you.

The Acid Test of a School

The acid test of a school comes when the boy or girl returns home and the father and mother begin to see just what effect the school has had. Has the pupil improved or deteriorated? Some of the schools have permitted the editor of this department to see letters written by parents after sizing up the result of life at school. We may be very sure that parents do not write letters like these unless the boy or girl shows a distinct improvement.

Take this letter-it is spontaneous, sincere:

"Lawrence got home all right. I notice he appears more and more like a man each time he comes home. I think your school is all O. K. He is beginning to see things in the right channel."

Another one stresses a point mentioned more than once on this page:

"I feel he is gaining a great many things that are not in the books, but come by fine associations with teachers and friends."

It has been remarked here also that boys and girls who are cold to parental advice will often welcome the good influences of a fine school. As a father writes to a headmaster:

"You have done something for Jack in six months that I have been trying for six years to accomplish, and I feel mighty grateful."

Parents, in fact, are frequently surprised by the transformation they find. They did not know that the boy "had it in him." It was there, but it took the skill of the trained instructors to bring it out. It is well put by this mother, who wrote to a headmaster:

"May I take, at this time, an opportunity to again say how delighted I am that William is with you? His good work amazes me and I am very grateful to you and your faculty. Of course, he may leave a lot to be desired as a student and personality in your estimation, but you have not known, perhaps, what a struggle school has always been for him. Up to now, it has meant, chiefly, failure in everything, loss of pride and interest, but, the developing of a fine case of inferiority complex. Seeing him emerge from this, you must know, is comforting, to say nothing of William's satisfaction. Of course, his physical development leaves nothing to be desired. Please accept my sincere gratitude.

Stand in one of the towers of The Waldorf-Astoria and survey the New York that lies within a few blocks of you. Fifth Avenue, humming with smart shoppers. Broadway, gay with its theatres and amusements. Park Avenue, Madison Avenue, and uptown to Central Park. The New York of clubs, art galleries, museums, churches. But the other New York that interests you lies

within The Waldorf, and you are part of it the moment you stop there. People who make news and history meet in the lobbics, the ballrooms, the restaurants. The fashionable world is glimpsed over the rim of your cocktail glass. New York that amuses... New York that matters meets there. Thus, even your briefest Waldorf-Astoria visit is completely stimulating and enjoyable.

Special room rates for Convention Delegates

THE WALDORF ASTORIA

Travel and Hotels

Do Our Doctors Travel?

Steadily increasing reports received almost daily by the Trivel Department of the New York STATE JOURNAL OF MEDICINE, makes it appear that this sec-

tion of your magazine may at least have had some influence in helping doctors to make up their minds where to go, how

to go, and where to stay

Hotels advertising here show an exceptional number of doctors registering, and the same may be said for the steamship and railroad lines although an accurate check has not been possible on the latter

The fine Bermuda hotels and guest houses have reported close to a hundred guests who are doctors, since the beginning of February

In the first week of March, just three hotels reporting from Atlantic City show fifty two doctors spending vacations at that resort

Many physicians have availed themselves of the free and conscientious service offered the Travel Department of the JOHNAL to assist them in every possible way when preparing to travel for business or pleasure

It is not necessary to call in person, a letter will receive the same prompt attention and care

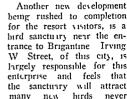

Spring Has Arrived at Atlantic City

Spring-like weather, and the Lenten season, has brought unusually large crowds of visitors to the shore and exceptionally heavy bookings at the hotels which run through the entire six weeks with indications that a greater throng will invade the resort on Palm Sunday and Easter than ever before in its history

Atlantic City's famous fashion parade, to take place on Palm Sunday this year, has grown to such size and importance that the newsreel men, newspaper photographers, fashion experts and "milady" herself, look forward to the debut of spring fashions along the

eight mile boardwalk

Plans for the artificial fishing bank have been reviewed and submitted to Secretary of War Dern Awaiting his decision with interest is the Pennsylvania Reading Seashore Lines With a favorable decision the rail road company plans to compile a fisherman's guide containing information of trains to Atlantic City, necessary fishing equipment, boats available, and all such data helpful to fishermen coming to this resort

before seen in this locality. Mr loseph W Tanum, Delaware Valley Ornithologist, who has been intking weekly trips to Atlantic City for the past five years to study the bird life of the Inlet section, has already identified 206 different species. Care of the wildfowl this winter by beachfront hotels, the South Jersey Sportsmen's League, and Boy Scouts, has attracted hundreds of wild brant and black duck, and has aroused wide-spread interest in the possibilities of an established year-round sanctuary.

A Few Facts about Your Convention Headquarters

The new Waldorf-Astoria, where this year's Annual Meeting will hold sway, is a new home for an old institution. Here many conventions of importance are held yearly for it offers an ideal location and exceptional facilities for large gatherings.

From its opening in 1893, the old Waldorf-Astoria was known for many years as a hotel which, by reason of its remarkable structure, equipment, and service, set entirely new standards. The unique place it has held in American public and social life, has been described over and over again in the public press and elsewhere.

The new Wildorf-Astoria, projected immediately after the close of the old in May, 1929, aroused worldwide interest. It occupies a double block from Park to Lexington Avenues, between 49th and 50th Streets. The building is a fine example of modern American architecture. It is massive and of great height. At the same time it is admirably proportioned and its strong vertical lines are entirely devoid of superfluous ornimentation. The building is open on all sides to light and air.

It is the largest and tallest hotel in the world The building covers 81,337 square feet or 11,862 more than the old Waldorf The old hotel was 198 and a half feet wide by 350 feet long The new is 200 feet 10 inches wide by 405 feet long The old Waldorf-Astoria was of sixteen stories and 225 feet high at its

Public Health and Medicine in Europe!

ANNOUNCING
A Professionalized Tour
Specially Organized for
Members of The New
York Society of
Medicine

Physicians from other states will be admitted, but the tour is open only to physicians and immediate members of their family. The itinerary includes Copenhagen, Stockholm, Helsingfors, Moscow, Kharkov, Kiev, Vienna, Leningrad, Prague and Paris. Arrangements have been concluded in cooperation with the British Medical Association, the Czecho-Slovak Ministry of Health, the Medical Center of Vienna, the Soviet Commissariat of Health and with Scandinavian Medical authorities, and the party will have an unusually extensive opportunity to study the most illustrative hospitals, spas and medical institutions en route. There will also be personal interviews and discussions with foreign medical leaders. The party will sail from New York on July 11th, and will return before September 1st.

• For literature and complete information on this tour, please address Department NY-3. A complete program of special EDUTRAVEL projects in other fields, will also be sent on request.

EDUTRAVEL

AN INSTITUTE FOR EDUCATIONAL TRAVEL

535 Fifth Avenue

New York

Land tours in Europe in conjunction with Amerop Travel Service, Inc. (in U.S.S.R., in cooperation with Intourist, Inc.) highest point. The new building has fortyseven stories and twin towers reaching to a maximum height of 625 feet seven inches.

Although it is the largest hotel in the world, as a structure, the Waldorf-Astoria is not the largest in number of rooms. This is due to the fact that, on an average, rooms are larger than other hotels of comparable size, and the extent and scope of facilities for public and private functions are such as to accommodate up to 4,000 persons.

Mystery Ships and Trains Thrill British Travellers

A modern liner, filled to capacity with passengers not one of whom knows the route or destination of the ship, is the latest innovation of the British Railways. "The Mystery Cruises" of the London & North Eastern Railway, two of which will be run in August, 1936, are based upon a knowledge of the romantic side of the British temperament. Railway officials assume, according to T. R. Dester of the Associated British Railways, that the same adventurous spirit which for centuries has led Englishmen to seek the unknown in all lands and seas, is a fundamental British characteristic still alive and potent in a work-aday twentieth century.

The venue of the cruise and the Continental port at which a call will be made are being kept as a dead secret, and cruisists will not know where their ship is taking them or what they will see—until they get there. A good time is guaranteed and this, together with the novelty of sailing from Harwich under "sealed orders" is expected to attract keen interest and happy speculation.

During the height of "Treasure Hunt" popularity, some genius connected with the British Railways conceived the idea of mystery trips by rail. Some of the most luxurious trains were advertised to leave certain stations and run over unnamed routes to unannounced destinations. No passenger knew, until arrival, whither the train was bound. Such excursions proved highly popular, completely justifying the keen insight into British character of the travel genius who originated them.

The next logical step toward satisfying the Briton's almost insatiable love of mystery and adventure was the travel cruises of the London and North Eastern Railway, which, it is believed, will be even more successful than the mystery trips by train.

S. S. Konigstein to Replace the Ilsenstein in Atlantic Run

Increasing demand for tourist accommodations to Europe during the approaching Spring and Summer season will be met by the Arnold Bernstein Line, substituting the larger and newly renovated S. S. Konigstein, for the company's steamer Ilsenstein, now in service on the Bernstein route between Antwerp, Belgium and New York.

In order to conform with the present schedule of arrivals and departures of the Bernstein Line steamers, the Konigstein will leave Antwerp on her westbound trip on March 28th and will depart on her return trip from New York on April 11th. The Ilsenstein now on the high seas en route here will arrive March 12th and leave for Antwerp two days later. She will then be dry-docked in the shipyard for annual reconditioning and placed in reserve.

The Konigstein is one of the popular tourist carriers of the Atlantic run, and last season carried a cruise party to the Mediterranean which was a most successful voyage, many of the passengers later booking on the vessel for other voyages. Thoroughly renovated and reconditioned, the Konigstein is a real pleasure craft, having wide decks running clear around the ship without obstructions of any kind, and forward beneath the bridge is the largest sports deck on any vessel of her kind in existence. She also carries a big swimming pool, always popular with the traveler during the hot summer days and nights, when swimming is also enjoyed by illumination.

She will have a capacity for 300 passengers, all of whom can be served in the huge dining room forward at one sitting, the dining room being so situated that during the warm days and evenings, the diners will get the full benefit of ocean breezes which sweep across the Konigstein's bow direct into the large windows of the dining room.

TO MODERN THERAPY

DIAL

NUPERCAINE

DIGIFOLINE

VIOFORM

• A powerful sedative and hypnotic which is effective in smaller doses than barbital, U.S.P. The sleep induced is calm and refreshing; awakening unclouded. In therapeutic doses Dial has no untoward effect. Administered orally or intramuscularly. Indicated in insomnia from various causes.

Tablets · Powder · Elixir · Ampules

• Provokes rapid local anesthesia of remarkable intensity and duration in higher dilutions than cocaine, procaine, etc. Not subject to Harrison Law restrictions. Indicated for topical application, infiltration, and spinal and caudal anesthesia.

Ampules · Powder · Tablets · Solution

• A biologically-assayed, uniform preparation of digitalis free from inert and undesirable extractive substances. Contains the essential cardio-active glucosides of digitalis leaf. Administered orally. or, when rapid action is desired, intramuscularly or intravenously. Each tablet, each ampule, each c.c. of liquid equals one cat unit.

Tablets · Liquid · Ampules

• A useful agent administered orally in the treatment of amebiasis. Designed also to replace iodoform, for external use, which it surpasses in antiseptic power and freedom from unpleasant odor. Non-irritant. Checks suppuration, maintains asceptis and so aids in healing.

Powder (in sprinkler-top cans, bottles and tins)

BACOMPANY, INC., New York, N. Y.

Albays PROTECTED

THE Dairymen's League takes every precaution to make certain that Dairylea Milk Products are of unsurpassed purity and quality.

Every year we spend several hundred thousand dollars for the inspection of herds and farms. Every herd must have a health certificate signed by a licensed veterinarian. Daily laboratory analyses are made of samples from every farm. Every can of milk received at every plant is inspected before it is accepted. We maintain a staff of dairy experts who travel from farm to farm—dropping in when least expected.

We are confident that the more complete protection which we give Dairylea Milk will appeal to you as a doctor.

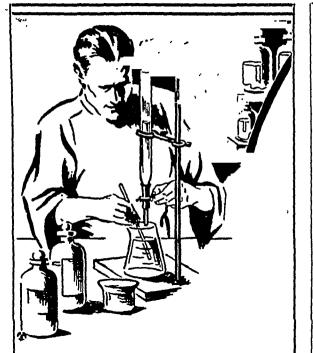

Produced by

THE DAIRYMEN'S LEAGUE CO-OPERATIVE ASSOCIATION, INC.

(Dirr Henne: We, the farmers of the Dairymen's League, recognize a definite obligation to the public. Since milk is nature's most nearly perfect food, we pledge ourselves, in the production of Dairylea Milk Products, to do everything within our power to safeguard their purity and quality.

DAIRYLEA MILK

IN BUFFALO DAIRYLEA MILK IS SOLD UNDER THE TRADE NAME, WECKERLE.

Maintain Mineral Alkali Balance

WITH

Kalak

Hypertonic - Alkaline - Carbonated - Not Laxative

The years of experience with physicians who have used Kalak show that the use of a formula containing calcium, magnesium, sodium and potassium salts represents a correctly balanced solution. This is Kalak which, as such, aids in maintaining a balanced base reserve.

How Alkaline Is Kalak?

One liter of Kalak requires more than 700 cc. N/10 HCl for neutralization of bases present as bicarbonates. Kalak is capable of neutralizing approximately three-quarters its volume of decinormal hydrochloric acid.

CHEMICAL WORKS

MAKERS OF FINE PRESCRIPTION CHEMICALS SINCE 1867

RESUMÉ OF THERAPY THE IMPORTANT IODIDES

ROBABLY one of the best drugs for chronic asthma are the Iodides (Clendening)... A "bronchial cathartic" (Forschheimer). Marine, using potassium iodide, reduced his thyroidectomies. Beckman refers to the iodides in the treatment of exophthalmic goiter ... Other authorities have demonstrated the value of the iodides in the treatment of sciatica, neuralgia, pleurisy and pneumonia, hypertension, grippe, apoplexy, hepatic cirrhosis, blood poisoning, and other disease.

When prescribing Potassium Iodide or other Iodides, you desire purity, exact potency and stability. These qualities are assured when run specify M.C.W.—Mallinckrodt, Mallinckrodt, Potassium Iodice, U.S. P. contains not less than 99½% of KI, dissolves readily reflected and the sediment or floating particles—exceptionally stable—free from independent or floating particles—exceptionally stable—free from independent of the property of the sediment of the sedimen

If your pharmacist is not now using Mallinckrodt Iodides and action tion chemicals, he will do so if you write M. C. W. on your pharmacist.

• A new brochure "lodides-Resumé of Therapy" gathers in latest clinical literature, giving useful information on the form of therapy. Clip the coupon.

NEO-IOPAX* shadowgrams tell a diagnostic story. With clarity they bring out even minute details of kidney, ureters and bladders.

THAT TELL THE STORY

NEO-IOPAX urograms can be completed in a few minutes; the first film is usually sufficient to aid in diagnosis of ordinary cases of urmary obstructions, ptosis of kidneys, dilations of ureters, anomalous or misplaced ureters, etc.

Only 20 c. c. of a solution containing 15 grams of NEO-IOPAX has been found adequate for routine urograms. It is usually well tolerated.

*NEO IOPAX

(Reg U S Pat Off) is D sod um N Methyl 3 S d odo 4 pyridoxyl 2 6 d carboxylate

Facts concerning ... LIVER THERAPY

and the treatment of

PERNICIOUS ANEMIA

Published clinical data indicates:

- I That ordinarily at least 200 grams of whole liver administered orally per day are required for adequate maintenance.
- 2 That in the preparation of the early extracts for oral use the amount of antianemic substance obtained produced clinical effects comparable to those of about 65 per cent. of the amount of whole liver from which the extract was derived.
- 3 That the parenteral injection of a given amount of solution liver extract is in general equivalent in clinical effects to 30 to 60 times the amount of liver from which it was derived given by mouth.

Published data shows that one vial of 3 cc. Concentrated Solution Liver Extract (*Lederle*) administered parenterally is equivalent in clinical effects to 3000 to 5000 grams of whole liver administered by mouth.*

It is evident:

- I That for oral use ordinarily 6000 grams or more of whole liver are required per month per patient.
- 2 That for oral administration the extract obtained from 9000 grams is, according to clinical observation, the approximate clinical equivalent of about 6000 grams of whole liver.
- 3 That despite inevitable losses of antianemic material entailed in its preparation, the equivalent dosage of parenterally administered Lederle extract will be that obtained from 300 grams or less of liver per month.
- The adequate treatment of pernicious anemia consists in the treatment of all of the symptoms and requires definite amounts of the antianemic substance.

Each vial of 1 cc. Concentrated Solution Liver Extract (Lederle) contains active substance obtained from 100 grams of liver.

CROOKES COLLOIDS and PHARMACEUTICAL SPECIALTIES

Known for Quality and Therapeutic Value

FOUNDED by Sir William Crookes (famed inventor of the Crookes Tubes) and his son, Henry Crookes, Crookes Laboratories are known for medicinal products of integrity wherever modern medicine is practiced. Physicians use them with implicit confidence,

Crookes Colloids and pharmaceutical specialties have been

made under careful pharmaceutical control for more than twenty years. The most modern laboratory machinery is used in their manufacture. Every product is released for use only after extensive clinical and laboratory experiments have demonstrated its therapeutic worth. Over 375 references concerning Crookes medicinals appear in the literature.

Full particulars, prices, etc., of Crookes Collosols and pharmaceutical specialties sent promptly upon request.

Notused to being ill

Insomnia, arising from fear of the consequences of illness or of operative procedure, is frequent—for most patients are not used to being ill. The use of a safe, effective hypnotic or sedative often allays apprehension and improves the psychologic state.

Ipral Sodium (sodium ethylisopropylbarbiturate) is a safe sedative which produces a sleep closely resembling the normal. The effective dose of Ipral Sodium is small and rapidly absorbed There is little danger of harmful after-effect and since excretion (through the urinary system) is prompt it is free from cumulative effect in therapeutic dosage.

Ipral Sodium is supplied in ¼-gr tablets as a sedative, 2-gr. tablets for use as sedative or hypnotic and in 4-gr tablets for pre-anesthetic medication.

Tablets Ipral Amidopyrine (2 gr. Ipral, 2.33 gr. Amidopyrine Squibb) provide an analgesic and sedative effect.

These Ipral Products may be obtained in vials of 10 and bottles of 100 and 1000 tablets For descriptive literature address the Professional Service Department, 745 Fifth Ave, New York City.

ADHESOL

It's the NEW idea in adhesive tape technique! Scientifically prepared to dissolve the adhesive compound on all types of tapes, plasters, Adhesol permits you to remove the tape quickly and gently—no matter how tender or hairy the surface. Adhesol leaves the skin clean and soft.

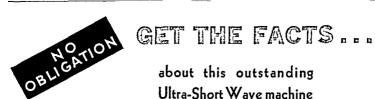

Adhesol is non-irritant and non-explosive. Has a pleasant odor that quickly disappears. Adhesol is economical, going from 6 to 10 times further than any other non-offensive solvent.

Adhesol has a real place in *your* bag. Your patients will thank you for this thoughtful addition to your dressing technique—and you'll save countless minutes of time and trouble.

Ultra-Short Wave machine

Hundreds of prominent physicians, including some of the leading specialists in electro-therapy, have chosen the Lepel 9 meter Ultra-Short Wave machine not only because of its therapeutic efficiency, but also because of the valuable modalities available from this unit. (See reverse side).

Costly tube replacements are completely eliminated by the super-quenched fixed spark gaps which operate the Lepel machine. These special gaps also assure a more constant output than is

possible from tube circuits, and make available a finely controlled current for DESICCATION-COAGULATION—and for energizing the Lepel quartz/mercury ULTRAVIOLET LAMPS for general, local and orificial irradiation.

A broadened understanding of the benefits of balneotherapy is directing medical attention to the new Saratoga Spa.

Here, at the site of the only naturally carbonated mineral springs in the eastern United States has been completed this great modern Spa development. A 10×13 ft. scale model will be on display in the Waldorf lobby during the convention.

Treatments—under medical superusion—are provided for myocarditis, coronary disease, arterio-clerosis, varia tions from normal blood pressure or functional heart conditions . . . for neurathenia, gout, muscular rheumatism, arthritic and neuritic conditions And many come just for a "restoration cure"

Complete provision also, is made for neurovascular training, mechano and light therapy, massage, etc.

The medical profession is invited to acquaint itself with "the Spa that was Inevitable." Booklet upon request.

VEGEX B ITTARES

Autolyzed Brewers Yeast Extract with Salt, Pure Vegetable Flavoring and Iron Salt.

—Potent, Palatable Source OF THE B VITAMINS

Vegex has an average of 45 B₁ and 45 B₂(G) Sherman units per gram; 840 International B₁ units per ounce,

In the B complex (all known B vitamins including the growth factor) 4% of Vegex in a B complex free diet gives good growth and reproduction. The Standard of the United States Public Health Service for dried brewers' yeast is 5% in the diet (Albino rat).

Anemia research has established the potency of Vegex in the extrinsic factor (Castle, Strauss, Wills, Hunter, Vaughan,

Jolliffe and West).

Its value in "alcoholic" polyneuritis was established by Strauss and by Jolliffe and Joffe in the "Relation of Vitamin B(B₃) Intake to Neurological Changes in the Alcohol Addict"

ation of s in the to feed a lilk is the

What Vegex Adds to Milk

A more practical test to guide in human nutrition is to feed a protective food like Vegex in a diet regularly used Milk is the basic diet for children and the protective food for nursing and expectant mothers and for adults, as recommended by the Health Committee of the League of Nations

In photograph I dried whole milk was the sole diet, photograph II the dried whole milk with 5% of Vegex as the sole diet.

Without Veges the red blood cell count was lowered and there was no reproduction With Veges the normal red blood cell count was maintained

Photograph I.

Photograph II.

Palatable and Easily Borne

The meat like flavor of the autolyzed yeast proteins in Vegex—meat free—is very palatable and Vegex, whether with bottle fed babies or in liquid diets of post operative cases, is easily borne.

Samples and literature to physicians on request.

MEAD'S OLEUM PERCOMORPHUM

Welcomed By Physicians

Rich in Natural Vitamins A and D

Mead's Oleum Percomorphum makes it possible to prescribe natural viramins A and D in the same ratio as they occur in cod liver oils. —but in drops dosage rather than in teaspoonfuls. Consisting of equal volumes of percomorph liver oil and cod liver oil, this product is so potent that it can be given in 1/100 the dosage of cod liver oil. Each gram supplies not less than 60,000 vitamin A units and 8,500 vitamin D units (U. S. P).

Convenient to Prescribe

Realizing that physicians are accustomed to the decimal system, we have blended Mead's Oleum Percomorphum to a potency 100 times that of U. S. P. cod liver oil, which has a vitamin A content of 600 units and a vitamin D content of 85 units. For physicians who prefer cod liver oil we have also prepared Mead's Cod Liver Oil Fortified With Percomorph Liver Oil (5% percomorph liver oil)

having a vitamin content 10 times cod liver oil. * Thus the physician can conveniently prescribe vitamins A and D in any required dosage, in convenient ratio to an acceptable standard cod liver oil.

Greater Economy per Dose

The pioneer work done by Mead Johnson & Company in improving the quality of cod liver oil is too well known to need reiteration. The accompanying chart, however, shows how successfully we have striven, all through the depression, to reduce the cost of vitamins A and D to the patient. All factors concerned in the production and marketing of Mead's Oleum Percomorphum are under our control. We are hopeful that by wholehearted endorsement of these new Mead products, the medical profession will make it possible for us, during the next few years, to make the patient's "vitamin penny" stretch still further.

CANNED FOODS AND THE PUBLIC HEALTH

III. Chemical Preservatives

• Some of our readers have inquired as to whether or not chemical preservatives are used in commercially canned foods. In certain instances this question was inspired by the fact that 'canning compounds' were formerly sold for use in home canning and preserving operations. Such compounds, however, are rarely used by the housewife of today, and never by commercial canners.

We wish to state here that no preserva tites are used in commercially canned foods

Spoilage of food is principally caused by the growth and multiplication in food of microorganisms such as yeasts, molds, or certain types of bacteria. These microorganisms depend upon the food they in habit for their nutrition and their life processes produce changes in the chemical or physical characteristics of food, or both These changes lead us to state that the food has "spoiled"

Like other living organisms, these spoil age microorganisms can grow and multiply in a food only as long as conditions remain favorable for their existence. If any en vironmental factor, such as temperature, moisture or acidity, becomes unfavorable, these spoilage organisms are destroyed, or their development is inhibited.

All methods of food preservation have a common underlying principle, they all alter some factor or factors in the food environment so as to render conditions unfavorable for the growth or development of spoilage organisms in the food

Thus, foods may be preserved by freez ing or refrigeration, which serves to lower the temperature below that optimum for growth of certain spoilage organisms, dried foods keep because the moisture content has been reduced to an unfavorably lockly, certain fermented foods keep be cause of the development of high acidity. All of these methods produce changes in the environment in which the food spoil age organisms must live

Commercial canning is a method of food preservation in which the temperature factor in the environment is raised to a level above that optimum for growth of spoilage microorganisms. Thus, canned foods keep because in their preparation they are subjected to heat processes in hermetically scaled containers. The thermal processes raise the temperature of the foods to those temperatures at which the most resistant spoilage organisms present cannot grow or survive (1)

The hermetic seal insures protection against future infection of the food by such organisms

Thus, commercial canning is a method of food preservation which has for its basis the thermal destruction of spoilage organ isms, no chemical preservatives are needed to insure preservation of the foods, and, consequently, none are used

MAPHARSEN

A REFINEMENT OF THE ARSENICAL THERAPY OF SYPHILIS

Mapharsen, developed through co-operative research conducted by two university groups and the research staff of Parke, Davis & Company, is offered to the medical profession as a distinct advance in the arsenical treatment of syphilis

Extensive clinical data have demonstrated Mapharsen to be an efficient antisyphilitic arsenical Healing of lesions and the disappearance of spirochetes occur rapidly, symptomatic improvement and serological response have been most satisfactory

Mapharsen posesses several distinct advantages in the treatment of syphilis

Mapharsen is a practically pure chemical substance

Mapharsen contains 29 per cent arsenic in trivalent form

Mapharsen possesses a relatively constant parasiticidal value

Mapharsen solutions do not become more toxic on standing in the air

Mapharsen does not require neutralization before administration, when dissolved in distilled water it is ready for injection

Mapharsen permits treatment of syphilis with small doses of arsenic The reactions following the use of Mapharsen have on the whole been less severe than those observed after the use of the arsenicals, arsphenarune and nee arsphenarune

Each lot of Mapharsen 1s chemically and biologically assayed before release

A review of the clinical evaluation of Mapharsen and a complete discussion of its use in the treatment of syphilis have been included in our new booklet. We shall be glad to send you a copy on request

> Mapharsen (meta amino-para hydroxy phenylarsine oxide hydrochloride) has been accepted by the Council on Phar macy and Chemistry of the American Medical Association

Obscure Conditions Now Accurately Visualized

Carcinoma of the body of the uterus. Salpingography following injection of Lipiodol.

LIPIODOL (Lafay) makes possible the application of precise radiologic diagnosis to the

female pelvic viscera, as well as to the bronchial tree. Terms such as "uterosalping ography" and "bronchography" owe their existence largely to this technique.

Lipiodol (Lafay) when indicated, promotes greater accuracy in radiologic diagnosis. It produces precise, clean-cut shadows, facilitating the interpretation and understanding of the lesions present. Moreover, many lesions which otherwise cannot be visualized, may be demonstrated by Lipiodol.

Dr. H. E. Dubin Interviews Physicians on Aminophyllin

Learns What They Seek In This Form Of Cardiac Therapy

Dr. H. E. Dubin recently visited and talked with various eminent heart specialists to learn what they sought in the theophylline they used for angina pectoris and other painful heart conditions. The physicians required speedy solubility, rapid action (cardio-stimulant, vasodilator, diuretic), and a wide margin of safety.

DUBIN AMINOPHYLLIN

(Theophylline Ethylenediamine)

Is Favored By Physicians For These Reasons

- 1. Ready Solubility in cold water (in as little as 3 parts of water at 25° C.)

 2. Rapid therapeutic action (in about
- 20 seconds).
- May be taken for long periods without ill effects.
 High theophylline content.

- 5. Quick absorption.
- Olnek absorption.
 Fully meets the U. S. P. and N. N. R. high quality standards.
 Accepted by the American Medical Association, Council of Pharmacy and Chemistry.

HEPATIC AFFECTIONS

THE experience of many generations has proven that the waters of Vichy are excellent cholagogues. That is especially true of Vichy Celestins. It helps not only to promote the flow of bile but also to increase its fluidity. Under the alkalinizing influence of the water, the metabolic activity of the liver lobules is stimulated and toxic material is more effectively destroyed or eliminated from the bloodstream. For these reasons Vichy Celestins has been found of distinct service in the majority of hepatic affections.

Vichy Celestins is the property of the French Republic, under whose supervision the water is bottled. The medical profession and all consumers are protected by a guarantee of the French Government as to the water's authenticity and purity.

Know the VALUE of

The NICHOLS NASAL SYPHON

by the RESULTS it has obtained

In the last 20 years physicians have given almost unbelievably strong testimony of the results they obtain in sinus conditions with the NICHOLS NASAL SYPHON. We have these letters in our files—available to all medical men.

SUCTION—suction with safety—is logical treatment. This device acts by suction. It gently draws out the offending material, flushes, drains, and evacuates the sinuses. It produces an hyperemia which tends to add tone to the mucosa.

Relief from SINUS PAIN—relief from the feeling of tightness—and from the annoying discharge—can be accomplished by the patient in his home—between office treatments. Thus elimination of symptoms aids greatly in the systemic and topical treatment of the disease often without operative procedure.

WATCH FOR SPECIAL OFFER TO BE MADE AT THE CONVENTION!

Physicians, visiting our booth (108) at the Waldorf-Astoria will receive a trial offer that they cannot afford to turn down—for their own personal use and investigation. Don't fail to ask for it!

PE OLD FORMULA

WHEN appetite is lacking . . . digestion delicate . . . mastication difficult . . . swallowing an ordeal . . . or anytime a good source of proteins. carbohydrates, mineral salts, and vitamins is needed to help nature furnish the remedy—try Reevatone.

When social obligations demand something new and different—try Reevatone.

REEVATONE, triple strength egg nog, has over 40 helpful uses... is instantly available, certified pure, and vitamin protected. It is made of the finest grade egg yolks, milk, and brandy (no coloring or artificial preservatives), may be diluted in milk, used with fruits, puddings, etc., or as a base for mixing drinks. It is economical and sold in three convenient sizes, with a money back guarantee. Ask for it at your pharmacy, grocer, or department store.

TRIPLE STRENGTH

WY NEW C

Sole manufacturers—RIVAS & COMPANY—106-108 West End Ave., New York

Free samples and analysis to physicians, sanitariums, hospitals, etc.

Something NEW! Something DIFFERENT! Something SERVICEABLE!

The complete line of Holland-Rantos Surgical Textiles

RANTOSILK

Pure silk impregnated with rubber. The rubber is forced into the strands of the silk, not just spread on. This makes Rantosilk far more waterproof and pliable. It will not stick, crack or peel. An extraordinarily fine material for hospital sheeting and for garments. Impervious to moisture and acids, durable, soft and pliable.

HOLLANDEX

An All-American product. A fine-combed cotton lawn, specially rubber-impregnated and supplied in extra widths not available in silk fabrics. For hospital and professional use.

SURGITEX

A processed silk. Specially adapted for pneumonia jackets and drapes; and to cover surgical dressings.

SPONGEGRIP

A new patented hospital sheeting with a soft, velvety upper surface and a specially constructed sponge rubber under surface. When placed on and folded under the mattress, Spongegrip sheeting WILL NOT SLIP or wrinkle. Two shades — Fawn and White. Three sizes — 36 inches wide, 45 inches wide, 54 inches wide.

Note: Both Rantosilk and Surgitex are available in hospital garments and by the yard. Hollandex is supplied by yardage only.

Prices and literature promptly sent upon request.

The Philadelphia County Medical Society

announces a

POST GRADUATE INSTITUTE

to be held at the

Bellevue-Stratford Hotel in PHILADELPHIA April 20 to 24, 1936

A program of great interest to the members of the profession, particularly those in general practice has been prepared.

The lecturers have been selected from the foremost teachers in this great medical center.

Arrangements have been made with all railroads for special rates. Consult your railroad agent or write us. For complete program and further information address

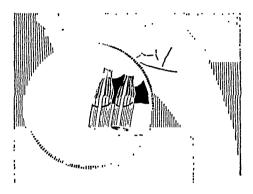

THE PHILADELPHIA COUNTY MEDICAL SOCIETY Post Graduate Institute

21st and Spruce Streets Philadelphia, Pa.

ELI LILLY AND COMPANY

FOUNDED 1876

Makers of Medicinal Products

Dependable Ampoules

Solutions to be used in the manufacture of Lilly Ampoules are prepared by dissolving chemicals of the highest degree of purity in water which has been repeatedly distilled. The solution is then assayed and the reaction precisely adjusted, after which the ampoules are filled, sealed, and sterilized. The finished ampoules are again assayed and tests are made to see that the optimum conditions for the administration of the solution remain unchanged. Only those ampoules that are brilliantly clear and have been found to be free from any particle of suspended matter, as examined under a lens with the aid of a powerful beam of light, are approved. In general, this is the record of any ampoule that bears the Lilly Label. Lilly Ampoules are designed, prepared, and tested under the most exacting conditions at all times.

ALLERGIC MANIFESTATIONS IN THE NERVOUS SYSTEM

FOSTER KENNEDY, M. D., New York City

As the nerves are distributed throughout the body so are they susceptible to changes in the body. No part of the organism lives to itself alone; in the interaction of unit forces within us lies the cause of our greatness and the causes of our diseases and death. In complexity lies mortality.

The chemical individualism of each of us may determine the trend of personality and may likewise be the basic reason of some of our physical disasters. The allergic constitution has rarely been examined for the clue to neural illness. This short paper is written to point observation in this direction and to this end.

Advances in knowledge of infection and the role of bacteria have indeed lessened our interest in internal humoral physiology and dimmed our perception of such processes which often play a vital part in the production of disease symptoms. Many individuals inherit a metabolism easily destabilized and capable of irritating an inherited, unduly sensitive auto-nomic nervous system. The composition of body fluids depends on secure exchange of fluids and body salts; abnormalities of water absorption and retention are now known to cause many symptoms, transient maybe but severe, when in the central nervous system or in the sympathetic and parasympathetic system as well. The circulation of amino acids in tissue fluids may irritate nerve cells, and variation in filtration and osmotic pressure may give rise to localized edemas with disordered function in connective nerve tissue. We may inherit, as a dominant Mendelian characteristic, the tendency to become sensitized or allergic to some foreign substance. A sensitiveness to a particular

substance on the part of each allergic person does not appear to be inherited but is seemingly determined by the chance of environment. Furthermore, a sensitized person may exhibit allergic phenomena only on emotion when the autonomic system is "triggered" and in a reactive state and such individuals may in time exhibit system-habits referable to an unstable metabolism and autonomic mechanism. This shadow border-country where the Saints dwell and in which psyche weds soma is, perhaps, the Never-never Land of Medicine. If we learn its borders clear enough for geography and charts we may slay imagination and lose our humanity. However, War and the stupidity of statesmen will surely ruin civilization in time to avoid such a disaster coming through too much knowledge!

The problem, nevertheless, becomes still more complex in the light of recent work in pharmacology. Otto Loewi has established that the effects of autonomic nerve impulses are transmitted by the peripheral nerve end release of specific chemical stimulants, so that parasympathetic effects are transmitted by release of acetylcholine and sympathetic effects by the release of a body related to adrenalin (Henry Dale). This conception of a chemical complex liberated by specific nerve impulse acting on spontaneous activities of plain muscle and gland cells must be held in mind along with our earlier but still very incomplete knowledge of allergens! By doing so we help ourselves to see the truth of John Hunter's statement that clinical medicine is indeed but a branch of experimental biology. While we can only see as in a glass darkly, it is important that we keep looking at the glass. We must proceed to

the complex and difficult from the apparently simple. Therefore, a plan of suggestive description will now be followed as is here put down: the phenomena of serum sickness, angioneurotic edema, and the neural effects of angioneurotic oedema producing allergic encephalopathy, allergic convulsions and retrobulbar neuritis, allergic headache and migraine, and some considerations regarding the morbid processes of multiple sclerosis.

470

I would remind you of some of the neural phenomena of serum sickness. Some years ago I reported before this Association cases of palsy of the circumflex and long thoracic nerves following the administration of tetanus antitoxin and described, also in detail, observations following the use of scarlatinal prophylactic serum on a boy of eleven. This child four days later became covered with urticaria and severely ill with evidences of great meningeal irritation. In three days he became aphasic and had a complete right hemiplegia and hemianopia. The nerve heads were greatly swollen, but their height could not be measured in that the retinae were edematous also. The spinal fluid was under very great pressure and had but fourteen lymphocytes per cm. These circumstances seemed to justify a good prognosis, it being apparent that the meninges were the seat of urticarial swelling similar to that seen in the retinae and skin. Symptoms rapidly improved and an examination four weeks later showed the boy to be free of signs or symptoms of disease.

The signally benign course of these seeming disasters can only be explained by urticarial edema of perineural tissue. There was clearly palsy by compression and not palsy by destruction of nerve parenchyma.

Such happenings may follow the use of therapeutic or prophylactic sera in persons constitutionally sensitive to them. This might be called an artifically induced allergic reaction but similar events occur in individuals prone to what ought to be called allergic angioneurotic edema.

In reporting such conditions at that time¹ they were described as being dramatic and rare. They are certainly dramatic but their rarity is now less evident; and many cases of transient palsies, retrobular neuritis, and maladies of per-

ipheral nerves and spinal roots, together with headache migraine and some cases of epilepsy, have sensitiveness to protein as their etiological bases. Furthermore, transient interference with the functions of parts of the nervous system may coincide with allergic manifestations other than skin edemata. A physician subject to eczema suffered successive attacks of blindness first in one eye and then in the other due to retrobulbar neuritis, one sharp cerebellar seizure (after, as he put it quaintly, "inadvertently crossing the pork-line") and, at another time, a slight right hemiplegia with abnormal plantar reflex and severe thalamic sensations over the right side of the body. The incidence of this disease, as has been said before, may follow the peripheral nerves and nerve roots. Matieu² reported an allergic individual who after crabmeat at noon experienced excessive fatigue and headache at night, was very dizzy and dropped into coma which lasted about twelve hours. He was then agitated and delirious, and vomited. There was a flaccid palsy of the right arm in which there were absent deep reflexes. Giant hives appeared on the body, legs, and arms. By four P. M., though still rather mentally confused, he was able to describe an intense prickling sensation in the affected arm in the hand of which all objective sensibility was absent. Four hours later the mind was clear and some movement was possible in the fingers though pain was still present in the right arm and shoulder. Urticaria was sinking. Full normality of sensation and movement was delayed, however, for a month.

A university undergraduate, a member of a strongly allergic family, was occasionally subject to hives and had had a mild attack in Mexico last Christmas. He returned to college afterward with a severe cold and an infection of both frontal sinuses. Within a few days he felt wellenough except for headache. Then one morning he found he could not jump when doing his morning exercises. A few hours later he noticed his handwriting was poor and feeble in classroom, and that afternoon he could not handle a foil properly. The following morning he had difficulty in getting out of bed and in an hour or so found both feet paralyzed. He was at first thought to have poliomyelitis but Dr. George Draper saw him that day and found temperature and the spinal fluid entirely normal. The hands were then slackly palsied, the arms very weak; the feet had largely recovered power though the thighs were now most weakened. There was no objective sensory loss and no sphincter disturbance. The trunk and belly muscles and diaphragh were very weak, there was a sense of cramp low down in the throat. Breathing was mainly performed by the accessory respiratory muscles. For some days he was in great danger but in this very acute period the motor palsies migrated in the manner already indicated. Total palsy of a group of muscles might last only a few hours and then partly recover, to be replaced by total palsy of another distant group previously but partially involved. The deep reflexes came and went coincidentally with the motor paralyses. He was treated by dehydration and atropine and adrenalin but recovery did not occur till after radical treatment of the sinuses. Here the lesion was undoubtedly periradicular edemas of fluctuating severity and place. It would seem clear that the inherited allergic disposition of this patient responded to the sinus infection, in the same manner as we are familiar with in asthma and urticaria.

Not nearly enough attention has been paid by the neurologist to the question of allergic headache. Eyermann's careful study of sixty-three cases shows that in sixty-nine per cent the headache was improved when certain and specific foods were eaten deliberately. It is noteworthy that in thirty-nine of his forty-four positive cases it was possible to obtain a trust-worthy history of the incidence of allergic manifestations in either the antecedents or the children of the patient.

The most frequent clinical syndrome was headache preceded by nasal blocking of either one or both nasal passages, with colorless nasal discharge followed by, or accompanied by, abdominal discomfort and nausea.

Miller and Raulston have pointed out that migraine and the diseases classed as clinical anaphylaxia have in common periodicity, heredity, temporary disappearance of symptoms after severe infections, cosinophilia and frequent favorable influence by pregnancy. It is impossible to

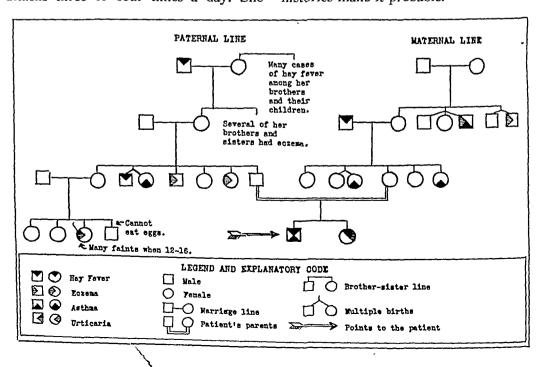

obtain autopsy material by which to substantiate ideas on the pathological processes of headache or of migraine and, as long as we are ignorant of the abnormal tissue changes produced, speculative pathology must stand in the place of knowledge. Hughlings Jackson has said truly that "the use of hypotheses is the method of science. To suppose we can make discoveries by the Baconian method is a delusion. A hypothesis of supposition is not a conclusion, it is only a starting point for methodical observation and experiment, the endeavor being not only to prove it, but to disprove it." The analogy of urticaria and migraine gives one to think in terms of a similar morbid process in the two widely separated ectodermic tissues. Such a local skin dropsy translated to the intracranial cavity would make us visualize focal areas of edema implicating painfully the meninges and especially their foldings and angled reflexions emanating probably from the brain tissue itself. Such localized swellings could form rapidly; the meninges are sensitive to pulling or stretching especially near the blood vessels. It is not necessary here to enlarge on the phenomena of migraine but it would be well to remember they are not confined simply to localized periodic headache lasting several hours and ending in nausea. The most typical attacks are associated with events characteristic of focal cerebro-meningeal irritation or transient injury. The scintillations are on all fours with the phenomena produced by an occipital lobe irritant and often these crude visual discharges are appreciated in the field away from the headache. At times such events are followed by hemianopic defect in the affected field and may be associated with alexia or a reduction in the educated ability to understand written symbols. Numbness and tingling of the contralateral hand and face, rarely of the leg, may be experienced and in such case a passing aphasia is not uncommon. Of course, ophthalmoplegic migraine will come to mind in this regard. Here the paralysis of the extrinsic eye muscles or of the levator muscle of the eyelid may appear in an hour or two and may persist for only a few hours. On the other hand the local paralysis may pass off so slowly as to be still apparent several weeks, or occasionally two or three months, later. In Bellevue Hospital lately was a woman subject to severe, irregularly recurrent right temporal headache associated with partial or, rarely, complete third, fourth, and sixth nerve palsy on the right side with proptosis of the right eye. Now such events are clearly organic; they are in no sense temporary deteriorations on some vaguely functional foundation. They have the appearance of coming from a rapid attack on, or rapid compression by fluid of, nerve tissue with more or less slow recovery of the function impaired thereby. Further, we found in this case of migraine with a sphenoidal fissure syndrome that recovery from symptoms and maintenance of health resulted from an elimination diet and immediate return of pain and local palsies was effected by resumption of the offending protein,

The rôle played by water retention in the brain in epileptics has been stressed by Temple Fay and dehydration has proven a valuable aid to the treatment of the convulsive state. Some years ago I was able to report the case of a child seen in consultation with Dr. Oscar Schloss. This child, a physician's daughter aged two years, had always been subject to attacks of giant urticaria. Six months before I saw her she began to have screaming attacks three or four times a day. She

gave the impression of having severe pain in the head at these times. Shortly after there developed periodic series of clonic convulsions with unconsciousness which were ended by repeated lumbar puncture. For some months the child remained well. Then urticaria reappeared to be followed in four days by screaming attacks and convulsions. Two or three of these associations made us search for a convulsing agent. This was found in milk to which by good fortune she gave a positive skin test. This food was discontinued and since then (1923), has been avoided. There has been no recurrence of either urticaria or epilepsy in the twelve years that have since passed.

Six months ago a boy aged thirteen was brought to me because of epileptic seizures which had appeared several times during the previous eight weeks. Inquiry revealed him as a subject of asthma and hay fever. The family history as regards known allergic sensitiveness is outlined in the accompanying genetic chart.

All his life he had known to avoid milk but lately having gone to boarding school he had become careless. No attacks have occurred since his diet has been controlled. It is yet too early to be sure that the noxious stimulant to the convulsion has been conclusively found but other case histories make it probable.

Crockett's experience in this regard is important In a hospital for tuberculosis in which the patients were treated with tuberculin, he noticed that if the patient also had epilepsy the seizures usually dis-He treated 23 cases with appeared tuberculin He always tried to avoid a reaction. A total of eight or ten injections were given at weekly intervals Eleven nationts were freed from attacks for more than three months. One patient who had 300 major and minor seizures in the month preceding treatment was free for nmeteen months However, the incidence of convulsions in an epileptic varies so m periodicity that more extended thera pentic testings of these ideas must be made The evidence, nevertheless, that many cases of epilepsy constitute a sensitization disease cannot be safely ignored family histories for allergic inheritance must be investigated, sensitization tests made, and elimination diets and dehydration experimented with before we can decently resign ourselves in the care of the idiopathic epileptic to the therapeutic despair of increasing doses of the barbituric series

It would seem doubtful if the possibility of the allergic origin of many cases of retrobulbar neuritis occurs easily to the minds of most doctors of the eye and bram Still it has been my fortune to observe many attacks, coinciding with hives, of acute transient edema of the optic nerve and retina, to watch the onset, the passing, and the structural effects of such events, and to observe, in the same individual phenomena affecting other areas of the central nervous system-in the medulla, in the capsule, in the nerves of hearing, invisible to the eye but visible to the intelligence as being identical with those seen by the ophthalmoscope

Ullman⁶ long ago reported the case of a man subject to transient swellings on the back of the hands, in the pharyinx, and laryngeal mucosa which were followed by symptoms of cerebral pressure, syncope and focal epilepsy. This observer thought that the disappearance of these grave cerebral symptoms in a few drys, the rapid and complete recovery of the patient and the later absence of consulsions after the disappearance of peripheral, circumscribed dropsies mide phusible the assumption of edematous

changes in the brain and its membranes Oppenheim⁴ with his vast clinical perspicacity, quoting this case, surmised that optic nerve disease might possibly develop on this basis but recommended great caution in such an assumption Through Handwerk's⁶ case and mine it has been possible to show how accurate Oppenheim's hypothesis has proven to be The same worker observed the combination of migraine, recurrent oculomotor paralysis and angioneurotic edem⁴

A severe and, I think, important case for the sake of exposition night here be described in detail

A man, aged twenty eight, for five years the subject of swellings varying in size from that of a pea to that of a walnut, oc ensionally becoming superficial but usually deeply seated in the muscles, was admitted for observation to the Neurological Institute If such a swelling occurred near a joint, such as the wrist, for the duration of the swelling-from two to six days-the joint was disabled through stiffness and pain These swellings occurred suddenly, within an hour, they were tender, painful and throbbing and, when the skin was involved, itchy They occurred in the arms and legs and occasionally in and on the trunk muscles Professor Fordyce diagnosed this condition as acute circumscribed edema

Two years after their inception, and during the course of an attack he began to be sleepy, to experience a dull headrche and to notice suddenly that lights seemed foggy and prismatic, in a few hours he discovered that he could no longer see with the right eye, the ball of which was acutely tender and surrounded by an area of pain In about six weeks vision returned to normal

A year later vision was lost totally in the left eye, and completely regained in a fort night The other phenomena were identical with the previous episode Ten months later. the right eye was attacked and recovered I saw him on October 15, when left vision, having disappeared two weeks before, had returned so that he could count fingers with the affected eye at a distance of four feet. Between the attacks of blindness he was well, except for occasional swellings in the muscles and skin The blood chemistry, Wassermann test renal function, calcium content, and basal metabolism were normal The blood pressure never rose above 110 The left pupil was irregular in shape, sluggish to light and on convergence, the left fundus could be seen but hazily by reason of vitreous opacity In a few days the reaction of the pupil became as brisk as that

of its fellow; the fundus was seen clearly, and vision was fully restored. He left the hospital at the end of October in perfect health.

A week later he had another attack of deep swellings in both forearms, then came a stabbing pain in the forehead, so that he screamed continuously for some hours, during which he began to lose vision in both eyes; he became stuporous and a left hemiplegia appeared. Three days later, the stupor had passed but he had no perception of light in either eye; the pupils were irregular and fixed, and no fundal light reflex could be obtained. He only partly recovered from the left hemiplegia in the course of the next four months.

The vitreous body began to clear up in a week, and one began to get fleeting glimpses of the fundal vessels as though through puffs of smoke which rose or moved from side to side in front of the disk, a moving, partly translucent, partly transparent cloud which was clearly being thrown into the vitreous; the nerve heads seemed blurred in outline but, by the time the smokiness of the media had disappeared, the papillae again looked clear-cut. Paracentral scotoma could be seen for two days, after which both fields and vision were again normal.

On December 19, 1923, swellings again appeared in the substance of the anterior tibial muscles; the next day speech seemed to be somewhat thick; two days later, more swellings appeared; the patient was drowsy and had pain over the right eye with decreasing monocular vision. The right pupil began to react sluggishly to light, and the appearance of puffs of smoke or mist was again seen with the ophthalmoscope, increasing in density until the right fundus passed out of sight, when vision also disappeared. On this day a large, red, boggy swelling appeared around the third metacarpophalangeal joint of the left hand. Two days later there was complete aphonia, and the patient was deaf in both ears. He could not hear the tuning-fork on contact. There was much difficulty in swallowing, as the palate was paralyzed, and he could not move the tongue into the left cheek. The blood pressure dropped to 90 systolic. Respiration was labored. The mind remained clear. While vision improved in the right eye it deteriorated in the left, and vitreous opacities appeared on that side as they began to clear on the other. Speech was absent, and alternating incontinence of urine and feces appeared.

On January 17 definite signs of improvement were seen; swallowing was less difficult; slight movement of the palate returned; vision was restored; sphincter control was reasserted. Deafness was still absolute, although Dr. Sowers could find no defect in the ear drums. Ten days later he could talk intelligibly, although with bulbar inflection; he could sit up, and he could hear loud conversation with the left ear. On January 30 he could hear a watch on contact with each ear, and on February 7 hearing was restored to normal. Through all these extraordinary fluctuations of function, only moderate improvement occurred in the left hemiplegia. which behaved in its course as such affections of thrombotic origin usually do. Lumbar puncture was not performed on this patient on account of the risk. Dr. Cook found equivocal sensitization reactions to milk and veal, but the patient had had asthma in childhood, and his mother always had urticaria after eating fish.

And then what is the pathology of multiple sclerosis? Its cause is unknown and no allergic basis for its production can be seen. But its episodes, its intermissions, the curability of its most acute crisis, its attack on the optic nerves, its neglect of sensory paths—all these things greatly resemble the happenings of localized allergic edemas after the central nervous system has come under fire. Further, the recent plaques in the rare autopsies of acute cases are not sclerotic; they are infiltrations by fluid of the nerve tissue surrounding blood vessels-what the agent may be that makes the coats of these vessels permeable by serum we do not yet know, but the morbid process is suggestively similar to those we have had under consideration. However, to leave aside such problems as yet beyond answer, the solutions of many of the epilepsies, migraine and other paroxysmal disorders including, I believe, many of the psychoses, are behind doors the locks of which we pick at. These will one day be opened by the key of biochemistry.

POLYGLANDULAR DISEASE

George Crile, M.D., Cleveland HENRY TURNER, M.D., Oklahoma City PERRY McCullagh, M.D., Cleveland

We present here four cases of a type similar to that ascribed by Cushing to pituitary basophilism. These patients have been treated by denervation of the adrenal glands.

Many writers on polyglandular disease comment upon the frequent presence in the disease of tumors of the adrenal cortex and appear to ascribe to them an etiological significance. Falta1 states, however, that the presence of an adenoma does not preclude the possibility of nerve influence. In this connection, it is interesting to note that Engelbach2 reported 54 cases in which no tumor was present. Kepler3 of the Mayo Clinic recently reported four typical cases with normal adrenals in two, an enlarged and hyperplastic adrenal in one, and carcinoma of the adrenal in the other. Two of these cases had latent and two marked diabetes. In two cases there was no histologic abnormality of the pituitary gland.

We have assumed that the manifestations of polyglandular disease are due in a large part to hyperactivity of the adrenal glands, an assumption which has been tested by denervating the adrenal glands and division of the major and minor splanchnic nerves on each side. We have performed this procedure in twenty-three cases of polyglandular disease. In some of these cases the operation has been performed too recently to form a final judgment as to the ultimate result, but in every case some if not all of the symptoms were alleviated promptly after the operation.

Case I. The patient, a girl seventeen years of age, was first seen by Dr. Turner on February 28, 1933. She had enjoyed perfect health until four months before she was first seen, when oligomenorrhea developed and hair began to grow on her face, abdomen, and extremities. The breasts began to enlarge, and the face became obese. The cheeks and lips became extremely red. During these four months the hands and feet had become purplish red in color; they were cold, and were constantly wet with perspiration. Appetite and thirst increased greatly, and definite constipation had developed. Headaches

were frequent. The eyes had become more prominent and she complained of nervous ness and of becoming easily fatigued. Dur ing the preceding two months the patient had noticed transient pains in the lower right quadrant. Before this illness the patient had been very brilliant as were other members of her family, a brother having been chosen as an All-American student for his grade. She had led her classes and had been very popular, but during the course of her disease she became dull and somnolent and lost her standing in school. Her energy and endurance became greatly diminished and she became despondent.

When admitted to the Cleveland Clinic May 29, 1933, the patient stated that all of her symptoms had increased. She complained of a gnawing pain in the lower right quadrant, undue fatigue, emotionalism, heat intolerance, general hyper-hidrosis, marked palpitation and tachycar-dia, tremors, and a gain of twenty pounds in weight during the preceding two months. The menses had continued to be very irregular, and the flow was so scant that a

pad was not required.

Physical examination: The temperature was 99.4° F.; pulse rate 120; blood pressure 140/80. The face was very full, round and plethoric with excessive fat about the cheeks, chin, and neck. Abnormal depositions of fat were noticed between the scapulae, on the breasts, and over the abdomen. There was a striking absence of subcutaneous fat over the extremities. The breasts were abnormally large and were covered with atrophic striae and symmetrical, purplish red, atrophic striae were present on the medial surfaces of both thighs (Fig. 1). There was an abnormal prominence of the eyeballs and a coarse tremor of the eyelids when closed. Her expression was dull in spite of her complaints of nervousness and palpitation. The cheeks and chin were covered with rather thick fine hair and there was much facial acne. Hypertrichosis was present on the legs, arms, abdomen, and back. The skin was warm and moist except over the hands and feet which were mottled, cyanotic, and cold. No goiter was present and there were no ocular, cardiac or neurological signs of thyroid disease.

Pelvic examination revealed no abnor-

mality.

ality.

Special examinations and higher than the second se

data: No evidence of pituitary tumor could be demonstrated. The fundi and visual fields were normal, and x-ray examination disclosed a sella turcica which was within normal limits of size, and there was no evidence of erosion. The x-ray examination gave no evidence of demineralization of the skeleton.

The blood findings were interesting. The hemoglobin was 123 per cent (Sahli); erythrocytes 6,220,000; reticulocytes 2 per cent; platelets 111,960; volume index .69; white blood cells 11,750; polymorphonuclears 71 per cent; small lymphocytes 17 per cent; large lymphocytes 10 per cent; transitionals 1 per cent; eosinophiles 1 per cent. The fragility test showed hemolysis beginning at .48; complete at .36. The blood chemistry findings were as follows: In mg. per 100 c.c. of blood, N.P.N. 35; urea 18; uric acid 4.2; creatinin 1.5; calcium 12. The fasting blood sugar was 133 mg. per 100 c.c.; and one and two hours after the ingestion of 100 g. of glucose it was 181 and 154 mg. per 100 c.c. respectively. The basal metabolic rate was minus seven per cent. Blood Wassermann and Kalin tests gave normal findings.

Examination of the urine showed the specific gravity to be 1.020, and there were no abnormal chemical or microscopical findings,

Fig. 1. Photograph of patient (Case I) showing atrophic striae on breasts and thighs.

There was a marked increase in urinary prolan as shown by a modification of the Friedman test. Before the first operation, this test showed 2 plus mature follicles and 3 plus hemorrhagic follicles, corresponding to the findings in pregnancy. One month after the first operation this excess was still present, the test showing 1 plus mature follicles and 3 plus fresh corpora lutea. Eight months after the second operation, however, no prolan was measurable by this method.

At the request of Dr. Cushing, Dr. Turner had sent forty c.c. of heparinized blood plasma to Dr. Irvine H. Page at the Rockefeller Institute, who found it markedly positive for pressor substance. Dr. Page states:

I regret to say that it is not justifiable to claim that this pressor substance is that which is causing hypertension in these cases. It is an extremely complicated situation, so that my feeling, at present, is that one is justified in accepting the finding as being factual, and leaving the interpretation open to future investigation.

Although the patient presented an almost typical picture of Cushing's pituitary basophilism, a diagnosis of polyglandular disease was made, the adrenals, the hypophysis, and the ovaries being involved. In the hope of stabilizing the neuroglandular system, and thus preventing the progress of the polyglandular symptoms, it was decided to denervate the adrenal glands, and a left denervation was performed on May 21. Heart consciousness and a sense of tension, of which the patient had complained, disappeared immediately, and the hands became warm. Three weeks after the denervation the right side of the face was noticeably less puffy than before, the breasts appeared to have stopped increasing in size, and the right one was smaller than the left. It was thought best to have the patient return home for a while to see whether the improvement continued.

During the next thirty days her progress was quite satisfactory. The majority of the vegetative symptoms disappeared; the hands continued to be warm, and the tremor, heart consciousness, inward tenseness, sweating of the palms, etc., did not bother her. Four weeks after returning to her home she experienced severe pains in both lower quadrants one morning, which required morphia for relief. At 7:00 o'clock that evening she had a convulsion, followed by severe vomiting. Later on in the evening she had another convulsion. Following these she complained of extreme tenderness in the left lower quadrant, her temperature rose one to three degrees and fell

to normal within three days. Burning and frequency of urination developed, and a catheterized specimen of urine revealed a large number of pus cells, Bilateral retrograde pyelograms gave negative findings, and there was no evidence of any kidney distortion or displacement. Cystoscopic examination revealed a moderate cystitis and urethritis, which abated under treatment.

The patient returned to the clinic for the second denervation on October 6, 1933. The atrophic striae were still present, the breasts and face were still puffy, and the abdominal fat was markedly increased. The basal metabolic rate this time was minus 13 per cent; blood pressure 110/80; pulse rate 80. A right adrenal denervation was performed. There was a compensatory hypertrophy of the gland, which was the largest we have ever denervated, being twice the normal size. The cortex was drawn into many convolutions. Because of the size of the gland and the abnormal amount of cortical tissue, a partial adrenalectomy was performed also, the inferior pole being excised.

The patient had a rather stormy convalescence, and showed signs of adrenal insufficiency which were controlled by the administration of eschatin. Her progress, subsequently, was excellent. The menses returned five months following the second denervation, and continued to be regular and normal in amount. Following the second denervation, the superfluous hair on the face, abdomen, and extremities completely vanished, and the fat on the face, supracervical region, breasts, and abdomen, disappeared. The skin became normal in color, texture, and temperature, and the

atrophic striae disappeared.

Her progress is indicated by the following extracts from letters from the patient and her home physician within five months after the right denervation.

My menses started functioning February 24 and continued until March 1. My menstruation

seems to be very natural. I am feeling exceptionally peppy and my appetite is very goodthe superfluous hair on my face and body seems to have vanished.

The following letter was from the family physician, Dr. J. C. Jacobs:

The face has come back to a slender appearance. The pad on the back of the neck and across the upper shoulders is gone. The abdomen is smooth, flat, and no longer puffy. Her skin is moist and normal in texture and the striae on the thighs and breasts seem to be disappearing. The hair on her face, arms, and limbs has entirely gone except for some small amount of hair on the anterior aspect of the lower limbs. Her mental aspect is very good. She takes an interest in reading books and periodicals of different kinds and is able to attend the theatre which she enjoys very much. She is making plans for the next year's school. Also, she tells me she expects to play tennis tomorrow. In fact, she has taken a new lease on life. Her appetite is good, bowels regular, she sleeps well and her strength is increasing from day to day. She is now taking eschatin 2 c.c. morning and evening.

In August, 1934, ten months after the second denervation, the patient wrote:

I have discontinued the use of eschatin and feel no ill-effects; am menstruating every month naturally and I attend many amusements which I enjoy very much. I am planning to re-enter school this fall to graduate and to also make high grades.

In a letter dated one year and five months after the second denervation, she wrote of her last semester's work:

My grades were A in English, B in Com-mercial Law, and A in Home Economics. I didn't carry enough subjects last semester to make high honors so I only made honors. I am taking an extra subject this semester. Business English. Are tennis, swimming, and skating too strenuous exercise for me?

This letter is quoted to indicate the mental and physical vigor then experienced by this patient in contrast to the dull, lethargic. apathetic state when we first saw her.

In the following month, the patient returned to the clinic for observation. Her status is indicated by Tables I and II.

The change in the appearance of this patient is shown in the accompanying photographs, (Fig. 2) but these do not tell the whole story for they cannot portray the

change in he personality of the patient, who had been transformed from a heavy, lethargic, listless, stupid individual into a vivacious, alert, normal schoolgirl, who again led her class, and had been voted the most popular girl in the college.

This patient died a few weeks after her last visit to the clinic from an infection which caused an acute epicarditis. Autopsy revealed the presence of an adenoma in the pituitary gland. The pituitary gland ap-

ment of the pituitary gland which evidenced that it was a true case of Cushing's syndrome.

The thyroid gland weighed fifteen grams. The lobes were of uniform consistency and normal in appearance and there was an abundance of colloid tissue. There was no adenoma. The gland exhibited no abnormalities on microscopic examination. The pancreas weighed 100 grams and was also found to be normal on microscopic exami-

Fig. 2. Photographs of patient (Case I) after first adrenal denervation and 1 year and 6 months after second denervation.

peared grossly to be normal but on microscopic examination, the entire anterior portion was found to be occupied by a welllocalized, oval-shaped nodule which was almost entirely basophilic in staining reaction. Between this nodule and the Pars nervosa there was a rather wide zone of histologically normal pituitary tissue. Unstained sections of this pituitary gland were submitted to Dr. Percival Bailey for his opinion. He states, "My interpretation would be chromophobe adenoma with possibly scattered basophilic cells." Dr. Bailey felt that the degeneration which had taken place in the pituitary had caused these cells to stain in much the same way as basophilic cells. Such degeneration was undoubtedly present and due to the very difficult circumstances under which the autopsy was obtained.

It is extremely significant that adrenal denervation completely controlled the symptoms in this case in spite of the involvenation. The right ovary weighed twenty-five grams and measured four by two by one-half cm.; the left ovary weighed five grams and measured four by two by 1.3 cm. Both ovaries contained numerous small follicular cysts. The tunica albuginea was smooth but thickened. Microscopic examination showed a few distended somewhat atrophic and cystic follicles in the cortex of each ovary. The number of primordial follicles was greatly reduced in each. Otherwise, there was no abnormality.

Examination of the adrenals indicated a distinct reduction of the cortical tissue and considerable fibrosis in the surrounding fatty tissue and in the adrenals. Both adrenals were the same in this respect.

Case II. The patient, a women thirty-one years of age, was first seen January 6, 1934. Ten years before she had an attack of pyelitis which was associated with boils. These lasted for about two years. As this condition improved the patient became in-

creasingly nervous and was unable to work, and tachycardia, palpitation and tremors developed. Her physician gave her what she described as an 'ironish colored liquid (possibly a preparation of todine) and as long as she took this she was able to work Five years before we saw her, her basal metabolic rate had been plus sixty per cent and during three months in that year she lost fifty pounds in weight A thyroidectomy was performed elsewhere and while in the hospital, she felt better but after getting up, the tachycardia and pulpitation returned The patient felt the same as before the operation, though she grinted some weight During the eight weeks before we saw her, she had ag un lost weight-fifteen pounds The menstrual periods were irregular and the flow scanty

Physical signs. The pitient was an obese womin weighing 182 pounds—she had weighed over 200. She was very alert and active. The temperature was 98.4° Γ , pulse

rate 120, blood pressure 124/80

The thyroid gland was not palpable but due to dullness to percussion over the upper sternum it was felt that there might be some substernal extension of the gland. This, however, could not be corroborated by x-ray. There was a tremor of the tongue and a tremor of the hands on exertion or tension of the muscles. The skin was warm and moist, and the face and neck were flushed.

The face was fat and hairs, there was a male distribution of hur over the abdomen The hair over the legs and arms was markedly increased. Fat deposits were particularly noticeable in the breasts, on the neck, between the shoulders, and on the abdomen. Pelvic examination revealed no

gross abnormalities

Laboratory data The basal metabolic rates averaged plus fifty eight per cent The red blood cells numbered 4,910 000, white cells 7,600, hemoglobin 91 per cent The Friedman test gave no evidence of urinary prolan and an assay for urinary estrin indicated the presence of less than four rat units per daily output (normal out put approximately 4 to 19 rat units per duent, by Kurzrok method)

The clinical diagnoses were recurrent hyperthyroidism, polyglandular disease, and neurocirculatory asthema. An exploration of the neck was advised to determine the presence and condition of thyroid tissue to be followed by denervation of the adrenal glands if no cause of the symptoms was found in the thyroid gland.

The exploration of the neck was done January 27 The tracheo esophageal grooves were isolated on both sides but no evidence of thyroid tissue could be found nor was any found in the upper mediastinum nor

was there any extension of thyroid material between the trachea and esophagus It was felt, therefore, that the symptoms were due to pituitary and adrenal hyperactivity and a left adrenal denervation and division of the left splanchine major and minor was

performed January 31

As this patient presented marked hirsutism, it was deemed advisable to perform as exploratory laparotomy in order to de termine whether or not an arrhenoblastoma of the ovary was present Several small cysts were noted in the substance of the left ovary and a suspicious area in the middle of the ovary was removed for pathological examination There was one small cyst in the right overy but no suspicious area was observed However, a biopsy was made of the right ovary also The pathologist stated that while there were areas in the left ovary which suggested arrhenoblastoma, whether it was present was questionable

There was improvement in many of the symptoms immediately after the denervation. The bisel metabolic rate fell to minus twenty-two per cent. The prinent lost twenty-two pounds in weight and the pulse.

rate became slower

When she returned for the second de nervation ten months after the first operathe tachycardia, palpitation tremor had recurred, the menses were pregular and the flow had become increasingly scanty The hirsutism was somewhat diminished. The temperature was 99 8° F, pulse rate 128, gradually diminishing in rate during ten preoperative days with rest and the administration of I u ol's solution The blood pressure was 167/85, basal metabolic rate, plus sixty one per cent The Friedman test still showed no prolan The blood iodine was not elevated, being 107 and 134 micrograms per 100 c c (normal, 7 to 14 micrograms) A glucose tolerance test gave the following findings The fisting blood sugar 85 mg per 100 cc, one half, two, three, and four hours after the ingestion of 100 grams of glucose the blood sugar was respectively 154, 163, 147, 112 and 73 mg per 100 cc

The right adrenal gland was denervated on November 22, 1934 The adrenal gland was twice its normal size and was very

similar in appearance to that of the right

adrenal gland in Case I.

It was thought that the gland had undergone compensatory hypertrophy and that the recurrence of the symptoms was due to this hypertrophy. Eight days after the second denervation the basal metabolic rate was plus four per cent.

Three months after the second denervation, the hair had almost entirely disappeared from the face and legs. The patient had lost her nervousness and looked vigorous. She was enjoying a normal social life. Her improvement is shown in Table III.

Case III. The patient, a woman thirty-five years of age, was first seen by Dr. Turner February 28, 1933. At the age of eighteen years she began to gain in weight markedly, and hypertrichosis developed on the upper lip, chin, sternum, breast, lower abdomen, and legs. During the next two years her weight increased fifty pounds. She menstruated only once every seven months and the flow was very scant, and lasted for only one day. She was in college and being embarrassed by her excessive weight—194 pounds—she decided to reduce. On a strict regimen which included a very limited diet and reducing exercises, she lost forty pounds in weight within a period of three months. She then became extremely fatigued, and suffered from headaches

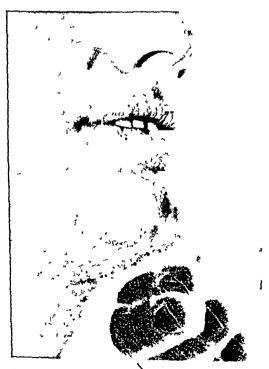

Fig. 3. Photograph of patient (Case III) showing growth of half on face.

which increased in severity, and from nervousness, dyspnea, tachycardia, and palpitation. In 1924 a diagnosis of hyperthyroidism was made and x-ray therapy was applied to the thyroid gland. Between 1924 and 1926 she was hospitalized repeatedly because of attacks of extreme weakness, diplopia, nausea and vomiting, and transient loss of memory.

From 1926 to 1929, under medication with antuitrin and pituitrin, she was able to continue her occupation, that of a teacher, and felt better, but most of the symptoms remained, although they were less severe. During the three years before Dr. Turner saw her she had taken Lugol's solution intermittently, and various kinds of replacement therapy had been administered without beneficial results.

The patient complained of obesity, hypertrichosis, high blood pressure, dyspnea, irregular and scanty menses, exophthalmos, palpitation, headaches, fatigue, nervousness, insomnia, increased thirst and appetite, hyperhidrosis, transient diarrhea, tremor of the hands and feet, dryness of the scalp and hair, and occasional pain in the abdomen. The growth of hair on the face required daily shaving. (Fig. 3.)

Physical examination: The patient was an obese woman, sixty-three inches in height and weighing 179 pounds. There was a generalized hypertrichosis. The temperature was normal; pulse rate 110 to 120; blood pressure 128/80 when at rest in bed, and 163/80 after walking a few steps. The palms and soles were moist; there was a digital tremor; the finger-nails were seamed and brittle. There were numerous white striae over the lower abdomen and thighs. The eyes were prominent, although there was no lid lag, and no definite exophthalmos. The vascularity of the thyroid gland was increased, as indicated by increased pulsation of the superior thyroid artery. The heart sounds were loud. Precordial activity was increased, and there was a soft systolic apical murmur

A unidigital vaginal examination showed a loss of elasticity of the vagina, and that the cervix had a very short anterior lip. The uterus was of normal size. There were no palpable masses in the fornices.

The distribution of fat was like that of lipodystrophy, the neck being relatively free of fat, and the arms and upper chest not obese. The breasts were large and pendulous, and the abdomen was obese and pendulous. The hips were broad and the thighs and legs showed pads of fat extending downward to each side of the tendo achillis. (Fig. 4.)

Significant laboratory data: The basal

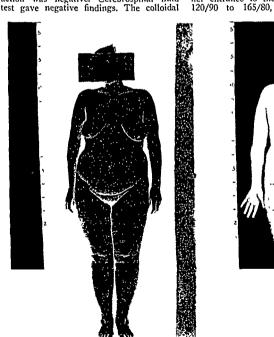

metabolic rates averaged plus 36.5 per cent. The glucose tolerance test gave the following findings: fasting blood sugar, 89 mg. per 100 c.c.; and one-half hours, one hour, two, three, and four hours after the ingestion of 100 grams of glucose, it was respectively 171, 183, 116, 63, and 76 mg. per 100 c.c. Prolan assays made by a modification of the Friedman test showed an excess of prolan—4 plus mature follicles being produced. There was a slight pallor of the optic disks, but examination of the visual field and an x-ray film of the sella turcica revealed no evidence of the pressure of a pituitary tumor.

The erythrocyte count varied between 4,890,000 and 6,260,000. The hemoglobin (Salhi) was 88 to 100 per cent; leukcocytes 8,800; polymorphonuclears 64 per cent; small lymphocytes 36 per cent; reticulocytes 5 per cent. The blood chemistry findings were as follows: In mg. per 100 c.c. of blood, N.P.N. 27; urea 12; uric acid 5.2; creatinin 1.5. The blood Wassermann reaction was negative. Cerebrospinal fluid test gave negative findings. The colloidal

gold curve was zero in all dilutions. Examination of the gastric contents gave the following findings: total acid 40; free acid 13. Urinalysis showed the specific gravity to be 1.022; and there were no abnormatichemical or microscopic findings. Roentgenograms of the chest and spine revealed no pathological condition of the lung fields and no bone changes.

Because of the interesting history and multiplicity of symptoms, and findings sugestive of a pituitaro-adrenal syndrome, Dr. Turner referred the patient to the Cleveland Clinic, where a left adrenal denervation was performed April 23.

Following the operation, the patient improved so notably that she did not wish to have the right adrenal denervation performed. She slept well; was less nervous; had neither palpitation nor heart-consciousness, lost seventeen pounds in weight; and the basal metabolic rate was reduced to minus five per cent. The blood pressure, which had been as high as 270/100, and on her entrance to the hospital ranged from 120/90 to 165/80, became stabilized at

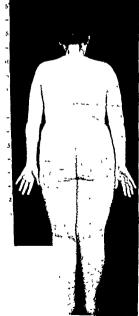

Fig. 4. Photographs of patient (Case III) showing distribution of fat.

120/70-80. The hirsutism practically dis-

appeared.

In the belief that the second denervation might complete her cure, Dr. Turner advised the patient to return. The right denervation was performed August 30, four months after the left denervation.

Three months after the second denervation, the patient wrote that aside from headaches which were less severe, she was feeling "exceedingly well." At that time she was attending classes at the University, making a trip of eighteen miles twice daily on an interurban car.

Six months after the second denervation the hirsutism, except for a small amount on the chin, had disappeared, as had the peculiar fat deposits, and the striae over the abdomen and thighs had disappeared. The basal metabolic rate and the pulse rate were normal. There was no palpitation. The systolic blood pressure was 110. Normal menstrual periods had become established.

When last examined by Dr. Turner, April 12, 1935, two years following the denervations, the patient continued to be free from all the symptoms and signs of which she originally complained, with the exception of headaches, which were much less severe, and occurred less frequently. She had continued to menstruate regularly every twentyeight days; the flow being of two days duration, moderate in amount, and unaccompanied by pain. She had been teaching school regularly during the preceding year, and had noticed no undue fatigue nor nervousness. The basal metabolic rate was plus 16; blood pressure 120/70; pulse rate 90.

Case IV. The patient, a married woman, thirty-three years of age, was first seen September 8, 1933. She complained of an increased growth of hair which she had noted during the preceding three months and of irregular painful menstrual periods. The patient had first menstruated at the age of fifteen years, but had had only two periods each year until she was nineteen years old, when the periods came at fourmonth intervals until she was twenty-one. At one time during this year she took ovarian extract and the following period she flowed profusely, the flow persisting for thirteen days at the end of which period a dilatation and curettage was performed. She then began to take thyroid extract and her menstrual periods came at thirty-day intervals until three months before we saw her, at which time she stopped taking the thyroid extract. Since the menarche she had had dysmenorrhea but this had gradually decreased in severity. During the preceding twelve years she had gained twenty-three pounds in weight (107 to 130 pounds); but during the last thirteen months, she had lost three pounds, and during this period she had noted an increase of hair over her entire body excepting her back. For several years her feet had felt cold. The patient said that she felt well except that she was very nervous. She had tremors which were so severe that sewing was impossible. During the two weeks before we saw her she had been excessively drowsy all day and could sleep as long as fifteen hours at a time. She had occasional severe headaches. She often had fits of uncontrollable crying.

In addition to the symptoms listed above, the patient had a tendency to an elevation of temperature, which was frequently as high as 100 to 102° F. Libido was so increased that it was embarrassing to her. Her face tended to be flushed. She had had generalized itching for several months before the dilatation and curettage, which was stopped for periods of six weeks by the application of the x-ray to the pituitary

gland.

The temperature was 99° F.; pulse rate 104; blood pressure 122/80; blood sugar 128 mg. per 100 c.c. 3½ hours p.c.

Marked general hypertrichosis was present. The pubic hair had the male contour and extended in a line up to the umbilicus. The quality and distribution of hair on the face, body and limbs resembled that of a male. Pelvic examination showed the presence of a solid round tumor of the right ovary one and one-half inches in diameter. The uterus was not enlarged or boggy.

Laboratory tests. The basal metabolic rate was plus two per cent. No evidence of pituitary tumor was demonstrated by examination of the optic fundi, the visual fields or x-ray examination of the sella turcica, all of which gave normal findings. An excess of urinary prolan was demonstrated repeatedly by means of the Friedman test. She excreted an average of 7.2 rat units of estrin per twenty-four hour output of urine (normal output per diem 5-20 units), an assay for urinary androtin showed eight mm. and six mm. comb growth in each of two capons tested (the average for normal men is 10.0 mm.).

The diagnosis was dyspituitarism and ovarian tumor, and the application of x-ray therapy to the pituitary gland was prescribed.

A course of x-ray therapy was given in five seances from September 15 to October 23. During this period the patient had no headaches. When seen October 23, she felt generally improved but no change in the abnormal growth of hair was observed.

She had a menstrual period beginning October 21, which lasted for four days. Preceding this period she had a severe headache which lasted for five days and was followed by a temperature of 100° to 101° F., together with pain in the back. When the patient was seen, nine days after the cessation of the menstrual period, she said that she felt very tired most of the time; her hands were moist; her skin dry; and her nails dry and brittle. Her basal metabolic rate at this time was minus one per cent.

The hypodermic administration of folliculin-menformon was prescribed and one month later the patient was decidedly improved. She was not nervous and had no uncontrollable crying attacks. The menses appeared to be re-established and her last period had been accompanied by but little pain. The hyportrichosis, however, was increasing. She was still taking thyroid extract. The pulse rate was 96; blood pressure 130/70. The administration of menformon and thyroid extract was continued.

In February 1934, five months after her first visit to the clinic, the patient was seen again. At this time she was more nervous. The pulse rate ranged from 84 to 100; the blood pressure was 135/70; basal metabolic rate plus 7 per cent. She weighed only 117 pounds, a loss of thirteen pounds since she was first seen. The right ovary was enlarged and was slightly tender. During her last menstrual period the flow had been very seant, although the preceding two periods had apparently been normal, the flow tending to be profuse. The growth of hair on the abdomen and arms was increasing. The feet were cold.

As the patient had received only temporary benefit from irradiation or medication and since her condition indicated increasing polyglandular dysfunction, denervation of the adrenal glands was advised and the two operations were performed on February 28 and July 26, 1934. One month after the first denervation the patient was much less nervous. The abnormal growth of hair continued, and if anything, was increased. She had gained a little weight. The pulse rate was 87. In general, she said she felt better than she had for years.

When she entered the hospital for the

TABLE IV. COMPARISON OF CONDITION BEFORE AND AFTER OPERATION (CASE IV)

	Bejore denertation	Three months after the second denervation
Heart	Palpitation	None except on exer-
Nrevousness Hirsutism	Marked; tremor Generalized	None; calm Body hair falling out
		especially or limbs Cool and only slightly
	Period lasted three days, flow scanty.	moist
Weight	130 pounds	days, flow more

second denervation, five months after the first operation, there was improvement in all the symptoms with the exception of the hirsutism. Normal menstrual periods had been re-established but the flow was scanty. The temperature was 99.2° F.; pulse rate 100; blood pressure 187/62; basal metabolic rate, plus two per cent. The hypertrichosis was unchanged, but the nervousness, attacks of crying, and dizzy spells had entirely disappeared.

The general improvement three months after the second denervation is expressed in Table IV.

The color was normal—not flushed. Her appearance did not suggest overstimulation; she did not cry. Her menstrual periods were more normal. Libido was normal. The hair was disappearing in patches over the legs and trunk. She was not drowsy. The itching had gone. There was no tremor of the extended hand. The temperature had not been elevated since the operation. The blood pressure was 110/80; temperature 98.8° F.; pulse rate 94.

Comment

The four cases presented here might well be classed as typically representative of either Cushing's pituitary basophilism or the adreno-genital syndrome. Inasmuch as bilateral adrenal denervation resulted in alleviation of the signs and symptoms, the diagnosis of polyglandular disease might be questioned; however, the presence of pituitary, adrenal, thyroid, and gonadal signs and symptoms would tend to substantiate the conclusion pluriglandular involvement present. The fact that similar cases which have come to autopsy show histologic changes in the adrenals without involvement of the pituitary or other glands, and vice versa, should not render our assumption less plausible as it is quite possible that a gland may overfunction secondarily for a time without the occurrence of histologic changes.

In the light of our present knowledge of the very close interrelationship of the glands of internal secretion and their physiological effects upon the organism, it would be difficult, if not impossible, to concede that the numerous physiopathologic changes observed might be due to a monoglandular disease. The symptoms and signs in cases such as these can apparently be accounted for more logically by assuming a stimulation of the thyroid gland and in some cases of the parathy-

roids, adrenals, and gonads. It is difficult, however, to explain on this basis why the urinary estrin is not increased.

It is interesting to note that many of the signs and symptoms observed in this syndrome are closely comparable to those of the menopause—the menstrual suppression; instability of the sympathetic nervous system; neuropsychiatric disturbances; probable adrenal stimulation as evidenced by facial hirsutism, secondary male sex characteristics, and obesity; signs of thyroid stimulation and the increased urinary prolan, observed at times in the climacteric—all of these are almost constantly present in polyglandular disease. Their occurrence in the menopause is ascribed to the removal of ovarian inhibition of the anterior-pituitary gland, resulting in a hyperfunction of the gland and the increased production of its adrenotropic and thyrotropic principles (Mazer).4

In our patients the depressed menstrual cycle became normal following denervation. This suggests that possibly the adrenal may have an inhibitory effect upon the ovary, and that perhaps menopausal ovarian failure is not primary in the ovary, but secondary to an adrenal influence. Theoretically, palliation menopausal symptoms by adrenal denervation is possible. This problem is being investigated.

Our present concept of girdle obesity is that it is more frequently associated with endocrine hyperfunction than with hypofunction. The sex changes, virilism, and vegetative signs might well be of adrenal origin. H. H. Woollard 5 states:

It is certain that sex reversal is caused by an abnormal growth of mesonephric derivatives, which are regularly present and are to be found in the rete ovarii and cortex of the adrenal. Tumors of the rete ovarii are also known. Those with the strongest masculinizing tendencies are rapidly growing masses of fat laden cells called arrhenoblastomas by Meyer.

Strauss and Bauer, in differentiating the suprarenal syndrome from pluriglandular disease and from arrhenoblastomas, state that atrophic striae and other skin manifestations, such as acne and isolated pigmentation, are not observed in the latter. Another differentiating point which we would add is the stronger masculinizing tendency of the arrhenoblastomas with mammary atrophy as against the mammary hypertrophy observed in polyglandular disease.

Tulius Bauer has attempted to dif-"interrenalismus" between ferentiate (suprarenal syndrome) and pituitary basophilism; the close relationship of the two conditions seems apparent. Although a rather prolific literature is developing and satisfactory arguments have been advanced in favor of both basophilic pituitary and adrenal cortical origin of this syndrome, it is our belief that the evidence so far presented is insufficient to establish a monoglandular etiology. We believe that the adrenal probably plays the major rôle, because of the satisfactory results obtained by ourselves and others in alleviation of symptoms by denervation or resection of the adrenals. We conclude that this polyglandular syndrome well-controlled by surgical measures directed toward partial inhibition of adrenal function.

Summary

Four cases presenting the symptoms of pituitary basophilism (Cushing's syndrome), and the adreno-genital syndrome are reported. Bilateral denervation of the adrenals in each case resulted in alleviation of all vegetative symptoms, with disappearance of hirsutism and of obesity. It is suggested that, in view of the multiplicity of signs and symptoms present in these cases which are referable to various ductless glands, the term polyglandular disease, is probably more appropriate, and that, because of the satisfactory results obtained by ourselves and others in the apparently complete alleviation of symptoms by denervation or resection of the adrenals, this is a very ecective method in the treatment of this syndrome,

A REVIEW OF ESTABLISHED ANESTHETICS With Analysis of Deaths in New York City for Five Year Period

CLIFTON W. HENSON, M.D., New York City

The pertinent knowledge concerning the physiology, toxicology, morbidity, and mortality of the various anesthetics is here presented in an attempt to determine the safest and most efficient of the anesthetics in general use. It is hoped that this investigation may reduce the hazard from this necessary adjunct to operative procedure.

Ether

The circulatory systems of normal individuals is but little affected by ether unless its administration is prolonged. Muns¹ demonstrated that after about one hour of continuous anesthesia, a marked and progressive arterial dilatation takes place. The effect of the anesthetic upon an organism suffering from shock is however different. As was determined by Cannon² in 1919, who showed that etherization of a shocked animal to the point of disappearance of the corneal reflex, reduced the blood pressure from sixty-five mm. to thirty mm. of mercury.

The effect of ether on the gastrointestinal tract is distinctly unfavorable. The experiments of Miller³ indicate that during ether anesthesia peristaltic action is abolished and muscular tone is diminished, that recovery is slow, and normal activity is not resumed until several hours after the administration of the drug

has been discontinued.

Many undesirable changes are produced in the blood by ether. They are an increase in its solid elements,* reduction of its oxygen carrying power, ten to twenty-five per cent,* reduction of coagulation time,* increase of icteric index and sedimentation rate of red blood corpuscles, reduction of alkali reserve, and an increase of acetone bodies, sugar, lactic acid, uric acid, and inorganic phosphates.

Experiments made by Stander⁷ upon dogs demonstrated that degenerative changes occur in the epithelium of the convoluted tubules of the kidneys, marked fatty changes always occur in the central

portion of the liver lobules and sometimes throughout the whole lobules following the administration of ether. Whipple and Speed⁸ in 1915 found the pthalein output lowered after the administration of ether.

The changes produced in the various systems by ether lead one to anticipate some morbidity following its use, and this substantiated by clinical reports. Lundy reported parallel series of 600 cases, one receiving ether and the other ethylene. Bronchitis occurred in 2.5 per cent of the first group and in .6 per cent of the second; bronchopneumonia occurred in 3.6 per cent of the first and 1.5 per cent of the other. Lundy felt that ether was at least partially responsible for six of the deaths of the first group. Finsterer observes five deaths from gastrointestinal atony in 610 operations under ether narcosis, three of which were demonstrated at autopsy.

The concentration of the blood and reduction of coagulation time already noted would seem to favor formation of thrombi, and it is significant that the occurrence of embolism has been observed to be more frequent following ether anesthesia than following the other types. Nordmann¹¹ reported a rise in frequency of embolism following operations of from 1.4 per cent to 4.4 per cent when ether narcosis replaced chloroform in his clinic, and Finsterer recently stated that in his experience the frequency of embolism was .98 per cent following ether as opposed to .24 per cent following local.

These are only a few of the many clinical reports which indicate that ether is followed by morbidity and a delayed mortality. The immediate mortality rate of ether is reported low. Keen¹² compiled records of 262,002 ether anesthesias with thirty-four deaths, a rate of one per 7,706, and McGrath¹² reported 49,057 ether administrations with no deaths. However, the statistics presented later indicate that the rate is higher than is usually reported.

Nitrous Oxide

The functions of the respiratory and circulatory systems, excepting the blood itself, are entirely unaffected by nitrous oxide, any changes occurring in them during anesthesia being always the result of

asphyxia.

If cyanosis develops the peristaltic waves of the intestine may be either tumultuous or abolished. (Sollman)¹⁴. Nitrous oxide causes changes in the blood similar to those produced by ether, with two exceptions; no concentration of the blood nor reduction of the coagulation time has been noted. The gas produces pathology in the liver and kidneys identical with that caused by ether.

As one would expect, and as clinical evidence demonstrates, the venous congestion produced by nitrous oxide anesthesia causes disturbances in the circulatory system. Miller¹⁵ has observed the postoperative course of 1493 patients who received nitrous oxide-oxygen, and 3501 who received ether and found that coronary embolism occurred twice as frequently after gas-oxygen, cerebral embolism and cerebral hemorrhage about seven times as often, and pulmonary embolism about one half times more following nitrous oxide-oxygen anesthesia.

The available statistics would seem to indicate that the administration of nitrous oxide gas is a safe procedure. Teter¹⁶ reported 23,952 personal administrations with but one death. Gwathmey17 estimated the mortality as about one in twenty thousand. Sollman¹⁴ stated that at the time of publication of his volume (1922) seventeen deaths had been reported, a mortality rate of one per five million. However, Baldwin¹⁸ in 1923 reported that twenty deaths occurred from this agent in Columbus, Ohio, within a few years, causing him to give up this anesthesia for patients requiring deep anesthesia, and later the death of a hearty young man occurring in Detroit caused him to give it up altogether. He stated that fatalities are perhaps fairly numerous, but reliable statistics are not avail-Evans in 193210 reiterated this warning, stating that the gas is particularly dangerous when used by the untrained. This would seem reasonable upon consideration of the necessity for the correct proportion of oxygen and the fact that the signs of deep anesthesia and approaching consciousness resemble each other so closely. Statements presented later confirm this statement.

Spinal Anesthesia

Spinal anaesthesia always causes partial vasomotor paralysis and this causes reduction in oxygenation of the blood by diminishing respiration if the solution rises above the tenth dorsal segment, this mechanism sometimes resulting in death. Seevers and Waters²⁰ believed that the occasional cessation of respiration during spinal anesthesia is due to insufficient oxygenation of the medullary center as a result of the mechanism described, and that cardiac dilatation accompanies it for the same reason.

It would seem that a prolonged reduction in blood pressure, with relative anoxemia, might produce degenerative changes in any or all organs in the body, which may be an explanation of the occasional death following spinal anesthesia, characterized by increasing listlessness and exhaustion. Observations of McKittrick, McClure, and Sweet²¹ support this contention. They found that twenty-five per cent of forty-five patients whose blood pressure dropped fifty per cent during anesthesia did not return to preoperative level until twenty hours after the injection.

The possible occurrence of trauma to the central nervous system, the possibility of atelectasis and of tissue degeneration would lead one to assume that morbidity would result from the use of this form of anesthesia; and clinical observations of its occurrence are becoming more frequent. Lindemuller²² recently stated that few reports of spinal anesthesia give clinical observations of the neurologic complications and necropsy observations, and then goes on to report his observations on eleven cases, seven of which developed neurological symptoms, and two changes in the spinal cord which he believed contributed to death.

McKittrick, McClure, and Sweet²¹ also reported that during the year in which spinal anesthesia was used in the East Surgical service at the Massachusetts General Hospital, there was an apparent increase in the number of postoperative pulmonary complications over the preced-

ing year, when ether was used Brown and Debenhames found postoperative pulmonary complications 4.29 times more often when subarchnoid anesthesia was used than when inhalation anesthesia was used in a series of 812 cases.

The mortality resulting from spinal anesthesia has been variously estimated Rygh and Bessessen21 in 1928 reviewed 250 895 cases. The mortality in this series was one per 3 345 mjections Babcocka stated that twelve patients died as a result of spinal anesthesia in six thousand in jections previous to 1914, but that in the ten years following no death occurred in approximately six thousand injections due to more careful selection of cases and Adam⁷⁶ recently better prophylaxis stated that he believed the mortality to be one per five hundred cases and that therefore he had discontinued the use of this form of anesthesia. It would seem, therefore, that in careful hands spinal anesthesia is attended by little risk but that when administered by those relatively mexperienced in its use, the risk is greater than that following ether or ethylene and probably nitrous oxide

Local and Regional Anesthesia

Several drugs are used to induce local anesthesia, but it is generally conceded that novocain is the least toxic and consequently safest. The physiological effects of novocain are irrelevant to this discussion. There is no evidence to indicate that novocain causes any damage to the various systems of the body, but small doses in susceptible individuals and large doses in normal individuals occasionally cause severe toxic symptoms and even death. The onset of convulsions indicates toxemia and usually death unless treatment is prompt and adequate.

There is little morbidity following the use of local anesthesia Finsterer observed no deaths from intestinal atony, following 4562 operations under local anesthesia, and the mortality from pneumonia was 24 per cent following the same series, whereas it was 1 31 per cent following 610 operations under general narcosis

It is believed that the mortality rate following the use of local anesthesia for abdominal operations is relatively low, but it is difficult to obtain a fair comparison with that of other forms of anesthesia

because of the more frequent use of local anesthesia in cases considered poor risks and often moribund. De Takats²⁷ reviewed 2,745 cases of splanching anesthesia and found eight deaths which he thought due to anesthesia.

Ethylene

Ethylene produces narcosis by direct action, and the symptoms of asphysia do not appear during its administration. The drug has no effect upon the respiration or circulation, and does not interfere with intestinal movements nor with the function of the ledneys.

The nervous system, respiratory system and circulatory system are not injured by the drug. The same changes occur in the blood as occur following the use of nitrous oxide, but these changes are in a less degree. According to Stander, the changes in the liver lobules are less marked than following the use of either or introus oxide and no changes are produced in the kidneys by the drug.

There appears to be no danger of death during the administration of ethylene According to Sollman's if the concentration of ethylene is pushed much beyond ninety per cent in animal experimentation respiration ceases due to anoxemia, but that the animal may be resuscitated by means of artificial respiration as the drug itself has no toxic effects

The available statistics demonstrate that the morbidity following the use of ethylene is considerably less than following the use of ether. Lundy's comparative report has been presented, and in the series of Luckhrudt and Lewis, post-anesthetic vomiting occurred in 30.2 per cent of the cases anesthetized with ethylene, and in 76.6 per cent of those given ether. Gas pains occurred in only 4.2 per cent of the first group and in 36.6 per cent of the last

No fatalities due to this anesthesia were found in a review of the literature for the past ten years, and Sollman³⁰ stated that at the time of publication of his volume (1925) no fatalities had been reported in the clinical literature

Unfortunately the idea has been fixed in the minds of many that the use of ethylene is dangerous, not only to the person receiving it but also to the anesthetist, surgeon, and any others near by

Upon examination of the facts we find that there is no possibility of serious injury to the surgeon, anesthetist or other bystanders, that the explosion may take place in the lungs of the patient with fatal results, but this occurs as often during the use of ether as when ethylene is used. There is no evidence to lead us to believe that the use of ethylene is attended by any more danger from explosion than the use of ether. will seem a startling assertion to some which cannot be substantiated, but let us examine the evidence. Shortly after the introduction of ethylene as a general anesthetic there were several catastrophic accidents which were widely publicized. The impression was spread abroad that these accidents were due to ethylene. Upon investigation this was found to be untrue.

In the first six years following the use of ethylene as an anesthetic twelve explosions supposedly due to it were recorded with three fatalities. explosion was due to the use of a cautery on a carbuncle of the neck.81 anesthetizing machine had been removed from the room before the occurrence of the explosion due to ethylene. This parin the lungs of the patient. The second fatality³² was caused by an explosion during the administration of nitrous oxide and ether but as ethylene had been in use earlier during the anesthesia, the occurrence was attributed to its use and certain newspapers so stated. The third fatality³¹ occurred in Evansville, Indiana, and many newspapers carried accounts of the explosion due to ethylene. This particular occurrence I believe to be the real reason why ethylene is not the standard anesthetic today. The facts are, that the explosion took place in a tank known to contain nitrous oxide which was not attached to the machine at the time. It was thought that as it had been attached some ethylene might have flowed into it through the connecting tubes. no longer possible, as all modern machines have valves making back-flow impossible.

Since that time several investigations have been made of the subject. A report of a committee appointed for this purpose appeared in 1931, drafted by Henderson.³³ Three sets of questionnaires were reported. 288 hospitals replied to the

first series, 129 stating that they used ethylene. 158 stated that they did not, and twelve that it had been discontinued. The last two groups stated that they did not use it on account of the uncertainty regarding the exposive hazard. Eleven explosions were reported, one being the first mentioned, and another the Evansville occurrence. 118 hospitals reported 330,000 ethylene anesthesias without a single explosion.

Another set of questionnaires revealed that among 146,000 ethylene anesthesias recorded, four explosions occurred, one following application of a cautery to an open abscess on a lung and another caused by a cautery, a third due to the explosion of the rubber bag after anesthesia had been discontinued, and a fourth reported as serious, cause not mentioned.

Fifty-eight surgeons reported 163,000 ethylene anesthesias with eighteen explosions, five serious and one death. These same surgeons reported the observation of a considerable number of ether flares and nineteen explosions due to ether, five being serious and two fatal.

Salzer³⁴ sent out questionnaires to 478 hospitals and received reports of 425,000 ethylene anesthesias. There were ten explosions, 1—42,000, as a result of which there were three minor injuries, four destructions of equipment, and one death, this being an explosion in the lungs of a patient. Herb³⁵ in 1933 sent out questionnaires to the leading anesthetists in the United States and Canada and received reports of 1,005,375 ethylene anesthesias. In this series there were twenty explosions, one injury, and five The replies to the same questionnaires indicated that there had been thirty-nine explosions during the administration of nitrous oxide-ether-oxygen anesthesias resulting in seven injuries and five deaths. Although the number of nitrous oxide-ether-oxygen anesthesias given during this series is not reported, the greater number of explosions re-ported as a result of this form of anesthesia would not lead us to the conclusion that the risk is greater when ethylene is used.

Ethylene unmixed with other gases will not explode. It must be mixed with air in certain proportions in order to explode. When mixed with air, the lower limit of ethylene necessary for explosive possibili ties is four per cent and the upper twenty two per cent according to the U S Bureau of Standards When mixed with oxygen, the mixture must contain between five and seventy per cent ethylene. For this reason the gas in the tanks and in the tubes leading from the tank cannot explode. That in the gas cylinder can explode, but it is not under sufficient pressure to cause serious damage. The concentration in the room is below that required for an explosion It is the opinion of Sise36 that when precautions are taken to prevent the ignition of ethylene, its use is safer than the use of ether without precautions. The means of chiminating all danger of explosion has been adequately described, particularly by Bevan,37 who has not observed an explosion in 20,000 ethylene anesthesias. The principles are the presence of humidity over sixty per cent and the grounding of the apparatus

Considering the fact that ethylene is nontoxic, has never occasioned a death due to inhalation, and is attended by no more danger of explosion than ether, it seems that it is unquestionably the best of the anesthetics in present use, and that the use and application of this fact would save many lives Statistics which are presented in Tables I and II make it seem likely that the mortality with the other forms of anesthesia is greater than is

usually reported

There were 369 deaths on the operating table in the five boroughs of New York City during the years 1928 to 1932 inclusive The statistics were obtained from the Chief Medical Examiner's office

Those resulting from anesthesia are

recorded in the accompanying tables. These cases are thought to be true anesthetic deaths, as no case in which any other possible cause of death such as status lymphaticus, heart disease, shock, toxemia or other complications appeared is included. It is probable that many more of the total number of deaths were due to anesthesia, and it appears that such was the case. Table I presents cases in good general condition previous to operation for a disorder not requiring immediate intervention, while Table II consists of cases that were in good condition but operated upon for acute illnesses.

A questionnaire was sent to all the hospitals in New York City, numbering 213, requesting the number of the various anesthetics administered during the five year period under consideration. Infeen replies were received and the numbers of the various anesthetics were reported as

ionows

centages of the various anesthetics administered in this city. One fact, however, stands out clearly, namely, that although ethylene has been shown to be the safest of the anesthetics in present use, the available information indicates that it is administered to approximately one per cent of the persons receiving anesthesia.

In view of the present report of 219 deaths in five years in New York City apparently caused by anesthesia it seems that some action should be taken to make ethylene the standard anesthetic, which we believe would greatly reduce, if not eliminate entirely, this cause of death.

Conclusion

A small percentage of mortality attends the use of all standard anesthesias, save ethylene.

This small mortality appears relatively insignificant when viewed from the standpoint of the number of anesthesias administered but appears in a different light on realization of the actual number of persons dying from this cause.

Ethylene is safest of the anesthetics in present use and should be the standard.

The limited use of ethylene is probably due to inertia and unwarranted fear.

30 East 40 Street

Discussions

Dr. James T. Gwathmey, New York City-Dr. Henson's contribution is most valuable because it brings out the safety of ethylene as compared to other anesthetics better than any paper heretofore written.

Ethylene anesthetizes as does ether or chloroform. In comparison, nitrous oxide is an asphyxiating anesthetic. But the statistics given by Dr. Henson indicate more clearly its safety than any possible description or comparison of the gases.

Over ninety per cent of all explosions is due to static electricity. This element is completely eliminated, in my opinion, by passing the gases through water, thus moistening the tubes, bag, and mask, and rendering static impossible in the apparatus. rendering static impossible in the apparatus; and by maintaining the proper degree of moisture in the operating room.

At the present time, it would be a very great mistake to attempt to make ethylene the exclusive anesthetic. The safety of

ethylene itself is enhanced by using it in sequence and combination with other anesthetics, as indicated by the type of operation and the condition of the patient.

Dr. Paul M. Wood, New York City— Dr. Henson has presented facts concerning of the more popularly accepted anesthetic agents. He has found numerous references to good and bad features of all and has set forth a timely and thorough defense of a very good and useful agent ethylene. His attempt to locate the cause of anesthetic disaster, unfortunately, did not go beyond the various agents in this report. As an anesthesiologist, I am certain that the agent is seldom any more at fault than is the method and skill of the anesthetizer. Given a properly trained and qualified anesthetist, morbidity and mortality will fall regardless of agent, technic or patient's condition.

THROMBOCYTOPENIC PURPURA

Following Medication With Sedormid and With Phenobarbital

ERNST P. BOAS, M.D., AND L. A. ERF, M.D., New York City From the Medical Service, Mt. Sinai Hospital, New York City

The fact that many disease states are directly caused by drugs administered or taken for the relief of symptoms is gaining ever greater recognition. For example, amidopyrine and dinitrophenol play etiological roles in agranulocytosis; cinchophen may cause acute yellow atrophy of the liver; arsphenamine administration may be followed by dermatitis, hepatitis or aplasia of the bone marrow, and thrombopenia; sulphonal may cause hematoporphyrinuria.

We wish to present two cases that illustrate unusual reactions to rather common drugs. The first is one of symptomatic thrombocytopenic purpura caused by sedornid; the second illustrates thrombopenic and febrile reactions that may follow the administration of phenobarital. Purpura following the administration of sedormid has been described.¹

Sensitivity may become manifest after long usage of a drug, and symptoms frequently develop when a drug is again taken after its use had been discontinued. Many unexplained mouth ulcers, bleedings, headaches, fevers are due to such drug sensitivity.

Case 1: F.G., white, female, age forty-seven, Russian, entered Mount Sinai Hospital December 9, 1934. The past history revealed a moderate conduction deafness due to scarlet fever in childhood. A cholecystectomy was performed two previously and was followed by phlebitis and edema of both lower extremities. The patient still complained of the same pains and epigastric distress especially after fatty meals. She had taken no medication, except sedormid, and used no hair dyes or hair remover during the past three years. The diet had been limited because fats caused discomfort. During the past two years the patient has taken sedormid (allylisopropylacetyl carbamide) occasionally, at times as often as three times a week. It was taken usually before her menstrual periods. One month before admission she took a single tablet (4 grains) and the next morning a diffuse purpuric eruption appeared over the

body. The menses also started, but the duration of the period, the amount of the flow and the time of its occurrence were normal. The purpura disappeared in about one week. On two successive nights immediately preceding the present attack, which occurred in the morning, she took four grains of sedormid. This again was just before her menstrual period. Between attacks she had taken no sedormid whatsoever. For thirty-six hours before admission she had severe epistaxis, profuse menstruation, and diffuse

generalized purpura.

On admission she presented a marked purpura, with the eyelid margins markedly hemorrhagic, and numerous petechiae of the conjunctiva, epistaxis, severe gum bleeding with hemorrhagic blebs on the buccal mucous membrane, with free blood in the pharynx, diffuse petechial spots and ecchymoses over the anterior and posterior aspects of the trunk and extremities, and profuse vaginal bleeding. There was blood in the urine and stool. The lymph nodes were not enlarged. The thyroid gland and the heart and lungs were normal. There was a healed right rectus scar but there was no abdominal tenderness and no masses were palpable. The spleen could not be felt. The uterus was small anteflexed and not tender. The adnexae were normal. There was moderate non-pitting edema of both legs. Blood pressure was 104/60. There was no fever at any time. The urine contained many red blood cells. The blood Wassermann reaction was negative.

The admission blood examination, De-

cember 9, was as follows:

Hemoglobin—92% Red blood cells, 4,250,000 White blood cells—10,400 Blood platelets—70,000 Polymorphonuclears

Non-segmented—40% Segmented—50% Lymphocytes—10% Clotting time—4 minutes. No clot retraction Bleeding time—30 min. Tourniquet test—positive in 2 minutes.

She received no treatment and in the course of five days there was a complete spontaneous remission with cessation of bleeding and gradual disappearance of the hemorrhagic spots. Blood count on December 15 showed:

Hemoglobin—61%
Red blood cells—2,450,000
White blood cells—6,700
Blood platelets—190,000
Reticulocytes—5.0%
Polymorphonuclears—72%
Non-segmented—18%
Segmented—54%
Łosinophiles—4%
Basophiles—1%
Lymphocytes—16%
Monocytes—76%
Clotting time—5 minutes—good clot retraction in one hour
Bleeding time—8 minutes

A biopsy of the sternal bone marrow on December 18 revealed no abnormalities. The megakaryocytes were normal in number.

Negative tourniquet test.

Because of the recurrent purpura with rapid spontaneous improvement a drug intoxication was suspected, and then the history of sedormid medication was obtained. A patch test with sedormid suspended in water and lanolin was negative. A test dose of sedormid was then given and during the following days frequent blood platelet counts were made as shown in Table I.

1-9-35 Hemoglobin—78%
Red blood cells—4,520,000
White blood cells—8,700
Polymorphonuclears
Segmented—35%
Non-segmented—26%
Eosinophiles—7%
Basophiles—2%
Lymphocytes—24%
Monocytes—7%
Reticulocytes—5%
Bleeding time and coagulation normal.

The patient left the hospital in good condition and was warned against sedormid. Six weeks later she had gained sixteen pounds in weight. She was seen four months later on May 2. She had had no purpura or other complaints. A blood count on that date revealed:

TABLE I. BLOOD PLATELETS

1-2-35	9:10 a.m.		Sedormid given 2 grs.
	9:15 a.m.	340,000	Negative tourniquet test
	11:15 a.m.	290,000	normal bleeding time.
	1:15 p.m.	280,000	
	6:00 p.m.	260,000	
1-3	9:00 a.m.	240,000	Bleeding time 8 minutes tourniquet test positive
	3:00 p.m.	140,000	Gums bleeding
	7:00 p.m.	160,000	General aches and pains
1-4	9:00 a.m.	190,000	Menstruation
	1:00 p.m.	190,000	
	7:00 p.m.	140,000	
1-5	9:00 a.m.	150,000	
1-6		150,000	
1-7	9:00 a.m.	140,000	
	7:00 p.m.	150,000

Case II—F. P., white, female, age fifty-two, Austrian, was admitted to the Mount Sinai Hospital, December 14, 1934, complaining of weakness and post-prandial vomiting.

She had been in fair health until the past year during which she lost forty pounds in weight. For six months she had frequent post-prandial vomiting and a sense of a moving hard ball in the upper abdomen.

Physical examination revealed a thin, elderly woman with sallow skin. The sclerae were blue and there was a central opacity of the right cornea. There were a few high-pitched squeaking rales at the right base. A short systolic murmur was heard at the apex. The liver was enlarged to approximately one inch below the costal margin. There was a protuberance of the upper abdomen and peristaltic waves were visible. Blood pressure was 104/46.

The urine was normal. The Wassermann reaction was negative. Blood: urea N 17 mg. per 100 c.c., chlorids 585, CO² 54%. Stools were guaiac positive. Gastrointestinal x-rays showed the presence of marked stenosis near the pylorus with seventy-five per cent gastric residue twenty-four hours after the barium meal. X-rays of the chest and pelvis were negative. Rehfuss test meal indicated a total acidity of sixty-three, no free HCl and positive lactic acid. Four days later gastric aspiration revealed no free HCl and lactic acid with Boas-Oppler bacilli. Blood examination showed:

Hemoglobin—34% Red blood cells—2,859,000 White blood cells—7,700 Polymorphonuclears—76% Lymphocytes—20%, Monocytes—4%

From the day of admission she received ½ grain of phenobarbital three times a day. On December 22, after she had been in the hospital eight days the temperature which had been normal suddenly rose to 103.6°F. Physical examination was negative except for the presence of a small red spot in the roof of the mouth. The next day the spleen was palpable. The fol-

lowing day (December 24) a diffuse miculopapular rish, (a typical phenobarbital cruption) appeared all over the body Temperature persisted at 102 8° F She received a transfusion of 300 e c of citrated blood in preparation for operation Immediately following the transfusion she had a chill with rise in temperature to 105, and a subsequent drop to 99 4 The following day the temperature again rose to 102 and gradually defervesced in five days and became normal on December 29 On December 28 miny purpuric spots appeared on the chest, abdomen, thighs, and legs There were petechine in the conjunctiva, and on the buccal mucosi Blood examination on this day showed

Hemoglobin—37% Red blood cells—3,240 000 Blood platelets—70 000

Coagulation time 6 minutes There was no clot retriction

Bleeding time—over 45 minutes

The tourniquet test was positive in 3 minutes

Blood count on December 29

On January 14 a Inprotomy was performed An adenocarcinoma of the pylorus without evident metastases was found and a partial gastrectomy was performed Convalescence from the operation was un eventful and the patient was retransferred to the Medical Service for further study A patch test with phenobarbital was negative

Blood count February 4 showed

Hemoglobin—41% Red blood cells—2,510 000 White blood cells—4,200 Blood platelets—120 000 Polymorphonuclears—54% Tosinophiles—4% Basophiles—2% Lymphocytes—38% Monoccoytes—2%

The patient then was given test doses of phenobarbital as shown in Table II She had a marked febrile reaction to the drug, but no rash or purpura appeared nor was there a drop in the blood platelets. The patient was discharged on April 13 feeling well

Purpura has been observed following the administration of many drugs such as quinine, neoarsphenamine, iodides, nin-vanol, and phenobarital Dennig observed a woman with two attacks of purpura, each following the ingestion of a tablet of sedormid He, however, attributed the purpura to iodides Loewy has pointed out that drug rashes caused by

ureids with an open chain of carbon atoms, drugs such as adalin, abasin, sedormid, develop insidiously without fever; whereas those caused by the barbiturates which are characterized by a closed ring of carbon atoms, drugs such as medinal, phenobarbital, nirvanol, cause acute rashes with fever.

Our two cases bear this out. The patient who had been taking phenobarbital first developed fever, then a diffuse maculopapular rash, and purpura appeared only four days later. This same sequence occurred in the reported case of nirvanol³ purpura. Subsequently when the patient was tested against the drug she promptly became febrile taking small doses but no rash appeared, nor did the blood platelet count fall.

The patient who developed thrombocytopenic purpura following sedormid medication is more instructive. The case again illustrates the fact that typical severe purpura may be only a symptomatic manifestation of drug idiosyncrasy. This must always be borne in mind, particularly when there are repeated bouts of purpura with spontaneous recovery. In this patient the appearance of purpura coincided with her menstrual period on two occasions. This might lead to the suspicion of some endocrine factor provoking the blood dyscrasia. Indeed not a few authors have described such cases

and have concluded that the ovaries may in some way determine such cyclic bleeding manifestations. Self-medication for the relief of menstrual pain or discomfort is so common among women that "allergotoxic" symptoms recurring periodically with the menses should always arouse the suspicion of drug idiosyncrasy. Transient monthly recurring disorders in women, particularly with gastrointestinal symptoms or cutaneous mainfestitations always call for careful investigation of drugs that may have been taken to relieve menstrual distress.

Summary

Two cases of symptomatic purpura are reported, one caused by the hypnotic sedormid, the other by phenobarital. Attention is called to the fact that self-medication by women for the relief of menstrual pain may give rise to cyclic disorders that may erroneously be attributed to endocrine influence.

STATE AUXILIARY ORGANIZED

The organization meeting of the Women's Auxiliary to the Medical Society of the State of New York, composed of wives of physician members of the various constituent county societies in the State society, was held on March 11 at the Hotel Waldorf-Astoria. More than fifty delegates attended.

The speakers included Dr. Frederic E. Sondern, president of the State society; Mrs. Samuel C. Red of Houston, Texas; Mrs. Rogers N. Herbert, president of the Women's Auxiliary of the American Medical Association, and Mrs. John L. Bauer

of Brooklyn.

The following officers were elected: President, Mrs. Bauer; president-elect, Mrs. Francis R. Irving of Kings County; first vice president, Mrs. Edward A. Fleming of Queens; second vice president, Mrs. Frederic E. Elliott of Kings; recording

secretary, Mrs. Henry Hirsch of Nassau, and treasurer, Mrs. Daniel Swan of Queens.

The following were elected to the board of directors: Mrs. Charles H. Goodrich of Kings, Mrs. A. M. Bell of Nassau, Mrs. H. Bull of Cayuga County, Mrs. W. Pennock of Onondaga County, Mrs. M. Berkowitz and Mrs. Edwin A. Griffin of Kings County.

The purposes of the organization are "to extend the aims of the medical profession to all organizations which look to the advancement of health, to act as a liaison body between the medical profession and the public, to interpret the thoughts of medical experts to the laity, and to do such other work as may be approved from time to time by the Medical Society of the State of New York and by the American Medical Association."

INFECTIOUS GASTROENTERITIS

JOSEPH P. GAREN, M.D., Olcan

From time to time, in several parts of western New York State, the practicing physician meets with epidemics of rather puzzling clinical condition which he can give no definite name. This condition, characterized by nausea, vomiting, diarrhea, and related symptoms, in varying degrees of severity and sequence of occurrence, is one which at no time is fatal, or productive of long periods of disability. It is, nevertheless, the source of much worry to the attending physician, due primarily to his inability to assure himself that he is dealing only with a minor definite clinical entity, instead of the prodromata of a more serious illness. The condition can be, and often is, a source of worry also to the health departments, inasmuch as diarthea occurring in epidemics may well be an indication of fecal pollution of a water supply, and at times a sign of an impending water-borne typhoid epidemic.

In view of the above, an effort is here made to present such observations as have been made regarding this condition in and about the city of Olean, to collect and correlate the information at hand in the literature at the present time regarding the condition, and to draw such conclusions as may seem justified therefrom.

Prior to 1928 it had been a matter of common knowledge among the physicians of Olean, for several years, that two or three times a year, in and around the city, outbreaks of diarrhea and other gastroenteric disturbances were likely to occur. Various opinions were held as to the cause of these outbreaks. Some maintained that they were synchronous with the appearance of various seasonal fruits and vegetables on the market, and were due to the injudicious use of these foods. held that the outbreaks were caused by the public water supply, which at that time, in Olean, was a mixture of well water and filtered and chlorinated surface water. Others still were of the opinion that the disease was a form of influenza, spread by contact, with the organisms

or virus entering the body through the nasopharynx.

Early in 1928 a particularly severe and wide-spread epidemic of gastroenteric disturbance occurred in Olean, and this was followed by a second outbreak in July and August of the same year. It was noted at the time by many physicians that some cases were appearing at the same time in rural areas and villages also.

In September 1928 an explosive outbreak of typhoid fever occurred in Olean. Investigation of the outbreak established it definitely as a water-borne one, and demonstrated a pollution of the public water supply at the point where water obtained from the auxiliary wells was added to the filtered, chlorinated supply of surface water from a stream.

Immediately the epidemics of gastroenteritis preceding the typhoid epidemic acquired a definite significance. It was felt that they were due to the pollution of the water supply with various fecal organisms and associated impurities. When the pollution causing the gastroenteritis was augmented by additional pollution from feces containing typhoid bacilli, a typhoid fever epidemic resulted.

The fact that the great majority of the people with gastroenteritis were consumers of the polluted water supported this assumption, although numerous isolated instances were recalled by physicians, of individuals outside of the city, who had at no time drunk the polluted water, but whose attacks of gastroenteritis were synchronous with those in the city.

Following the epidemic of typhoid fever, an entire reorganization of the water system of Olean took place. All sources of possible pollution were obviated, and a supply obtained entirely of surface water, chlorinated, filtered, and again chlorinated; with a complete and frequent bacteriological control of the process. A water was produced consistently free from colon bacilli, and meeting every requirement of the Federal and State health services.

However, outbreaks of gastroenteritis

continued to occur in Olean. It was thought for a time that these outbreaks might have been more apparent than real, due to a "diarrhea consciousness" among the people, as a result of their experience with typhoid fever.

In time it became evident, however, that these outbreaks of diarrhea were actual. Some of them were minor, others quite severe. Studies of the records available in the files of the Olean City health department show that in March 1929, February 1932, August 1932, April 1934, and March 1935 the condition was prevalent enough to warrant correspondence with the county and State health authorities, and at times to necessitate newspaper notices of reassurance as to the purity of the public water supply. It is worthy of note also that at the time of the April 1934 outbreak cases were prevalent in other western New York places, especially Salamanca, Portville, and Randolph.

At no time, in connection with these outbreaks in Olean, since 1928, has it been possible to demonstrate pollution of the water supply, either preciding or at the

time of the gastroenteritis. It has been a difficult task to obtain any complete clinical or epidemiological data on the disease as it has existed in Olean. Comparatively few of the cases have been ill enough to seek the services of a physician, and the presence of a large number of cases was often ascertained only by judging from the number of calls coming to the health department, inquiring as to the safety of the water supply. Questioning of such inquirers usually brought out the information that several cases of gastroenteritis were present in the family, or in a friend's or neighbor's family. At times telephone calls and questionnaires to physicians have been of use in obtaining information, as have inquiries in drug stores, etc.

Based upon personal experience, upon information given by persons affected, and upon attending physicians' observations, a typical case of the local gastroenteritis may be described as follows:

There is a sudden onset of nausea, accompanied by a dull headache. At the same time, or within an hour or so, a diarrhea begins, which lasts about twelve hours, with evacuations at first every half hour or oftener, but gradually diminishing. There

is a moderate amount of griping with the diarrhea, and a feeling of soreness through the entire abdomen. There is moderate prostration during the attack, and some dizziness. Recovery is usually rapid. There is no fever, and the pulse is not markedly changed. In the few cases locally where leukcocyte counts have been taken they have been within normal limits.

Epidemiologically, in connection with the April 1934 outbreak, the services of TERA nurses in Olean were utilized, and a house to house canvass was made in representative areas of the city. The survey covered a period of fifteen days. A total of 777 individuals, in 190 families, The cases uncovered was enumerated. were thirty-six, indicating approximately 1,000 cases for the entire city for the period studied. No differences were found in the distribution of the cases in different parts of the city, and no article of food or drink was demonstrated as common to all the cases. The water used by five of the cases was well or spring water exclusively, by eighteen of the cases city water exclusively, and by thirteen, combinations of sources. There had been no absences from the city in the preceding seven days in twenty-five of the cases. In fifteen of the thirty-six cases there was a history of contact with a similar case within the preceding seven days. The duration of the attack varied from less than one day in one case to three days in nine cases, with twelve of the cases lasting longer than three days. In addition to diarrhea, the most prominent symptoms were, in the order of their frequency: severe abdominal pain, "feverishness," vomiting, headache, dizziness. chills, nausea, and general aching.

A study of the literature shows that this condition, or a comparable one, has aroused interest of late in other places. Spencer, of the United States Public Health Service, reports 1 a mild, dysentery-like epidemic, with no deaths, occurring during the summer months in the northwestern part of the United States. He found the unknown infection resembling symptomatically the food poisonings due to the enteritis group of organisms, but with no epidemiological confirmation. He found the condition transmitted from person to person, or from person to food to person. The incubation was less than

twenty-four hours, and the onset was sudden, with watery diarrhea and abdominal pain. Second attacks were fairly frequent, occurring in twenty out of ninety-five cases. A leukocytosis of 10,000 to 15,000 was a frequent phenomenon.

In 1932 the United States Public Health Service studied 2 an epidemic of gastroenteritis occurring in and around Ellicottville, in this county. There were 248 cases discovered and studied, and the conclusion was that the condition indicated an infectious enteric disease the specific cause of which was unknown. Water as a source of the disease was eliminated by demonstrating that many cases occurred on farms, using individual wells and springs.

On the other hand, Veldee,* studying an outbreak of gastroenteritis in Charleston, W. Va., implicated a water supply. He reported that late in October, 1930 there appeared in Charleston an acute ailment initiated by a severe pain in the epigastrium, followed by nausea, sometimes by vomiting, and diarrhea within a few hours. In relatively few cases was a physician consulted, and the attacks rarely lasted over three or four days, with the milder one lasting only a few hours. Following the subsidence of the epidemic in Charleston, similar cases appeared in Huntington, W. Va., and then further down the Ohio River, in Ironton, O. and Ashland, Ky. Later the condition arrived in Cincinnati and in Louisville.

Veldee found that during the period of the epidemic Charleston's water supply was largely from a river which empties into the Ohio just above Huntington. All the other cities affected derived their water from the Ohio River. In no instance was he able to find that there had been any breakdown in the purification processes by which the polluted water of the Ohio was prepared for drinking. In all cities affected the colon bacillus indices of the treated waters were within proper limits. Veldee concluded that the causative agent in his epidemics was transmitted by the public water supplies of the cities involved, which water supplies had a common source. He found no evidence that the condition was produced by a viable organism in the water, as determined by standard methods of analysis, but was strongly of the opinion that the cause was the presence of some irritant with a strong purgative action. He was not prepared to say whether the irritant was a cleavage product of bacterial action, or a new chemical produced by bacterial synthesis, or an increased concentration of some chemical agent in the water, due to drought conditions.

A series of outbreaks in Michigan have been reported by Wildman who states that apparently there exists quite generally a clinical entity which has in the past been erroneously diagnosed intestinal influenza, food poisoning, etc. To the condition he gives the name polytropous enteronitis. Clinically he finds that the cases are characterized by a sudden onset of one or more of the following symptoms, here given in the order of their frequency:

anorexia, nausea, vomiting, diarrhea, dizziness on standii drll frontal headache, aching in the ck and legs, abdominal distress, chilliness, and "cold in the head."

In his cases fever was absent or slight. Tenderness was noted in many cases along the colon, especially the sigmoid. At times tenderness was at McBurney's point. Early in the disease he found a moderate leukeocytosis (15,000) followed later in the disease by a leukeopenia.

According to the symptoms most prominent, he classified the disease into six types. These were:

gastroenteric (nausea, vomiting, and diarrhea) entero-colic (diarrhea and cramps) gastric (anorexia, nausea, and vomiting) neuro-circulatory (dizziness and dull headache) typhlo-appendical (resembling appendicitis) colic (severe mid-abdominal pain, constipation)

In Alabama a possibly similar condition has been noted by McLean among children. He finds it related to acute respiratory infection, and gives it the name "seasonal gastroenteritis."

In Louisiana, Lucas has noted epidemics of vomiting, sometimes accompanied by diarrhea, occurring in children in the winter months. He suggests that the condition might well be an intestinal influenza.

That influenza can give rise to symptoms similar to those here described is indicated by an English writer, Douthwaite, who describes the influenza prevalent in England in 1932. In no year, he asserts, were the abdominal symptoms of the disease more evident. were four main types of abdominal or intestinal influenza seen by him. were: the gastric, the gastrointestinal, the appendicular, and the typhoid.

It is evident from the foregoing that the cause and mode of spread of the gastroenteritis sometimes prevalent in and around Olean and other parts of western New York is at present not entirely clear. It is evident also that this gastroenteritis has its counterpart in other areas of the country. Investigation in these areas has, so far, given rise to no definite etiological conclusions. Perhaps the condition can best be considered as an infection of the contagious

If we admit the existence of intestinal influenza as a clinical entity, it is possible to consider the condition a form of influenza. However, its occurrence in Olean and other places in the entire absence of any of the more conventional forms of influenza, argues strongly against this view.

From a practical standpoint, some little consideration must be given to this condition, at times when it is prevalent, by the surgeon, in his differential diagnosis of acute abdominal conditions.

THOMAS WILLIAM SALMON MEMORIAL LECTURES

The Salmon Committee on Psychiatry and Mental Hygiene invites the medical profession and their friends to The Fourth Series of Thomas William Salmon Memorial Lectures to be given by Samuel T. Orton, M.D., April 10, 17, and 24, at 8:30 P.M. at The New York Academy of Medicine, 2 East 103rd Street, New York.

Developmental Disorders of the Language Faculty and Their Psychiatric Import

Lecture I. (April 10) Language Losses in the Adult as the Key to the Developmental Disorders in Children. A discussion of the physiological background of the language faculty as revealed in the aphasias. The problem of unilateral cerebral dominance. Reports of studies

indicating that all degrees of intermixture occur between right and left sidedness. Such intergrading between the hemispheres is suggested as the background for many language disorders in children.

Lecture II. (April 17) The Syndromes of Disorder in the Development of Language. Six syndromes are discussed from the point of view of their symptomatology:-Reading Disability (strephosymbolia), developmental word deafness, congenital apraxia, motor speech delay,

writing disability, and stuttering.
Lecture III. (April 24) Treatment and Psychiatric Interpretation. A brief review of the general principles of treatment of the various syndromes, together with a discussion of the relation of these conditions to emotional and

mental development.

A clinical session on chronic pulmonary diseases under the auspices of the Tuberculosis Sanatorium Conference of Metropolitan New York will be held in the amphitheatre at Cornell University Medical College, 1300 York Avenue, New York City (between 69th and 70th Streets), on Wednesday evening, April 8, 1936, at 8:30 P. M., with informal presentation of x-rays 7:45 to 8:30 P. M. Physicians are invited to bring with them any interesting x-ray films.

For further information communicate with Bernard S. Coleman, Secretary, 386 Fourth Avenue, New York City, CAledonia 5-2240.

Information has come of the existence of a Bureau of Medical Relations with Foreign Countries (Bureau des Relations Medicales avec l'Etranger) at the Faculty of Medicine in Paris; here students and physicians will be able to obtain any information they de-

sire concerning postgraduate courses or hospital services.

Foreign students or physicians should communicate with the Bureau of Medical Relations at the Faculty of Medicine in Paris and inform them of their arrival; a cordial welcome will be extended to them.

SARCOMA OF THE PROSTATE Report of One Case

TLRIY M TOWNSEND, MD, FACS, New Yorl City and

OLIVER A KOBISK, M D, New Yorl City

From the Department of Urology, Morrisania City Hospital, New York City

The rarity of sarcoma originating in the prostate gland justifies the report of each case verified by the microscope. In 1934 Lowsley and Kimballi scarched the literature and reported 132 authenticated cases. Since their publication twelve other case reports have been added, and are shown in Table I.

Therefore, we learn by search of the hterature that our case is the one hundred and forty fifth authenticated one of this

tumor

J I age twenty seven was admitted to Morrisami City Hospital on September 29 1935. His chief complaint began one verification frequent hematuri, and lumbar pain radiating to groins and perineum. He had lost fifteen to twenty pounds in the preceding two months and had constant malaise. The family and other personal history is irrelevant.

He was somewhat currented and anomic in appearance. The left costovertebral angle was somewhat tender the right kidney was palpable and slightly enlarged. Immediately over the symphysis pubes there was a small mass quite eensitive to pressure. The prostate was firm arregular slightly enlarged median sulcus obliterated by a small very sensitive area on the outer margin of the right lateral lobe. Both seminal vesicles were cord like in form and consistency. The sphincteric tone was good.

Residual urine forty c c contained a frint trace of albumin few red blood cells and six to eight clumped pus cells per high power field The blood picture showed red blood cells 3 900,000, white cells 11 200, blood urer 12, creatinine 1 Kidney function by phenolsuphionephthalein was sixty five p r cent

Intravenous urography three days later is reported as follows

First plate showed a very large right kidney, the lower pole of which extended to the level of the crest of the thinin. The left kidney was not satisfactorily visualized due to the overlying intestinal gas the right kidney outline smooth and regular in contour.

No radio opique fluid appeared in the right kidney or right urcter. The left kidney showed distinct and marked dilation of the kidney pelvis and calyees more particularly the lower calve left lidney also enlarged. The left ureter was dilated throughout with an especially wide dilation at the ureterovesical orifice.

On the following div a cystogram was done with the following results

A large right kidney as previously reported was visualized. In the urunity bladder region was seen a faint irregularly circular shadow about the size of a plum

The bladder was somewhat irregular in contour and suggests the possibility of the presence of a large diverticulum. Within the bladder region was seen a shadow about the size of a plum but somewhat less dense than the remainder of the bladder. Its appearance suggested the probability of a large mass of lesser density than a stone, but there appeared a slight deposit of calcium or other opaque material on its surface.

He recuperated from these instrumentations and one week later October 10 under light spiral anesthesia cystoscopy with the number twenty four panendoscope and the

number twenty-four Brown-Buerger supplied these findings:

The vesical mucosa was very congested and edematous. Just above the right ureteral orifice was a mass the size of a lemon, attached on a broad pedicle to the bladder floor. Part of this mass was covered with a calcified coating. The left ureteral orifice could not be seen. The right orifice was seen anterior to the mass described above. The bladder neck and posterior urethra were normal.

The partially necrosed and partly encrusted growth is shown in the accompanying colored plates which were made in water color by Dr. John Duff, Associate in Urology in our hospital. No one of the staff ventured a diagnosis of the nature of the neoplasm, nor could we hope for its total ablation because of its broad base. Solely with the attempt to increase the lumen of the bladder, he was operated the

following day.

The bladder was opened in the usual midline. Retractors were introduced with difficulty around the tumor mass which was small orange size, greyish green in color, and fairly firm in consistency. It was firmly attached to the right lower portion of the bladder by a broad pedicle about three cm. long, which apparently rose from the right lateral prostatic lobe and was continuous with the prostatic capsule A broad right angle clamp was locked about this pedicle, the tumor excised, and the pedicle ligated. A portion of the pedicle slipped from the ligature and the lively hemorrhage was controlled by packing.

The final packing was removed in one week and moderate hemorrhage recurred. He was transfused with 500 c.c. by the direct method. Fulguration under gas narcosis did not completely control bleeding and the bladder was repacked for three days. Active bleeding then ceased. The wound was sutured in layers and the bladder gradu-

ally closed.

Pathologic report: The tissue mass was 6½ cm. in length by 3¾ cm. wide, greenish in discoloration. The microscope showed round and spindle celled fibrosarcoma with commencing pigmentation (early melanotic) originating in the prostate gland. The tumor was extremely vascular, had some large blood vessels with thickened media (muscular coat) such as could be seen in the prostate gland. Mitotic changes were present in the larger cells.

The bladder was infected and foul, and his septic temperature elevation ranged from 101° to 103° F. for twenty-six days.

From Nov. 6 to Dec. 21, thirty-one deep x-ray treatments were administered. The patient was discharged Dec. 21, all symptoms absent or much ameliorated.

He was readmitted January 4, 1936, stating that he had gained weight and had no pain, hematuria or burning on urination, nor any discomfort in the renal regions. He had nocturia twice and four urinations during the day.

On January 9, 1936, he was cystoscoped under gas anesthesia with a number twenty-four Brown-Buerger instrument revealing as follows:

The bladder walls were mildly hyperemic throughout. There was a large epithelialized tumor mass extending from just above trigone to one o'clock on the vault. The mass seemed to be pedunculated as the cleft between bladder and lateral wall could be seen. The left ureteral orifice was normal in size, position, and appearance. The right was not visible as it was covered by the tumor mass. The bladder neck was normal.

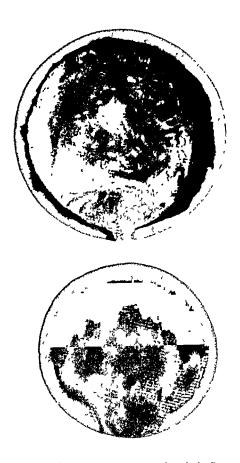

He was again operated on January 14, under general anesthesia. A mideline incision into theb ladder through the old scar was made because of peritoneal adhesions. A large, round, smooth, hard mass, epithelialized, the size of a small orange, with a very broad base, was found attached to the bladder on the right side of the ureteral orifice. The mucosa on the left side of the ureteral orifice was puckered and could be traced into the right lobe of the prostate and then lost. The tumor was very friable and attempts to grasp it with volsella were unsuccessful, causing more bleeding. It was clamped at the base, excised and the base thoroughly fulgurated. Because of hemorrhage, the bladder was packed firmly around a Marion tube, and the wound sutured in the usual manner.

On January 17, the malodorous packing was removed under general anesthesia, with slight bleeding, which ceased after copious bladder irrigation.

The laboratory examination of the removed tissue revealed tissue of young elliptical fibrocytes with areas of large round vesicular cells and with prostatic tubules. Diagnosis: Fibrous sarcoma of prostate.

The temperature elevation and chills pointed to systemic infection and a blood culture revealed bacillus coli in the circulation. Two days (January 19) later he was transfused with 315 c.c. by the direct method, with immediate improvement. He became ambulant in the ward; the bladder wound almost closed and on February 11, ten seeds of radium emanation of approximately 1.5 milcuries (total 15.3 milcurie hours), were inserted into the stump of the tumor through the cystoscope.

During the second admission the patient lost six pounds and continued emaciated. The blood picture was essentially unchanged

At top Intravesical tumor as seen through the Brown Buerger cystoscope—Bottom The tumor as seen through the McCarthy panendoscope

and he showed no evidence of protein toxemia from the radium seed implantation.

Neither was there evidence of metatastic involvement unless the non-functioning right kidney was the site. This can be confirmed only by autopsy.

Discussion

Doubtless there have been thousands of patients who have died from sarcoma of the prostate, which was either incorrectly diagnosed or remained undiagnosed. our case attention was directed first toward the upper urinary tract because of the renal discomfort, with subsequent hematuria, and the preliminary intraven-In other reous urographic findings. ported cases the observers relate that their preliminary working diagnosis was acute prostatitis, prostatic abscess or senile prostatic obstruction. All of the cases were correctly diagnosed only after operation or autopsy.

The etiologic theory of cells misplaced in embryonal development is purely conjectural and is less tenable when the age incidence of four months to eighty-eight years is remembered. The only finding which might give any credibility to this theory is that seventy-one of the 145 reports are in patients of thirty or less

The tumor is painless and symptoms are present only secondarily due to necrosis, incrustation, or pressure. In our case the symptoms were due to the above enumerated causes and possibly in addition thereto renal back pressure from intravesical obstruction to drainage. tumor enlargement may occur in any direction, thus producing pressure symptoms from the diaphragm to Scarpa's tri-The symptomatology of metaangles. stases gives an entirely different picture, and inexplicable findings suspicious of malignant metastases in any part of the body form a potent argument for complete prostatic and cystoscopic inventory.

Metastases may occur in any organ or Whether conveyed by the lymphatics or blood, the kidney is most frequently involved. The round and spindle-celled are shown to be the most malignant in type. The relatively rare carcinoid-sarcomata are the most vicious since they show greater extension, more rapid metastases, and earlier death than

the other pathologic types. Treatment is futile. Symptomatic relief is the only therapeutic indication. Deep x-ray and radium therapy assuage our consciences and cheer the sufferer. Bumpus prolonged the life of a fifty-nine year old patient for seven years with xray and radium, but the grand average of life duration in all patients after the onset of symptoms was 300 days. bright spot in this gloomy picture is the infrequency of the lesion.

SUICIDE AS A PREVENTABLE DISEASE

The Committee for the Study of Suicides, Inc., was chartered at Albany recently to make a scientific investigation of the motives and impulses that lead to suicide. The organization, headed by Marshall Field, feels that self-destruction is a preventable disease and this has led to the organization of the group. There are seven psychiatrists and two social workers listed as incorporators; as given in the New York Physician, they are Dr. Henry Alsop Riley, Professor of Neurology and Psychology at the College of Physicians and Surgeons, Columbia Uni-

versity; Dr. Gerald R. Jamieson, Dr. Dudley D. Shoenfeld, adjunct psychiatrist and director of the Mental Help Clinic, at Mount Sinai Hospital; Dr. Bettina Warburg, Dr. Gregory Zilboorg and Dr. Herman Nunberg, all of New York, and Dr. Franklin G. Ebaugh, of Denver. The social workers are Barklie McKee Henry, President of the Association for Improving the Condition of the Poor, and Miss Elizabeth G. Brockett, of New York. Mr. Field will also serve as director.

TRAUMATIC SUBDELTOID BURSITIS

Treatment by Physical Medicine

JOSI PH ECHTMAN, M.D., New York City From the Clinic of Physical Medicine, Mount Smai Hospital

Experience has shown that physical medicine (physical therapy) is the treatment of choice in traumatic bursitis at any stage. In fact the malady is one of those conditions which are most amenable to physical medicine. It seems, however, that not many members of our profession are aware of that fact if we may judge from the 'Queries and Minor Notes' of the AMA Journal of Sept. 7, 1935, where the discussion of the treatment of bursits fails to include this worthy branch of Medicine.

The methods of treatment discussed in this paper have been used by the author at the Mount Sinar Hospital Clinic of Physical Medicine and in his private practice for many years. They have proven to be successful in such a gicat percentage of cases that the author is continced that physical medicine is the treatment of choice in this condition, and should at least be given a chance before

surgery is resorted to

According to Monro¹ (Professor of Antomy of the University of Edinburgh) there are 140 bursae in the body thirty-three in each of the upper extremities and thirty-seven in each of the lower extremities. The bursa, however, most often affected is the subdeltoid* as it was the subdeltoid bursitis that most often came under my care, and was of traumitic etiology. It shall, therefore, he referred to in discussing the treatment which holds good for any other bursitis, usually met with in practice and being of the same etiology.

One has to consider the pathology of the three stages of bursits—acute, subacute, and chronic—for an intelligent approach to its treatment by physical

medicine

Pathology of the Acute Stage

In this stage we deal with an acute in-

flammation, the cardinal symptoms of which, as we know, are rubor, tumor, calor, and dolor When the bursa is located superficially, the first three symptoms have not be detected at all, if the inflamed bursa is situated in the deeper tissues. The bursa is distended by fluid, there is hyperemia and edema of the tissues surrounding it, producing pressure upon the neighboring herve structures. This pressure is a factor in the causation of pain

Treatment of the acute stage consists of cold applications, and galvanization* or ionization with magnesium sulphate

1 Cold applications (compresses) A consideration of the changes in the circulatory dynamics brought about by the increased physiologic process of oxidation that takes place in the acute stage and also of the physiologic effect of the cold compress upon these changes will help to better appreciate the importance of this hydrotherapeutic measure. In the acute stage the oxidation process in the affected tissues is increased This results in increased heat formation The latter is responsible for the increased capillary pressure and edema as shown by Landis and by Drury and Johnes Landis has shown that (as quoted by Wolf3) the capillary pressure in the afternal limb in the skin of a finger is normally thirty-two mm mercury and twelve min in the venous capillars, and that the pressures rise to sixty min and forty five min respectively at a temperature of 42°C Drury and Johnes found that edema formation is two to five times greater at 42° C than at 16° C Macleo I points out the relation between edema and capillary pressure stating that condi-tions capable of causing increased capillary pressure are likely to cause edema. The cold compress causes a decrease in the capillary

^{*}The subacronnal bursa is next in frequency although in reality it is a part of the subdeltoid one if the arm is abducted the bursa is subacronnal, when in contact with the side of the body it (or at least a large part of it) is subdeltoid.

^{*} The suggestion is made that the application of the galvanic current using just tap water without the addition of any medication should be termed galvanization. The definition of the latter is The employment of a galvanic current with the purpose of utilization of the properties of a given pole in diseases. This is distinguished from ionization, the standard definition of which is Ionization or ionic medication is the introduction of chemical ions into the superficial tissues for medical purposes by means of a direct current.

pressure and consequently in the edema, establishing the proper circulation necessary for the relief of pain and repair of the injury. The compress achieves this by reducing oxidation and heat formation, and by creating an optimum temperature. Such a temperature, according to Starr⁵ should range between 36½-37½° C. This temperature has proven to be so beneficial in inflammatory conditions, that Starr has recommended it, and it is being used today successfully,3 in the treatment of gangrene of the foot. It is, however, remarkable to note that (as it has been shown) the temperature of the skin under the compress is also about 36½-37½° C. Thus by applying cold compresses in the acute stage, we are creating those favorable conditions which are necessary for the relief of the pain and repair of the injury.

Technic. The cold applications are carried out in the form of a compress (wet dressing) the technic of which is as follows: two or three folded towels or sixteen layers of gauze are wrung out from ordinary tap water and applied to the shoulder. The compress is held in place by a spica bandage. The patient is instructed to keep it constantly wet and cool by instilling, now and then, some cold water into it; (an ice bag applied upon the compress or directly on the bare shoulder may sometimes be necessary). The compress is changed daily and kept up for about a week or so. Experience has shown that during this time the patient is, as a rule, greatly relieved of his pain, although limitation of motion and other symptoms of disability may still be present.

The therapeutic effectiveness of the wet dressing in combination with massage,⁶ or without*, is so great that it has frequently happened that its employment has not only arrested the inflammatory process, but the patient has uneventfully recovered without any other treatments being necessary. However, not always is this treatment alone sufficient. In stubborn cases (or in order to hasten the relief of pain) the addition of galvanization or ionization with magnesium sulphate is of definite benefit.

2. Galvanization. In order that the reader might realize the mission of this treatment in the acute stage, it is felt that a discussion of the biochemistry of acute inflammations and of the biochemical effect of galvanization upon such inflammations would be in place. In acute inflammations a disturbance in the normal ratio of the hydrogen ion concentration and the hydroxyl (OH) ions takes place in the body fluids of the in-

flammed tissues: the hydroxyl ions increase. This means that the alkalinity rises. Alkali is an irritant, and when present in a relative excess becomes a factor in the causation of pain. Galvanization, according to modern views, restores the quantities of the hydrogen ion concentration and the (OH) ions to their normal ratios. In employing galvanization for this purpose in the acute stage, the positive pole is placed at the region of the injury. This pole possesses the property* of collecting oxygen from which acid** is formed. The acid, as pointed out by Neiswanger,8 replaces the excess of the alkalinity, i.e. the excess of the hydroxyl ions resulting in the restoration of the normal ratio of the two kinds of ions. Favorable conditions are re-established for the relief of pain and repair of the injured tissues.

Technic. A compress is prepared and applied to the shoulder as described above. A sufficiently large piece of blocked tin is placed on the compress, taking care that none of the metal is in contact with the skin. The compress and the metal constitute the active electrode. The metal is attached to the positive pole of a galvanic apparatus. A similarly prepared electrode, which is much larger in size and soaked in warm water, is attached to the negative pole and applied at the region of the neighboring spine, or the patient may sit on it. The current is opened, a straight galvanic current only being used, which is gradually increased to the patient's tolerance. Time: twenty to thirty or forty-five minutes.

Ionization with magnesium sulphate. The author employs the same technic as for galvanization, but, instead of plain water, a solution of one per cent magnesium sulphate is used in the preparation of the shoulder electrode. The magnesium ion reduces edema as pointed out by the author elsewhere. Some workers, including the author, have employed one per cent solution of mecholyl instead of the magnesium sulphate, but the writer has not noticed any advantage of the former over the latter.

These treatments, which shorten considerably the period of the acute stage, are kept up until that stage is over. The following case illustrates the importance of the methods above discussed:

A man of thirty-eight, a laborer, suffered from an acute traumatic subdeltoid bursitis. His physician, in order to relieve the pain,

** Acid, as stated by Neiswanger,⁸ is a sedative, and its presence, too, contributes to the

relief of pain.

^{*}The author has discarded hand massage in his clinic as an unnecessary item. Only on rare occasions is this procedure employed.

^{*} The positive pole is also a vaso constrictor, i.e. it lessens hyperemia. This property still more adds value to its employment in the acute stage where hyperemia is always present.

administered an injection of morphine and applied diathermy to the acutely inflammed shoulder. The patient felt relieved for two hours. The pain then returned with greater severity. The doctor repeated the same treatment. This was done for three days with the result that the pain grew progressively more severe every time the effect of the morphine wore off; and the patient, according to his statement, nearly became insane from the unbearable pain. In this condition he came under our care. In this case wet dressings and even ice bags did not give the desired relief. Ionization with magnesium sulphate was soon added. Because of the severe pain, mecholyl was also tried but did not seem to show any advantage over the simple and unexpensive magnesium sulphate. The pain was rapidly controlled and the condition cured with twelve treatments which the patient received almost daily.

In other stubborn cases, the pain is relieved but the process may go on, giving formation to the second stage, or the patient may present himself for treatment in that stage.

Pathology of the Second Stage

Fibrous adhesions form or are present in the bursa, nearby tendon sheaths and between adjacent muscles. The adhesions cause definite mechanical hindrances to abduction and rotation; and atrophy of muscles and periarticular fibrosis may be forming or present.

Treatment consists of infra-red radiation and massage afternated by ionization with sodium chloride followed by sinusoidalization.

- 1. Infra-red and massage. The patient's shoulder is exposed to infra-red rays* for twenty to thirty minutes. This is followed or accompanied by massage and manipulations to the point of causing no pain to the patient.
- 2. Ionization with sodium chloride followed by sinusoidalization. The sodium chloride on the negative pole because of its ability to inhence the "lytic" (dissolving) action of the latter, has proven to be one of the best treatments for fibrous adhesions. It causes absorption of the latter. The sinusoidal current breaks up the adhesions and serves as a marvelous massage for the muscles that tend to become or are already atrophied.

Technic. The electrodes are prepared and applied as for ionization already described using one per cent warm solution of Na Chl instead of the magnesium sulphate for the electrode placed on the shoulder. This electrode is attached to the negative pole. The galvanic current is brought up gradually to the patient's tolerance for twenty to thirty minutes. After this treatment the electrodes are left in situ, and the galvanic current is changed to sinusoidal with a frequency of twenty interruptions per minute. A very mild voltage is employed at the beginning, increasing it gradually at each seance until a maximum tolerance is reached. The treatment time is started with two minutes and is increased by one minute at each scance until four or five minutes are given. Diathermy instead of infra-red may be employed towards the termination of the subacute stage. If the diathermic heat does not provoke any pain* but disability of the shoulder is still present, the condition has reached the third or chronic stage.

Pathology of the Chronic Stage

This stage presents two varieties: the protracted adherent variety in which x-ray findings are negative, and another variety in which x-ray reveals the presence of calcium deposit and is known, therefore, as calcified (subdeltoid) lumities.

In the former the pathology and treatment are the same as in the subacute stage. It remains for us to discuss the latter variety. Brickner¹⁹ describes the calcification as follows:

It may be as small as a pinhead or so large as to form a cap over the outer portion of the head of the humerus. Its shadow as revealed by x-ray, may sometimes be obscured by the acromion process. The shadow is not due to thickening of the hursa. It is due to lime salt deposit, but the deposit is not in but beneath the bursa, in or upon, or in and upon the supraspinatus tendone.

Others, like Montgomery, a state that "the amorphus masses of lime salts were deposited and confined to the upper wall of the bursa." Fortunately for our method of treatment the exact location of the deposit is immaterial.

Treatment of calcified subdeltoid bursitis. The only treatment employed by the writer with uniform success is diathermy applied to the affected shoulder.

^{*} The application of infra-red radiation causes occasionally a return of the pain. This indicates that the acute stage is not yet entirely over. Infra-red should be discarded and the treatment of the first stage continued for a few more scauces.

^{*} Diathermy causes occasionally a sudden exacerbation indicating that the sub-acute stage is still in its early phase. The diathermy is then discarded, and infra-red ionization continued for another week or so.

Technic. There are two methods; The anteroposterior and the cap method In the former, two metal electrodes of equal and sufficient size (four by five inches or larger) are placed at the shoulder joint, one anteriorly and the other posteriorly, and held in place by a bandage The current is gradually increased to 800 M.A or to the patient's tolerance for thirty to forty-five minutes From twenty to forty treatments may be necessary for a cure. The treatments are given daily or three times a week

The Cap Method. This consists of a capshaped electrode five by six inches or larger, the concavity moulded so that it conforms to the shoulder curve and is the active electrode The inactive electrode consists of a large plate ten by twelve inches applied to the opposite side of the body, its upper border falling about two or three inches below the tendon of pectoralis major. It seems that the diathermic heat exerts a special effect on that lime deposit, causing it to disappear If Roentgenograms are taken after each series of eight or ten treatments, they will show a gradual diminution of the lime deposit, as illustrated by the following case

Mrs M, age 42, wife of a New York physician, suffered from a chronic subdeltoid bursitis. She was treated by her husband for over a year with baking and massage, manipulations, exercises, medication, etc., but without results Her suffering was so great that during that year, she lost twenty-three pounds (usual weight 130 lbs) She was then referred to me The x-ray of the shoulder taken just before she started treatment revealed the presence of a large deposit of lime Its shadow resembled a minia-ture skyscraper She received forty diathermy treatments, during which Roentgenograms were made after each series of eight to ten seances. Each time the x-ray plate showed a diminution of the lime deposit as compared with the last one. The final x-ray plate showed a complete disappearance of the deposit which corresponded with a total disappearance of the symptoms and complete recovery

The methods of treatments discussed here are for non-usppurative bursitis.

Summary

The writer is convinced, judging from the results obtained in the many years of his experience in a large clinic, that traumatic bursitis is successfully treated by physical medicine. The methods of treatment employed are in accordance with the pathological, physiological, and biochemical processes of the various stages of the disease in question.

In the acute stage hydrotherapy in the form of cold compresses and galvanization or ionization with magnesium sul-

phate are employed.

In the sub-acute stage infia-ied followed by massage or ionization with sodium chloride followed by sinusoidalization is used

In the chronic stage, if there is no calcification, the treatment of the sub-acute stage is continued. If calcification is present, diathermy alone was found to excel. A case where the wrong treatment caused great suffering to the patient is reported.

SHALL WE PAY THE EXECUTIONER?

It is coming out that certain states contribute far more in direct payments and in federal taxation to our big government expenditures than ever comes back to them, while other states receive much more than they give New York is one of the states pouring its wealth into Washington to be spent elsewhere Of course in a way this is natural, as New York is a rich state, and our national motto is apparently, "Sock the rich," but it may be pertinently pointed out that among those taxed are the physicians and their patients, and any further schemes for showering wealth around the

country in spectacular projects will entail still heavier levies. Among the plans on the horizon is state medicine, bound to entail heavy cost If it goes over, the doctor will have the pleasure of putting his hand still deeper in his pocket and actually paying the expense of undermining his own practice and turning the profession into a brigade of medical orderlies, to run here and there as sent by their superiors is the custom in some countries to make the condemned dig their own graves, but at least they do not have to help pay the expense of the execution.

APPENDICITIS

A Study of 596 Consecutive Cases

FRIDERIC W BANCROFT, M.D., New York City Eric R Sholuda, M.D., New York City

General statistics in this country and in other countries show a high mortality rate for appendicitis whether operated or not. This rate is mounting. At the present time our statistics compare unfavorably with European statistics. With this thought in the brekground, and a desire to find out what actually might result as possible complications of the operative treatment of appendicitis this study of the complications of 596 appendictionies was mide.

It was felt that for the study to be worthwhile, we should have at least five hundred cases. In reviewing the operations at the Fifth Avenue Hospital, we found that if we took all appendectonies done from September 28, 1928 to January 2, 1933, we would have available for our study a total of 596 consecutive cases, of which 350 were acute and 246 chronic cases.

In order to establish some definite limitations as to cases to be included in the series, it was decided to discount those cases in which the appendix was removed in the course of another operation explain further, if an operation was performed for the removal of an ovarian cyst and a normal appendix was taken out in the course of the operation this case was not included in our study However if an operation was done for a dormant or acute appendix, and an ovarian cyst was removed in the course of the appendectomy, such an operation would be included in our study other words the primary pathological condition decided whether the case was to be included

It is readily seen in Table I the acute cases offer the vast inajority of the complications. Infection and hematomata of the wounds were in the main the only complications of the chronic cases. In all probability they were due to less care in protecting the wound edges during the removal of the appendix and the stump inversion, and more retraction on wound

edges with resultant trauma due to ab dominal exploration

The acute cases were then analyzed and comparative results in other institutions obtained. In our cases there were only 15 deaths. This is only 25 per cent of our total number of cases. These deaths all occurred in acute cases giving a percentage of about 43 mortality in our acute cases. This compares favorably with that in other institutions. (Table II.)

Age was seen to be a definite factor in mortality (Table III) Childhood and oldage pay the heavest toll. Our figures correspond to those of Finicy³ and others

Gross pathological classification from the description of the operator at the time of operation is indefinite due to the difficulty in recognizing the entire pathology thru a small meision and to the personal element since our cases were not all operated by the same surgeon We have followed the classification used by Bancroft in his New York Hospital report We were concerned first with the pathology of the appendix itself and secondly with the reaction of the peritoneum (Table IV) The latter group consisted of four subdivisions (a) Acute inflammation of the appendix without reaction of the adjacent peritoneum, (b) with free fluid-the cases in which serum or cloudy fluid escapes on entering the peritoneal cavity, but in which there is

no general peritoneal reaction; (c) acute diffuse peritonitis; (d) with abscess formation.

The peritoneal classification was further studied as to mortality and again a comparative attempt was made with other reports (Table V). For this purpose, we had available the work of Bancroft and of Garlock, both done at New York Hospital. Garlock did not differentiate the cases without adjacent peritoneal reaction, from those with free fluid, so we were unable to make a perfect comparison.

Total and the state of the stat	46

We next studied the most important of our immediate postoperative complications with concern as to the frequency of occurrence and the mortality. Intestinal obstruction was found to occur in only two of our 350 acute cases or 0.5 per cent. Our fecal fistula per cent occurrence was unusually low when compared with other records

There has been everywhere so much controversy as to whether to drain or not that we felt it would be advisable to give some data as to complications in drained cases as opposed to non-drained. (Table VII).

The complications were more numerous in the drained cases. This is not meant as a criticism for it happens that the drained cases were the more advanced cases in our series. The average drained case spent 21.1 days in the hospital while the average non-drained case was hospitalized 12.4 days.

Discussion

On reviewing our statistics we noted that acute cases constituted more than fifty-seven per cent of our cases and that of these acute cases fifty-seven per cent were sufficiently advanced to show anything from free fluid to abscess formation. We also noted increased mortality in the more advanced cases. Cases with abscess formation showed a lower mortality per pent than those with diffuse peritonitis.

The drained cases which in our series were practically entirely the more advanced cases showed more complications and required longer hospitalization.

Conclusion

Surgical and economic results require early recognition of appendicitis, and immediate operation. Any delay increases the risk and prolongs the patient's convalescence.

A NEW FIND IN IMMUNITY

A new method for preparing vaccine against deadly bacteria, which promises to open up an entirely new field in immunity against diseases for which so far no vaccine exists, is announced in a preliminary report in the current issue of Science, official organ of the American Association for the Advancement of Science

The new method is based on the discovery that by treating bacteria with ketene, a gas obtained from acetic acid, contained in singar, the bacteria are made completely barneless, and then can be used as an effective vaccine against that bacteria

When these ketene-treated bacteria are injected into animals, it has been found, they render the animals completely immune against lethal doses of living bacteria Other animals not so immunized all died without exception.

The report is presented by Dr Joseph T. Tamura, becteriologist, and Dr M J Boyd, biochemist, of the College of Medicine, University of Cincinnati

IT'S THE KINKS THAT COUNT

A perfectly normal person would be unspeakably dull, according to Dr Earl D. Bond, Professor of Psychiatry at the University of Pennsylvania, who outlined his views before the Monroe County Mental Hygiene Society in Rochester a few weeks ago. We are all "a little queer," he thinks "Most of us have nervous symptoms,

"Most of its have nervous symptoms, fears and prejudices which indicate that we are not quite as normal as we might suppose," he said "Take the so called model child, for instance He is obedient and well behaved That's his behavior Actually all individual activity has been squelched out of him, and unless some effort is made to remedy the situation, he'll develop into a dull adult"

TO PAY CLINIC DOCTORS

The movement in New York City to secure pay for physicians serving outpatient departments of the various city hospitals has resulted in the submission of a bill providing for their remuneration to the Municipal Charter Revision Committee by the county medical societies of the metropolitan area Di Goldwater, Commissioner of Hospitals, is said to approve the plan and it is reported that a fee schedule of \$5 per clinic session per doctor has been presented to Goldwater and there is great likelihood that an appropriation on this basis will be made in the next budget

EDITORIALS

An Unfortunate Omission

The state government, which has taken the lead in many highly commendable medical reforms, nevertheless lags sadly in utilizing the full resources of organized medicine for the public good. Only recently the position of Director of Health and Physical Education in the Department of Education was filled without regard for the judgment of the New York State Sanitary Officers' Association, the New York State School Physicians Association, the State Health and Physical Education Association, the New York Teachers Association, and the Medical Society of the State of New York. The interesting and valuable report of the New York State Commission on State Aid to Municipal Subdivisions suffers from a similar lack. Although the Commission investigated many activities of a medical nature, such as state aid for health and school medical service, not one of its six members was a physician or qualified by experience to evaluate medical needs or the performance of health services. The same is true of the six members of the Commission's research staff.

This is no criticism of the report itself, which covered important ground and made some highly pertinent criticisms. In fact, many of the Commission's observations on inefficiency and extravagance in the administration of relief and the

demoralizing effects of dependence on government reinforce the profession's arguments against state medicine.

Aside from the context of the report itself, however, and regardless of the undoubted integrity and ability of the Commissioners in their respective spheres, it is a grave mistake for the government to ignore the counsel of the reputable physicians of the state in medical matters. The S.C.A.A. had a definite influence in framing the welfare features of the report. Surely the views and experience of organized medicine are entitled to equal weight in health questions.

It is true that most of the large welfare organizations have adequate full-time staffs and can lend active assistance to such investigations. If this has any significance, it is that organized medicine, too, must develop full-time workers charged with the protection and advancement of the doctor's interests. Under any conditions, however, the state should recognize the supremacy of the profession in medical affairs and give the physician due representation on all projects directly or indirectly touching health services.

A Blow at Quackery

Senator Feld apparently realizes that few battles are won with the first shot. Undiscouraged by the defeat of his original bill, he has introduced another measure to cut off the sustaming advertising of quackery. The new Feld Act not only forbids physicians to advertise for patronage but subjects them to disciplinary procedure for employing or cooperating with unheconsed practitioners.

These are two well-directed blows at chirchtanty. No quack can build up a following without publicity, and the Feld Act closes every channel of publicity to the physician except the unpaid personto person endovenient on which the reputations of reputable practitioners are built. The medical mountebank leans heavily on advertising to counterbalance his lack of merit. Remove this prop and the structure of quackery is doomed to fall.

The costs of the extensive advertising in which the modern quack must engage to attract a clientele necessitates a vast volume of business. To braidle this, "mass production" methods are neces sary In many of the more successful institutes of charlatinry, the medical pro prietor is assisted by so called "doctors" who rely on the license of their employer to shield them from the charge of illegal practice Some of these "doctors" are medical graduates who were never licensed or who lost their permits for statutory infractions Others are undergraduates who were forced to leave medical college for some reason or another before completion of their course Still others rely solely on a white coat and glib tongue To cut the master quick off from the services of such assistants. would seriously impair the volume of work required to carry the heavy overhead of quackery

There is nothing in the Feld bill that would restrict the prerogatives of reput able physicians, deprive the public of any essential service or deplete the legitimate revenues of honest advertising media. If anything, it would rid the responsible practitioner of unscrupidous competition and protect the ignorant and gullible layman against exploitation. The Legislature can demonstrate its loyalty to high standards of medical practice and the public

health by prompt enactment of Senator Feld's new measure

511

Another Aspect of Coronary Sclerosis

The knowledge of the pathology of coronary sclerosis continues to be augmented by the newer studies in the field of atherosclerosis. The descriptions in text books are based largely upon the postmortem material obtained from patients who had been hospitalized for some time. In such instances secondary changes already have made their appearance and it is these that Leary believes have obscured the true picture of coronary sclerosis.

His observations are based upon pathology found in patients who have "dropped dead" and so come under the jurisdiction of the Medical Examiner's office These cases represent, in the majority of instances, people who never have been sufferers from cardiac distress and also those who had had no prior attack of coronary occlusion. These early or primary processes present at first a deposit of free lipoid beneath the arterial endothelium This is followed by the appearance of pliagocytes and an increase in the thickness of the fibrotic layer. Since this new tissue derives its nutriment from the blood flowing through the lumen of the artery, necrosis of the most distant portions of the intimal tissue occurs. This is accompanied by fat deposits and lymphocytic infiltration which lead either to thrombus formation or to sudden death by occlusion of the lumen

Leary feels that atheroscierosis of the coronary arteries is a metabolic disease Cholesterol is one of the important lipoids found in the body and is derived from the impostion of this substance as such rather than as the result of a process of synthesis Cholesterol is a prime requisite for rapid cell division and acceleration in growth and consequently is needed mostly during the embryonic stage and in early infancy. Thereafter it is not an essential

¹ Leary, \(\Gamma\) Amer Heart Jour , 10 328 1935

for body growth or maintenance. Man is the only mammal who, throughout life continues to ingest milk and eggs, both of which are high in cholesterol content and represent the foods which early growth necessitates. While it is true that the human fetus has no yolk, the increase in blood cholesterol during pregnancy replaces this for the furtherance of embryonic growth.

Atherosclerosis can be reproduced in rabbits by feeding cholesterol to them. These experimental findings are corroborated by reports from the Joslin diabetic clinic² which show that atherosclerosis and xanthomas are of less frequent occurrence when patients receive a diet low in cholesterol containing fats. The import of Leary's observations is very great since it suggests the possibility of coronary sclerosis being added to the list of preventable diseases.

New Theories on Gastric Ulcer

The exact factor responsible for the formation of gastric ulcers is still unknown. Many theories exist which would account for their mode of production. It is for this reason that no definite procedure for the treatment of ulcer of the stomach has been determined. Some ulcers respond favorably to dietary measures while others do not. Recurrences do follow adequate surgical removal of preexisting gastric ulcers. Furthermore, gastris surgery yet remains a serious undertaking.

The report of Volini and McLaughlin¹ anent the most recent type of therapy for gastric ulcer which has been advanced is of extreme interest because it furnishes us not only with results but also with sound reasoning based upon work performed. Of seventy-three patients who were treated with histidine monohydrochloride, seventy-nine per cent were improved clinically while the remainder were not. They cannot account definitely for the

manner in which their favorable results were obtained. By means of experiments conducted with rats, they were able to produce ulcers by the repeated injections of histamine dihydrochloride, but, when the animals had prior injections of histidine, ulcer formation did not follow the administration of histamine.

These observers devolve an interesting theory from their work. They allege that peptic ulcers are the result of excessive stimulation by histamine which reduces gastric acidity and perhaps also peptic activity. They do not overlook the possibility that the injection of histidine may produce a histaminase which would inactivate histamine in its destructive action.

These theories possibly could account for the changes observed in the physical characteristics of gastric secretion which are noted in the presence of peptic ulcer. The use of amino acids as therapeutic agents presents new potentialities which cannot be overlooked without intensive investigation as to their merit.

CURRENT COMMENT

From the January 1936 issue of Hospitals we quote Dr. J. J. Golub, Director of the Hospital for Joint Diseases in New York City. "The hospital has the added responsibility of sharing in the community's efforts to lessen social degeneration. Its achievements in that direction are no better than its understanding of and active participation in the community's welfare, and above all, its own conception of the possibilities of service. An understanding of the community and the individuals in it broadens the hospital concept and weaves it more effectively into the fabric of community life, needs, and responsibilities. * * *

It is becoming complete in that it attempts to embrace all known phases of health service, and it is a community health center in that it is the product of communal, social and medical thinking and planning—satisfying the special needs of the community."

IN THE Bulletin of the Bronx County Medical Society of March 1936, under the title "Medical Economics" Dr. Nathan B. Van Etten writes, " * * * Scientifically, medicin is glorious, economically it is im-

^{1.} Volini, I F, and McLaughlin, R. F. III Med Jour, 69 39, 1936 2 Year Book of General Medicine, Chie, p 551, 1935.

provident. Living in an industrial age it makes little effort to learn from industry practical methods for spreading the knowledge of its potentialities. Hiding its light under obscurant ethics, because of fear of commercializing individual abilities, screens from publicity much knowledge of great popular value. Membership in a profession seems to have caused the physician to forget that everything in this country moves to the tempo of industry. * * * It cannot be denied that the workers in Organized Medicine have been retarded in their work by a very large number of physicians who are so indifferent to their own welfare that they do not take the trouble to attend the meetings of their County Medical Societies, but, while being entirely uncooperative, do not hesitate to revile their officers for involving American Medicine in an economic crisis. It cannot be denied that conservative doctors, indifferent doctors. lazy doctors, unethical doctors, socialistic doctors, communistic doctors, doctors of Public Health doctors of philosophy, are all taking a shot at Organized Medicine. * * * In the light of debasing foreign experience with State Medicine and in the light of our own experience with political bureaucracy, the physician who respects the high calling of his profession must meet the threat of an extension of State Medicine as a militant fighter for the maintenance as well as the elevation of his ideals. It will be a backward step into chaos if the Department of Labor of the United States should succeed in imposing upon the Medical profession codifications such as those which have created such confusion in industrial and agricultural production. * * *

"* **. His age old experience and his education qualify the physician to meet a changing world and should qualify him for wise leadership of its evolution. The future of medicine challenges him. If he becomes indifferent, selfish, lazy, socially uncooperative, he will write a sad chapter in medical history; if he becomes alert, awake to his opportunities to meet the new daily demands of the American people and give the most faithful service, the service of personal devotion to the science and the art of medicine, his glorious traditions will be multiplied * * *"

"Mechanization has brought new and vicious health hazards. But, as many have overlooked, the benefits, too, have been great, and the future possibilities are even greater. As we foresee developments in machinery we can anticipate the elimination of man as much as possible in the production of material involving hazardous exposure. Study of the correct type of ventilation to

be installed at the point of generation of poisonous gases and harmful dusts will cut down the main causes of ill health among workers.

It has been the premise of the industrial hygienist that if we can eliminate dust, funnes, and gases from the atmosphere of the shop, we shall come very near to the goal set by Sir Herbert Samuel, when he said, 'there should be no such thing as industrial disease possible.' The above is from an article in the Columbia Alumni News of March 6, 1936, by Frederick B. Flinn, PhD., associate professor of physiology in industrial hygiene.

From the Supplement to the Bulletin of the Bronx County Medical Society we quote two of its Timely Brevities, "Most of the propaganda for state medicine was inspired by the depression years. Yet the medical profession did not cause the depression. Government and industry must answer for that. Let government and industry seek a cure for the financial ills of this country! Let them set their own houses in order! When they have done so, many of our other problems will be found to have taken care of themselves."-"If vivisection is to be abolished it would be entirely within the keeping of the medieval spirit that brought it about to abolish, also, all facts learned by vivisection. That extreme would be no greater than the law which was introduced by antivivisectionists into the Illinois State Legislature several years ago. According to the strict interpretation of this law, any physician who gave a patient a drug for the elimination of a tapeworm would be guilty of a misdemeanor. Even a tapeworm has his rights!"

"Medicine is just now in a state of metamorphosis. Within a few years our present conceptions of bacteriology will undergo radical changes. Men and women in many laboratories are fervently conducting researches to conquer cancer and other scourges. To stay those eager hands now would be as damnable racially as is a criminal abortion individually. This controversial attitude is not prompted by any selfish motive. The physician's own economic status is subordinate. This vital problem is of national importance.

Governmental regulation of medicine is inherently unthinkable and must inevitably prove unsound. The covetous politician has no place in our realm. We do not live in the same world. If we suffer him to gain control of our system he will tincture the whole fabric with his disastrous schemes and futile mal-administration. Such incongruity seems monstrous. ** * When the physician is relegated to an ancillary rank, when his

liberty of independent action is restricted, his life grows insipid and he becomes a pathetic puppet. Magisterial supervision involves unwarranted controlment. Exploitance smothers altruism. Despotic sway is democracy without liberty. Subordinate cooperation of laymen with medical society beneficences would be conducive to health welfare, but civil dominance would mean chaotic disorder in this critical period of our national emergency."—J. A. Hagemann, of Pittsburgh, Pennsylvania, writing in the Medical Record of March 4, 1936.

THE EDITORS OF Today under date of March 7, 1936, comment to the effect that "The Pure Food and Drugs Bill, badly mangled after three years of battering, may yet be pushed through near the end of the session. It passed the Senate last year. Representative Sam Rayburn is now trying to find out whether it is worth passing. Some of the experts would rather let it die and start fresh with a new bill in the next Congress."

THOMAS PARRAN JR., M.D., state commissioner of health, spoke on February 25 at the annual meeting of the New York Tuberculosis and Health Association. From the *Health News* under date of March 6, 1936, we read that, "He described the signing by President Roosevelt of the bill appropriating money with which to launch the

social security program as one of the most significant events in the history of public health in this nation. He warned, however, that too much is not to be expected from the health measures which can be carried out under the present social security act since they represent only the first steps toward health security of a people who are at last beginning to realize what they need. He said, 'In public health work we stand today just about where we were in public education in the middle of the last century. I hope that in our attempt to provide good health for everyone we may avoid some of the blunders which characterized our effort to make education available for all, through measures more generous than they were discriminating. * * * In conclusion, Doctor Parran emphasized the necessity of caution in working out the national health program -the effort that will be required to avoid potential evils arising from lack of ex-perience, lack of vision, and the tendency to partisanship. * * *

An OLD OPINION couched in slightly different terms, to wit, that: "Congress is decidedly careless about ordering new investigations without checking on what it has already authorized. Either the work has been done before, or a new agency is set up to do it when there are already others in the field." From the Saturday Evening Post, March 21, 1936.

Society Activities

Post Graduate Lecture Courses

Doctor K. R. McAlpin addressed the Greene and Columbia County Medical Societies on the subject of "Pernicious Anemia" on March 3, concluding a course on general medicine given to these Societies by the Committee on Public Health and Medical Education. Doctor McAlpin's talk was regarded as very excellent by the members of these Societies. Judging from the attendance and the attitude of the men in these two Counties, it would seem that the plan of giving a course jointly to the two Societies, recently made possible by the construction of the new bridge over the Hudson River, is practical and satisfactory and it will probably be used in the future for other County Societies similarly located.

On March 4, Doctor S. Potter Bartley lectured to the Sullivan County Medical Society, in Liberty on the "Diagnosis and Treatment of Injuries of the Knee Joint." General comment from the members of the

Society was that he gave an excellent talk which was very instructive and well-received.

Doctor Harvey B. Matthews spoke to this group on "Breech Presentation" on March 11, and at this lecture the custom was inaugurated of distributing, when possible, mimeographed abstracts of the lectures to those attending the meetings, in order to give more permanent value to the course. Doctor Matthews was well received by the Society, and his talk was regarded as most instructive and interesting.

On March 18, Doctor Robert Barber spoke to this group on "Vascular Diseases of the Extremities," and on March 25, Doctor George Roberts on "Recent Advances in Therapeutics."

A course on General Medicine is being planned for the Chemung County Medical Society to be given on Wednesday evenings during April and early May, in Elmira.

Annual Reports

MEDICAL SOCIETY OF THE STATE OF NEW YORK

1935-36

REPORT OF THE PRESIDENT

To the House of Delegates, Gentlemen

At the close of the term of service, I beg leave to render the customary report of stewardship. The past year has been characterized by many developments, the most noteworthy of which is the definite improvement in conditions in general, which has resulted in a decided lessening of the apprehension so increasingly prevalent during the list years. While this increased cheerfulness is still tempered to a degree by the remaining uncertainty concerning social unrest and the financial policy of our government, the frame of mind of our people is however definitely better, and they are in consequence the more able to assume the duty of help in

the shaping of our destinies

What applies to the nation, applies to our Society as well. In medicine as in all else, greater optimism is apparent everywhere, and more energy in the direction of development and progress is the result In like spirit your officers, standing and special committees, as well as all others serving your Society, have done their work efficiently and cheerfully, and fully deserve my commendation and your ap preciation and gratitude. It serves no purpose to review the details of their labors as all evidences of these appear in the reports submitted to you at this time In no instance of which I am aware, has an assumed or assigned task had anything but close attention and wholehearted efficient service. It must be remembered that such service is in many instances very time consuming and thus at the direct expense of those rendering it The Special Committee on Workmen's Compensation Procedure may well serve as an example For over five months at frequent and long sessions, a group of seven teen sat to adjudicate the Tee Schedule. your representatives being the only noncompensated members of that body.

though burdened with statewide responsi-

bility to the profession

A review of the administrative activitics of the Society during the past few veirs indicates an example of modern trend toward increased efficiency with all possible economy, doubtless stimulated by general conditions of world affairs Changes in the publication and management of the Journal and Directory, management of the Technical Exhibits, management of the Malpractice Indemnity Insurance Group Plan, establishment of the Burcau of Public Relations, etc. were all undertaken with one or other or both these aims in mind only, namely, betterment with all possible economy Such changes, radical in nature as they often have to be, are rarely accomplished without some error and misunderstanding These are probably announg for the time but trifling as a rule, compared with the advantages gamed In these instances most of the error was based on misunderstanding, and the rest will disappear by elimination Conservative estimate has every indication that some of these former liabilities of the Society will become assets of no mean value in relatively few years Again you have been, and are being served by men of talent, without reward

Annual reports to the House of Delegates in recent years, as well as frequently expressed opinions of various observers. would seem to indicate an overlapping in the functions of some of the standing committees, and probably duplication of expense It has been apparent for some time that there is a lack of coordination of these activities largely due to the structure and method of functioning of the executive body representing this House between sessions My predecessor, in his report at the last session of your body advocated a full time executive, certainly in part for the purpose of creating such desirable coordination, which matter was referred to the Executive Committee for study. The thought is also prompted that over-organization may exist owing to the cumulative zeal of successive administrations.

For these various reasons it is quite probable that the present structure of the administration of the Society could be revised in the interest of greater efficiency with lessened expense if possible. For the purpose of a broad study of all these questions, the Executive Committee authorized the appointment of a Committee on Organization, to report to this House of Delegates. Attendance at one meeting, by courtesy of the Committee, was sufficient for the conviction that many improvements in the interest of efficiency and economy can be had. In any event, it is a most important matter which merits your closest attention and best possible judgment. Since any radical alterations in a reorganization plan created by this House will require changes in the Con stitution and By-Laws of the Society, there will be ample time for mature de liberation before they can be enacted.

In this connection it may be well to call attention to other procedures which experience teaches might be subject to revision.

Under the By-Laws the budget and all other expenditures recommended by the Executive Committee, must have the approval of the Board of Trustees to become effective. In practice, all requests for appropriations are presented to the Executive Committee, then subject to discussion concerning the need and the amount, which is followed by a simple recommendation to the Trustees. The Trustees in turn, usually with little more than the brief reference at hand, agree to it, or reduce the amount appropriated, or refuse to make an appropriation. Since the purpose of their approval would logically seem based not only on the ability of the Society to meet the cost, but also on the desirability of the expenditure contrasted with the cost, it would seem desirable that they should have at least the same information relative to the matter as that presented to the Executive Committee including the discussion concerning it, on which the recommendation rests.

Under the By-Laws, no Committee shall inaugurate or initiate any policy, or commit the Society unless expressly approved by this House, the Council or the Executive Committee. In this rule there is no provision relative to the Committee on Legislation, which frequently violates it on account of the lack of time to observe it. While such action is safeguarded by the authorized Advisory Committee and the County Legislative Committees, a better provision in the By-Laws might be considered. The same may be said in a way of the Committee on Medical Research. While it receives instructions from this House from time to time relative to legislation concerning animal experimentation, its specific action is often the matter of a moment at the time of a legislative hearing or on a similar occasion. While no safeguard would seem required, a By-Law provision may well be made.

It happens from time to time that differences of opinion occur between a County Society Committee and a State Society Committee having similar functions. The new provisions of the Workmen's Compensation Law which impose duties on each County Society, may lead to definite differences between them, which may easily produce an unfortunate impression on the public to the detriment of the profession. While the By-Laws provide the means to prevent conflict in Constitution and By-Laws as well as in opinion relative to proposed legislation, there are no regulatory provisions otherwise or methods of adjudication indicated. It would seem in the interest of the profession that more definite central control might be established to advantage, in a way this House might direct after careful analysis. Again the thought is prompted that over-organization may exist.

Repeated references to the justice of proper remuneration for professional services rendered in hospitals, the increasing efforts by some hospitals to actually practice medicine on their own account particularly in workmen's compensation and obstetric cases, and general evidences of dissatisfaction as expressed by the proposed Crawford bill of several years ago to prohibit any charge to patients in dispensaries, and the Moran bill of more recent date, to limit hospital charges to bed, board, and nursing, are sufficient evi-

dence of definite breach of understanding between hospital authorities and the medical profession. Official conferences of outstanding representatives of the profession with similar representatives of important hospitals, and possibly welfare and public health interests as well, would seem a logical plan to bring about in adjustment of existing differences, more equitable perhaps thin by arbitrary laws causing resentment and leading to evasions. Thought might well be given to the subject in the hope of evolving a plan to find a solution for the evident dissatisfaction which exists.

The Public Relations Bureau established by the Committee on Trends, is quite in keeping with the purposes of the Society as expressed in Article 1 of the Constitution, namely, "to enlighten and direct public opinion in regard to the problems of medicine and public health" Its functions are as much what not to

print, as to make public in digrified and interesting manner what the public should know in its own interest. The value rendered and to be rendered in this way is not necessarily apparent, but can easily be learned by conference with the Director and the perusal of his scraphook. It is to be hoped that when completely established and in full working order, it will serve every arm of the Society throughout the State.

In closing, allow me to again expressing admiration of all who serve the Society, and of the cheeful, self surficing and efficient manner in which this service is rendered. May I add my personal grateful thanks for their courtesy, kindness, and understanding which has made my task so simple and pleasant.

Respectfully submitted, Frederic E Sondern,

President

P16 March 1, 1936

REPORT OF SECRETARY

To The House Of Delegates, Gentlemen

For the eleventh time your Secretary has the honor of presenting to you his annual report. Although during these years his duties have greatly increased the burden has been lightened by the inspiring thought that between him and the membership there existed a mutual feeling of cordial respect and friendship

The Society

The constant and stendy growth of the Society in membership and activities has continued and that this growth is a healthy one is evidenced by the interest in and criticism of the various activities. The slowness of this growth and the expressed wish of many to investigate before adopting are manifestations of its soundness.

Three important changes in the conduct of the Society's affairs have been made during the year. The duties of the Publication Committee have been taken over by the Committee on Journal Management, the plan of Group Insurance changed and the provisions of the Workmen's Compensation. Law brought to a practical consummation.

Although no vicious or prejudicial legislation detrimental to the interests of

the Profession has as yet been emeted many threatening clouds exist and a militant attitude must be preserved and the old complacency done away with Foes exist both without and within our ranks and it is your Secretary's opinion that every member should realize that it is his fight and that unity and solidarity in thought and action are the only means of preserving the integrity of the Profession and holding it in the high place which it has attained, ever remembering that "Eternal vigilance is the price of liberty"

The Society's Office

It is stud that "variety is the space of life" and your Secretary realizes that even in a prosace report repetition may be thought tiresome, but he also realizes that refreshment of memory is an absolute necessity, their fore, let him again say that the location of the General Administrative Offices is at 2 East 103rd St, New York City, the Legislative Bureau is at 100 State St, Albrin, and the office at 33 West 42nd St, New York City, is that of Thomas R Gardiner, Business Manager for the Journal and Directory Official communications sent to the Secretary should be addressed to the Administrative Offices

These Administrative Offices house the Secretary's competent and efficient office staff of seven regular clerks and stenographers with occasional extras when the work gets heavy. Few if any of this staff could be readily replaced. The staff is under the immediate guidance and control of Miss L. D. Baldwin, the Office Manager, whose efficient management, wonderful grasp of details and knowledge of the Society's affairs past and present are of incalculable value not only to the Secretary but to the Society in general.

Financial Department

The Secretary has no comment to make regarding this Department of the Society. It remains in the same capable hands as at the last report.

The Treasurer and Board of Trustees should receive the thanks of the Society for the able and efficient manner in which the finances have been handled during these days of stress.

Legal Department

Another Department worthy of appreciation and all commendation is the Legal Department. Mr. Lorenz Brosnan who for the past few years has successfully defended our members in malpractice suits and whose sound judgment and legal ability has guarded the Council and Executive Committee against errors and pitfalls continues in charge of this Department ably assisted by Mr. Thomas Clearwater, our attorney. No task has been too difficult or problem too deep for him to tackle and he has never failed those who have had occasion to call upon him for advice.

The Secretary acknowledges thanks Mr. Brosman's assistance and advice and his never failing courtesy.

District Branches

Although your Secretary has not been able to personally attend the District Branches he has followed with keen interest their proceedings and progress.

Some years ago in addressing the Conference of State Secretaries in Chicago he laid particular stress on the advantage to the membership of the social aspects of their meetings and the opportunities given to meet old friends and neighbors. Nothing has occurred to change this opinion and he still feels that the scientific programs are secondary to the opportunity afforded for the getting together of friends and acquaintances and the enthusiasm inspired by these contacts.

Secretary congratulates Branches on the excellence of their choice for officers. The present Councillors are in his opinion second to none that have ever held office.

The attention of the County Secretaries is called to a remark made by one of the Branch Presidents; "I know it is my duty to visit the county societies in my Branch each year and examine into the condition of the profession in the County but how can I do this when these societies never notify me of when and where their meetings are going to take place." Your Secretary hopes that the County Secretaries will bear this in mind and assist the Councillors in carrying out their duties.

The Annual Conference of Secretaries and that of Legislative Chairmen were well-attended and the interest of those present was shown by the large number taking part in the discussions. Secretary is of the opinion that these conferences are among the most valuable functions of the Society. Accurate numutes were kept and through their distribution those not fortunate enough to be present were informed of the proceedings.

Committees

The earnest, active, energetic work done by the members of the Committees is indeed inspiring. These committeemen meeting frequently and journeying considerable distances to the place of meeting, self-sacrificingly giving their time and thought to the welfare of others show a loyalty well-worthy of emulation. The Secretary extends to them and their Chairmen the thanks of the Society.

The Secretary cannot close this section of his report without referring to the important and stupendous amount of work done by Drs. Kaliski, Heyd, and Elliott as the Committee on Workmen's

Compensation.

The indefatigable work of Dr. Kaliski is well worthy of special mention. Without hope of recompense and at great personal sacrifice he has created order out of chaos and success out of what might have been disastrous failure.

General

In a former report your Secretary took occasion to call attention to the fact that "much dissatisfaction which arises from time to time is occasioned by lack of knowledge or by erroneous impressions gleaned from hearsty or from unauthorized statements" At no time has this been more manifest than during the present year and he again requests the members not to form opinions on matters received from unauthorized sources. Many of them have stated that they did not wish to annoy or consume his time, to these and to all your Secretary definitely states that he does not consider moury whatsoever as annoving believing that it is his duty to assist members in every way possible if within his power and the limitations of reason

The Secretary sincerely thanks the President, Dr Frederic E Sondern and the members of the Executive Committee for their support, consideration, and friendship. He wishes also to extend his thanks to the Assistant Secretary, Di Peter Irving and the Executive Officer, Dr J S Lawrence for the willing and earnest cooperation which they have given

him at all times

REPORT OF COUNCIL

To the House of Delegates, Gentlemen

The Council has the honor of presenting the Annual Report which includes those of the Executive Committee, Committee on Insurance, and JOURNAL Management Committee

Two regular meetings have been held May 14, 1935, in Albany and December

12 1935, in New York City

Pursuant to the provisions of the By-Laws governing the constitution of the Executive Committee the following members of the Council nominated by the President, were elected to serve with the Officers therein provided as the Executive Committee for the ensuing year Samuel J Kopetzky, Chas Gordon Hevd, Terry M Townsend, John E Wattenberg, and Alfred K Bates

· On nomination by the President, Chas Gordon Heyd was elected Chair man of the Committee on Arrangements

It was decided that the 1936 Annual

Respectfully submitted,

DANIEI S DOUGHERTY, Secretary March 1, 1936

Meeting should be held at the Hotel Waldorf Astoria, New York City, on April 27, 28, 29, 1936

On nonunation by the President the following were elected members of Standing Committees

Public Health and Medical Education Leo F Schiff, Russell L Cecil Martin B Tinker, Edward G Whipple, Clayton W Greene, Oliver W H Mitchell, James K Quigley, Furfue Hall

Legislation Bernard B Berkowitz, B Wallace Hamilton, James F Rooney, Leo F Simpson

Economics **Frederick** Wetherell, Joseph P Garen Alfred E Shipley, Joseph C O'Gorman Cassius H Witson, Fred erick M Miller, George C Vogt, Edward T Wentworth, Homer L Nelms, Walter W Mott Morris Maslon

Public Relations William H Ross, Herbert H Bauckus Arthur I Heyl, David J Kaliski, Augustus J Hambrook, Warren Wooden

William A. Krieger was elected a member of the Committee on Scientific Work.

Arthur J. Bedell and Thomas H. Cunningham were appointed to investigate the appointment of a layman as Director of the Department of Health and Physical Education in the State Department of Education.

In accordance with Chapter 1265 of the Medical Practice Act J. Richard Kevin, Arthur J. Bedell, and Samuel J. Kopetzky were nominated to fill the vacancy on the Grievance Committee, which occurred through the expiration of the term of Dr. Kevin on December 31.

In accordance with Article 52, Section 1383, of the Education Law Paul G. Taddiken was nominated to fill the vacancy on the Nurse Advisory Council which occurred through the expiration of the term of Dr. Taddiken on December 31, 1935.

The plan for syphilis control as proposed by the New York State Department of Health was approved provided that the legal status and prerogatives of physicians be not invaded.

Executive Committee

The Executive Committee has held regular meetings on the second Thursday of each month with the exception of July and August and the June meeting which was held on the first Thursday. Two special meetings were held: July 19, 1935, to consider the change of the group insurance from the Aetna Life Insurance Company to the Yorkshire Indemnity Company, and on February 20, 1936, to consider the action which was to be taken by the State Society in regard to certain bills which had been introduced in the Legislature.

At the first meeting it organized under the Chairmanship of Frederic E. Sondern. Samuel J. Kopetzky was elected Vice-Chairman. Lorenzo J. Brosnan was appointed Counsel, and Thomas H. Clearwater, Attorney.

Although the work of the Executive Committee is of necessity more or less routine, it is of extreme importance. Many problems of interest to the welfare of the Society and of the Profession are constantly presented to it for solution and all of these have received most careful consideration.

In accordance with the By-Laws the Annual Budget was prepared and referred to the Trustees for the necessary appropriation.

The renewal of the contract with the Executive Officer was approved and re-

ferred to the Trustees.

The contract with Dwight Anderson as Director of the Public Relations Bureau under the Committee on Trends was renewed for one year from January 15, 1936.

The following Special Committees were appointed by the President:

Medical Research: John J. Morton, Jr., Chairman; John Wyckoff, Joshua E. Sweet, Allen O. Whipple, Simon Flexner, Augustus B. Wadsworth, Edwin MacD. Stanton, Herman G. Weiskotten, Winfield W. Scott, Burton T. Simpson, Peyton Rous, George J. Heuer, Marshall Clinton.

Insurance: Chas. Gordon Heyd, Chairman; Carl Boettiger, Frederic E. Elliott.

Prize Essays: Eugene H. Pool, Chairman; James Alexander Miller, Edward G. Whipple. Dr. Pool having resigned, James A. Miller was appointed Chairman and Burton T. Simpson member of the Committee on Prize Essays.

Budget: Chas. Gordon Heyd, Chairman; Daniel S. Dougherty, Charles H. Goodrich.

JOURNAL Management: George W. Kosmak, Chairman; Peter Irving, Secretary; Samuel J. Kopetzky, Thomas M. Brennan, William A. Groat, the duties of the Committee to include the Directory publication and act as Supervisor Commercial Exhibits.

Trends in Medical Practice: James F. Rooney, Chairman; George A. Leitner, Chas. Gordon Heyd, David B. Jewett, David

J. Kaliski.

Workmen's Compensation: Chas. Gordon Heyd, Chairman; David J. Kaliski, Frederic E. Elliott. Dr. Heyd having resigned, Dr. Kaliski was appointed Chairman and B. Wallace Hamilton, member of the Committee on Workmen's Compensation.

By-Laws: Daniel S. Dougherty, Chair-

man; Samuel J. Kopetzky.

Advisory Committee to T.E.R.A.: John A. Hartwell, Chairman; Louis H. Bauer, Samuel E. Appel, William Hale, Jr., Peter J. Di Natale.

Woman's Auxiliary: Mrs. John L. Bauer, President, with an Advisory Committee consisting of H. P. Mencken, Chairman; Frederic C. Conway, John L. Bauer, William H. Ross, Herman W. Galster.

James M. Hitzrot was appointed Chairman, Cassius H. Watson, Secretary, of

the newly created Section on Industrial Medicine and Surgery

Richard Kovaes was appointed Churman, Lee A Hadley, Sceretary, of the

Session on Physical Therapy
Nathan B Van Etten was appointed
Chairman and B Wallace Hamilton,
Joseph C OGorman, Thomas A
McGoldrick, and William P Howard
members of a Committee to study available plans which come within the scope
of the Ten Point Program of the American Medical Association and draw up a
model plan for bringing approved medical
care to all people at a cost within their

John Wyckoff was appointed Chairman, and Frederic C Conway and George Scott Towne members of a Committee to confer with the Saratoga Springs Commission in developing the mineral water resources of Saratoga

Springs

means

A three year contract was entered into with Thomas R Gardiner for the publication of the Directory and the management and sale of Dalubit Space at the Annual Meetings The contract with Thomas R Gardiner for the publication of the Journal was renewed for three years

The recommendations referred to the Council by the House of Delegates for the annual election of a Nominating Committee and the appointment of a full time Executive in charge of affairs were dis-

approved

Chas Gordon Heyd was appointed Charman and Charles H Goodiich, Samuel J Kopetzky, and Terry M Townsend members of a Special Committee to make a survey of the activities of the Society, particularly in regard to paid officials and expenses of Standing Committees and report to the House of Delegates Dr Goodrich and Dr Kopetzky having resigned Milton G Potter, and Thomas H Cunningham were appointed in their stead

The Governor was informed that if and when he mide an appointment to the Public Health Council, the State Society would greatly appreciate his considering the name of Joseph C O Gorman of

Buffalo

C Ward Crampton and Moses Keschner were appointed to represent the State Society at the Governor's Conference on Crime, the Criminal and Society

The following resolutions presented by the Special Committee appointed to investigate the appointment of a layman as Director of the Department of Health and Physical Education in the State Department of Education were approved

- 1 That the qualifications for this and other such positions closely associated with the delivery of medical service should be reviewed by our Society and appropriate suggestions made before the examination, are advertised
- 2 That in view of the facts above stated we ask the Civil Service Reform Association to investigate this recent examination and appointment and render a seport of their findings
- 3 I hat we acknowledge our indebtedness to our President, Dr Sondern, to Dr Leonard for his excellent work and for his valued protests, all mide in the interest of the people and the medical profession, and that we also express our thanks to Dr Hurold H Matchell, President of the New York State School Physicians Association, Dr Ellis II Champlin, President of the New York State Health and Physical Education Association to our Public Relations Committee through Chairman Warren to Dr Joseph S Lawrence our Executive Officer, and to the legion of others who endoised the appointment of a graduate in medicine as the head of such an important State Department

4 That in farness to all concerned such Examination Boards should consist of three members

That the President inform the Regents of the above action taken by the Executive Committee and that an editorial be published in the State Journal

Permission was granted the Committee on Public Health and Mcdical Education to participate with the State Department of Health and the State Association of Public Health L thoratories in organizing and directing a campaign for the prevention of pneumonia deaths

The President was empowered to appoint a Committee of three to represent the State Society in cooperation with Committees from the County Medical Societies from the Metropolitan Area to make a survey and to take preliminary steps for the proper representation of organized medicine at the George Washington World's Fair in 1939

Probably the most important action taken by the Executive Committee during the year was the decision to change the Group Insurance from the Aetna Insurance Company to the Yorkshire Indemnity Company. This change was made on the recommendation of the Insurance Committee who, after careful consideration of the service rendered by the two Companies, felt that that offered by the Yorkshire Indemnity would be of the greater value to the members.

Committee on Insurance

This Committee presents the following

report:

The Committee on Malpractice Defense and Indemnity Insurance were confronted in May, 1935, with a proposed increase of \$4.00 in the base rate on group mal-

practice insurance.

Meetings of the Committee were held in June and July, 1935, when the entire subject of malpractice insurance was considered. These deliberations were covered in a Report of the Committee published in the November 15, 1935, issue of the New York State Journal of Medicine,

page 1167.

Your Committee recommended to the President of the Medical Society of the State of New York on July 10, 1935, that a Special Meeting of the Executive Committee of the Medical Society of the State of New York be held for the purpose of terminating the arrangements between the Aetna Life Insurance Company and the Medical Society of the State of New York. At a Special Meeting of the Executive Committee on Friday, July 19, 1935, motion was duly made, seconded and carried:

That the Aetna Insurance Company be notified by the proper officials of the Medical Society of the State of New York that the arrangements between the said Aetna Company and the Medical Society of the State of New York be terminated as of midnight, December 31, 1935.

That the Insurance Committee, Mr. Brosnan, Counsel, and Mr. Wanvig, Insurance Representative, be instructed to act with power for the purpose of bringing into being an arrangement between the Medical Society of the State of New York and the

Yorkshire Indemnity Company.

Following the action of the Special Meeting of the Executive Committee of the Medical Society of the State of New

York, the membership of the Society were notified of the change from the former carrier to the Yorkshire Indemnity Company, to take place at midnight of December 31, 1935.

In the October 15, 1935, issue of the New York State Journal of Medicine, the Insurance Committee published under "Society Activities," page 1044, the financial background of the Yorkshire Indemnity Company and again in the December 1, 1935, issue of the New York State Journal of Medicine, dage 1226, the Insurance Committee brought to the attention of the membership the Regulations of the House of Delegates in regard to members insuring in companies other than the recommended carrier.

On Thursday, December 12, 1935, the Council approved the action of the Special Meeting of the Executive Committee.

On the first day of January, 1936, the official and recommended carrier of the Group Malpractice Insurance—the Yorkshire Indemnity Company—took over this function.

It was obvious that a change from the former carrier to the Yorkshire Indemnity Company would be associated with great interest, in some cases doubt, and

in a few cases open hostility.

Since the formation of the present Insurance Committee various members of the Committee have visited a number of the Component County Societies, together with the official Insurance Counsel—Mr. Harry F. Wanvig—and explained the various features that went into the decision for making the change and the merits of the much better protection afforded by the new carrier, the Yorkshire Indemnity Company.

In conclusion, we would like to repeat verbatim the following communication: [Reproduced page 444, March 15 issue]

Established 1824

The
YORKSHIRE INSURANCE COMPANY
Yorkshire House
66 & 67 Cornhill
London, E. C. 3

10th, January, 1936

Dr. C. Gordon Heyd, 116, East 53rd Street, New York Dear Sir:

We have your letter of the 26th ulto., and

may advise you that the Yorkshire Indemnity Company being entirely owned by our selves its habilities will be taken care of by us so long as they exist in the same way as our own liabilities both in the United States and elsewhere

Yours faithfully, W MAUDSLEY,

General Manager

At the close of business on January 31 there were only fifty two members in the entire state out of a total of 843 whose insurance expired in January who failed to renew their insurance in the Society's Group Plan As against this there were approximately minety new applications received from members not previously in sured. This represents a net gain of thirty eight insured.

The accomplishment of the Insurance Committee would not have been possible without the help, expert advice, and cooperation of the Insurance Counsel, Mr Harry F Wanvig, who was one of the founders, with Mr Whiteside of the malpractice group insurance, and who has contributed so much in the last fifteen years to making this insurance for the members of the Medical Society of the State of New York such a significant success

Respectfully submitted,
Chas Gordon Hend Chairman
Carl Boettiger
Frederic E Llliott

Journal Management Committee

Your Management Committee, charged January 1, 1934, with the duty of effecting publication of the JOURNAL and given a somewhat similar responsibility on May 14, 1935, for the Directory begs to report on its double stewardship

THE JOURNAL

Substantial advances have been made in 1935 by the JOHNAL and at a very small increase in cost per member over the figure set for 1934

In its editorial expressions it may be said that the magazine has assumed a definite clear cut individuality or personality all its own which has gained attention not only in this State but also nationally Moreover, widespread recognition of the editorials has been accorded by the lay press of the entire state, an evidence that the JOURNAL is regarded as

the official mouth-piece of organized medicine in this commonwealth. This development, which is essential for such a publication, has been made possible by designation of a single member of the Committee as responsible for the editorial pages.

The other sections have become stabilized and because an increase in size has been found possible new columns have been opened. The heading County Society News was cliniged to Medical News in order to widen that portion by inclusion of items of medical interest from each county in addition to reports of County.

Society activities

Two new columns have been opened Public Health News, because of its importance to all physicians in the state, has been accorded a title. In the section named Across the Desk comment is made on matters of general and wide human interest. It has been felt that, because the physician in his work comes into close contact with human activities of all kinds and the resultant effects on his patients, many things besides medicine have for him a vital interest.

The flow into the Journal office of material for which publication or comment is sought has increased enormously, particularly in the field of original scientific articles. It has been necessary to reject many articles, otherwise acceptable, because of lack of space. The Committee hopes that contributions will continue to multiply, that authors will recognize the advantages of appearance of their articles in the New York Statt Journal of Medicing which now has a circulation (press run) of over 20,000 copies.

It became clear early in 1935 that an increase of the number of pages would be possible during the winter of 1935-36. For that reason extra articles were accepted well in advance of enlargement. This has occasioned some delay in appearance, but recently the size has been jumped from 96 to 128 pages and the surplus absolute the start of the s

surplus is leaving the shelves

Your Committee desires to call the attention of the members to the fact that papers read at the Annual Meeting automatically become the property of the So ciety for publication if suitable Apparently this is not sufficiently understood Some authors prefer publication in special

journals. While such a presentation finds a wider specialist audience, it deprives the general group of valuable material.

Your Committee has not hesitated in such instances to seek or grant permission for reproduction, feeling that the duplication of printing is an advantage rather than a detriment to all concerned. With few exceptions, however, the specialist journals do not like to be the "followers." The hope is expressed that this attitude might some day change. For technical reasons, what is called simultaneous publication is well-nigh impossible.

It is recommended that the Society consider the possibility of making the papers read by invited guests also become the property of the Society just as in the case of member papers.

Some idea of the growth of the Jour-NAL may be gained from the following

figures:

Average total circulation: 1933, 13,690. 1934, 15,406, 1935. 19,099. These figures include members, paid subscribers, exchanges, advertisers, advertising agencies, and file copies.

Page content compares as follows:

		1934	1935
Total number of text pages Advertising pages

The purely scientific content was:

1934 1935 6% pages 738 pages

and for the first four issues of three years

1934 1935 1936 101 123 194

Of passing interest as indicating the magnitude of the publication task, the total pounds of postage paid for in the year 1935 was 199,685; and in 1936 it is estimated that more than 10 carloads of paper will be used for printing.

The actual cost to the Society in 1935 was 90 cents per member as compared to 70 cents in 1934. This rise, due to greater expense of certain improvements established in securing editorial material, news material, cuts and other incidentals, still

leaves the figure well within the dollar appropriated for the JOURNAL. It should be compared with the figure of \$1.49 per member in 1933.

Your Committee conceives it to be its duty to serve all committees and the officers through the Journal. It deprecates the dissemination of our "publicity" force into too many channels. It would like to see all members turn to the Journal for all their medical news. It, therefore, recommends that all committee news, all statements having a news value from officials be published in the Journal after editing to conform with the policies of the Society.

THE DIRECTORY

While the lists of physicians are still compiled in the Office of the Society, actual printing and mailing and advertising are now managed by Thomas R. Gardiner through the JOURNAL Office and under direct supervision of the JOURNAL Committee. It was thought wise to change the complete format for the 1935-1936 edition producing a book with a stiff cover. This has been accomplished for \$1.04 per member as compared to \$1.06 in 1934, practically the same cost but with a better book.

It is the opinion of your Committee that the book would be improved by printing full details under the name of each physician in New Jersey and Connecticut, just as is done for New York doctors. Negotiations with officials of the other two State Societies are in progress.

The inclusion of informative material of various other kinds for reference is under consideration for 1937, such as the certification by National Boards, qualifications to serve under the Workman's Compensation Law, and teaching positions held, etc.

Respectfully submitted,

GEORGE W. KOSMAK, Chairman THOMAS M. BRENNAN WILLIAM A. GROAT SAMUEL J. KOPETZKY PETER IRVING, Secretary

Reports of these three Committees— Executive, Insurance, and Journal Management—are

Respectfully submitted,

DANIEL S. DOUGHERTY, Secretary

March 1, 1936

REPORT OF COMMITTEE ON SCIENTIFIC WORK

To the House of Delegates, Gentlemen:

Your Committee has held two regular sessions and there have been several special conferences relative to the preparation of the scientific programs and ex-We have been so fortunate as to have with us at these sessions the President of the Society, the Chairman of the Committee on Airangements, the Speaker of the House, the Secretary of the JOURNAL Management Committee, the Director of Public Relations Bureau, and the Executive Officer It has happened that the Secretary has been unable to be present but has always communicated with us and in his familiai untiring way has assisted and advised us In the opinion of your Chairman, the presence of these ex officio members and guests has stimulated the members of the Committee and brought clearly to their minds the importance of high standards for papers to be presented with an eye toward their publication for the betterment of the Journal and their usefulness for the dissemination of sound practical information to the profession and public Reasonable publicity on medical matters through official channels is now approved scientific medicine does interest the public and when properly edited for news value and controlled greatly facilitates the acceptance of innovations and improvements which active research medicine so frequently implicates

The Scientific program will be presented by distinguished guests who will speak to us on the great medical topics of the day and others equally distinguished who will inform us concerning their valuable investigations that we, too, may make use of their discoveries. The bulk and backbone of the program, however, will be the timely, carefully prepared presentations of our own members in the sessions

of the various sections Each Section Chairman has worked most faithfully and commendably in preparing for their morning sessions devoted to the specialities. Your Chairman believes these section programs to be of the very highest order and that they will be found intensely interesting.

We are particularly indebted to Dr Krieger and to the Local Committee headed by Dr Henderson for their careful attention to the selection and arrange-

ment of the Scientific Exhibit

The attention to every detail shown by Dr Chas Gordon Heyd, Chairman of the Committee on Arrangements, gives each section suitable space and all equipment and arrangement necessary for the

proper presentation of papers

The cooperation of the hospitals with the Local Committee on Arrangements in preparing a clinical program for Thursday is to be highly commended. These clinics in order that they make full use of interesting current material will not be finally arranged until shortly before the annual meeting Announcement and full schedules, however, will be available on Wednesday, April 29, at 1 00 PM at the Registration Desk and Bulletin Board Every effort is being made to correlate these clinical demonstrations with the scientific program. It is expected that some of our distinguished guests will participate in the clinics

Your Charman recommends that the extra day program be continued, the character of the program to be suited to the particular facilities of the city where the meeting is to be held and to be arranged by a Local Committee with the approval of the Committee on Scientific Work

Respectfully submitted,

WILLIAM A GROAT, M.D., Chairman March 1, 1936

Respectully submitted,
CHARLES H. GOODRICH, Treasurer

REPORT OF BOARD OF TRUSTEES

To the House of Delegates; Gentlemen:

I have the honor to report for the Board of Trustees that the finances of the Society are in a very sound condition. The Board has met as occasion de-

The Board has met as occasion demanded and considered carefully the various items of the budget as well as subsequent appropriations recommended by the Council or the Executive Committee.

These recommendations were generally approved with very little, if any, modification.

The constant aim of the Board has been to conserve the funds of the Society without restricting the legitimate activities of any department.

Due to the alertness of the Treasurer and the Investment Committee of the Board, regarding changes in the market, the position of the invested funds of the Society has been materially improved.

The report of the Treasurer will reveal these changes in detail.

There have been a number of instances, however, when the restrictions applying to Trustees have seemed to deprive the Society of the benefits to be derived from investment in other securities.

After several discussions of this situation it was finally decided to recommend to the House of Delegates that the Board of Trustees be authorized to invest up to twenty-five per cent of the Investment Fund in carefully selected securities outside of those now permitted Guardians of Trust Funds.

Respectfully submitted, HARRY R. TRICK, Chairman March 1, 1936

REPORT OF COMMITTEE ON PUBLIC HEALTH AND MEDICAL EDUCATION

To the House of Delegates; Gentlemen:

Your Committee on Public Health and Medical Education begs leave to submit the following report for the current year, 1935–1936.

Graduate Education

Graduate courses have been given, or will be given, to the following County Medical Societies during the year.

Courses Completed

Cortland County ... Neurology

*Columbia County ... Internal Medicine

*Greene County ... Internal Medicine

Monroe County ... Internal Medicine

Rockland County ... Internal Medicine

Courses Not Completed

*Course was given jointly to both Counties.

A report at this time does not include all the courses which will be given before July 1. For obvious reasons, many County Societies prefer to have a course during the more favorable weather of the late Spring, and have not made the necessary arrangements. However, it is not expected that as many courses as usual will be given, owing to the intensive graduate education concerning pheumonia, which is discussed in another part of the report.

Postgraduate medical education is an annual activity of several County Societies. Except for two of the counties mentioned, all have had courses for several succeeding years. Chemung, Jefferson, St. Lawrence, and Sullivan County Medical Societies continue their record of having had a course each year since this work was started by the State Medical Society. It is now possible to give a joint course in Greene and Columbia Counties, owing to better means of transportation, and they appear in the list after a lapse of a few years. Where previously there were difficulties in carrying on separate courses in these Counties, the need and demand for this work is most satisfactorily met by the combined course. This plan should be considered by other similarly located County Societies. Reports indicate that all courses were very satisfactory.

During the past year, the courses which the Committee provides have been revised in order to keep them up to date. This has resulted in the elimination of a few courses, and in making changes in some of the others. One new course on Obstetrics has been added, and the Committee is considering material for those dealing with other subjects. The Committee is having prepared, when possible, mimeographed abstracts of the lectures. These are distributed to those attending the meetings, in order to give more permanent

value to the talks. The Committee is indebted to the lecturers who have served during the past year, as well as to the physicians who have aided in the organization of courses Past experience has facilitated the administrative details and has enabled the Committee to do its work efficiently and economically Requests for information as to the work of the Medical Society of the State of New York, in furmslung graduate education to its members. have been received from the Idaho State Medical Association the Dean of the Emory University School of Medicine, and from the New York City Bar Association This information has been provided, and advice given regarding these activities

Public Health

With the improvement of organization in postgraduate education, the Committee has had more time to devote to the consideration of other public health matters Postgraduate medical education is one of the major activities which the medical profession contributes to the modern public health program As the duties and responsibilities of physicians increase in such a program, the importance graduate education becomes all the more obvious During the past year the Committee's major attention has been directed to Child Hygiene, Maternal Welfare, Pneumonia Control and Syphilis Control For the purpose of studying these subjects the Committee has continued its previous plan of living sub-committees made up as follows

Child Hygiene Dr Furfax Hall, Churman, Dr Leo Schiff, Dr O Mitchell

Maternal Welfare Dr James K Ouigley, Chairman, Dr Pairfax Hall, Dr Martin B Tinker

Pneumonia Control Dr Russell L Cecil. Chairman, Dr Clayton Greene, Dr O W II Mitchell

Nursing Education Dr Clayton W Greene, Chairman, Dr Russell L Cecil, Dr Martin B Tinker, Dr O W H Mitchell, Dr Peter Irving (Dr Irving serves by special permission of the Executive Committee)

Dr Fairfax Hall was re appointed as representative of the Committee on Public Health and Medical Education on the Joint Sub committee on the Deaf and Hard-of-Hearing Each of the sub committees studied intensively those subjects under its consideration and reported its findings to the whole Committee for approval. The Committee has found this plan to be very satisfactory

Child Hyaiene This sub-committee has continued to work with the County Societies in an endeavor to develop a committee and r program on Child Hygiche in such County Societies which as yet have not organized All County such committees and programs Societies have been notified that federal funds will probably be available to the State Department of Health to expend on Child It is therefore necessary Medical Societies be well Health work that County organized to take the leadership in directing these activities if physicians in active prac tice are to do the work and be compensated for it The Committee has listed the following subjects as suggestions for contemplated activities by County Medical Societies

1 Intensive effort to improve care of pre mature infants

2 Pre School Γχαπιπατίσης 3 School Health Programs cooperation with school health (a) Active authorities (b) Appoint advisory committee (c) Improve forms used for examinations (d) Physical ex aminations by private physicians

4 Children's Health Hour in physicians' office for health measures including immunizations against communicable diseases

A request submitted in August, for information regarding the activities of County Medical Societies in the field of Child Hygiene was followed by replies received from sixteen Counties indicating that four had done a large amount of work six a fan amount while six others had left most of the work to the official health department Recent correspondence with County Medical Societies indicates that there is a growing appreciation of what the County Society can do in this field. Undoubtedly a survey made at the present time would show a marked improvement

Maternal Welfare The sub committee on Maternal Welfare has continued to progress in its work as outlined in previous reports There are now twenty five County Societies with maternal welfare commissions, or simi lar committees Twenty of these have been organized through the efforts of the State Committee Undoubtedly similar commissions have been organized in other County Societies which have not been reported to the State Committee Some of these maternal welfare commissions have been very active, and are developing well rounded programs As previously stated, it is the desire of the State Committee to have a maternal welfare commission in each County Society

The churman of the sub committee, Dr

Quigles, gave an address at the Annual

Conference of Public Health Officers in Saratoga on June 27, detailing the work that had been accomplished by this Committee. He has assisted in preparing programs on this subject, for several County Societies, some of which were public meetings. Dr. Quigley also took part in the program of the American Maternal Welfare Committee on June 12, in which he discussed maternal welfare in New York State.

A conference of the chairmen of maternal welfare commissions of County Societies was held at the time of the last annual meeting of the State Medical Society and a similar conference is planned in conjunction with the next annual meeting.

Procumonia Control. The Committee on Public Health and Medical Education in its annual report to the House of Delegates, presented at the 1935 meeting, indicated the need of a campaign for the control of pneumonia to be carried on with the assistance of other organizations. Such a program is now in operation, being sponsored by the New York State Department of Health, the State Association of Public Health Laboratories, the Metropolitan Life Insurance Company, the Commonwealth Fund, and the Medical Society of the State of New York.

The State Department of Health has set up a separate unit for this purpose under the direction of Dr. Edward S. Rogers. The State Department of Health has also appointed an Advisory Committee, consisting of representatives of the above mentioned organizations. The members of the sub-committee on Pneumonia of the State Medical Society are members of this Advisory Committee.

The purposes of the campaign are, briefly, as follows: 1. Early medical care for pneumonia patients. 2. Laboratory service for rapid type determination and other bacteriological studies. 3. Increased use of concentrated anti-pneumococcic serum when this treatment is indicated. 4. Adequate nursing service for all patients.

One of the important activities of the State Medical Society in this program has been the provision of postgraduate instruction regarding pneumonia. Early in December a letter was addressed to the officers of each County Medical Society inquiring as to what attention the County Society had given to this program, and whether or not, it would care to have the Committee on Public Health and Medical Education provide speakers as part of the scientific program of an early meeting. A group of well-qualified internists, residing in various parts of the State, was organized for the purpose of giving clinical talks on pneumonia, with

special reference to serum treatment. This group included the following physicians:

In addition to these clinical talks, the bacteriological side of pneumonia with a demonstration of the rapid typing method has been discussed by qualified bacteriologists. The purposes of the campaign have been presented by Dr. Rogers, or by some member of the Committee on Public Health and Medical Education of the State Medical Society. To date such programs have been given at the meetings of twenty-seven County Medical Societies, and definite plans. have been arranged for meetings during early March for six other County Societies. Seven County Societies will have such meetings, but have not arranged for definite dates. There are only fourteen County So-Metropolitan cieties, not including the Counties, which have not made plans for such meetings. Considering the short time since this matter was brought to the attention of the County Medical Societies, this record shows keen interest and splendid cooperation on the part of the medical profession. With the exception of six counties, all the details in connection with these meetings, were arranged through the office of the chairman of the Committee on Public Health and Medical Education.

The percentage of attendance at these meetings has been unusually high with intensive interest and good attention on the part of the members. The general comment of the members has been that the programs have been most satisfactory, helpful, and practical. Reports are reaching the Committee on Public Health and Medical Education of the successful results obtained from the use of the antipneumococcic serum Type I, in the treatment of appropriate cases.

While the Metropolitan Life Insurance Company, and the Commonwealth Fund have made appropriations to the State Department of Health to help finance the Pneumonia Control Program, all the work which the State Society has done, has been paid

for from the appropriation made to the Committee on Public Health and Medical Education, by the Medical Society of the State of New York

Your Committee on Public Health and Medical Education feels that medical and educational problems, concerning the Pneumonia Control Program, should be responsibilities of the Committee, through the subcommittee on Pneumoma

The Committee believes that the work of the physicians in the Pneumonia Control Program will prove to be a model of what the medical profession can do in public health work This is evidenced by the very active participation of the medical profession The activities of this Committee demonstrate that the State Medical Society is well-organized to cooperate in a modern health program and can bring its forces into immediate action

A supplementary detailed report of the Pneumonia Control Program will be presented later. It is hoped that the material necessary for this support will be collected so that the report can be published before the time of the Annual meeting of the

State Society

Nursing Education This committee has no report to make on this matter, in view of the fact that there has been no general agreement during the present year for changes in nursing education. It is advisable that this sub committee be continued

Deaf and Hard-of-Hearing The joint subcommittee on the Deaf and Hard-of-Hearing, which represents the Public Relations Committee, and this Committee, will make its own separate report

Syphilis Control

Early in the year the plan for the control of syphilis, proposed by the New York State Department of Health was submitted to this Committee for study meeting of the Committee on June 26, the following resolution was adopted:

"The Committee on Public Health and Medical Education has studied the plan for the control of syphilis proposed by the New York State Department of Health ures for the control of syphilis should include the following

1 Intensive epidemiological investigation of recent syphilitic infections

2 Adequate facilities for diagnosis and treatment of all persons with syphilis and special care and attention to those with communicable

3 Compensation of physicians for services to patients unable to pay Compensation for services in clinics

These measures are necessary if the number of infections is to be reduced and the disease eventually eradicated. The Committee believes that the proposed plan provides for these necessary control measures, and that it conserves and protects the interests of physici ins and patients

The Committee on Public Health and Medical Education recommends that the Medical Society of the State of New York approve the plan for syphilis control as proposed by the New York State Depart-ment of Health?

This resolution, with slight change, was approved by the Council at its meeting m December

General Comments

The Committee has held four general meetings during the year as follows June 26, July 30, and October 19, 1935, and February 20, 1936 The Sub-committees have met from time to time as occasion necessitated

The Committee wishes to acknowledge the cordial and cooperative relations that have existed between the State Department of Health and the Committee on Public Health and Medical Education At the annual Health Officers' Conference in Saratoga the chairman of the Committee presided at one session, and three of the members of the Committee gave addresses at different sessions

In the last annual report the Committee expressed the view that future health problems must be concerned more and more with the individual practicing physician and stated that it was prepared to offer its services in advising County Medical Societies to this end The Committee is very happy to report that during the year there has been a marked increase m the interest of County Medical Socities in these programs, and has frequently received letters requesting advice and information from public health committees of County Medical Societies

The Committee and especially its chairman wishes to acknowledge the fine cooperation which it has received from the President, the other officers, and the other Standing Committees of the State Society during the present year. The Chairman wishes to express his appreciation of the unselfish service of all the members of the Committee

Respectfully submitted,

THOMAS P FARMER, M D, Chan man March 1, 1936

REPORT OF COMMITTEE ON ECONOMICS

To the House of Delegates; Gentlemen:

1. Tangible progress has been made during the year just past. Some of the issues which concern the profession—as the activities of foundations, contract practice, the practice of medicine by hospitals, law revision, compulsory health insurance—have become more clearly defined and, therefore, some of the problems, arising out of our civic-social environment, are nearer solution. There is an increasing recognition that the public and the profession have a common or mutual interest in the maintenance of a reasonable economic security for the practicing physician. More cordial and understanding relations have been promoted between the profession, as represented by its officers and committeemen, and the public and private agencies, as represented by their administrative heads. The successful undertaking by the County Medical Societies of responsibilities in relation to the care of injured workmen has gone far in correcting bygone abuses. It has awakened the profession to the possibilities of a more perfect organic structure for the administration of those matters which concern us individually, but, which must be handled by collective action.

The practice of medicine is not unlike a door—there are two faces or aspects, inseparable yet distinctly apart—on the one side are the biologic problems of diagnosis and treatment, while on the other side, are the economic problems. The old order of organization has served one side admirably. A new order of organization is needed at this time to deal with the economics on the other side.

2. We felicitate the Society upon the progress made in setting up an amended law for the care of the injured workmen. The recommendations of this Committee reported in 1933, after slight alteration by the special commission, appointed by Governor Lehman, passed thru the Legislature with only slight modifications and are now law. In the metropolitan industrial centers conditions certainly are improving; many of the old abuses are disappearing, and this considerable field of practice is being returned to the more responsible members of the profession. The Committee on Workmen's Compensation will report on the tasks yet to be accomplished in this direction.

3. Injured workmen engaged under the Works Progress Administration are beneficiaries of the United States Compensation Law. Negotiations with the responsible authorities have resulted in turning the care of these Federal workmen into the same status as workmen who are employed in private industry. This is true at least in those counties in which the local Medical Society board has registered the list of "enrolled physicians" with the State W.P.A. Administrator.

New York City (five counties) is a separate district and the negotiation for similar arrangement has not been effected. In the city of Buffalo the arrangement is not working satisfactorily due to the transfer of a large number into the facilities of the Marine Hospital maintained at this point by the Federal Government.

Public Works Administration (P.W.A.) should not be confused with Works Progress Administration (W.P.A.). Employees on P.W.A. projects have the same status as employees of any other employer of industry—the state Workmen's Compensation Law applies. (See bulletin published in March 1, 1936 JOURNAL, page 366).

4. In Niagara Falls the local County Medical Society has transposed the terms of the Compensation Law into a proposition to the city council for the care of the poor and unemployed who are on relief. Acceptance has not been accomplished at the time of this writing. Whether it succeeds or not, it represents an excellent demonstration of local initiative and splendid cooperation with civic authorities.

There is also pending at this time a proposed amendment to the Welfare Law which will eliminate the "contract" doctor for the care of the community poor and will substitute service of a private physician in the home of the patient—with compensation for the service. This amendment includes cities as well as rural areas.

5. The Gradient Plan. This Committee has presented a statement of a program which embraces many different features, thru which every person may have needed medical care upon terms or conditions economically sound and just. Organized medicine cannot hold public confidence thru a multiplicity of plans and a declaration that no one of them will fit every locality. Of course, this is true. The need is for a single designation under which the local medical group, cooperating with other agencies, can exercise a directing control and establish those provisions which are suited to the local conditions. More of our public could be retained in a self reliant status if in every community

there were one office or institution, sponsored by the medical profession and associated interests, where anyone needing advice or guidance could go with assurance of receiving sympathetic and helpful counsel We believe it would be comparatively easy to educate the public to become familiar with and to utilize such scrvice

The pamphlet on The Gradient Plan was circulated to stimulate thought and comment. Considerable response has been received. Members of the Committee have been presenting a discussion of the subject before many of the local County Medical Societies We would only emphasize here that this is not a finished plan ready to be proposed for adoption. We are still soliciting further comment still developing details Some parts of the plan can be adopted immediately thru the initiative of local County Medical Societies Some of the features of The Gradient Plan, of course, will require recasting of law details and a better coordination of all parties of interest in the promotion of health and welfare

We recommend that this Society formulate, within the framework of the ten points or principles of the American Medical Association, a program of which The Gradient Plan is an illustration Such program should be uniform in all localities and susceptible of adjustment of details Then, every feature, demonstrated by experience to be sound can be utilized insofar as it is suited to local conditions Discussions thus may become less tangential and each established gain will fit into an orderly system of the complex civil and social environment

6 Law Revision The project of revision of health and welfare laws has been discussed in previous reports and is being actively pursued. This is an instance in which time and persistent effort are required The interests are multiple and nothing can be accomplished without legislative action. The task requires the study of a properly constituted state commission representing all points of view

7 In Brattleboro Vermont, there has been operated a voluntary type of insurance which has proven satisfactory to the public and the local profession after several years' experience Mr Richards M Bradley, Trustee for the Thomas Thompson Fund, has resources available and a desire to establish a demonstration of this type of insurance in New York State At the time of writing, a bill is before the Legislature which, if enacted, will amend the Insurance Law of the State and mile this and other demonstrations possible. This is true insurance-it provides the money to pay the expense of sick care without coming between the patient and those who serve his needs

There are those who fear the development of any type of "voluntary insurance" because in the experience of European countries it has invariably led to governmental regulation in the form of some kind of a state compulsory insurance. This sequence has developed because the medical profession has traditionally held aloof from rational consideration of the financial aspects of then service. If our organized units will assume reasonable responsibilities, the known possible abuses of "voluntary" insurance will not occur. It was the abuses which developed in the voluntary systems that led to governmental regulation

8 Foundations The past year has witnessed a change in our relations with the directors of several foundations. There is now a better acquaintance and understanding Continued developments may bring more than a visionary hope that in the immediate future years financial support for truly constructive efforts, under the guidance of the medical profession, will be avulable from such sources

9 The Committee would be derelict if it failed to direct attention to the serious threats now impending over the economic security of the profession. One is the competition of hospital institutions. The other is the growth of commercialism under the beneficient guise of "contract practice" of medicine

10 In less than a decade hospital institutionalism has risen to a preemment place in the care of the sick. Over-building and extravagance and in some instances maladministration have brought these enterprises into financial difficulties, even before the effects of the general industrial depression Free medical carc to great numbers of persons above the need of charity and fully able to practice some measure of self reliance is part of the disturbing situation Many hospitals have educated the people to believe that it is they who are the donors of this service. Their importance has been emphasized and the part played by the generosity of the profession goes without knowledge or notice in the public mind

Many hospitals have extended their

claims as being the donors of professional service to that of being the vendors of our gratuitous service. The theory of "clinic fees" constitutes an exploitation of the medical profession. The hospitals have not stopped here. Instances can be cited where some hospital corporations are now "buying and selling" professional service for profit. When the enactment of the amendment to the Workmen's Compensation Law became effective some hospitals asserted a right to a license to conduct a "medical bureau" thru which to commercialize the care of injured workmen—they yielded reluctantly upon authoritative ruling by the Attorney General.

May we point out that the hospitals are in a position to establish a devastating competition against the individual physician. The hospitals are in a position to violate every rule laid down for the conduct of the ethical physician. We enumerate. They gain public favor by news publicity which often includes frank advertising. Claims of superior service are supported by self praise. They practice the inducements of "cut rate" or "small unit" fees. Added to this, hospitals enjoy tax exemptions. They may indulge in annual deficits which are met from funds solicited in the name of charity and this without sacrifice of dignity or prestige.

The medical profession will suffer demoralization and pauperization if this challenge is not aggressively and successfully met. We must be the masters in our own house or else become enslaved to institutional service and lay-minded regulation.

11. Of even greater danger to the moral integrity of the profession is the threat of commercialization of medical care thru "contract practice" in some of its forms. In some parts of this country failure of organized medicine to assume a firm stand and to establish sensible regulation, and in some instances with actual condonement or such practice, has resulted in a loss of public respect and confidence. This Committee has under consideration the matter of setting up restrictive specifications limiting the range of contracts which an ethical member in good standing may make. This is a challenge of first degree importance. Success in meeting it depends upon wholehearted cooperation of the profession. If we fail, and if commercial exploitation of the public become general, we may reasonably expect some form of bureaucratic medicine to be established by popular demand.

12. Neighboring States. Continued cordial cooperative relations with economic groups have been most helpful and gratifying. All the northeast states have common problems. The exchange of experiences and discussions of methods has been valuable. Success of this Committee in some details of its work has been largely due to team work with our neighbors and we would be grossly unappreciative did we not here make acknowledgment of it.

13. County Medical Society Contacts. During the past year your Committee has endeavored to establish a more intimate and personal contact with all County Medical Societies. Each member has assumed the task of visiting his neighboring County Medical Societies. We believe a much larger number of the State Society membership has become familiar with and interested in the work of this Committeewith mutual benefits. We are sure that we have become better acquainted with local problems and needs. We are convinced that pursuit of this program will give State organization a more practical and composite unity, both as to thought and action.

14. Bulletins. We have continued the issuance of "bulletins" as circumstances justified. The correspondence of the Committee has become a tremendous task. We have received regularly a large number of Medical Society bulletins, from which we have received great benefit and inspiration. The most hopeful aspect in the field of medical economics is the evidence of a widespread awakening to its problems and an energetic determination to solve them.

May we conclude our report with an acknowledgment of deep appreciation for the very friendly and generous assistance and encouragement of the officers and committees of the State and County Medical Societies, which has made our work possible and most pleasant.

Respectfully submitted,

FREDERIC E. ELLIOTT, Chairman JOSEPH P. GAREN MORRIS MASLON FREDERICK M. MILLER WALTER M. MOTT HOMER L. NELMS JOSEPH C. O'GORMAN ALFRED E. SHIPLEY GEORGE C. VOGT CASSIUS H. WATSON EDWARD T. WENTWORTH FREDERICK S. WETHERELL

March 1, 1936.

REPORT OF THE COMMITTEE ON PUBLIC RELATIONS

To the House of Delegates, Gentlemen

At the last meeting of the House of Delegates there were three matters assigned to the Committee on Public Relations to investigate and to finally report upon They were

1 That the care and examination of school children with defective eyesight be entirely in the care of physicians

2 That hospitals for insune and tubercu lous patients should from time to time report to the physicians regarding the progress

and condition of these patients

3 That individual county societies appoint active committees for the purpose of bringing before the public and the lay press their point of view in medical questions arising in their own counties.

I beg now to report on these three mat

ters in the order presented

In the study of the first issue (the care and examination of children with defective eyesight by physicians only) the Committee met with members of the Department of Education and found that there are authorized and chartered under the Board of Regents two schools of optometry. The Regents have prescribed curricula, have established an examination for licensure, and successful candidates are given certificates legalizing their work in refraction only. Hence by law they are a group licensed to practice and may live as their clients any individuals who wish to avail themselves of their work. The Division of Higher Education controlling their license and supervision feels that it cannot discriminate against the optometrists in refraction work. It is readily seen that if this body wishes this matter pressed further it must consider a change in law Turthermore, as your Committee had received some communications from county societies speaking of some irregu larities developing in the examination of the eyes of school children, a conference was held with the optometrists and the Department of Education The final re sult of such efforts may be stated briefly as follows That the Society of Optometrists has a code of ethics which is copied from the code of ethics of the Medical Society of the State of New York If any of their members are guilty of unprofessional conduct they welcome receiving specific information through formal complaint

From the facts above stated, your Committee has no recommendation to make on this matter

The second matter which this House at its last meeting passed to our Committee is "That hospitals for insane and tuberculous patients should from time to time report to the physicians regarding the progress and condition of these patients" From the Department of Social Welfare of the State it is learned that there were 17,000 patients last year in tuberculous hospitals, and the Department of Mental Hygiene had 61 499 patients registered in the insane hospitals of the State, a total of 80 000 Under the circumstances, it seems to your Committee that to report from time to time on each of these patients would be a very considerable undertaking, particularly if the report was complete enough to really tell something of the status of the patient. Patients with these illnesses really require individual letters from an intimate knowledge of the patient, or else the letter is of little use Although a form letter simply stating that the patient is improved, or no better. or worse is not impossible even with such large numbers, yet on the other hand it cannot mean too much with patients who often have such variable periods of intprovement or adverse progression Both departments mentioned above feel that the routine letter writing would be almost beyond their power to execute, and vet both state that it is now a common practice to write any physician who wishes information concerning patients

Your Committee believes and recommends that physicians who have prtients in the tuberculous and insane hospitals of the State should individually ask for

reports on such patients

The third resolution which this body asked us to study and report upon has given considerable discussion Your Committee believes that the matter is one of great importance and has greater implications than would appear at first glance. That a better public relationship should be set up at many local and county areas there is no question. It is the only way that local matters can be handled properly Early in the year your Committee communicated with the chairmen of the Public Relations Committees of all our

County Societies asking them to acquaint us with their problems. This was done with the idea of sorting out from local relationship problems some rather uniform ones that were the concern of many counties. It was quickly found that most of their problems were purely local and should be adjusted through local means. Most of these problems arose through the fact that a single group in the community was trying to foster some pet thing. I may have been a hospital group, or a social group, or a school group who independently was trying to put over some program. These circumstances occur hundreds of times a year in the State of New York, and they only serve to show that there are many local problems which do not have local machinery to work them out in a satisfactory and successful manner.

After much deliberation your Committee is bold enough to suggest that one of the problems of medicine is to develop a local machinery for the study and solution of many of its public health-relationship problems. There are in any local community many agencies working in healthrelations matters, and if there is to be a successful solution of local issues, there must be a pooling of interests by these agencies. This union tends to do away with diffuseness of effort and misguidance and misunderstanding which have been so prevalent in the past. The formation of a council or a community community health-relations council offers a machinery which has been worked out and which has been eminently successful in its undertaking. In this organization all the recognized health agencies become members. The purposes of such a council would be:

1. To coordinate and facilitate the work of the component agencies.

2. To assemble and make available facts calculated to promote the health-relationship

problems of the community.

3. To comprehend the local situation, its needs, the resources available to meet them and to further the adjustment of these resources to the needs.

4. To delegate responsibility for specific

undertakings to particular agencies.

5. To initiate projects shown to be desirable.

6. To act as a bureau of information for any organization or individual seeking in-

formation on health—public relationship activities or agencies.

With the formation of a community health-relations council of such character and defined purposes, it speedily receives community recognition. Matters which it brings to the community are received with thought and cooperation is attained. Such a council eliminates individual striving and duplication of effort. It is able to properly consider the important community problems, as well as to eliminate the uselessness of working on unnecessary problems. One might argue that in such a group a proper medical viewpoint could not be obtained. Experience has shown, however, that the deliberations of the body are guided by its medical representatives. All the members of the council recognize that we have been appointed as a special group by the State not only to bring average intelligence and ability to the care of those intrusted to us, but also to preserve in every way possible the health relationships of the people of the State. Furthermore it is equally recognized that we are acquainted with these problems better than any other group and are the only group who know the machinery for working them out. This type of organization allows us then to again take the leadership and guidance in all public health-relationship matters to the ultimate good and better health of the community.

Studies of Other Matters

In addition to the study of the matters referred to by the last House of Delegates, your Committee undertook to study six other matters that we believed were of key importance in continuing to carry out soundly our responsibility to the public as well as to develop a continuing wholesome attitude in the public's mind toward our efforts in the execution of our relationships and the proper guidance in the solution of these relationship prob-The program included:

1. Studies of the Malpractice and Grievance Committee cases with the object of reducing the number of such cases.

2. Studies on hospital interns including the number practicing in the State without licenses and the number of interns here who are not permitted to take the licensure

3. Studies in the licensing of foreign

trained physicians with the idea of determining if there is an abuse or not

4 Studies working towards a closer professional affiliation with the legal profession

5 The health surveys of school children, particularly as to the relation of the practicing physician to these surveys

6 Continuing investigation of the problem of the hard of hearing of our State

In the order mentioned each of these subjects will be briefly presented, conclusions drawn and recommendations made

1 Malpractice cases and grievance minities problems. The Committee committee problems recognizes the thoughtful and prinstrking work of the individuals and bodies dealing with these problems. It is further aware that there are yearly reports on the work done by both these divisions is conscious of the fact that in the State Journal there are quite regularly important contributions from the Legal However, in the study of the Grievance Committee cases for a period of a year we found that there were seventy one cases before that body, not a great number, and yet many of them unnecessary and inadvertently crused by thoughtlessness on the part of the doctors We will all agree that all such actions brought against any members of our profession remain as stains in the minds of some of the public, and there should be a more determined effort to minimize such charges

Of the seventy one cases before the Grievance Committee, it reports that twenty were from unethical conduct. This is accurate but not as informative as it should be It is thought that one should know the causes of unethical conduct in these cases and in a general way from this information the profession can be requainted with the pitfalls that have put others into trouble. It is not meant that cases are to be cited or names indulged in but from the study of the causes, general statements can be made from time to time which should eliminate at least some of this difficulty Your Committee believes that a closer relationship between the Grievance Committee and the Legal Division should be maintained with this thought in mind It further believes that from such studies made information of a general character should be sent to the Charmen of the Public Relations Com mittees of the County Societies, where ultimately such information should get, if one is to accomplish anything along this line

Other cases before the Grievance Committee were from improper advertising, and yet many of these individuals did not know they were indulging in implicating practices

Again such matters as aiding and abetting, and fraud and deceit were common reasons for appearing before this Committee. A study of each of these issues should yield information which, if placed in front of our profession would keep some from thoughtlessly indulging in practices that have befallen their brethren.

It is understood that the above plan for meeting this important relationship problem does not in any way minimize, detract or yet replace any of the work of these two divisions, but has as its object the intimate study of causes which the rank and file should finally be acquainted with if they are to be aided in keeping out of difficulty that has myolved others

It recommends

1 That a closer relationship between the Public Relations Committee the Grievance Committee and the Legal Division be established

2 That ifter a study of the cruses of these cases is made, such information in general form be presented to the Chairman of the Public Relations Committee of each County Society when and if such communication receives the endorsement of the House of Delegates the Council or the Executive Committee

2 Hospital Interns State supervision of interns is under the Department of Social Welfare The law allows interns in recognized hospitals to intern and practice there without a license Board of Regents of the State of New York allows only interns of recognized Grade A schools to apply for licensure in the State Yet a partial survey on interns discloses the fact that there are about fifty graduates of unrecognized medical schools who are interning throughout the State The survey is not complete, and there may be moderate in-creases. This seems paradoxical that the State allows interns to practice within its borders who are graduates from medical schools that are not recognized by the State and whose graduates cannot even apply for licensure. Your Committee believes that this is an untenable situation and recommends:

That the Department of Welfare and the Department of Education be asked to take steps to eliminate the situation, and that hereafter only graduates of medical schools recognized by the Regents of the State of New York be allowed to intern within the State.

In further study of the intern matter your Committee finds, from a survey of the Department of Social Welfare and a special committee studying the intern situation in New York City, that there are in up-State hospitals 415 interns, of whom 171 are licensed in the State; and in New York City there are 1,550 interns, of whom 749 are licensed in the State. The survey is not complete, but it shows that New York State is educating from twenty to twenty-five per cent of the interns of the country, and that only onehalf of the interns in our State are licensed to practice here. This matter is receiving continued study by your Committee with the idea of eventually arriving at a decision as to whether or no all interns should be compelled to be licensed in the State.

At this time your Committee is not qualified to recommend concerning this matter.

- 3. Forcign Physicians. The study of the subject of licensing foreign graduates in medicine shows that these graduates fall into three groups:
- 1. Young physicians educated in their native lands who come here and are admitted to the regular medical licensing examinations

2. Foreign physicians who have been established in practice in their countries for a certain number of years and come here and apply for licenses without examinations.

3. American students who go to foreign countries for their medical education and are licensed in foreign countries and then return to this country in order to practice.

Applicants for examination in the first group include graduates of governmental institutions or universities in Great Britain, France, Germany, Austria, Switzerland, and Italy. Schools in South and Central America and Mexico are not recognized. Applicants were formerly taken from Russia but are not now

accepted. In one or two cases there have been applicants from other countries, and in those cases their preliminary education has been carefully investigated and their cases handled individually. In case their preparation is considered comparable to ours, they are permitted to take the regular examination. The mortality of the first group of applicants is very high. Failures average about thirty-five per cent annually.

The second group is composed of native Europeans who have been well-established in practice. Many of them are distinguished men. A considerable number of these settle in New York, partly because many other states do not allow them to come in unless they are full citizens, and partly because they feel more at home in New York City.

The number in the third group is not great at present. Probably not over 125 in the whole State are studying medicine abroad, and yearly this number is growing smaller.

Further investigation discloses the fact that during the past ten years there have been about one hundred graduates of foreign medical schools admitted yearly to practice in New York State. In the year 1933 there were ninety-eight admitted to practice in New York State out of 184 who came to this country. In 1934 there were 299 graduates of foreign countries licensed to practice in the United States, and 217 of this number obtained licensure in New York State. In 1935, 157 graduates of European medical colleges were licensed, after examination, in New York State, and sixty-five graduates of foreign schools received licenses by endorsement. The law of New York State regulating this matter does not allow of any adjustment unless it is changed. The Division of Immigration of the United States Labor Department informs us that there is no attempt at regulating the number of physicians who wish to enter the United States. Authorities tell us that we have 25.000 doctors too many, and yet our doors remained open to literally thousands in the past ten years. It seems that this matter is of wider interest than is at present claimed and is a matter that should be taken to our National body.

Your Committee recommends:

That the delegates from the New York State Medical Society he instructed to present the matter to the House of Delegates of the American Medical Association isking for a comprehensive investigation of the matter and such action after study as seems wise

4 The Legal Profession During the past year your Committee has given some thought to the establishment of a closer professional affiliation and understanding with the legal profession We believe that these two great professions should work in greater harmony in matters that The impression involve both of them is current in the legal profession that the doctors often take advantage of their prerogatives at their expense, and our profession ofttimes believes that the legal profession takes advantage of them Certainly these two great bodies contact frequently in legal and legislative matters, and it would seem that nothing but good could come from the more intimate understanding of each other's problems and The Committee is not able at this time to offer concrete recommendations, but believes that the matter is one which deserves further study and conference, and at a liter time it hopes to be able to make recommendations con cerning such a relationship

5 Lyamination of School Children The Department of Education by law re quires school children to present a health certificate yearly on entering school. On account of economic difficulties many of the families of children have found it impossible to have their children exammed by their physicians, as they have no funds to pay for the same. This has led to an attempt to have this work in part carried out by school physicians. It has been found that in certain localities the school physician has attempted to examine from forty to sixty children an hour One cannot be satisfied with such superficial work. At best it is only a visible inspection. If the children of the State are to be educated in the value of periodic health examinations they should be impressed by such a standard of work as will favorably influence them to continue these yearly examinations through life A school physician cannot possibly accomplish this end On the contrary, the superficial inspection would leave bad

impressions and eliminate in the minds of some forever the thought of yearly exanimations The Department of Education recognizes that annual examinations should be made by the family doctor and is anxious and willing to do all in its power to see that such conditions obtain However, ultimately the matter depends upon the attitude of the local superintendents and the local school boards. If they so desire they can add to their hudgets a certain amount to be used to pay the family doctor for the examination of the child of the indigent family We find that in some communities this is done It becomes then a local problem as well as a state-wide problem. Those localities which have the proper machinery for the solution of medical relationship problems are in a better position to handle matters of this kind than those who have no machinery. This is only one of many local problems which show the absolute need of local machinery such as is described in the fore part of this report when it emphasized the need of a Health-Public Relations Council for at least every

county unit Although much might be gained by this local approach of the school child exammation problem, your Committee believes that there are added matters of fundamental importance in this issue Within the Department of Education there is a Health and Physical Education Division Under it the 1,470 school phy sicians work to care for 880,000 school children Until recently a physician was in charge of this Division It would seem that the matter of health of school chil dren far transcends the matter of their physical education If this be true, it would seem that a physician should guide the important part of the work of this Department of Education Division The section on Physical Education has as its function the teaching οŧ mimetics. rhythms and dances, games, calesthenics, drills, athletics, stunts, marching tactics, and apparatus drills Although we recognize the importance of these activities for growing and developing children and young adults, yet we cannot conceive that they are of greater importance than the health problems of those same children In the recent appointment of a nonmedical man to the headship of the Division of Health and Physical Education we are fearful that a proper viewpoint of health matters may be lost and that proper cooperation and development in the Division will suffer. We believe the problem is of great importance and recommend:

That a special committee be appointed to investigate the entire matter and in particular to determine whether health matters in the schools would be best served by remaining in the Department of Education or whether they should be transferred to the Department of Health.

- 6. On the Deaf and Hard of Hearing. The Sub-Committee on the Deaf and Hard of Hearing has worked very diligently during the past year. Dr. Hambrook, of Troy, is chairman of the Sub-Committee; Dr. Fairfax Hall, of New Rochelle, is the other member; and Mrs. Estelle E. Samuelson is the Secretary. Many important phases of the problem have been studied, of which the following are examples:
- 1. The idea of raising the standard of the otological care of children in the schools for the deaf.
- 2. The elimination of moderately hard of hearing children from the schools for the deaf.
- deaf.

 3. The possibility of admitting children at an earlier age to the schools.
- 4. The desirability of reporting hard of hearing and deaf children.
- 5. The annual otological examination of school children through scientific means.
- 6. The conservation of hearing of all school children.

These and many other phases of this very important problem have received thoughtful consideration. Although progress is being made, yet it seems too slow for the amount of effort and thought given to this issue over the past few years. The Sub-Committee has been active in creating interest in the subject. Radio talks have been given, papers have been presented before medical and lay groups, sub-committees have been formed in many of the county societies, and an exhibit was held last year at the State meeting. Through the cooperation of the State Department of Health and Education one hundred hard of hearing cases were selected for treatment from the counties of Tompkins, Westchester, Albany, and Rensselaer. Each case had been certified by the Educational Department and then placed under the care of an otologist selected by the County Medical Society. Nominal fees have been allowed for this work. Much good should come from this project. It will not only have a decided educational value to those intimately interested in it, but some of the children, through early corrective treatment, may be prevented from having more serious loss of hearing. In a few scattered places throughout the State scientific hearing tests have been given to the school children, and through these many cases of beginning deafness have been discovered.

Although the above are steps forward in this very important problem, yet what has been accomplished does not seem commensurate with the tremendous effort that has been made. The issue of the hard of hearing has been so long carried on by precedent surrounded by legislative regulation and so completely isolated from other health issues, that constructive direct approach is almost impossible. The loss of hearing is a very serious hardship to every citizen, and modern methods of study, investigation and management should be speedily available to all children who show a beginning loss of this function.

After much discussion your Committee believes that the matter merits serious consideration from this body and recommends:

That the Governor of the State of New York be petitioned to appoint a commission which is to include members of the Medical Society of the State of New York to thoroughly investigate the problem of the care of the deaf and hard of hearing children of the State.

Finally, the chairman wishes to recognize the splendid cooperation of each member of the Public Relations Committee, who have all worked diligently and loyally to the end that we might constructively add something to our relationship to the public.

L. F. Warren, Chairman H. H. Bauckus A. J. Hambrook A. F. Heyl D. J. Kaliski W. H. Ross W. Wooden

REPORT OF THE COMMITTEE ON ARRANGEMENTS

To the House of Delegates, Gentlemen.

The Committee on Arrangements for the 130th Annual Meeting of the Medical Society of the State of New York wish to report to the House of Delegates that all of the activities connected with the forthcoming Meeting will take place in the Waldorf Astoria Hotel, New York City

The Executive Committee approved of the following Committees the General Committee of Arrangements, Committee of Publicity, Committee of Broadcasting, a local Committee of Broadcasting, and a local Metropolitan Committee for the Banquet, a large Committee of 'Key" Hospital Men for the purpose of listing the Clinic Day, Thursday, April 30th, 1936 The membership of these Committees has been published in various issues of the Journal of the Medical Society of the State of New York and are not herewith listed

The Scientific Sessions in charge of Dr William A Groat have been able to procure the assignment of Assembly Halls for the Scientific Sessions of the Meeting The arrangement is particularly advantageous to the members of the Society in that all the Scientific Sessions will be field on one floor level, with the addition of the Grand Ballroom

Scriatim the Program for the Annual Meeting is as follows

Monday, April 27th

10 A M —Convening of the House of Delegates, Grand Ballroom, Waldorf-Astoria Hotel

6 30 r M — House of Delegates Dinner, Starlight Roof (Price of Dinner, \$4 00)

Tuesday, April 28th

10 AM-House of Delegates, Sert Room, Park Avenue Untrance

10 AM—Opening of Scientific Sessions 2 PM—General Meeting—Grand Ballroom

7 PM —Annual Meeting, Medical Society of the State of New York

7 PM —Bunquet, Medical Society of the State of New York

9 i M —Reading of the Minutes of the last Annual Meeting, Dr Daniel S Dougherty, Secre-

> Introduction of Distinguished Guests, Dr Chas Gordon Heyd, Toastmaster

> Address by Dr Trederic E Son dern Retiring President, Medical Society of the State of New York

> Address by Rt Hon Lord Horder of Ashford, Chief of Medical Service St Bartholomew's Hospital London England

> Address by Dr Willard C Rappleye Denn, College of Physicians and Surgeons, Columbia University, New York

> Address by Dr William M Lewis, President, Lafayette College, Paston, Pa

10 30 PM -- Reception and Dance, Starlight Roof

Wednesday, April 29th

9 AM -Scientific Sessions

2 PM -General Meeting, Grand Ballroom

8 30 Р м -- Ореп Гогит

Opening Remarks by Di T T Sondern, who will preside What the Community Should Know About

Diabetes Dr Albert A Erstein, New York City

Appendicitis Dr George P Muillr Stuttering and Stammering Dr James S

Greens, New York City

Failing Exessight Dr Arthur J Broell,

Albuny

Gotter Dr Chas Gordon Heyd, New

York City

Infantile Paralysis Dr Louis C
Schroeder, New York City

Common Colds Dr A RAYMOND

DOCHET New York City

Quacks and Quackery DR Morris FishBrin, Chicago, III

Thursday, April 30th

Chinics in all specialties in all of the public and voluntary hospitals in Manhattan Schedule of Clinics will be available at noon

dule of Clinics will be available at noon, Wednesday, April 29th, at the Registration Booth, Silver Corridor, Waldorf-Astoria Hotel-Lexington Avenue Side The Commercial Exhibits under the direction of Thomas R. Gardiner have been extended and increased with remarkable degree. They will occupy the entire Fourth Floor of the Lexington Avenue part of the Waldorf-Astoria Hotel, together with the East and West Foyers adjacent to the Grand Ballroom.

The Scientific Exhibit in charge of Dr. William A. Krieger, assisted by Dr. John Henderson and Dr. Eilif C. Hanssen, will occupy the two sides and rear of the Mezzanine of the Grand Ballroom Floor and will comprise fifty-five booths of uniform space, allotted to fifty-five exhibitors.

In addition, a motion picture theatre has been created as part of the Scientific Exhibit, Cloak Room Section of the Grand Ballroom. It is proposed to give motion picture displays in rotation, continuously from 10 A.M. to 6 P.M. on Monday, Tuesday, and Wednesday of the meeting. The names and titles of the Scientific Exhibitors are published elsewhere in this issue of the Journal.

Respectfully submitted
Chas. Gordon Heyd, Chairman
March 1, 1936.

REPORT OF COMMITTEE ON LEGISLATION

To the House of Delegates; Gentlemen:

Your Committee on Legislation has been in conference six times during the year, three times prior to January 1. On one of these occasions it conferred with the legislative committee of the State Hospital Association and understandings were reached with regard to the introduction and support of a joint lien bill. Another of the conferences was with the Legislative Advisory Committee which you authorized to be appointed, at which time we outlined a program for securing the utmost support both of the physicians and organized lay groups for supporting our position on legislation. It was agreed that members of the Advisory Committee should give more than the usual amount of attention to commenting upon bills that would be sent them and also assist in stimulating County Chairmen. It was announced at this meeting that the chiropractors were showing unusual activity; that they were publishing a journal in Westchester County and selling stickers similar in appearance to the Christmas seals.

The first meeting of the Committee in the new year was held about the middle of January, at which time the bills that were then before the Legislature were carefully reveiwed and action taken; also plans were developed for the annual conference with the County Society Chairmen, which was held in Albany on February 6. Twenty-eight County Societies were represented at this conference and the Advisory Committee was

also in attendance. All of the bills before the Legislature at the time were carefully reviewed and action taken on those that had been introduced since the last meeting of the Committee. Up to this time no lien bill had been introduced and the Committee on Economics had requested that a bill which it prepared be given consideration. The Committee recommended that certain changes be made in the bill before it should be introduced, and requested the Economics Committee to have the changes made. The bill was sent to the Society's Counsel for revision and the revised copy has only recently been received.

A conference requires that each member sacrifice a day from his office and practice and costs the Society the travel expenses to Albany and return. The Telephone Company, through its conference department, suggested that we could hold conferences from our offices. At a time we might mention they would give us each a clear wire that we might use without interruption as long as we desired. Such a conference was held on February 27. The day preceding, each member was mailed for study a copy of each bill that was to be considered at the conference. At the time stated we were all connected and proceeded to discuss our business in much the same manner as we would have done had we traveled to Albany, with the only difference that we could not see each other. In the office at Albany, Dr. Lawrence and Miss Briggs took stenographic notes of the transactions. We are pleased to report that the conference was very

satisfactory and the expense to the Society was approximately the same as is incurred by the other type of conference. We are planning another such conference for Sunday, March 8, and on Thursday, March 12, we shall have a meeting in Albany with our Advisory Committee

From the Legislative Bureau the usual informative bulletins are being distributed to the County Chairmen and all of the members of the various County Society Legislative Committees, as well as to many others who are interested in and supporting our work, and copies of the bills considered are being sent to the chairmen of each County Society Committee as promptly as they are received from the printer. To date we have issued eight regular and three special bulletins and have distributed sixty-four bills

Thus far the usual autivivisection bill has been introduced, and four chiropractic bills. Three lien bills, two providing for hospitals alone and the third for hospitals, physicians, and nurses, and a number of amendments to the Workmen's Compensation Law, are before the Legislature Some of the latter are very objectionable, if enacted they would do great harm to the Compensation Law enacted last year

A bill proposing that the medical inspection of school children be transferred from the Department of Education to the Department of Health has been introduced and is producing a great deal of comment The bill is the result of the reaction to the appointment by the Department of Education of a layman as Director of the Division of Health and Physical Education

The Committee has had introduced, by request, a bill limiting the licensure of foreign physicians without examination to those graduated from schools registered by the Department of Education, and requiring that all others take our State Board examinations There is another bill, introduced by Assemblyman Conway, which requires full citizenship of all who apply for licensure, and a bill prohibiting physicians from advertising for patronage, similar to one enacted to the Dental Law last year

The work of the Committee is heavier than in any preceding year, as a matter of fact, it is growing heavier annually and it is bound to do so as long as we are obliged to protect the public and ourselves against those well-wishers who are inclined toward socialized medicine. The Health Insurance Bill of last year was reintroduced but we are hoping that it will be defeated in committee However, this sort of activity will continue and it is highly important that the Society take special pains with its organization and with its educational work to organize informed groups wherever possible, who will realize the dangers that state medicine entails. We, as physicians, are not, as has been repeatedly proven, a very influential politicial organization during the period of the election campaigns. We have many friends in the Legislature when it convenes and we always have a fair hearing on matters that come before the Legislature But we could strengthen our position very materially by developing friendships with other bodies and groups that have an active interest in the elections Naturally, legislators feel obligated to those of their constituents who show active interest in the elections, and one cannot censure them for giving a preference to such persons when there is before the Legislature a debatable matter in which they are interested

Your Committee has asked the County Chairmen to establish a closer relationship with their Congressmen than they have in past years so that we might assist the American Medical Association in influencing Federal legislation if the need occurs. We are trying to take with the AMA a position similar to that which we ask the County Societies to feel for us

This report is written while the Legislature is still in session, and we ask the privilege of submitting a supplementary report at the close of the session if that occurs before the meeting of your Honorable Body

Respectfully submitted. HARRY ARANOW, Chairman

March 1, 1936

REPORT OF COMMITTEE ON MEDICAL RESEARCH

To the House of Delegates; Gentlemen:

In behalf of your Committee on Medical Research, I have the honor to pre-

sent the following report:

The annual antivivisection bill, Assembly Int. No. 83, was introduced by Mr. Doyle and referred to the Committee on Public Health. This bill differed in no respect from those previously presented. It was designed to prevent experimentation on the living dog. Many prominent citizens protested to the members of the Public Health Committee that such a bill was decidedly against the interests of the public health. Several members of the Committee on Public Health have been present at previous public hearings on this bill at Albany. It was unnecessary to convince them that no new evidence had been gathered by the antivivisectionists to show that the present laws are not adequate. The new members of this committee were contacted and the oppposition of the State Medical Society to this bill was explained to them. Up to the present time no action has been taken on this bill and it appears that it will not receive favorable consideration.

It is suggested that careful selection of material be made by medical men who are making motion pictures to illustrate scientific research. Any procedures which might be misinterpreted or misunderstood by the public should not be included.

Your Chairman wishes to thank the members of the Committee on Medical Research for their cooperation in carry-

ing out the annual program.

Respectfully submitted,

John J. Morton, M.D., Chairman

March 1, 1936

REPORT OF COMMITTEE ON TRENDS

To the House of Delegates; Gentlemen:

By a process of de-limitation from the work of other Committees of the Society that of the Committee on Trends has been confined, in the main, to the supervision under the direction of the Executive Committee, of the projects and plans of the Public Relations Bureau of your

Society.

In these days of mass action and propaganda it is most important that the profession, which in the end through their labor, sustain or promote the civilization within which they live should have some means, and those most effective, for presenting their view point in relation to. not alone professional, but relative social problems, to the people whom they serve. Without this action antagonistically minded groups who have access to the people by the present diverse and rapid means of communication both of eye and ear may readily secure such following of emotional, but not rational, conviction on the part of the people that without having a medium of explanation and truthful restatement the labors of innumerable generations of the profession to advance its capability of service in the prevention and cure of disease may be crippled by its reduction to serfdown under lay administrative officials.

In order to fulfill the requirements which necessity has placed upon us the Bureau of Public Relations was established and has, we believe, even in the brief time that it has been in existence, thoroughly and completely justified its institution.

During the past year it has widely extended its efforts and has increased the respect of the public press for the opinion of the organized profession. Not alone has this been true as concerns this State but its influence has reached to the farthest parts of the Union, from Maine to California and from Louisiana to Minnesota and even to the Philippines.

The attached report of the Director of the Public Relations Bureau will more specifically cover the scope of its efforts and plans. As time goes on and knowledge of its capabilities for usefulness becomes more wide-spread the Bureau should become one of the most important factors in disseminating to the public the ideals of the profession, the progress of scientific medicine and the advancement of the Public Health.

Public Relations Bureau

In rendering this report of activities of the Public Relations Bureau, attention may well be drawn to the purpose for which it was instituted, Janury 15, 1935
"To bring about a better understanding upon the part of the public of the aims and ideals of the incdical profession sup-

porting the society"

Since its inception the Bureau has dispatched a total of ninety-five releases These went to daily and weekly newspapers, industrial house organs, the labor press, the agricultural press, grange, fraternal and foreign language newspapers in New York State They had to do with such matters as meetings of the state society and its district branches many of them were in opposition to socialized medicine, compulsory sickness insurance, and anti-vivisection. Some explained features of the Medical Abuses Act, and others referred to editorials and other material published in the New YORK STATE JOURNAL OF MEDICINE

In July the special weekly column, "DO YOU KNOW?' was started with the weekly papers of the state, 272 of these publications have requested that it be sent them. In thirty-seven counties of the state, local medical societies are sponsoring this weekly column which goes direct from the Public Relations Bureau to the newspapers Letters of appreciation from editors on file in the office of the Bureau, as well as press clippings, indicate the widespread accept ance of this material. One chain of five weekly newspapers sends this material out in duplicate with a circulation in excess of 12,000 homes in Westchester

In addition to the use of this material by the weekly press, it has been inde the subject of radio broadcast by stations in Rochester and Buffalo The United Press Association at its Albany office selects one paragraph each week and sends it to its subscriber papers in the State of New York

Two pamphlets have been published and distributed by the Bureau Will America Copy Germany's Mistakes? by Gustav Hartz and Medicine and Men, by Dr Frederic E Sondern, president of the Medical Society of the State of New York Of the former a total of 2161 copies were distributed to important persons throughout the state and 304 were sent outside the state by special request Of the latter, to date, 4200 copies have

been distributed, thirty eight on request from individuals, libraries, and schools outside the State of New York. The foregoing pamphlets have also been sold singly and in quantity at cost to public libraries and universities and to seven medical societies. Purchases at cost of Medicine and Men totalling 3300 copies have been made by the Maine Medical Association, Medical Society of the State of Pennsylvania, Iowa State Medical Society, Indiana State Dental Society, and the Medical Society of the State of North Carolina.

Medicine and Men has been reprinted by the Journal of the Philippine Island Medical Association and by Southwestern Medicine

Both pumphicts have recently been indexed and listed in every public library in the country and additional orders are expected from time to time for which a nominal charge will be made to cover the

cost of printing and mailing

The Public Relations Bureau was instrumental in obtaining the publication of Will America Copy Genmany's Mistal erg in the Nation's Business and an editorial quoting Dr Sondern's Medicine and Men in the Saturday Evening Post Both the Bureau and Dr Sondern were in receipt of many requests for further material from high school debating teams and others, as a result of this editorial

Four special confidential bulletins have been prepared and issued to officers of medical societies relating to influencing popular opinion about matters in which the society is interested Requests for duplicates of some of these bulletins have been received from several state and county medical societies outside New York State

The director of the Bureau has attended eight conference meetings in New York. City of various committees and groups, and five in Albany He attended the American Medical Association meeting in Atlantic City in May, made one trip to Washington, one trip to Philadelphia, and one trip to Perth Amboy, New Jersey, in addition to attending eight district branch meetings throughout the state in the fall of 1935. He was privileged to attend county society meetings in Westchester, Nassau, and Bronx At the request of the Journal Manage-

ment Committee the director attended weekly editorial conferences of the Jour-NAL staff.

The director of the Bureau spoke at Syracuse, before the New York Press Association, January 31, 1936, on the subject, *The Doctor Looks at News*-

papers.

Many conferences have been had by the director both in his office and elsewhere with editors, magazine writers, and other influential key persons. Contacts have been established with every available avenue for the dissemination of information to the public so as to render them accessible for voicing the opinions of the medical profession from time to time as occasion may arise.

The Bureau handled relations with the press at the Annual Meeting in Albany, May 13-15, 1935, assisting local newspaper representatives as well as those of the Associated Press and the United Press in obtaining information of interest

to the public.

In connection with the meetings of eight district branches of the society in September and October, the Bureau released to the weekly and daily press in each locality, the news pertaining to each

individual branch meeting.

The Public Health and Medical Education Committee of the society under the chairmanship of Dr. Thomas P. Farmer participated with the New York State Department of Health in a pneumonia campaign during the winter months. Other agencies cooperating in this campaign were the Metropolitan Life Insurance Company, the Rockefeller Institute for Medical Research, the New York Public Association of Laboratories, and the Commonwealth Fund. At the request of a sub-committee on lay publicity, Dr. Peter Irving, chairman, the Bureau assisted by preparing a plan for lay education on the subject of pneumonia control. Six releases were distributed to the daily and weekly press and the director assisted in arranging a radio broadcast in which the participants were: Hon. Herbert H. Lehman, Governor of the State of New York, Dr. Frederic E. Sondern, president of the Medical Society of the State of New York, and Dr. Thomas Parran, Jr., State Commissioner of Health. In connection

with this broadcast an official proclamation was issued by the Governor calling upon the people of the state to cooperate in this educational effort.

The material issued by the Bureau has been quoted at various times in the Journal of the American Medical Association, the New England Journal of Medicine, the Ohio State Medical Society Journal, the Journal of the Iowa State Medical Society, the Florida Medical Association Journal, and various bulletins and publications of state and county medical societies.

The reception by the press of newspaper releases is shown in two scrap books kept on file in the office of the Bureau. Representative clippings of each release are contained in this file which now covers 160 pages. This record discloses a significant representation of editorial comment.

In December, 1935, the Bureau installed modern addressing and mailing mechanical equipment. This machinery was used at the outset to mail the usual releases and bulletins and its operation reduced the clerical work by two-thirds. The Bureau is compiling a mailing list to comprise ultimately 10,000 to 15,000 names of civic leaders throughout the state for purposes of placing in their hands directly such documents as Medicine and Men and other pamphlets or bulletins desired to be issued to present the news of medical activities or to express the objects of the society. These names are compiled from lists of educators, teachers, lawyers, social workers, legislators, and public officials. Sixteen county medical societies have cooperated and provided lists of names of important persons in their communities. To date 7250 stencils for automatic addressing have

A graphic display will be on view at the annual meeting of the society describing the work of the Bureau.

Respectfully submitted,

JAMES F. ROONEY, Chairman, CHAS. GORDON HEYD DAVID B. JEWETT DAVID J. KALISKI GEORGE A. LEITNER

March 1, 1936

REPORT OF THE COUNSEL

To the House of Delegates, Gentlemen

Your Counsel herewith submits his report of the activities of the Legal Department of the Medical Society of the State of New York for the period from March 1, 1935, to and including January 31, 1936. It will be noted that the reporting period this year covers a period of eleven instead of tucke months. This was made necessary by reason of the date of the meeting of the House of Delegates and the fact that the reports must be published in advance of the Annual Meeting

As our report indicates, the past year has been an exceedingly busy one both in court and in consultation. The report states only conclusions. It does not give any adequate picture of the work involved or the responsibility assumed by our

Department

At the outset of this report your Counsel wishes to record his appreciation for the assistance and cooperation furnished him by your officers and committeemen. It is difficult for the membership to realize the numerise amount of work done by these gentlemen for the welfare of the members generally. Suffice it to say that they are giving unstantingly of their time and talents to the many important problems confronting organized medicine in these parlous times.

In making his report your Counsel adheres to the convenient category on ployed in previous years whereby his activities have been divided into three min divisions (a) The actual hindling of malpractice actions before courts and juries and in the Appellate tribunals, (b) counsel work with officers, commit tees and individual members of the Society, and (c) legislative advice and

activities

Litigation

We have so often written and spoken on the ever present possibility of a malpractice action and the hazard presented by such a lawsuit that no extended comment is necessary in a report of this character

We wish to again point out that under our law the physicians' rights so far as the facts of the case are concerned are entirely in the hands of a lay jury The prevalence of prejudice and misplaced

sympathy as affecting the verdict of a jury is well known to anyone who has had anything to do with our jury system

It is pertinent at this point to make mention of the fact that careless, hasty, and unjustified criticism by one physician concerning the work of another often leads to the commencement of a malpractice action

Your Counsel believes that such unjustified criticism is not often deliberately made but frequently the effect on the patient is precisely the same as if the criticism were motivated by malice

Some fifteen years ago your representatives, with far seeing vision and with a realization of the ever present hazards confronting the physician in this state, sponsored a group plan of insurance for the benefit of your membership

The successful operation of our group plan is so well known to the membership generally that no extended comment upon this point is necessary. Through the group plan, opportunity is furnished to the members of your Society to insure themselves in adequate amounts so as to eliminate the fin inicial hazard of a mulpractice action.

In the field of litigation your Counsel is ple used to again note the splendid work of his associate, Mr. William F. Martin Mi. Martin has had many years of actual court experience in the defense of mal practice ictions. From all parts of the State, from judges, lawvers, and doctors, have come to me expressions of approval regarding. Mr. Martin's high character and his unusual ability as an advocate.

Your Counsel also wishes to note the excellent work done by his associate, Mr Thomas H Clearwater, the attorney for the Society

Mention should also be made of the splendid spirit of loyalty and devotion manifested by your Counsel's entire staff both legal and clerical

With this preliminary statement we note that there were commenced in the present *eleven month* reporting period 185 actions as against 232 actions during the previous reporting period which covered a period of taclive months.

These actions do not include a large number of claims in which we were suc-

cessful in persuading the claimants or their attorneys from bringing suit. There remain a number of claims outstanding in which suit may ultimately be brought.

The Table of Comparisons appended hereto shows that we disposed of in eleven months 208 cases as against 201 cases disposed of in the previous twelve month reporting period. Of the 208 cases disposed of during the reporting period thirty-seven were settled. In 166 actions we have obtained judgment for the physician or they have been disposed of through discontinuance or abatement. In five cases judgments were rendered in favor of the plaintiff.

Of the cases in the Appellate Division we were successful in 4 cases and un-

successful in one.

We note from Table I that there were pending as of January 31, 1936, 602 cases as against 625 cases pending February

Litigation and insurance protection are inextricably interwoven. It is fair to state that without adequate insurance no physician can practice his profession with

financial safety.

In this connection it should be noted that during the present reporting year the Society changed its insurance carrier. The new carrier of our group plan is the Yorkshire Indemnity Company. reasons for the change have been fully explained to the membership in the columns of your STATE JOURNAL.

Excellent work has been done by your Insurance Committee which is composed of Dr. Charles Gordon Heyd, as Chairman, Dr. Frederic E. Elliott, and Dr. Carl Boettiger. This Committee in the first instance considers and passes on all questions pertaining to matters that may arise in the operation of our group plan. The Committee works in cooperation with your Counsel and with your authorized indemnity representative, Mr. Harry F. Wanvig.

Table II gives a comparison of the number of members insured in 1933, 1934, 1935, and 1936, and the number of members in the County societies, and the percentage of insured members in the County societies, and in the entire State Society. The figures are sufficiently clear to obviate the necessity of extended

comment.

Counsel Work

During the period of this report, your Counsel has prepared for publication in the Society's Journal articles in the nature of editorial comment. These editorials have included the following:

Malpractice—Care of Maternity Case Plaintiff's Burden of Proof in Malpractice Action

Autopsies in Cases of Suspicious Deaths

A Salutary Decision

Dentist—Unethical Advertising

The Appellate Division Corrects an In-

Malpractice—Court Exonerates Physician Revocation of License Obtained by Fraud Workmen's Compensation: Physician In-

jured While in Employ of Municipality

Accidental Injury to Patient Physician's Choice of Methods

Restraint of Unlawful Practice of Medi-

Practice of Pharmacy by Aliens Ownership of X-rays

Malpractice—Removal of Uvula During Tonsillectomy

Responsibility of Physician for Negligence of Another Physician

An Interesting Foreign Body Case Antenuptial Contract to Abandon Medical Practice

Your Counsel has also digested and there have been published in the STATE Journal case reports upon malpractice actions which it has been felt were of special interest to the members of the profession. The case reports which were published during the previous year are as follows:

Treatment of Sty Removal of Semilunar Cartilage Treatment of Carcinoma Treatment of Injured Wrist

Death Following Taking of Pill Containing Strychnine

Claimed Negligent Diagnosis and Treatment of Fractured Shoulder

Claimed Negligence in Removal Tubercular Kidney

Negligent Diagnosis

Claimed Negligent Delivery Treatment of Fractured Wrist

Death by Leaping from a Window Burn Discovered Subsequent to Opera-

Claimed Delay in Diagnosis of Mastoiditis Operation upon Prostate Treatment of Cut on Foot X-ray Treatment of Acne

549

Claim for Failure to Recognize Fracture

Treatment of Colles Fracture

Death Following Novocaine Injection

Wrongful Death Action

Removal of Metallic Fragment from Finger

Treatment of Tuberculosis

Facial Paresis Following Mastoidectomy Fracture of Elbow

Electro-Coagulation of Tonsils

Recurrence of Gall Stones Reconstructive Operation on Knee

Confusion of Prescriptions

Death from Removal of Tonsils and Adenoids Intestinal Repair by Use of Murphy

Button
Your Counsel is pleased to learn from

the members of your Society that they find these reports and editorials interesting and instructive.

In addition to his other duties, your Counsel receives frequent requests for

opinions on various subjects. It should be remembered that the Executive Committee of your Society has ruled the requests for legal opinion, whether coming from individual members of your Society or from component County Societies, must in the first instance be referred to that body for action. If the Executive Committee deems the inquiry a proper one for opinion by the legal Counsel it refers the same back to him for reply. Some of the matters upon which advice has been rendered are the following:

- 1. Inquiry from a physician, a member of the Advisory Board, and Otologist for a nursery for pre-school deaf children, as to the legality and advisability of placing on the school records photostatic copies of records containing otological findings in such cases.
- 2. Inquiry from a surgeon as to his liability for the acts of an anesthetist, and the liability of the anesthetist for his own acts,

and a further inquiry concerning malpractice insurance indemnity in such cases.

3. Inquiry from a physician suffering from coronary thrombosis and subject to attacks of angina pectoris as to his legal responsibility in case a patient should be unable to obtain his services due to his disability, and the further inquiry as to the manner in which such physician could guard against claims of abandonment by his patients.

4. Communication from a physician, the director of a tuberculosis sanitarium, concerning the liability of such a sanitarium for the acts of members of its resident staff who are not licensed to practice in New York

State.

5. Inquiry from a physician concerning the legal responsibility that may arise where a physician is of the opinion that he should administer tetanus antitoxin, and the patient refuses, and tetanus subsequently develops.

- 6. Inquiry from a component County Society requesting information as to what steps should be taken in a case that had been reported of an attempt by an individual to purchase drugs from office girls in doctors' offices.
- 7. Inquiry from a physician concerning the Statute of Limitations applicable to malpractice actions in New York State.
- 8. Inquiry from a physician, as secretary of a hospital, concerning the liability which might be incurred by the hospital when an anesthetic is given by an intern not licensed to practice medicine.

9. Communication from a physician making inquiries concerning the following subjects:

(a) The advisability of physicians assisting in the compilation of a list of delinquent

(b) Whether a physician who has made a few calls on a patient, and demands payment of a fee which is refused, can discharge himself

10. Inquiry from a physician specializing in x-ray work as to the legal and ethical problems involved in a partnership between a doctor and a layman to operate an x-ray laboratory.

11. Inquiry from a physician concerning the responsibility of the State Insurance fund under the Workmen's Compensation Law for the payment of a physician's fee for treating an injured workman, and further concerning the responsibility of the injured workman's employer for said fee.

12. Communication from a physician as to the extent to which a physician served with a subpoena to testify concerning the facts of a case treated by him may be

required to give opinion evidence as an expert, and to give answers to hypothetical auestions.

13. Communication from a physician requesting information concerning forms, to be signed by patients, both in the case of adults and infants, acknowledging that tetanus antitoxin had been advised and refused before the continuation of treatment by the doctor.

14. Inquiry from a physician as to the legality of providing certain information to

the Life Extension Institute.

15. Inquiry from a physician concerning the legality of a contract, the substance of which was as follows: Dr. A. became associated with Dr. B. upon a salaried basis. Dr. A. agreed that should Dr. B. retire or die, Dr. A. would purchase Dr. B's equipment and the good will of his practice for a stipulated sum. Dr. A. further agreed that he would not practice medicine independently of Dr. B. in two specified counties.

16. Inquiry from the State Medical Association of one of the Western States requesting information regarding malpractice defense in the State of New York, and requesting details as to the number of claims and suits handled by the Society's legal

counsel.

17. Inquiry by a physician as to the extent to which, if at all, his group insurance policy would cover him for the acts of a physician associated with him under an informal partnership.

- Communication from a physician concerning the extent to which a physician, having made a physical examination of a plaintiff in a damage suit pursuant to court order obtained by the defendant, is entitled to testify on the trial concerning his knowledge of the physical condition of the plaintiff.
- 19. Communication from a making the following inquiries concerning medical care under the Workmen's Compensation Law:
- (a) When an employer sends a prospective employee to a physician for a film of his chest. can the interpretation of the said x-ray be given to the State Insurance Fund;
 (b) If such information is given to the State

Insurance Fund, whether or not the roentgen-

ologist may be liable in damages;

(c) Whether a so-called Central Bureau could be formed by the insurance carriers or by the physicians to keep on file records of prospective employees who are diagnosed as having certain diseases,

(d) Whether a roentgenologist would be legally liable, having given such information to

such a Central Bureau.

20. Inquiry from a physician concerning

the extent to which he could safely provide information concerning the physical condition of a person treated by him as a relief

patient,

21. Inquiry from a physician requesting information concerning whether a member who elects to secure malpractice insurance protection from a company other than the carrier of the Group Plan shall be entitled to defense by the Counsel of the State Society.

22. Inquiry from a physical requesting information as to the legal aspects of trauma

and tuberculosis.

23. Inquiry from a component County Society as to the status of a member suspended from the right to practice medicine for a specified period of time.

24. Communication requesting information concerning the following phases of the

Welfare Law:

(a) Whether under the law the Welfare Commissioner may decide that a patient is an indigent so far as his hospital bill is concerned, but self-supporting so far as the doctor's bill is concerned.

- (b) Whether a welfare officer, having authorized medical care, may compel the town welfare officer to pay for that care, or whether the doctor must himself bring suit to enforce the payment of his bill, and the extent to which a doctor may enforce the payment of that bill.
- 25. Inquiry by a component County Medical Society as to whether a doctor who has undertaken for a specified fee and has promised to attend a women during her period of pregnancy, and to attend her with respect to her delivery and postnatal care, upon learning that the patient has a reputation of never paying her bills, is entitled to withdraw from the case.

26. Inquiry by a physician as to the extent to which he is entitled to reveal information concerning a former patient who has died to the attorney for the patient's wife, where an attempt is being made to break the patient's

will.

27. Inquiry from the Medical Society of a mid-Western state concerning the precedents in the State of New York upon the illegality of the practice of medicine by corporations.

28. Inquiry by a physician in charge of a not-for-profit hospital as to (a) the liability of said hospital in damages for alleged acts of malpractice of the members of its staff; and (b) the advisability of such a hospital carrying insurance against such liability.

30. Inquiry by a physician as to the legality of a sterilization operation performed at the express request of a patient, and the liability of a doctor who has performed such an operation in the event the

patient should later decide to sue the doctor.

31. Requests from several physicians for further details concerning cases discussed in your Counsel's articles in the JOURNAL.

32. Communication from a physician requesting information as to forms to be signed by patients giving a doctor permission to render radium treatment, including in such forms an acknowledgement that the result of the treatment is not guaranteed.

33. Inquiry from a physician concerning the legal responsibility that he might incur in administering various types of anesthetic.

34. Inquiry from a physician requesting advice as to the manner in which the physicians in his community might take steps to remedy a situation that had arisen by reason of a doctor continuing to engage in the practice of medicine although his sanity is questioned.

35. Inquiry from a physician for advice as to the best method of procedure for the purpose of avoiding a lawsuit, where in suturing after a delivery a suture needle has broken and remained embedded in the patient's body.

36. Inquiry from a physician concerning the details of a malpractice case tried by your Society's Counsel in which the court exonerated the physician in charge of the x-ray department of a hospital and held responsible the hospital technician.

Your Counsel acting with the Committee on By-Laws has examined various proposed Amendments to the Constitution and By-Laws of the State Society and of a number of component County Societies and has rendered advice and made suggestions in connection therewith.

Your Counsel has also rendered his assistance to one of the component County Societies with respect to its problem concerning the advisability of a reorganization of its legal status as a medical society.

Your Counsel has rendered advice with respect to the re-organization of the Dutchess-Putnam Medical Society pursuant to the permission granted the physicians in Putnam County to organize as a separate component county society, which authority was granted by the House of Delegates at its 1935 meeting.

Your Counsel has also rendered his advice to the Board of Censors of one of the component county societies which sought information as to the details of the method of procedure in disciplinary proceedings.

Your Counsel has also advised from

time to time with the Charman and members of other standing Committees of the Society

Your Counsel has been in conference and consultation with the members of the Committee on Insurance with respect to the various matters which has been referred to them for action

Your Counsel has been in conference with the Board of Trustees and with the Members of the Committee on Medical Trends and his prepared the existing contracts entered into with Thomas R Gardiner involving the Directory, Journal, and Technical Exhibits at the annual meetings

Your Counsel has also been in conference with the Board of Trustices and the Executive Committee and has prepared the existing Contract between the State Society and the Executive Officer

Legislative Advice and Activities
As this report is being written the

Legislature has only been in session for a short time. Main important bills, however have dready been introduced and your Counsel has examined and given his opinion with respect to a number of them which affect the included profession. He has also assisted in the drafting of several bills for introduction to the Legislature of this session.

Conclusion

Once again in concluding this report we do so by expressing our grateful thrules to the many members of your Society who have so generously given of their time and talents in assisting us both in court and out in the defense of malpractice actions. Without their generous assistance we could not have obtained the results shown by this report.

Respectfully submitted,
I ORENZ J. BROSNAN, Counsel
February 1, 1936

REPORT OF COMMITTEE ON WORKMEN'S COMPENSATION

To the House of Delegates, Gentlemen Your Committee on Workmen's Compensation herewith submits a report of its activities for the year

The Special Committee on Worlmen's Compensation was created as the result of the following resolution passed by the House of Delegates on May 13 1935

Resolted, Flast a Special Committee on Workmen's Compensation Procedure consisting of three members be appointed by the President. The duty of this Committee shall be to draw up the specifications and devire a basic plan or model which shall be inthred by the County Medical Societies in order that the idministration of the law will be successful in so far as organized medicine is concerned. This Committee shall act in an advisory capacity with the local County Societies in order to avoid a County Societies in order to avoid a County Society acting automatically in contradiction to the State wide plan. This Committee is to report to the Council or its Executive Committee as soon as possible.

On May 14 1935 a Committee of three was appointed consisting of Dis Chas Gordon Heyd, Chairman Dr David J Kalishi, and Dr Frederic E Elliott Dr Heyd resigned on January 9, 1936 and the Committee was reconstituted with Dr David J Kalishi as Chairman, Dr Frederic E Elliott, and Dr B Wallace Hamilton

The Committee has held continuous sessions since its inception in order to carry out its functions in coordinating the worl of County Societies throughout the State and insuring uniformity of action and as far as possible creating a unanimity of opinion in regard to the provisions of the amended Act. We shall enumerate below some of the details of the various actions of the Board. It may be stated here that the Committee as a whole and the individual members of the Committee, have held over one hundred conferences with representatives of the insurance interests of the State, with employer's organizations, with self-insurers, with the Industrial Commissioner, and with the Industrial Council and with the sub committee of the Industrial Council In addition to these conferences the Commuttee has spent many days of preparatory work prior to conferences before the Department of Labor

The Committee has also held conferences with representatives of the Hospital Associations in order to clarify those provisions of the law which relate to the hospitals participation in Workmen's Compensation medicine. The relationship of the hospital medical staff particularly part and full-time paid hospital physicians and technicians, to the hospitals were de-

fined. These conferences are still in progress and it is our hope that they will lead to a successful definition of the physicians' and hospitals' status in relation to the Workmen's Compensation Act.

The Board has recently concluded a series of conferences with representatives of employers and self-insurers in relation to the establishment of medical bureaus at the place or places of employment. Under Section 13-c a sub-committee of the Industrial Council of the Department of Labor, together with a representative of the Workmen's Compensation Board or of the County Society, will combine to make the necessary inspections, mandatory under the Law. The question as to the number of hours such bureaus shall be covered by qualified physicians during each working day will be decided in each instance on the nature of the hazard presented at the place of employment, the frequency of accidents, and the prompt availability of an outside physician in relation to the type of hazard presented. Up to March 1 no bureaus have been licensed pending the definition of this Chapter of the Law, but now that a formula has been agreed upon for the inspection of the proposed bureaus, County Societies will be instructed to proceed with their inspections and recommendations. In order to facilitate the inspection whenever possible a sub-committee of the Industrial Council will accompany the physicians of the County Societies. No license may be issued without the consent of the County Society or of the Board thereof.

Up to March 1 approximately 11,987 physicians have been qualified by the County Societies or their Boards. In addition to those licensed through this Board approximately 200 physicians have been qualified by the Homeopathic Board and 400 by the Osteopathic Board. According to the figures of the Department of Labor some 13,500 physicians have been qualified throughout the State. Apportioning these to the five compensation districts of the State, we find:

8,147 have been qualified in the New York district:

New York County.	2 062

A complete roster of qualified ph	ysı-

A complete roster of qualified physicians is on file at the office of the Board. Rosters are further classified according to Counties. All County Boards and Societies have been requested to send in lists of physicians qualified by them and

most counties have already complied with this request. A few county Boards have not yet sent in complete lists of physicians or have failed to submit the names of physicians qualified after their first list was submitted. All County Societies are urged to advise the Board at once of the registration of new applicants and to inform the Board when the rating of a registered physician is changed. Physicians are classified according to their field of practice so that the Board has a complete record of the code letter of every qualified physician in the State. In a few of the rural counties the method of qualifying physicans has not been in accordance with suggestions made by the Committee. Such counties have been requested to simplify the designations granted to practitioners as indicated below. A letter covering this point was published in the NEW YORK STATE JOURNAL OF MEDICINE on October 1, 1935, and all county societies were urged in the interest of efficiency and simplicity to reclassify all practitioners to whom multiple designations had been assigned.

From July 1, 1935, to February 15, 1936, a total of \$1,486.88 was spent for the conduct of the business of the Com-

mittee, as follows:

Rent for headquarters in the building

of the Academy of Medicine, 2 East 103 Street	\$156.6
Salaries for clerks and secretaries	483 3
Reprints of the Workmen's Compen-	
sation Law which were distributed	
throughout the State	242.20
Postage	5.49
Printing of application forms and	
instruction sheets and other minor	
expenses	334.0

No fees have been paid to the members of the Committee. The expenses of the Board have been kept down to this low figure by combining the offices of the State Committee on Workmen's Compensation with that of the New York County Society and sharing the expenses on the basis of service rendered.

The chief functions of the State Society are first, the preparation of a fee schedule for the State of minimum charges for medical care. This will be entered into in more detail below. Since the Commissioner has ruled that under Section 13-d the list of especially qualified physicians shall be submitted to him according

to the distribution of the Workmen's Compensation districts of the State and not according to county societies, the Committee of the State Society has taken action to gather the lists prepared by the various county societies and allocate them according to the five compensation districts in the State in accordance with the membership of the County society, or the total number of physicians in each county in relation to the number of county societies in the district. Physicians on these lists will be rotated at intervals so that all physicians submitted for such impartial panels may have an opportunity The County Societies will be asked to replenish these lists at stated intervals. The authorities of the Departlent of Labor and the representatives of the various interested groups have found it convenient to deal with the small State Committee in preference to taking up each matter of discussion with the sixty odd county societies of the State. has been in the interest of efficiency and promptness. The various county society Boards have also referred to this Committee the local matters that presented questions difficult of interpretation and innumerable letters have been received and acted upon by the Committee. In many instances these required an interpretation of one of the sections of the amended law, or direct action on the part of the State Committee with the Industrial Commissioner, the Industrial Council, or the insurance carriers. The experience thus far seems to indicate the absolute necessity for the retention of a small committee on the part of the State Society to protect the interests of the profession and to act as a liaison between the profession, the State officials, and other interested parties. The volume of work is such as to require the full time of at least one fully informed officer with a small committee to act in an advisory capacity.

It is strongly recommended that the State Society set up a continuing committee on workmen's compensation and provide for the services of one member to act as executive director.

Section 3 of the amended Act, Section 24 of such Chapter, as last amended by Chapter 615 of the Laws of 1922, has been amended in such a way that the claim of a physician for medical services

cannot be adjudicated by the Industrial Board which in the past had this power under Section 24. Now only claims of attorneys and counselors-at-law for legal services in connection with any claim arising under this Chapter, and claims for services, or treatment rendered, or supplies furnished in the treatment of person injured outside the State and entitled to compensation, may be assessed by the Industrial Board and become a lien upon the compensation awarded in a manner fixed by the Board. Under the present law since the Industrial Board has no longer the power to assess the costs of medical care and compensation against a non-insured employer, it will be necessary to submit to the legislature an amendment giving the Industrial Board such power. It has come to our attention that such an amendment has now been introduced in the legislature. In the meantime the only recourse a physician has in the payment of a bill against the non-insured person is action in the courts.

As stated above one of the first responsibilities that devolved upon the Committee was the preparation of a fee schedule as required under section 13, chapter 258, of the amended workmen's compensation law:

The commissioner shall prepare and establish a schedule for the state, or schedules limited to defined localities, of minimum charges and fees for such medical treatment and care, to be determined in accordance with and to be subject to change pursuant to rules promulgated by the commissioner. Before preparing such schedule for the state or schedules for limited localities the commissioner shall request the president of the medical society of the state of New York to submit to him a report on the amount of remuneration deemed by such society to be fair and adequate for the types of medical care to be rendered under this chapter, but consideration shall be given to the view of other interested parties. The amounts payable by the employer for such treatment and services shall in no case be less than the fees and charges established by such schedule. Nothing in this schedule, however, shall prevent voluntary payment of amounts higher than the fees and charges fixed therein, but no physician rendering medical treatment or care may receive payment in any higher amount unless such increased amount has been authorized by the employer, or by decision as provided in section thirteen-g herein.

The Committee after numerous meetings, prepared a schedule of fees in consultation with groups of specialists, as well as general surgical and medical practitioners, who had had experience with this type of work. The schedule was based upon prevailing rates chiefly in the metropolitan area. This tentative schedule was submitted to every county medical society in the state for constructive comment. A number of county societies submitted, in response to the Committee's request, schedules of fees which they believed should be adopted. In most instances these schedules were identical with the committee's tentative schedule. In a few instances the county societies asked for higher fees. On the basis of all returns, the Committee drew up a schedule for the metropolitan area which was submitted to the Industrial Commissioner. It was then suggested that it would be preferable to go into conference with the representatives of the insurance carriers and of the self-insurers and other employers of the State, in an endeavor to reach an agreement rather than to submit the schedule to the Commissioner and have him hold hearings on the thousand or more items contained in the schedule. This procedure was suggested to the Industrial Commissioner and having been agreed upon, the Committee began conferences with representatives of the Compensation Insurance Rating Board on June 27, 1935.

Its first meeting was attended by some fifty or sixty representatives of the insurance companies, employers, and other employers organizations, and by your Committee. At this meeting it was agreed that the various insurance and employers interests should be represented by a sub-committee. The sub-committee, acting for these interests, numbered about fifteen men including a number of medical directors of insurance companies. Meetings were held once or twice a week until July 25, and were resumed on September 12. Finally, the insurance interests and your committee agreed upon a schedule which was then submitted to the Industrial Commissioner by the President of the State Society. The Industrial Commissioner thereupon called a number of hearings on the schedule as submitted, to which were invited all interested parties

in accordance with the amended law developed that exception was taken to the fee schedule by certain self-insurers and employers organizations, but the insurance interests supported the schedule as submitted by your Committee, with the exception of a few items upon which agreement had not finally been reached at the time the schedule was submitted Subsequently these differences with the Insurance interests were compromised, and the schedule was accepted by the Commissioner on February 26, 1936 has not yet been promulgated by hun but it is expected that it will be shortly A copy of the fee schedule is herewith appended

[The compensation fee schedule will appear in a forthcoming issue]

It is to be noted that this schedule is for the metropolitan district, and is to be regarded as the minimum fee schedule Agreement may be reached with the insurance carriers in respect to certain items of the fee schedule in those outlying counties which may not have approved Most of the Counties of the schedulc in the State have indicated their satisfaction with the schedule as a whole and their desire to adopt it for their county It is the opinion of your Committee that the schedule should be adopted by the whole state, and given a fair trial for at least a period of one year, after which adjustments may be made where indicated by experience The schedule represents the prevailing rate for persons of the social economic status of the average injured workmen throughout the State We further believe that the schedule is fair and equitable to employers, carriers, and the medical profession, and will not result in increased premiums due to an merease in the cost of medical care say this because it is our belief that the free choice principle will draw into the work a larger number of well-qualified, ethical practitioners, who while providing adequate and sympathetic medical care, will not be interested in prolonging treatments with a desire to profit improperly from this type of work

In addition to the hearings on the fee schedule, your Committee represented the profession at numerous hearings in respect to the various other provisions of the newly amended chapter The following items were considered

- 1 The definition of rehabilitation bure its and rules and regulations for beensing, etc.
- 2 Poster notices to employees and employers regarding the provisions of the new law
- 3 The employer's right to recommend a physician to injured employees
- 4 The composition of the 48 hour and 20 dry notices to be filed by attending physician
- 5 The posting of names of panel doctors on the premises of employer
- 6 The question of medical first aid stations
- 7 The question of chinics maintained by employers
- 8 Application forms and rules and regulations governing the operation of medical bureaus and physicians medical bureaus
- 9 Rules for transfer of patient from one doctor to mother
- doctor to mother

 10 Application forms for a ray and pathological laboratories and standards for
- same
 11 Methods for arbitration of medical
- 12 Question of payment of physicians at hearings Differentiation between physician's testimony and expert testimony
- 13 Medical treatment by hospitals—Definition
- 14 Question of herrings by County Boards for discipline of physicians

As a result of these conferences a series of communications were addressed to the county societies and to the Workmen's Compensation Boards of the county societies in connection with the duties of the county boards and in relation to the interpretation of the various provisions of the law as agreed upon (1) in prelimitary conferences between the interested parties, and (2) by ruling of the Industrial Council

Communication No 2 was concerned with the application form for registration and qualification of all licensed physicians, whether members of the county societies or not, who desired to engage in workmen's compensation practice

The Committee devised an application form after much study and distributed some 50,000 of these forms throughout the State for distribution to all licensed physicians by the county societies or boards

The Committee also devised a code. system for registering all physicians in accordance with the qualifications registered by them on their application forms. The Committee secured a favorable ruling from the Industrial Commissioner concerning the charging of a reasonable fee for such registration. As a result of this the larger county societies were enabled to meet the expense entailed in the setting up of Workmen's Compensation Boards, and other duties devolving upon these Boards.

On July 1 when it became apparent that it would not be possible to work out all the details of the Law by July 1, on which date the law was supposed to go into effect, and before the members of the medical council had been appointed by the Governor, the Committee succeeded by conferences with the Industrial Commissioner and other interested parties in establishing a status quo ante to enable physicians throughout the State to engage in compensation work pending registration which was then being carried on rapidly and the Committee also agreed upon the prevailing fees existing prior to July 1 as standards to be used until the new schedule could be devised and adopted.

As soon as the medical members of the Industrial Council were appointed by the Governor, your Committee began an almost uninterrupted series of conferences with a sub-committee of the Industrial Council, consisting of Dr. Edward C. Podvin, Dr. Wm. Linder, Dr. Horace E. Avers and Messrs, Max Meyer and Thomas Curtis, in regard to the various rules and regulations affecting physicians, insurance carriers, employers, hospitals, pathological and other laboratories, technicians, employers of medical bureaus, and first-aid stations, and other matters involved in Chapter 258 of the amended law. The Committee wishes to express its deep appreciation of the support, helpfulness, and cooperation manifested by the Industrial Council in all its negotiations with the Committee, Conferences are still in progress on many of the provisions of the amended law.

The Committee feels that the Industrial Council and the Industrial Commissioner in the carrying out of their responsibilities under the amended chapter have taken due regard to the interests of all parties concerned. They also think they have been of considerable help to the officials in bringing to them the experience and point of view of the medical profession throughout the State.

The Committee opposed the licensing of lay and incorporated laboratories and bureaus as being inimical to the best interests of the public and of the medical profession in a brief submitted to the Industrial Commissioner, and by him submitted to the Attorney General of the

State for opinion.

The Committee also submitted a brief after hearing before the Industrial Commissioner on the question of the interpretation of section 13-i, chapter 258, on the question of soliciting and posting. As a result of the opinion of the Attorney General on this brief, the posting of names of physicians was prohibited by official ruling of the Industrial Council, and confirmed by the Industrial Commissioner.

The Committee also prepared a brief on the interpretation of section 13-f (2) of chapter 258, concerning the attendance of a physician at a hearing before the

Department of Labor.

On October 17, 1935, the Committee issued to each County Society and published in the State Journal the Rules and Regulations promulgated by the Industrial Commissioner covering chapters 258 and 930 of the Workmen's Compensation law. Copies of these rules and regulations are as follows:

Rules and Regulations Promuigated by the Industrial Commissioner Covering Chapters 258 and 930 of the Workman's Compensation Law

1-All doctors whose applications have been disapproved by the various County Medical Societies may continue to treat workmen's compensation cases until a final decision is rendered by the Industrial Council.

2-All reports, except Form C-104, filed by attending physicians and specialists should be verified before a Notary Public or a Commissioner of Deeds, to insure their value as prima facie evidence in a compensation case.

3-In the event of a serious accident requiring immediate emergency medical aid, an ambulance or any physician may be called to give first aid treatment.

4—Homeopathic and osteopathic societies and boards should receive applications from

homeopaths and osteopaths only and recommend for authorization to treat workmen's compensation cases only homeopaths and osteopaths.

5-All specialists, consultants, etc. shall submit a report of their findings in triplicate; one copy to the Industrial Commissioner, one to the attending physician, and one copy to the employer or insurance carrier. If the specialist acts as attending physician, he should file a 48-hour report with the employer or carrier and with the Industrial Commissioner.

6-A registered physiotherapist may treat workmen's compensation cases at his own office or bureau when the case is referred to him by an authorized physician. The authorized physician should, however, give written directions to the physiotherapist as to the kind of treatment to be rendered and the number of treatments to be given. These directions must be given in writing by the physician and shall constitute a part of the record of the case.

7-Removal of physicians from panels. Section 13-D.

(a)-The doctor accused of misconduct shall be notified of the charges in writing by the Medical Society or Board that recommended him. He shall also be notified as to the date and time of the hearing.

(b)-Careful records shall be kept of the

minutes of the hearing.

(c)—These records, together with the report of the Board of the Medical Society or other Board, with its findings, shall be submitted to the Commissioner.

Appeal by physicians to the Industrial Comcil to be referred to a Sub-Committee to report

findings to Council.

(a)-The doctor appealing and the Medical Society or other Board shall be notified in writing as to the date of the hearing.
(b)—The doctor may be represented by

(c)-Accurate stenographic or stenotype min-

utes of the hearing shall be kept for the files of the Commissioner and Industrial Council.
(d)—Findings of the Committee shall be submitted to the Industrial Council for final

action.

8—Arbitration of Medical Bills.

A panel of physicians is to be appointed by the President of each County Medical Society, who shall submit the names of the physicians on the panel to the Industrial Commissioner. The Commissioner shall, when arranging hearings on medical bills, select two members of each Arbitration Committee from this panel, and two physicians are to be selected by the employer or insurance carrier from the membership of the Medical Society of the State of New York, qualified under this Act. for each arbitration session, the Industrial Commissioner to set the dates for all hearings and notify all interested parties. The Arbi-

tration Committee shall submit to the Industrial Commissioner its decisions, on a form prescribed and provided by the Industrial Commissioner, who will then forward notice of decision to all interested parties. If the physician whose bills are being arbitrated is a member in good standing and duly qualified by the New York Osteopathic Society or the New York Homeopathic Society, the members of such Arbitration Committee are to be appointed similarly and shall consist of physicians of such organizations, the president such organizations to make the designation provided herein.

In the event of disagreement as to the value of medical services rendered, a hearing shall be held in the county in which the doctor practices or in which his main or principal office is located. Notice of this hearing shall be sent to the doctor or hospital who rendered the services, the employer and the insurance carrier, any of whom may appear or be represented, if they so desire. The Arbitration Board shall pass upon the matter in dispute in accordance with Section 13-G of the amended law,

Careful records of the hearing shall be kept in the office of the County Medical Society,

In the event of disagreement as to the value of medical services rendered by members of the New York Osteopathic Society, a hearing shall be held at a location convenient to the interested parties. The Industrial Commissioner is to select two members from the panel of physicians appointed by the President of the New York Osteopathic Society, for each arbi-tration session, and the employer or his insurance carrier is to select two arbitrators from the membership of the New York Osteopathic Society who have been duly qualified under this

The Arbitration Committee shall pass upon the matter in dispute in accordance with Sec-

tion 13-G of the amended law
Careful records of the hearing shall be kept
in the office of the New York Osteopathic Society.

9-In the event of rejection of a physician by a County Medical Society or other Board, the jurisdiction of the County Medical Society or other Board has terminated, and it cannot reconsider its action. Each County Medical Society or other Board must pass upon the application of each physician within thirty days of the receipt of the application and notify the Industrial Commissioner of its action.

10-Bills for x-rays and consultations shall be submitted for payment directly to the employer or carrier by the specialist rendering the service.

11-A hospital may not secure a license to operate a medical bureau to render care to compensation cases.

12-No insurance company or self-insurer may reduce the size of notice to employees (Form C-105), which is to be placed in all places of employment covered by the Act, unless such permission is granted on application to the Industrial Commissioner.

13—Physicians treating claimants in hospitals may secure the signature of claimant for authorization to obtain copies of any necessary hospital records.

14—The physician in attendance in public hospitals must be the judge as to when the "emergency status" of the case has terminated. In case of a dispute, the matter shall be referred to the Compensation Board of the Medical Society of the county in which the hospital is located, for immediate decision.

15—Medical inspectors of insurance companies shall be admitted to hospitals or other institutions where injured employees are confined, upon proper identification, for the purpose of complying with Section 13-J.

16—No license is necessary to operate a first aid station for emergency treatments, but no subsequent treatments are to be rendered by anyone other than a qualified physician.

17—The physician in attendance must seek authorization for a specialist first from the employer or carrier. If unable to secure it, he may apply to the Industrial Commissioner in accordance with Section 13-A-5.

18—The authority of an employer for the services of a specialist in excess of a \$25.00 fee, applies only to the necessity for such services, but the choice of such specialist is entirely within the jurisdiction of the injured worker.

19—All medical bureaus and laboratories in operation on July 1, 1935 shall be charged a license fee, effective July 1, 1935, to and including June 30, 1936.

20—When it is in the interest of the injured employee, and where an x-ray is required and it is impossible to secure the services of a qualified x-ray specialist, the Board of the local County Medical Society may designate a specially qualified individual to take x-ray pictures under the supervision of the attending physician. The attending physician, however, shall render a bill for such service to the employer. This in no way, however, deprives the employer or insurance carrier from having other x-ray pictures taken if they so desire.

21—No advertising matter of any nature, on compensation work, by authorized physicians, medical bureaus, or laboratories, will be permitted.

22—All County Medical Societies and other Boards shall be instructed to first investigate all complaints submitted to them, and if the evidence warrants it,

charges shall be preferred against the physicians, after which the physicians shall be notified in writing of the charges, as well as given a bill of particulars, so that they may be in a position to defend themselves properly at the hearings.

23—Physicians authorized to treat workmen's compensation cases, when requested to supersede another physician must, before beginning treatment of such patient, make reasonable effort to communicate with the attending physician to ascertain the patient's condition. The superseding physician must also advise the attending physician of the name of the person who has requested him to assume care of the case and state the reason therefor. If the second physician cannot contact the attending physician, and the claimant's condition requires immediate treatment, the said physician should advise: the doctor previously in attendance, within 48 hours, that he now has the patient in his care.

24—Hospitals shall render bills for board and room accommodation, medical and surgical supplies, nursing facilities, and routine laboratory service. Bills for all services rendered by physicians in hospitals, including physiotherapy, x-ray, pathology, anaesthesia, medical and surgical care, etc. shall be made out separately and paid directly to the doctor rendering the service.

25—All medical reports filed by attending physicians and specialists must contain the authorization certificate number and code letters.

ELMER F. ANDREWS

Industrial Commissioner

January 3, 1936

The Committee also recommended a restriction of the authority of the Homeopathic and Osteopathic Boards to qualify other than graduates of their own schools. This rule was adopted by the Industrial Council.

The Committee drew up the basic standards for recommending physicians under the new law under the designation "X" (general practitioners) and "S" (specialists). Following is a copy of the code:

X General Practice

S Practice limited to specialty

A General Surgery-major

B Orthopedic Surgery

C Traumatic Surgery—not inclusive of major or open procedures unless also qualified under A or B

D Roentgenology (1) and/or Radiology (2).

E Ophthalmology ´(1), F Laryngology Rhinology (2),and/or Otology (3) G Genito Urinary Diseases

H Dermatology (1) and/or Syphilology

Neurology (1) and/or Psychiatry (2) I Internal Medicine

K Pathology (1), Clinical Pathology (2),

Bacteriology (3)), Chemistry (4), Serology (5) and/or Hematology (6) L Gynecology (1) and/or Obstetrics (2) Physical Therapy M(1)

Tuberculosis and Lung Diseases M(2)

M(3)Gastroenterology M(4)Cardiology

M(5)Minor Surgery M(6) M(7) Anaesthesia Plastic Surgery

M(8) Proctology M(9)Neuro Surgery

M(10) Public Health and Industrial Diseases

M(11) Metabolic Diseases M(12) Immunology and Allergy

M(13) Bronchoscopy

M(14) Endocrinology M(15) Oral Surgery

M(16) Vascular and Veno-therapy

Numerous letters were written in response to questions from county society boards explaining the system of qualification and the use of the code system. One such letter was published in the NEW YORK STATE JOURNAL OF MEDI-CINE, [page 989, October 1, 1935 issue].

Under date of July 19, the Committee took steps to comply with the request of the Industrial Commissioner for a list of especially qualified practitioners under

section 13-d.

Recently your Committee has entered into an agreement with the Industrial Council, after a hearing before the Department of Lahor, to provide a panel of impartial physicians in the same manner as the above panel under section 13-d, to adjudicate questions of difference of medical opinion as to treatment when neither accident nor causal relationship is questioned by the employer or carrier. In such disputed cases where the patient's physician feels that one form of medical treatment is necessary, and the consultant for the carrier or employer is of another opinion, it is thought that the interests of the injured workman will be best served if the two physicians not in accord select from a list of mature. impartial practitioners or specialists a consultant to help adjudicate the matter. The fee for the impartial specialist will be paid by the insurance carrier or employer.

Your Committee made efforts to induce the Industrial Commissioner to furnish the various medical societies with clerical and stenographic help to assist the county societies to do the administrative work which the new medical bill compels them to do, or to make such appropriation as would cover this work. The Commissioner replied that the Compensation Division of the Department of Labor was not in a position to release any of its employees to do this work and that it did not have sufficient funds to employ additional help to assign to this work. The Commissioner suggested as a solution to this problem that the State Medical Society prepare an amendment to this section to permit it to charge an annual fee to all physicians who have secured an authorization and to permit the Society to use the fee to supply the necessary clerical and other help out of the money so obtained. It should be noted in this connection that in addition to the responsibilities of the county societies in registering and qualifying or licensing physicians in the counties, the county society boards are required to participate in many functions under the amended law.

It must examine and license compensation medical bureaus operated by qualified physicians and employers medical bureaus under section 13-c and also laboratories and bureaus engaged in laboratory or x-ray treatment, or in physical therapy. It must also, under section 13-d, investigate and determine all charges of professional or other misconduct by any authorized physician or by any compensation medical bureau licensed under the Act under Rules and Procedures to be determined by the Industrial Council of the Department of Labor and shall report evidence of such misconduct with their determination thereon to the Commissioner. Such investigation, hearing, report, and determination may be made by the Board of an adjoining county.

Under section 13-e the county society or board that has recommended the licensing of a compensation medical bureau may ask the Commissioner to revoke such license for certain reasons mentioned in this chapter.

The Committee has been so busy with the administrative and other work necessitated by the assumption of responsibility under the new law, that it has had little time to prepare an adequate statement of all which it has accomplished, or has attempted to do. At this writing there are still going on conferences and discussions on many aspects of the law which require interpretation and adjudication. The fee schedule itself, while approved by the commissioner, has yet to be announced and published. Arbitration proceedings must await the official promulgation of the fee schedule. As a result of the delay in putting the law fully into effect on July 1, 1935, an opportunity has been given the county society boards to familiarize themselves with their duties, and the State Committee has been in close touch with the county societies in making it possible for the law to operate, pending the many decisions that had to be made. The time is now approaching when the law, as written and interpreted, will be fully in effect. The state and counties societies will be faced with the responsibility of representing the medical profession in all matters pertaining to the practice of medicine and the other administrative and judicial functions described above. The way in which these duties are performed will determine in a large measure public and official opinion as to the ability and reliability of the organized profession to assume major responsibilities in regard to medical and administrative functions.

No less important a function will be the creation of good will and mutual confidence between the profession and the other parties to the law in the interest of proper medical care of the injured employee at a fair and reasonable cost. In all our deliberations we have kept constantly in mind that the law was modified primarily in the interests of the injured employee, but at the same time we have not lost sight of the highest interests of the profession, nor have we been unmindful of the responsibilities and burdens of those employers of labor who must stand the cost of this humanitarian service.

We strongly recommend that the various county societies and the State Society make every effort to uphold and strengthen the work of those committees upon whom devolve the carrying out of the duties and responsibilities which the organized profession have undertaken. Many millions of dollars are involved in the carrying out of the provisions of the Workmen's Compensation Act and of these a goodly percentage is represented by the fees accruing to physicians of the State. In the larger counties it may well be necessary to provide, in addition to the additional clerical help already employed, executive help to direct the work. That such part or full time executive medical help is a necessity for the State Society has been amply demonstrated.

The present Chairman of the Committee wishes to express his appreciation of the valuable and sympathetic counsel of the former Chairman, Dr. Chas. Gordon Heyd. Dr. F. E. Elliott has devoted a major portion of his time since June 1 to the work, and his ability and energy have in a large measure made possible whatever success we have had in carrying out our functions. Dr. Hamilton, who has recently joined the Committee, has served with distinction.

Respectfully submitted,
DAVID J. KALISKI, Chairman
March 1, 1936

REPORT OF THE FIRST DISTRICT BRANCH

To the House of Delegates; Gentlemen:

The First District Branch of the Medical Society of the State of New York, comprising the Counties of Bronx, Dutchess, Putnam, New York, Orange, Richmond, Reckland, and Westchester, held its Twenty-ninth Annual Meeting at the

Hotel Pennsylvania on the afternoon and evening of October 8, 1935. The date and location of the meeting, as well as the special features of the program were decided by the Executive Committee of this Branch at a meeting on Tuesday evening, May 28, 1935.

We were honored by the presence of the President of the Medical Society of the State of New York, Dr. Frederic E. Sondern, who spoke on the dangers of Compulsory Sickness Insurance and stimulated the minds of his audience on the dangers of providing mass medicine by bureaucratic law.

Dr Russell L Cecil, Chairman of the Sub commutee on Pneumonia, of the State Society, spoke of the necessity of educating the laity on the advisability of prompt aduntion to prodromal symptoms of pneumonia, and accentiated the necessity of the prompt use of scrum to obtain miximum benefits.

Because of the increasing interest of the profession in the minagement and treatment of compensable diseases, the following scientific program was presented

Some Phases of Traumatic Surgery, John J Moorhead, M D, New York City

Hand Destruction and Construction, Hugh You Closs MD, New York City Some Dermatores, Their Origin and Irratment, George Miller Mackee, MD,

New York City
Vertebral and Associated Spinal Cord
Injuries Management and Treatment;
Byron Stookey, M.D., New York City

The evening session consisted of a dinner with an address by Mr. Upton Close, whose subject was "White, Black and Yellow" (a consideration of the modern problems of the three races)

Instance as I received no notices of the meetings of the various County Societies in the First District no visitations were made to their meetings To the best of my knowledge, each local County Society has functioned smoothly and normally

Respectfully submitted,
Terry M. Townstnd, President
March 1, 1936

and Health, as a part of the Exposition The Annual Meeting was held on

REPORT OF THE SECOND DISTRICT BRANCH

To the House of Delegates, Gentlemen

The great new responsibility of the component county societies comprising the Second District Branch during the year 1935 arose out of the changes in the Workmen's Compensation Act. In fulfilling their obligations under this law it was necessary for all of them to assume additional financial burdens for elerical workers, and in the case of Kings County for additional office space. While the extra expenditure was met this year by the filing fee, which was collected, it is to be noted that the expense will be a continuing one while the income will be negligible after the first year.

Queens and Nassau Countics saw the completion and opening of new County Hospitals during the year. In both cases the County Society was directly interested in the selection of the staffs and in their

organization

Queens County was given a warning of a new responsibility to come, the George Washington World's Fair, to be held within its boundaries during 1939 and 1940 The County Society responded promptly with the appointment of a World's Fair Committee which has already gone on record as advocating a Permanent National Museum of Hygiene

November 21 at Gurden City, Long Island, continuing the policy mangurated last ve ir under Di Van Kleeck's adminis tration the special feature was the Scientific Lyhibit There were fourteen exhibits from hospitals and individuals, all of them illustrating lesions of the Respiratory I ract A prize for the best exhibit was offered this year and was awarded to the Mary Immaculate Hospital of Janiuca for an exhibit on Anatomy and Embryology of the Tracheobronchial System, prepared by Dr Emil F Koch and Staff Honorable mention was given to St John's Long Island City Hospital for an exhibit on Diagnosis and

A Symposium on Nontuberculous Discases of the Lungs was given during the afternoon The papers were as follows

Serum Treatment of Pneumonia, pre-

1 Pneumonokonioses

pared by Drs

Elmer Kleefield

(a) Experiences with Dust Diseases of the Lungs

William Benenson and

CHARLES T GRAHAM ROGERS, M D
(b) Clinical Experiences (Silicosis
and Asbestosis)

Anthony J Lanza, M D

- 2. Bronchitis and Bronchicctasis, Abraham Braunstein, M.D.
- 3. Carcinoma of the Lung. HENRY M. Moses, M. D.
- 4. The X-Ray Examination of the Lungs. Frederic E. Elliott, M.D.

The Annual banquet featured an address by the President of the State

Society on State Society Problems, and on the Workmen's Compensation Law by the Honorable Elmer F. Andrews, Industrial Commissioner of the State of New York.

Respectfully submitted, CARL BOETTIGER, M.D., President. March 1, 1936.

REPORT OF THIRD DISTRICT BRANCH

To the House of Delegates; Gentlemen:

The Third District Branch, which is composed of the Counties of Albany, Columbia, Greene, Rensselaer, Schoharie, Sullivan, and Ulster held the Twenty-ninth Annual Meeting at the Hendrick Hudson Hotel, Troy, Tuesday, September 24, 1935. The meeting was attended by over 125, and represented all the counties in the Third District. The morning was devoted to operations and clinics at the Troy Hospitals, Pawling Sanatorium and Marshall Sanitarium, A printed program of operations, clinics, and demonstrations was furnished each member at the registration desk at the Hotel, and were available at each Hospital. The program was very diversified and represented all departments of medicine and surgery, including laboratory and electrocardiograph units.

The afternoon meeting started with a luncheon at the Hendrick Hudson Hotel, at which many prominent members of the State Society were present, including the President of the State Society, Dr. Frederic E. Sondern, First Vice President, Dr. Thomas H. Cunningham, Treasurer, Dr. Charles H. Goodrich, Past President, Dr. Arthur J. Bedell, Dr. John P. Cummings, President of the Fourth District, and officers of the component county medical societies. Dr. Sondern spoke briefly of state affairs and especially of the change in Group Insurance from the Aetna to the Yorkshire Company. Brief remarks were made by Judge Parmenter, representing Mayor Burns of Troy, Dr. John D. Carroll, President of Rensselaer County Medical Society, and others at the speakers tables.

The following scientific program was

carried out: Gastric and Duodenal Ulcer Treatment from a Surgical Viewpoint, Warren Wooden, M.D., Rochester; The Clinical Manifestations of Autonomous Nervous System Imbalance, CLEMENT J. HANDRON, M.D., Troy; Cancer of the Vulva and Uterus, Louis C. Kress, M.D., Buffalo; Mortality Factors in Thyroid Surgery, Eldridge H. Campbell, M.D., Albany; Legal Aspects of Malpractice, Hon. Thomas H. Guy, Troy. A very active discussion followed each paper.

The Third District Branch has a coordinating committee and also a committee on Trends and Medical Practice. Both have worked in unison with the State Society during the year. The State Compensation Law, with its important recent amendments, has received the active cooperation of each county society, and the special committees have performed their duties in a commendable manner. There has been much discussion in the counties about the care of indigent cases, and in some counties, arrangements have been made, with Welfare Officers, whereby members of the Medical profession are paid for services rendered. Columbia County continues to function efficiently as a County Health Department.

I wish to take this opportunity to thank the members of the Third District Branch for their attendance at the annual meeting; and again thank the officers of the Branch, the officers and committees of Rensselaer County Medical Society and the speakers at the meeting; all cooperated in making the meeting a success.

Respectfully submitted,
Augustus J. Hambrook, President
March 1, 1936

REPORT OF FOURTH DISTRICT BRANCH

To the House of Delegates, Gentlemen

The Annual Meeting of the Fourth District Branch was held in the auditorium at the Saratoga Spa on Sept. 27 and 28

Notwithstanding the inclement weather it was well-attended. The program was planned in May by the Executive Committee, and proved to be an excellent one. It could not be otherwise when such speakers as Drs. Howard Lahenthal, R. LaF. Cecil of New York City, L. W. Gorham, Albany, and A. L. Lockwood, Toronto, read papers on chest topics. Drs. W. S. McClellan, Saratoga, and Thomas P. Farmer, Syracuse, also con-

tributed in making it an occasion of time well-spent. In the evening of Sept 27 we were addressed by our State President, Dr. F. E. Sondern, on pertinent topics, and he received close attention and applause I would be remiss in this report without acknowledging my appreciation to the Presidents of the eleven counties of the Fourth District, to Dr. Joseph S. Lawrence, Executive Officer, and the Saratoga members, for wholehearted assistance and cooperation.

Respectfully,

I P I CUMMINS, President

March 1, 1936

REPORT OF FIFTH DISTRICT BRANCH

To the House of Delegates; Gentlemen:

The Fifth District Branch held its Annual Meeting the first of October in Watertown We had a very large attendance, and a very instructive and interesting meeting; one of the largest attended meetings we have had in several years. There was a very free discussion of the papers and the members seemed to take an unsual interest in the program. The President of the State Society was with us and gave a very interesting and instructive explanation of the reason for changing the Insurance Carrier and I believe that it was the concensus of opinion of the members.

present that it was a wise move

The different counties comprising the Fifth District are holding their monthly or semi-monthly meetings with good attendance and there is an unusual amount of interest being shown. We are cooperating with officers of the State Society, I believe, 100 per cent

An unusual amount of interest is being taken in the Pieumonia Program by the State and Dr. Farmer of Syracuse is doing some good work along that line

Respectfully submitted, LrRoy F Hollis, President March 1, 1936

REPORT OF THE SIXTH DISTRICT BRANCH

To the House of Delegates, Gentlemen The Annual Meeting of the Sixth District Branch was held in Elmira on September 18, 1935 The session was

well-attended and the addresses created a good deal of interest

The program began promptly at 9 30 A. M. with a paper by Dr. Ethan F. Butler on Cough and Hemophysis. This was followed by a paper on Management of Delayed Umon, Non-Umon, and Malmon of Fractures of the Long Bones by Dr. H. M. Bergaumm of New York City. Dr. A. W. Booth, member of the Board of Trustees of the American Medical Association and Past President of the Medical Society of the State of New York gave an illustrated lecture on The Activities of the American Medical Association. This was followed by The

Treatment of Burns by Dr Leon E Sutton

Immediately after luncheon the following officers were elected President, Dr. Leo P Larkin of Ithaca, First Vice-President, Dr Reeve B Howland of Elmira, Second Vice-President, Dr. George M Mackenzie of Cooperstown; Secretary, Dr Hubert B Marvin of Binghamton, Treasurer, Dr. William A Moulton, Candor

The afternoon's program was resumed with an address on the State Society by President F E Sondern Then followed addresses by Prof Joseph F McCarthy and Dr Geoige W Crile There were in attendance upwards of 175 physicians and lay guests

Seven of the Counties in the Sixth District availed themselves of the State's

postgraduate lectures during 1935. tendance at these lectures showed an improvement over last year, when it was

sixty-two per cent.

All of the Counties are engaged in attempts at diphtheria prevention. Health officials have stimulated a growing interest among members of the profession in the prevention of other communicable dis-Recently the treatment of pneumonia and its prevention have received a great deal of attention. The same is true of cancer.

Postgraduate lectures by the State Society are being better attended and more generally appreciated. They are doing a great deal of good and should by all means be continued. They should, furthermore, be extended to counties not now, having them.

Respectfully submitted,

J. E. WATTENBERG, President

March 1, 1936 ·

REPORT OF SEVENTH DISTRICT BRANCH

To the House of Delegates; Gentlemen:

The Twenty-ninth Annual Meeting of the Seventh District Branch of the Medical Society of the State of New York was held in Canandaigua on Thursday, September 29, 1935.

Through the courtesy and cooperation of Dr. Hans Hanson, Manager of the Veterans' Hospital, the splendid facilities of this institution were placed at the disposal of the District. This gave those attending the meeting an opportunity to inspect the beautiful grounds and buildings in addition to benefiting from the scientific program. Dr. Alfred Armstrong of Canandaigua did much to make the meeting a success.

The Seventh District Branch was honored by the presence of Dr. Frederic E. Sondern, President of the Medical Society of the State of New York. Dr. Sondern

addressed the meeting after the noon recess.

The other speakers on the program were Dr. EDWARD T. WENTWORTH, Rochester, who spoke on The Fractured Calcaneus; Dr. Nelson G. Russell, Buffalo, who discussed Anemia; Dr. JOHN A. KOLMER, Philadelphia, who reviewed his work on Susceptibility, Immunity, and Vaccination in Infantile Paralysis; and Dr. Howard M. Clute, Boston, who covered the Clinical Management of Obstructive Jaundice.

The meeting was well attended and much interest was expressed in the papers presented. It maintained the high standard set by previous meetings of the Seventh

District Branch.

Respectfully submitted, Alfred K. Bates, President

March 1, 1936

REPORT OF THE EIGHTH DISTRICT BRANCH

To the House of Delegates; Gentlemen:

Following a spring conference between the officers of the component societies and the Executive Officer of the State Society, the following desirable topics were selected for the Annual Meeting which was held at Warsaw, on October 3, 1935.

Experiences with Medical Relief Under the T.E.R.A., H. Jackson Davis, M.D.

The Management of Arthritis, Howard K. Thompson, M.D.

Peripheral Vascular Disease, G. TAKATS, M.D.

Although this was an unusually good program it did not draw the attendance that might have been expected. However, the Society was honored by the presence of Dr. Frederic E. Sondern, President of the Medical Society of the State of New York, who addressed the meeting on miscellandous subjects of immediate importance.

The Branch President attended a meeting of the Council held in New York, December 12, 1935, to consider Society matters in the interim between meetings

of the House of Delegates.

It is the opinion of the undersigned that efficiency of the State Society would be greatly increased by expanding the work of the District Branches beyond the annual presentation of scientific programs to include the services of paid, full-time secretaries who should contact and correlate the officers of the over-worked county societies.

The affairs of organized medicine have become too vast and complicated for the small amount of time that can be spared by the average officer or committee of a county medical society.

Respectfully submitted,

RICHARD H. SHERWOOD, President March 1, 1936

MEDICAL SOCIETY OF THE STATE OF NEW YORK

Annual Meeting, New York City, April 27, 28, 29, 1936

House of Delegates

The regular Annual Meeting of the House of Delegates of the Medical Society of the State of New York will be called to order at 10:00 A.M., Daylight Saving Time, on Monday, April 27, 1936, in the Hotel Waldorf-Astoria.

> SAMUEL J. KOPETZKY, Speaker DANIEL S. DOUGHERTY, Secretary

Annual Meeting

The Annual Meeting of the Medical Society of the State of New York will be held on Tuesday, April 28, 1936, at 7:00 P.M., in the Hotel Waldorf-Astoria.

> FREDERIC E. SONDERN, President DANIEL S. DOUGHERTY, Secretary

Registration

The Hotel Waldorf-Astoria will be the general headquarters. Registration for Delegates will be held on Monday morning, April 27, from 9:00 o'clock; for members on Monday, Tuesday and Wednesday, April 27, 28, 29, from 9:00 A.M.. to 6:00 P.M.

Exhibits

Scientific and Technical Exhibits will be located in the Hotel Waldorf-Astoria.

Scientific Sessions

General Sessions on Tuesday and Wednesday afternoons. Section meetings on Tuesday and Wednesday mornings will be held in the Hotel Waldorf-Astoria.

Hospital Clinic Day

On Thursday, April 30, an all-day Clinic Day will be held in the Hospitals and Universities of Greater New York. Program of these Clinics can be obtained between one and two p.m. on Wednesday, April 29, at the Registration Booth of the Society.

130th Annual Meeting

Grand Ballroom—Hotel Waldorf-As-

toria—Tuesday, April 28, 7:00 P.M.
Calling the Society to order by the
President, Frederic E. Sondern, M.D.

Reading of the minutes of the 129th Annual Meeting by the Secretary, Daniel S. Dougherty, M.D.

The Annual Banquet

The Annual Banquet will be held in the Grand Ballroom of the Hotel Waldorf-Astoria on Tuesday, April 28, at 7:00 P.M. The guests of honor will include Lord Horder, Chief of the Medical Department of St. Bartholomew Hospital, London, Dr. Willard C. Rappleye, Dean, College of Physicians and Surgeons, Columbia University, New York City; and Dr. William M. Lewis, President Lafavette College, Easton, Pa.

10:30 P.M.-Reception and Dance in the Starlight Roof of the Hotel Waldorf-Astoria, tickets will be issued in connection with the Banquet tickets.

Requests for tickets and reservations for tables should be sent to Daniel S. Dougherty, M.D., Secretary, Medical Society of the State of New York, 2 East 103rd Street, New York City. Tickets will be \$5.00. Tables will be allocated in order of receipt of reservations.

Delegates Dinner

Dinner for the Delegates will be served in the Hotel Waldorf-Astoria on Monday following the adjournment of the afternoon session of the House of Delegates. Tickets can be procured from the Secretary of the Medical Society of the State of New York, Daniel S. Dougherty, M.D., 2 East 103rd Street, New York City. Tickets will be \$4.00.

Open Forum

An Open Forum will be held on Wednesday evening, April 29, at 8:15 P.M. in the Grand Ballroom of the Hotel Waldorf-Astoria. The meeting is for the public but admission will be by card only, which can be obtained by writing the Secretary of the Medical Society of the State of New York, Daniel S. Dougherty, M.D., 2 East 103rd Street, New York City.

Validation of Railroad Tickets

Members holding railroad certificates entitling them to a reduction in return railroad fare must have them signed and validated at the Society's Registration Desk before purchasing tickets for the return trip at the special fare allowed to those attending the meeting.

Scientific Program

All Meetings Will Be Held By Daylight Saving Time

GENERAL SESSIONS

PLACE OF MEETING-THE WALDORF-ASTORIA, GRAND BALLROOM

Tuesday, April 28-2:00 P.M.

1. ADDRESS.

The Right Honorable Lord Horder of Ashford, K.C.V.O., F.R.C.P.; Chief of Medical Service, St. Bartholomew Hospital, London, Eng. (invited guest).

 THE EPIDEMIOLOGY, DIAGNOSIS AND TREATMENT OF AMERIASIS.

William M. James, M.D., Panama, R.P. (invited guest).

3. THE TEACHING OF FORENSIC MEDI-CINE.

Harrison S. Martland, M.D., Newark, N. J. (invited guest).

4. Artificial Fever Therapy of Syphilis and Gonococci Infections.

Walter M. Simpson, M. D., Dayton, Ohio (invited guest).

Wednesday, April 29-2:00 P.M.

- 1. THE INFLUENCE OF THE PRESENT DAY DEPRESSION UPON THE NUTRI-TIVE STATE OF THE AMERICAN PEO-PLE.
- James S. McLester, M.D., President of American Medical Association, Birmingham, Ala. (invited guest).
- 2. THE PLACE OF SURGERY IN THE THERAPY OF PEPTIC ULCER.

Urban Maes, M.D., New Orleans, La. (invited guest).

3. MALIGNANT NEOPLASMS OF THE COLON.

Fred W. Rankin, M. D., Lexington, Ky. (invited guest).

4. THE DIFFERENTIAL DIAGNOSIS OF CONDITIONS ASSOCIATED WITH SUGAR EXCRETION.

William G. Exton, M.D., New York.

Charles H. Goodrich, M.D., *Brooklyn*. General Discussion.

SECTION ON OBSTETRICS AND GYNECOLOGY

Place of Meeting-The Waldorf-Astoria, Jansen Suite

Tuesday, April 28-10:00 A.M.

1. The Physicians Responsibility in Community Obstetrics.

George W. Kosmak, M.D., New York.
Discussion opened by Thomas P. Farmer,
M.D., Syracuse, and Benjamin P. Watson,
M. D., New York.

2. THE INJECTION OF VARICOSE VEINS DURING PREGNANCY.

Goode R. Cheatham, M.D., and Abel E. Peck, M.D., Endicott.

DISCUSSION opened by Harold J. Shelley, M.D., New York.

3. Full Term Extra-uterine Preg-

Harry Hudnall Ware, Jr., M.D., Richmond, Va. (invited guest).

Discussion opened by Alfred C. Beck, M.D.

Brooklyn, and Alfred M. Hellman, M.D., New York.

 THE ROLE OF INTRAVENOUS RESUSCI-TATION IN ASPHYXIA NEONATORIUM, Robert A. Wilson, M.D., Brooklyn.

DISCUSSION opened by Ralph M. Beach, M.D., Brooklyn, and Arthur C. Martin, M.D., Hempstead.

Wednesday, April 29-10:00 A.M.

1. THE USE OF LOCAL ANESTHESIA IN VAGINAL PLASTIC OPERATIONS.

Harvey B. Matthews, M.D., and Vincent P. Mazzola, M.D., Brooklyn.

Discussion opened by Vincent P. Mazzola, M.D., Brooklyn.

2. THE HORMONAL CONTROL OF THE HUMAN UTERUS.

Raphael Kurzrok, M.D., New York.
Discussion opened by Philip E. Smith,
Ph.D., New York (invited guest).

3. THE RETENTION OF LIPIODOL IN THE FALLOPIAN TUBES.

Isidor C. Rubin, M.D., New York,
Discussion opened by Walter T. Dannreuther, M.D., New York.

4. THE MENOPAUSE.

Robert T. Frank, M.D., Morris A. Goldberger, M.D., and Udall J. Salmon, M.D., New York.

Discussion opened by Samuel R. M. Reynolds, Ph.D., Brooklyn (invited guest).

SECTION ON PEDIATRICS

Tuesday, April 28-10:00 A.M.

- TREATMENT OF SYDENHAM'S CHOREA WITH TYPHOID PARATYPHOID VAC-CINE.
 Donald J. Weisman, M.D., New York.
 Discussion opened by Paul W. Beaven, M.D., Rochester.
- 2. SIMPLE MILK MIXTURES IN THE FEEDING OF PREMATURE INFANTS, Abraham Tow, M.D., New York.
 DISCUSSION opened by Bela Schick, M.D., New York.
- 3. THE DIAGNOSIS AND TREATMENT OF ACCIDENTAL POISONING IN CHILDREN. John Aikman, M.D., Rochester.

Discussion opened by Frank vander Bogert, M.D., Schenectady.

4. RELATIONS OF ACID BASE EQUI-LIBRIUM TO THE PATHOGENESIS AND TREATMENT OF WILOOPING COUGH, Joseph C. G. Regan, M.D., Brooklyn, Discussion opened by Harry Bakwin, M.D., New York.

Wednesday, April 29-10:00 A.M.

- 1. Results in 63 Cases of Poliomyelitis Treated in the Respirators at Willard Parker Hospital.
 - M. Bernard Brahdy, M.D., Mt. Ver-

Discussion opened by Wardner D. Ayer, M.D., Syracuse.

Hypogonadism and Cryptorchidism in Children.

Murray B. Gordon, M.D., Brooklyn.

Discussion opened by Simon A. Beisler,
M.D., New York.

 THE ROLE OF THE THYMUS GLAND IN GROWTH AND DEVELOPMENT. AN EXPERIMENTAL STUDY.

Leonard G. Rowntree, M.D., Philadelphia, Pa. (invited guest).

Discussion opened by Walter Timme, M.D., New York,

SECTION ON OPHTHALMOLOGY AND OTOLARYNGOLOGY

Chairman......John F. Fairbairn, M.D., Buffalo Secretary.....Walter S. Atkinson, M.D., Watertown

Place of Meeting-The Waldorf-Astoria, Assembly Room N-P-R

Tuesday, April 28—9:00 A.M. Instructional Hour 9:00 A.M. to 10:00 A.M. Hearing Tests, Interpretation in the Light of Recent Research.

Edmund Prince Fowler, M.D., New York.

DISCUSSION opened by Mr. R. L. Wegel, Research Physicist (invited guest).

1. Non-Healing of Mastoid Wounds; Causes and Remedies.

Ralph Almour, M.D., New York.

DISCUSSION opened by Marvin F. Jones, M.D., New York, and William A. Krieger, M.D., Poughkeepsie.

The Treatment of Fractures of the Bones of the Face.

Gerard H. Cox, M.D., Glen Cove.

DISCUSSION opened by Jay D. Whitham, M.D., New York, and D'Arcy McGregor, M.D., Buffalo.

3. Conservative Treatment of Nasal Sinus Diseases.

Harold Hays, M.D., New York.

DISCUSSION opened by Irving W. Voorhees, M.D., New York, and Chester C. Cott, M.D., Buffalo.

- 4. VASOMOTOR RHINITIS.
- C. Stewart Nash, M.D., Rochester.
 DISCUSSION opened by Lee M. Hurd, M.D.,
 New York.

Wednesday, April 29—9:00 A.M. Instructional Hour 9:00 to 10:00 A.M.

Ocular Therapeutics.

Sanford R. Gifford, M.D., Chicago, Ill. (invited guest).

1. Sources of Grafts for Plastic Surgery about the Eyes.

John M. Wheeler, M.D., New York.
DISCUSSION opened by Webb W. Weeks,
M.D., New York, and John F. Gipner, M.D.,
Rochester.

2. Allergy as it Affects the Eyes. Arthur J. Bedell, M.D., Albany.

DISCUSSION opened by Foster Kennedy, M.D., New York, and Conrad Berens, M.D., New York.

3. Sympathetic Ophthalmia Following Intraocular Operations. Harold H. Joy, M.D., Syracuse.

Discussion opened by Albert C. Snell, M.D., Rochester, and Harry M. Weed, M.D., Buffalo.

4. THE PRESENT STATUS OF THE SUR-GICAL TREATMENT OF RETINAL DE-TACHMENT.

Mark J. Schoenberg, M.D., New York. Discussion opened by John H. Dunnington, M.D., New York, and Searle B. Marlow, M.D., Syracuse.

SECTION ON DERMATOLOGY AND SYPHILOLOGY

Chairman.....Louis Tulipan, M.D., New York Secretary.....Clarence H. Peachey, M.D., Rochester

Place of Meeting-The Waldorf-Astoria, Assembly Rooms J-K-L

Tuesday, April 28—10:00 A.M.

1. Sensitivity to External Irritants in Industry.

Louis Schwartz, M.D., New York.

Discussion opened by Earl D. Osborne, M.D., Buffalo.

2. The Role of Food Allergy in Diseases of the Skin.

Joseph G. Hopkins, M.D., New York.

DISCUSSION opened by George M. MacKee,
M.D., New York.

3. ALLERGIC DERMATOSES DUE TO FUNGI.
Samuel M. Peck, M.D., New York.
Discussion opened by Fugers F. Troub

Discussion opened by Eugene F. Traub, M.D., New York.

4. The Role of Allergy in Drug Eruptions.

E. William Abramowitz, M.D., New York.

Discussion opened by Howard Fox, M.D., New York.

5. Allergic Manifestations in Dermatology.

Marion B. Sulzberger, M.D., New York.

Discussion opened by Maximilian A. Ramirez, M.D., New York.

Wednesday, April 29-10:00 A.M.

1. TREATMENT OF ALOPECIA AREATA. Herbert H. Bauckus, M.D., Buffalo. Discussion opened by Edward R. Maloney,

M.D., New York.TREATMENT OF PSORIASIS WITH COLLOIDAL MANGANESE.

Henry D. Niles, M.D., New York.

DISCUSSION opened by Frank C. Combes, M.D., New York.

3. Specific Therapy of Rhus Dermatitis.

Herman Sharlit, M.D., New York.

Ben A. Newman, M.D., New York.

Discussion opened by Oscar L. Levin, M.D., New York.

4. BISMUTH BY MOUTH IN THE TREAT-MENT OF SYPHILIS. (An Experimental Study.)

Charles R. Rein, M.D., New York.

Discussion opened by A. Benson Cannon, M.D., New York.

5. THERAPY WITH VARIOUS HORMONE PREPARATIONS IN ACRE VULGARIS.

Theodore Rosenthal, M.D., New York.

Discussion opened by Albert R. McFarland,
M.D., Rochester.

SECTION ON PUBLIC HEALTH, HYGIENE AND SANITATION

Chairman..........John A. Conway, M.D., Hornell Secretary.......Lewell T. Genung, M.D., Ithaca

Place of Meeting—The Waldorf-Astoria, Jansen Suite (Blue room, entrance thru 4-U)

Tuesday, April 28-10:00 A.M.

- 1. Report of Poisoning by Cicuta Maculata (Musquash).
- D. Roger Haggerty, M.D., Arkport.
 Discussion opened by John A. Conway,
 M.D., Hornell.
- 2. A Proper Dietary as a Public Health Measure.

Edward J. Wynkoop, M.D., Syracuse.

Discussion opened by George R. Murphy,
M.D., Elmira.

3. PNEUMONIA PREVENTION, MANAGE-MENT AND SERUM TREATMENT. Rufus I, Cole, M.D., New York.

Discussion opened by Edward S. Rogers, M.D., Albany.

Wednesday, April 29-10:00 A.M.

- Sypitilis Control in the Scandinavian Countries,
 - David J. Kaliski, M.D., New York.

Discussion opened by Thomas Parran, Jr., M.D., Albany

- 2. MUNICIPAL CONTROL OF SYPHILIS. Thomas F. Laurie, M.D., Syracuse.
- 3. Present Status and Technique of Tuberculin Testing.

John K. Deegan, M.D., Albany.

Discussion opened by N. Stanley Lincoln, M.D., Mt. Morris.

SECTION ON NEUROLOGY AND PSYCHIATRY

Chairman.....Byron Stookey, M.D., New York Secretary.....Lloyd H. Ziegler, M.D., Albany

Place of Meeting-The Waldorf-Astoria, Assembly Room 4-M

Tuesday, April 28-10:00 A.M.

1. A STUDY OF TRAUMATIC LESIONS OF THE SPINE.

John E. Scarff, M.D., New York.
Discussion opened by Foster Kennedy, M.D.,
New York.

- 2. Oxygen Consumption in Organic Psychoses,
 - John Y. Notkin, M.D., Poughkeepsie.
 Discussion opened by S. Bernard Wortis,
 M.D., New York.
- 3. NEUROLOGICAL COMPLICATIONS OF SUBACUTE BACTERIAL ENDOCARDITIS.

 Josephine B. Neal, M.D., Henry W. Jackson, M.D., and Emanuel Appelbaum, M.D., New York.

- Discussion opened by Joseph H. Globus, M.D., New York.
- EXTRANEURAL PATHOLOGY OF PARA-NOIA AND MANIC DEPRESSIVE PSY-CHOSES.

Nolan D. C. Lewis, M.D., Washington, D.C. (invited guest).

Discussion opened by Joseph H. Globus, M.D., New York, and Armando Ferraro, M.D., New York.

Wednesday, April 29-10:00 A.M.

- Symposium on the Nervous System in Relation to Automobile and Industrial Accidents.
- 1. THE CHAIRMAN'S INTRODUCTORY REMARKS.

Byron Stookey, M.D., New York.

2. Selected Tests Used in Industry to Measure Specification Abilities and Aptitudes.

Michael Lake, M.D., New York.

3. CERTAIN NEUROLOGICAL PHASES OF THE PROBLEM OF MOTOR CAR ACCI-DENTS. Cassius H. Watson, M.D., New York.

4. Responsibilities of the Individual in Automobile Accidents.

Colonel Harold Fowler, First Deputy Commissioner, Police Dept., New York (invited guest).

Discussion opened by Charles A. Mc-Kendree, M.D., New York.

SECTION ON UROLOGY

Chairman	.Ernest M	. Watson,	M.D., Buffalo
Vice-Chairman	Fedor L	Senger, I	M.D., Brooklyn
Secretary			

Place of Meeting-The Waldorf-Astoria, Palm Room, 18th Floor

Tuesday, April 28-10:00 A.M.

1. Renal Function Following Trauma of the Kidney.

John H. Powers, M.D., Cooperstown.

Discussion opened by Oswald Swinney
Lowsley, M.D., New York.

2. RECENT ADVANCES IN CLINICAL CYSTOMETRY BY MEANS OF THE MICROCYSTOMETER.

Irving Simons, M.D., and William Bisher, M.D., New York.

DISCUSSION opened by Ernest L. Brodie, M.D., Buffalo.

3. Factors Influencing the Formation and Dissolution of Renal Calculi and Their Application to the Prevention of Recurrent Renal Lithiasis.

Charles C. Higgins, M.D., Cleveland, Ohio (invited guest).

DISCUSSION opened by Leo E. Gibson, M.D., Syracuse.

Wednesday, April 29-10:00 A.M.

1. An Evaluation of the Present Knowledge of Urethral Disease in Women.

Arthur Hilton Paine, M.D., Rochester.

Discussion opened by H. Dawson Furniss, M.D., New York.

2. Newer Pathologic Concepts of Bladder Tumors with a Report on an Improved Technique in Treatment.

Russell S. Ferguson, M.D., New York

DISCUSSION opened by Edward L. Keyes, M.D., New York.

THE RATIONALE OF TREATMENT IN URINARY INFECTION.

David M. Davis, M.D., *Philadelphia*, Pa. (invited guest).

DISCUSSION opened by Frederick J. Parmenter, M.D., Buffalo.

SECTION ON RADIOLOGY

Chairman	Leo	P. L	arkin,	M.D.,	Ithaca
Vice-Chairman	Cliffor	d R.	Orr,	M.D.,	Buffalo
SecretaryW	illiam P	. Ho	ward,	M.D.,	Albany

Place of Meeting—The Waldorf-Astoria, Carpenter Salon

Tuesday, April 28—10:00 A.M.

1. Cancer of the Esophagus.

William L. Watson, M.D., New York.
DISCUSSION opened by D. E. Ehrlich, M.D.,
New York and James Ewing, M.D., New York.

2. ROENTGENOLOGICAL CONSIDERATION OF DYSPHAGIA OF ESOPHAGEAL ORIGIN.

John M. Barnes, M.D., Buffalo.

Discussion opened by Barney B. Smith, M.D., Buffalo.

3. Roentgen Diagnosis of Malignant Tumors of the Stomach.

George T. Pack, M.D., New York and Harry Hauser, M.D., Cleveland, Ohio (invited guest).

Discussion opened by James M. Flynn, M.D., Rochester.

4. PRESENTATION OF AUTOMATIC ELEC-TRIC SERIALOGRAPH WITH CASSETTE HOLDER.

Moses Einhorn, M.D., New York.

Wednesday, April 29-10:00 A.M.

1. IRRADIATION IN THYROTOXICOSIS.

J. Thompson Stevens, M.D., New York.

Discussion opened by Lucas S. Henry, M.D., Syracuse.

2. Hodgkins Disease with Bone Manifestations.

Samuel George Schenck, M.D., Brooklyn.

Discussion opened by Lloyd F. Craver, M.D., New York.

3. Suppuration in the Pneumath Petrous Apex.

Henry K. Taylor, M.D., New York.

Discussion opened by William P. Howard M.D., Albany and Frederick M. Law, M.D. New York.

4. A REVIEW OF THE BONY CHANGES IN CASES OF ARTHRITIS TREATED BY FEVER THERAPY.

S. C. Davidson, M.D., and Stafford L. Warren, M.D., Rochester.

SECTION ON INDUSTRIAL MEDICINE AND SURGERY

Chairman......James M. Hitzrot, M.D., New York Secretary.......Cassius H. Watson, M.D., New York

Place of Meeting-The Waldorf-Astoria, Carpenter Suite

Tuesday, April 28—10:00 A.M. Symposium on Silicosis.

1. THE CAUSE AND PATHOLOGY OF SILI-COSIS.

Leroy Gardner, M.D., Saranac Lake (invited guest).

DISCUSSION opened by David Reisner, M D, New York.

THE DIFFERENTIAL DIAGNOSIS OF SILICOSIS FROM OTHER PULMONARY DISEASES.

George G. Ornstein, M.D., New York. Discussion opened by William S. McCann, M.D., Rochester.

3. THE CLINICAL FEATURES AND INDUSTRIAL SIGNIFICANCE OF SILICOSIS.

Anthony J. Lanza, M.D., New York (invited guest).

Discussion opened by Leonard Greenburg, M D, New York.

Wednesday, April 29-10:00 A.M.

Symposium on Industrial Diseases and Accidents to the Hand.

1. INDUSTRIAL DERMATOSES OF THE HAND.

Benjamin J. Slater, M.D., Rochester.

Discussion opened by George M. Lewis,
M.D., New York.

 THE INFECTIONS OF THE HAND. Robert F. Barber, M.D., Brooklyn. Discussion opened by Preston A. Wade, M.D., New York.

3. Injuries to the Tendons and Nerves of the Hand.

John H. Garlock, M.D., New York,
Discussion opened by Mather Cleveland,
M.D., New York.

4. THE FRACTURES OF THE HAND.

Clay Ray Murray, M.D., New York.

Discussion opened by John J. Moorhead,
M.D., New York.

SESSION ON PHYSICAL THERAPY

Chairman..........Richard Kovacs, M.D., New York Secretary.......Lee A. Hadley, M.D., Syracuse

Place of Meeting-The Waldorf-Astoria, Ballroom, 2nd Balcony, West Side

Wednesday, April 29-10:00 A.M.

 Physical Measures in Proctological Conditions. Rudolph V. Gorsch, M.D., New York. Discussion opened by F. Leslie Sullivan, M.D., Scotia, and John C. M. Brust, M.D. Syracuse.

2. Diagnosis and Treatment of Peripheral Vascular Disease by Physical Agents.

William Bierman, M.D., New York.

DISCUSSION opened by Kristian Gosta Hansson, M.D., New York, and Joseph Kovacs, M.D., New York.

3. Certain Aspects of Blood Flow. Thomas P. Sprunt, M.D., Baltimore, Md. (invited guest).

Discussion opened by Peter Irving, M.D., New York, and Norman E. Titus, M.D., New York.

4. THE TREATMENT OF GENERAL PARESIS BY ULTRA HIGHFREQUENCY HEATING.

Leland E. Hinsie, M.D., New York, and Joseph R. Blalock, M.D., New York.

Discussion opened by Walter M. Simpson, M.D., Dayton, Ohio (invited guest) and William Bierman, M.D., New York.

CLINIC DAY

Thursday, April 30

Clinics in all divisions and specialties of medicine will be given in the following hospitals:

Detailed information available on Wednesday, April 29th, at 1:00 P.M. at the Registration Desk and Bulletin Board in the Silver Corridor, Waldorf-Astoria.

Knickerbocker Hosp70 Convent Ave. Lenox Hill Hosp111 E. 76th St.
Lincoln Hosp141st St. and Concord Ave.
Montefiore Hosp. Gun Hill Rd. & Jerome Ave.
Morrisania Hosp168th St. & Gerard Ave.
Mount Sinai Hosp 1 E. 100th St.
New York Hosp525 E. 68th St.
New York Orthopedic Hosp420 E. 59th St.
Polyclinic Hosp335-361 W. 50th St.
Roosevelt Hosp428 W. 59th St.
Hosp. for Ruptured & Crippled. 321 E. 42nd St.
Woman's Hosp110th St. & Amsterdam Ave.
Post-Graduate Hosp2nd Ave. & 20th St.
Manhattan Eye, Ear & Throat Hosp.
210 E. 64th St.
New York Eye & Ear Infirmary,
218 Second Ave.

Scientific Exhibit

Corridors—East, South and West, Ground Floor and Mezzanine Floor of Grand Ballroom, and Third Floor Foyer Lexington Avenue Side, Waldorf-Astoria Hotel.

BOOTH NO. 1

Dr. William M. James, Dr. Lawrence Getz, The Herrick Clinic. Panama, R. P.

THE PATHOLOGY OF AMEBIASIS.

Description: A demonstration of the pathological lesions in amebiasis and of the amebia histolytica in stools and cultures. A clarification of the true etiology of amebiasis and its relation to the associated colitis and a differentiation of the pathogenic from the nonpathogenic amebae. Photographs illustrating the pathological fields will also be displayed and several specimens showing the gross pathology and characteristic lesions of the disease.

NO. 2

Dr. Simon L. Ruskin, Bronx Hospital, New York.

CENTRAL AND VEGETATIVE INNERVATION OF THE NASAL ACCESSORY SINUSES.

Description: Transparencies and charts will demonstrate both the sectional anatomy and dissection diagrams of the innervation of the nasal accessory sinuses. Relationship to symptomatology will be pointed out.

NO. 3

Dr. William E. Caldwell, Dr. Howard C. Maloy, Dr. D. Anthony D'Esopo, Sloane Hospital for Women, New York.

CLINICAL AND ROENTGENOLOGICAL RECOGNITION OF ANATOMICAL VARIATIONS IN FEMALE PELVES AND THEIR OBSTETRICAL SIGNIFICANCE.

Description: (1) Some 100 large half tone illustrations portraying pelvic variations and the mechanism of labor. (2) A precision stereoscope demonstrating the roentgenological technic. (3) Fifteen skeletal mounted pelves.

NO. 4

Dr. Rapheal Schillinger, Brooklyn.

CHRONIC NASAL SINUSITIS.

Description: Roentgen studies of mucosal function, with the aid of opaque medium. Description of an opaque survey and its application in the diagnosis and treatment of nasal sinusitis.

NO. 5

Dr. Charles Murray Gratz, Post Graduate Hospital of Columbia University, New York.

BIOMECHANICS. A NEW APPROACH TO THE STUDY OF LOW BACK PAIN AND ARTHRITS.

Description: Summary charts of biomechanical studies of fascia are presented; adhesions in the fascial spaces are shown histologically; anatomical studies are demonstrated with radiographs of the fascial planes after they have been injected with air. Fascial adhesions are regarded as causes of symptoms in low back pain and arthritis by interfering with the normal mechanics of the soft tissues.

NO. 6

Dr. James S. Edlin, Dr. Pol N. Coryllos, Polyclinic Hospital, New York.

PULMONARY DISEASES.

Description: X-rays and photographs demonstrating routine clinical procedures. Mantoux test, Lipiodol injection, collapse therapy, extra-pulmonary tuberculosis, non tuberculous pulmonary diseases, anomalies, etc.

NO. 7

Dr. Irving S. Wright, New York Post-Graduate Medical School and Hospital, New York.

PERIPHERAL VASCULAR DISEASE.

Description: Charts, apparatus and x-rays of arteries (Arteriograms) showing recent studies in peripheral vascular disease. The effect of tobacco on this circulation. The therapeutic use of cholines; tissue extract; ceritamic acid. NO. 8

Dr. I. Seth Hirsch, College of Medicine, New York University and Beth Israel Hospital, New York.

Kymoroentgenography.

Description: A method of graphically recording cardiac movement. Motion picture

NO. 9

Dr. William L. Corcoran, Dr. G. Allen Robinson, Tumor Institute, St. Clares Hospital, New York.

CANCER EXHIBIT BY TUMOR INSTITUTE, ST. CLARFS HOSPITAL.

Description: The diagnosis and treatment of cancer by combined methods will be shown. Special attention will be given to early diagnosis, radiation technique, electrosurgery, intragastric photography and the study of living tumor tissue by iridescent microscopy.

NO. 10

Dr. Adoniram J. Quimby, Polyclinic Hospital, New York.

DEPARTMENT OF ROENTGENOLOGY.

Description: Transparencies of cranial, chest and abdominal lesions. Bone sarcoma.

NO. 11

Dr. Edward F. Hartung, New York Post-Graduate Hospital, New York.

CHRONIC ARTHRITIS.

Description: The blood in arthritis. The gastrointestinal tract, teeth, tonsils, gastric acidity, gall bladder, colon. Physiotherapy. Orthopedic considerations. The treatment of arthritis.

NO. 12

Dr. Edwin Boros, Bronx Hospital, New York.

GASTROSCOPY.

Description: Instruments, technique and visualization.

NO. 13

Dr. Carl H. Greene, New York Post-Graduate Medical School and Hospital, New York.

Types of Gallbladder Disease and of Associated Jaundice.

Description: Charts, models and drawings demonstrating distinct types of gallbladder disease, together with records of cases from the clinic. Models and drawings of conditions with associated jaundice with case records from the clinic. Moving pictures of normal and pathological physiology of the gallbladder.

NO. 14

Dr. David M. Bosworth, Polyclinic Hospital, New York.

LESIONS OF THE MENISCI OF THE KNEE. Description: (a) Gross specimens of menisci of the knee showing (1) lacerations (2) cysts. (b) Transparencies of x-rays. NO. 15

Dr. Frank H. Lahey, Lahey Clinic, Boston, Mass.

SURGERY OF THE LUNG, THYROID, RECTUM AND GALLBLADDER.

Description: Transilluminated, colored reproductions of the surgery of sub-total thyroidectomy for exophthalmic goitre. The Lahey abdomino-perineal resection of the rectum for cancer of the rectum. One stage total pneumonectomy for carcinoma of the lung. Cholectsyectomy and exploration of the common duct. Also various x-ray films, wax models and tumor specimens. Two motion picture films will be shown, one in color on the technique of sub-total thyroidectomy and one on the general subject of Endocrinology

NO. 16

Dr. Joseph C. Regan, Dr. Alexander Tolstoouhov, Brooklyn.

CHANGES IN ACID BASE EQUILIBRIUM IN WHOOPING COUGH; RELATON TO UNDERLYING PATHOGENESIS OF DISEASE; THERAPEUTIC SIGNIFICANCE.

Description: Charts, graphs, drawings and descriptive placards. The subject matter includes results of blood chemistry studies; description of characteristic changes, dimunition of inorganic phosphorus and increase in hydrogen ion concentration; significance of these changes, uncompensated acidosis; detailed exposition of this form of acidosis; causation, accumulation of free carbonic acid in the blood; relation to the paroxysms; therapeutic significance.

NO. 17

Dr. Maxwell Maltz, New York.

PLASTIC RECONSTRUCTIVE SURGERY.

Description: Correction of deformities of the face illustrated by photographs and masks of patients before and after reconstruction. Demonstration of new instruments and technique for rhinoplasty and tubal skin grafting.

NO. 18

Dr. Jesse G. M. Bullowa, Littauer Pneumonia Research Fund, New York.

MANAGEMENT OF THE PNEUMONIAS.

Description: The methods of typing; composition of endemic pneumonia results of serum therapy; oxygen therapy; treatment of special conditions.

NO. 19

Dr. David Sashin, Hospital for Joint Diseases, New York.

Low Back Pain. Relation of pathologic changes of the Sacro-iliac joints and lower lumbar and lumbo-sacral inter-

vertebral disks to pain and disability in the lower back.

Description: Numerous gross formaldehyde and macerated specimens, photomicrographs, charts, drawings, photographs showing normal and pathological changes of the sacroiliac joints and intervertebral disks. Case histories and x-ray prints and drawings of the method of treatment. Mounted macerated specimens showing effect of a narrowed intervertebral disk on the articular facets and on the normal lumbar curve.

NO. 20

Dr. David Reisner, Dr. Oscar Auerbach, Sea View and Metropolitan Hospitals, New York.

SILICOSIS AND SILICO TUBERCULOSIS.

Description: Roentgenograms and pathological specimens illustrating pulmonary lesions resulting from occupational dust exposure. Various forms and stages of silicosis are included, both with and without association with tuberculosis.

NO. 21

Dr. Samuel G. Schenck, Jewish Hospital, Brooklyn.

HODGKIN'S DISEASE WITH BONE MANI-FESTATIONS.

Description: Reductions of roentgenograms showing Hodgkin's invasion of the pelvis, spine, skull and femur. Photographs of gross specimens of Hodgkin's spine with low and high power photomicrographs.

NO. 22

Dr. Henry K. Taylor, Beth Israel Hospital, New York.

SUPPURATION IN THE PNEUMATIC PETROUS APEX.

Description: The exhibit consists of 48 10 x 12 illustrations. The roentgen appearance of the petrous pyramids with all types of otitic infection are shown. The major portion of the exhibit is devoted to suppurative lesions in the petrous apex.

Dr. Louis Nathanson, Sea View Hospital, New York.

LARYNGEAL TUBERCULOSIS.

Description: The exhibit consists of 112 8 x 10 films, showing tuberculous lesions in all the structures of the neck. The major portion of the exhibit is devoted to laryngeal tuberculosis. Depending upon the size of the lesion, it is designated as either, minimal, moderate or extensive. Lesions demonstrated: Tuberculosis in ventricle. Involvement in interarytenoid area, cords, aryepiglottic folds, epiglottis, subglottic extensions, prevertebral cold abscess, perichondritis, etc.

NO. 23

Dr. Conrad Berens, Dr. Brittain F. Payne, Lighthouse Eye Clinic, New York,

CERTAIN PHASES IN THE DEVELOPMENT OF THE HUMAN EMBRYO.

Description: A series of specimens of human embryos ranging from 6 mm. in length to term, demonstrating the formation of the primary optic vesicle and invagination of the surface ectoderm to form the crystallin lens and the development of the secondary optic vesicle. Further development of the human eye is demonstrated by various intermediate stages up to term.

NO. 24

New York City Cancer Committee, New York.

CANCER EDUCATION.

Description: A series of charts and photographs showing how cancer education may be carried on for both the lay public and the medical profession.

NO. 25

Dr. Irving Greenfield, Dr. Irving Gray, Jewish Hospital, Brooklyn

Acute Lead Poisoning. (Analysis of 50 Cases.)

Description: The diagnostic criteria, symptomatology, physical findings, chemical studies and other laboratory data. Laboratory data will include such special studies as renal function tests (urea clearance, phenolsulphonthalein and dilution and concentration tests), liver function tests (bromosulphonaphthalene, galactose tolerance and glucose tolerance), gastric analysis, blood chemistry, including calcium and phosphorus studies, urine, stool and blood studies for lead, etc. The results of studies on the cardiovascular system by electrocardiographic, blood pressure and oscillometric readings will be shown. Fluroscopic and x-ray findings in the gastrointestinal tract will be displayed.

NO. 26

Dr. J. Thompson Stevens, New York.
IRRADIATION IN THYROTOXICOSIS.

Description: Charts of collective and personal statistics of the results of irradiation in thyrotoxicosis. Charts setting forth the types of thyroid disease suitable for irradiation. Charts showing the craftiseries and exciting causes indications for i of patients before and after treatment with case histories, physical findings and follow up findings. NO. 28

Dr. A. Sumner Price, Dr. Malcolm

Campbell, Polyclinic Hospital, New York.

LESIONS OF THE MAMMARY GLAND.

Description: A series of about 40 transparencies mostly photomicrographs of histological sections, including benign, inflamatory and neoplastic lesions with emphasis on borderline lesions and criteria for early diagnosis.

NO. 29

Dr. R. Franklin Carter, New York Post-Graduate Medical School and Hospital, New York.

Appendicitis in Children.

Description: Exhibit is composed of paintings depicting the organs of the abdomen. Clay models of different types of appendicitis experienced in operating on 300 cases in children under 14 years of age, 115 cases of chronic appendicitis and 185 cases of acute appendicitis.

NO. 30

Dr. Moses Einhorn, New York.

NEW INSTRUMENTS AND NEW LABORA-TORY METHODS IN GASTRO-ENTEROLOGY.

Description: (a) Analytic bucket for complete quantitative and qualitative analysis of gastric content.

(b) Rapid filtering apparatus stopped auto-

matically and at will.

(c) Koproscope — special container for feces.

(d) Electric automatic serialograph.

(c) Minin method for complete quantitative and qualitative analysis of gastric content.
 (f) Douche and shower apparatus for clean-

ing gastrointestinal tubes.

(g) Special cabinet for storing gastrointestinal tubes.

(h) New procto-sigmoidoscopic instruments.

(i) New dilator apparatus for cardiospasm. NO. 31

Dr. Jerome M. Lynch, Polyclinic Hospital, New York.

BORDERLINE TUMORS OF THE RECTUM AND COLON.

Description: Illustrations of the author's operation employed in malignancy. Gross specimens, photographs, photomicrographs and charts. NO. 32

Dr. Alfred Plaut, Dr. Ella H. Fishberg, Beth Israel Hospital, New York.

OBLITERATING ARTERITIS OF SMALL LUNG ARTERIES.

Description: Photomicrographs showing the old and recent obliterating lesions in the

lung arteries and the accompanying tissue reactions. Gross specimen of lung with obliterated vessels. Charts and graphs explaining the change in blood gases.

NO. 33

Dr. A. J. Hambrook, Troy.

CONSERVATION OF HEARING. SUB-COMMITTEE ON THE DEAF AND HARD OF HEARING. COMMITTEE ON PUBLIC HEALTH AND MEDICAL EDUCATION AND THE COMMITTEE ON PUBLIC RELATIONS.

Description: Charts, panels, photographs and audiometers.

NO. 35

Dr. William Bierman, New York.

SKIN SURFACE TEMPERATURES IN THE DIAGNOSIS AND TREATMENT OF PERIPHERAL VASCULAR DISEASE.

Description: The diagnostic significance of the temperature of the surface of the big toe when heat and cold are applied locally and elsewhere on the body. The therapeutic significance of toe temperature in evaluating the influence of fever, anesthetics, acetylsalicylic acid, alcohol, coffee and tobacco.

NO. 36

Dr. M. Bernard Brahdy, Willard Parker Hospital, New York.

METHOD FOR THE IDENTIFICATION OF DIPHTHERIA BACILLI.

Description: Rapid method (4 hour) for the identification of diphtheria bacilli, which the practicing physician can perform himself. Photomicrographs of stained smears from 4 hour (rapid method) cultures taken from diphtheric membrane. Charts to show comparative results of the rapid method and Loeffler method in diphtheria cases and controls. Application of the rapid method to the detection of virulent carriers, photomicrographs and charts.

NO. 38

Dr. Murray B. Gordon, Long Island College of Medicine, Brooklyn.

ENDOCRINE DISORDERS IN CHILDREN.

Description: A consideration of the newer methods of endocrine diagnosis based upon physical, chemical and roentgenographic interpretation. Differential diagnosis, disturbances of development, growth, mentality, sex and nutrition with the results of treatment will be illustrated by photographs, charts and films.

NO. 39

Dr. Joseph Safian, New York.

RECONSTRUCTIVE SURGERY OF THE FACE. Description: Casts, photographs and diagrams of operative procedures in nose, ear and chin reconstruction.

NO. 40

American Medical Association, Chicago, Ill.

AN EXHIBIT ON PHYSICAL THERAPY.

Description: Charts, pamphlets and motion pictures giving information on short wave diathermy, positive and negative pressure therapy and information on home made apparatus.

NO. 41

Dr. George W. Kosmak, Maternity Center Association, New York.

TEACHING THE PUBLIC ABOUT MATERNITY CARE.

Description: Posters, text and literature depicting adequate maternity care.

NO. 42

Dr. Jacob Sarnoff, Israel Zion Hospital, Brooklyn.

SYSTEM OF GENERAL SURGERY IN MOTION PICTURES.

Description: A continuous performance without repetition, of motion pictures depicting the clinical findings, surgical technique, gross, microscopic and pathological findings, clinical course and end results of a variety of rare and interesting surgical conditions presented in natural colors, including plastic surgery; with life size models of end results.

NO. 43

John Oppie McCall, D.D.S., The Murry and Leonie Guggenheim Dental Clinic, New York.

DENTAL DISEASES IN NEW YORK CITY CHILDREN.

Description: Photographs of clinic patients showing various types of dental caries, irregularities, etc. Photomicrographs of extracted teeth showing various types of carious lesions. Enlarged intra-oral x-ray photographs showing results of early dental neglect, anomalies, evidences of retarded and accelerated alveolar growth, etc.

NO. 44

Dr. Joseph L. Moreno, New York Training School for Girls, Hudson.

PLANS FOR RE-SETTLEMENT OR RE-GROUPING POPULATION ON A SOCIOMETRIC BASIS.

Description: Graphs demonstrating the scientific method of sociometric procedure applied to the problems of re-settlement and re-grouping. NO. 45

Dr. Louis F. Bishop, Jr., New York.

DRAWINGS OF INTERESTING CASES SHOW-ING CARDIOVASCULAR PATHOLOGY.

Description: Drawings of pathological speci-

mens with brief description of outstanding pathological findings under each drawing.

NO. 46

Dr. William S. Collens, Dr. Nathan D. Wilensky, Israel Zion Hospital, Brooklyn.

PERIPHERAL VASCULAR DISEASE.

Description: A demonstration of the results of the use of intermittent venous compression on peripheral vascular obstruction. This method is based on the principle of reactive hyperemia.

NO. 47

Public Health Committee of the Medical Society of the State of New York and The Metropolitan Life Insurance Co.

Description: Pneumonia. Charts on statistical and clinical aspects of pneumonia including incidence, diagnosis, serum therapy, etc. NO. 48

Dr. Samuel Weiss, Polyclinic Hospital, New York.

X-RAY STUDIES OF NORMAL AND ABNORMAL CONDITIONS OF THE GASTROINTESTINAL TRACT.

Description: Reductions of x-ray films, photomicrographs and infra red photographs, to be exhibited on a specially constructed view box to be provided by exhibitor.

NO. 49

Dr. Jacques Maliniak, New York.

PLASTIC SURGERY.

Description: Photographs, charts, casts and motion pictures illustrating the variety of congenital and acquired deformities of face and form with special emphasis on repair of extensive post-traumatic and pathological defects about the facial cavities, also repair of conspicuous deformities of the breast.

NO. 50

Dr. Charles W. Schwartz, Dr. Cornelius G. Dyke, Neurological Institute, New York.

ROENTGENOGRAPHIC EVIDENCES OF CRANIAL AND INTRACRANIAL DISEASE.

Description: Forty roentgenograms of the skull, twenty illustrating cases readily recognized, the remainder consisting of encephalograms showing various intracranial conditions which can be diagnosed by the injection of air into the cerebrospinal fluid pathways.

NO. 51

Dr. Keith Kahn, Gouverneur Hospital, New York.

PLASTIC SURGERY.

Description: The most common surgical

procedures employed in plastic reconstruction and normalization and the results that may be expected following such operations. The surgical technique is evidenced in natural color movies, which forcefully record step by step each operation as performed upon the most commonly malformed or injured parts of the body. The results are demonstrated by the more recent photographic transparencies which are supplemented by casts and models.

NO. 53

Dr. William G. Exton, New York.

DIAGNOSIS OF DIABETES.

Description: Charts illustrating one hour, two dose, tolerance test, Clinical identification and measurement of urinary sugars and statistics concerning one thousand urines showing reducing substances.

NO. 55

Dr. Burton T. Simpson, Division of Cancer Control, State Department of Health, State Institute for Study of Malignant Disease, Buffalo,

CANCER.

Description: Transparencies portraying cancer in different parts of the body before and after treatment. Types of treatment. Photomicrographs and end results. Also wax models showing, in realistic manner, cancer in various parts of the body.

NO. 56

Dr. Mortimer N. Hyams, Department of Gynecology, New York Post-Graduate Medical School and Hospital, New York.

STERILIZATION OF THE FEMALE.

Description: A new method of transuterine occlusion of the uterine cornu under direct vision with a special high frequency current. An exhibit of instruments and equipment used; the progress of the work from its inception to the present date, illustrated by utero-salpingograms in special illuminating boxes, models, pathological specimens, gross and microscopic studies of uteri showing the progressive changes following treatment by this technique; hysterosalpingograms of patients treated before and after sterilization.

Dr. I. C. Rubin, Mt. Sinai Hospital, New York.

UTERO-TUBAL INSUFFLATION, A CLINICAL DIAGNOSTIC METHOD FOR TESTING TUBAL PATENCY.

Description: A motion picture including animated drawings.

Technical Exhibits

No physician should miss the rare opportunity to examine personally the important products offered for inspection in the six rooms of technical exhibits.

Over one hundred and twenty-five firms will have exhibits at this year's meeting—breaking all previous records. These firms are spending thousands of dollars to present their products for your inspection, and it will prove well worth

while to set aside an hour or two to see them.

For the benefit of members whose office hours do not permit their spending any time during the day, also for the busy delegate, the exhibit rooms will be open until 10:00 P.M., on Tuesday evening.

A glance at the names listed below is enough to show the importance of this year's exhibits:

Public Health News

IS BOVINE MASTITIS A PUBLIC HEALTH PROBLEM?

PAUL B. BROOKS, M.D., Albany

Deputy Commissioner, New York State Department of Health

Veterinarians find that anywhere from three to ten per cent, more or less, of cows in the average milk-producing herd are suffering from mastitis: conditions varying all the way from limited, old indurations, suggestive of latent infections, up to acute and chronic cases with obvious discharge of pus. The vast majority of cases are incited by a "bovine type" of streptococcus, not known to be pathogenic for man. On the other hand, nearly every year, in "up-state" New York, we have from one to four or five serious milkborne outbreaks of sickness, usually infections incited by hemolytic streptococci but occasionally poisoning by a staphylococcus toxin, traceable to cows with mastitis.

Under these conditions it is not surprising that the question often arises whether, or to what extent, bovine mastitis is a public health problem. A great deal of confusion, as to the answer, exists in the minds of dairymen and even of many milk control officers. Answers to questions in state licensing examinations in hygiene indicate that few recent graduates in medicine have any clear idea as to the answer. This latter is not remarkable, since it probably will not be found in any medical textbook. Having recently attempted to formulate an answer to the question in discussion at a meeting of food control officials, I am presenting my answer here in the hope that it will be of interest to physicians.

Udder damage resulting from mastitis reduces the milk-producing capacity of the cow. Infections often spread from one cow to others in a herd. Dairymen who have succeeded in "cleaning up" their herds, report increased milk production. Milk from "clean" herds is likely to bring a better price. There is no question, therefore, but that this is an economic problem.

Considering the great prevalence of mastitis and the difficulty of controlling it, it is obvious that, at one time or another, nearly every milk consumer has used milk

from cows with mastitis. There is little, if any, concrete and convincing evidence that serious harm has resulted, even with unpasteurized milk, from infections with the bovine type of organism. On the other hand there is no proof that isolated cases of illness, never traced to their source, are not due to such milk.

The practical question, of course, is whether eradication of mastitis should be pushed as a health measure. Certainly, on the evidence thus far presented, it would not be warranted.

The cases of mastitis known to be dangerous to human health are those in which the infecting organisms are transmitted to the cows' udders from infected persons. Commonly it is one who has had a sore throat but several outbreaks have been traced to milkers with suppurating wounds. Such cases, as compared with the ordinary "bovine type" of infection, are relatively rare: surely not one in a hundred. As a rule they develop quickly, following teat or udder injuries. The general eradication of mastitis, if this is feasible, would not prevent them. The more intelligent and conscientious dairyman will exclude the milk from any cow with mastitis as soon as the condition is discovered, but in this class of cases milkborne infection could occur before the condition was recognized. Pasteurization, therefore, is the only dependable safeguard.

My answer to the title question, then, is that bovine mastitis, in general, is primarily an economic problem for the dairyman and only incidentally a public health problem. The general eradication of the disease would result in elimination of many unprofitable cows, would improve the quality of our milk supply and, whether or not it would be safer or more healthful, would make it more desirable, from the esthetic standpoint, for human consumption. But on present evidence there is not sufficient warrant for demanding it as a measure for the protection of public health.

The Second International Congress of the Scientific and Social Campaign Against Cancer will be held in Brussels from September 20 to 26, 1936. For particulars, apply to the General-Secretariat of the Congress, 13, rue de la Presse, Brussels. Among American surgeons participating are Drs. Dublin, Ewing, Lynch and Wood.

Economics

Reprint from Medical Economics February 1936, by special permission.

What does your friend, the patient, think about state medicine? If he's typical of a large segment of the public who have heard and read only one-sided comments about it, he will probably tell you that "it sounds like a great idea . . . something this country needs." Yet what happens when an intelligent layman really studies the subject and interprets what he learns sensibly and dispassionately? The accompanying article not only answers this question but serves also as a vivid revelation to physicians. Mr. Walch, general manager of the Debaters Information Bureau, Portland, Maine, and compiler of the "Handbook on State Medicine," has no doubt probed the question as exhaustively as any layman in the country. His remarks, being those of an impartial onlooker with no axe to grind, carry double weight in consequence.

I Don't Want to be a Statistic!

By J. Weston Walch

For over a year now I have been wallowing in a sea of medical-economic books, articles, and pamphlets—to say nothing of the limitless reports of the Committee on the Costs of Medical Care. I have wallowed until numbers and percentages fairly dance before me in my sleep. I have almost been convinced that I am merely a statistic myself—an insignificant statistic—a one-hundred-and-twenty-millionth part of that series of reports.

But I don't want to be a statistic! Statistics have no feelings! Statistics will do for stock market reports, and sacks of sugar, and burned out motor bearings in my car. But I rebel at becoming an impersonal number.

When I have a stomach ache it is my ache. It hurts me. When a cavity is found in one of my teeth, I am not interested in the fact that 79% of the American people should go to a dentist. I have got to go to a dentist. He is going to work on me.

When I am very sick, I am very unreasonable. I don't like to be sick. I don't want to die; perhaps I am afraid of Hell fire! And I have heard of so many people dying from such little things! I want the best doctor regardless of whether my ailment is a little one or a big one. That is the one time that I insist on efficient service.

And so, as I read about state medicine, a library full of statistics does not impress me so much as the answer to one simple question: Would state medicine give ME efficient medical service?

- I should like to discuss this under four sub-questions:
- 1. Would state medicine provide me with the best of doctors?

2. Would those doctors have modern equipment?

3. Would they be interested in me and my welfare?
4. Would they treat me quickly and efficiently?

Would state medicine provide me with the best of doctors? Naturally, under state medicine all doctors would be members of a state system. They would become members by appointment. I wonder whether the state would be as interested in having a competent doctor attend to my stomachache as I would?

Let us suppose that the state medicine system for my state needs an additional young surgeon for the hospital in my town, Three candidates apply. Doctor A led his class in medical school. Doctor B is a nephew to the local state senator, Doctor C's father is willing to pay the local political boss a thousand dollars for his son's appointment. Now, of course, the head of the medical system would prefer Doctor A, but he knows he needs support in the state senate for the new hospital in Jonesport. Besides, the governor who appointed him has political obligations to repay to that local political boss. While I would hope that Doctor A would land the position, I rather suspect the appointment would go to Doctor B or Doctor C!

I have seen too many politicians spending too much money to get into public office to believe that many of them are honest. I wouldn't accept the advice of one of them in betting on a horse race or a prize fight, let alone in picking a doctor to operate on ME! While I would be glad to be allowed to choose the services of any state doctor I liked, I certainly would

not accept even the free services of any random state physician for anything more serious than a cold or a sore toe!

Would those state doctors have modern equipment? I am not interested in the promises of sociologists. I am interested only in what kind of equipment the state has provided for the functions it has undertaken. I have so often heard the free school system compared with our medical system that I immediately think of our present school equipment in connection with state medicine. The economics classes in the biggest high school in my own city are studying from a textbook which teaches that the Federal Reserve System put an end to all depressions! You can imagine when that book was written! I wouldn't want a doctor with equipment that antique. And I'm afraid that's what my state would give me!

The same politicians who would be able to force an inferior surgeon into the hospital system in my community would also control the funds which would go to operate the system. I fear that the order for ether, or bandages, or vaccine, would not be approved until the right politicians had received their little rebates. Naturally, the companies making these products would not be able to put the proper value into them when part of the price had to go into outside pockets.

I would not want to be etherized or vaccinated with an inferior product while a foundation collected statistics on the increasing death rate from poor ether, or the increasing death rate due to poor vaccine! Once again, I say, I do not want to become a statistic!

Would these doctors be interested in ME and my welfare? It is a bit difficult for an efficiency expert to see why I want my doctor to be interested in MY troubles and not be satisfied to have him make a mere scientific attack on the malady with which I am afflicted. This is difficult for any one to appreciate when he is well and the problems of sickness seem remote.

I must ask you to try to imagine how state medicine would work out when you are seriously ill—when the things of time and sense in your every day world recede and leave you isolated to face the forces of disease. Doesn't the question of the efficiency of the doctor assigned to you become an overwhelming obsession? Fears and irrationalities that you would dismiss at once in full health crowd upon you and refuse to be chased way. "Is my doctor interested in my case? Then why doesn't he come!" Of course your friends have been told that you are making prog-

ress! But in what direction? The mere worry over your condition drives up your fever and your blood pressure!

You are patient number 196 in ward 112. You were sent there by doctor D-19 and examined by intern number I-42 preliminary to operation by surgeon S-76. The surgeon does not have to come to see you. He can learn all about you—your past medical history and present complication—by consulting his card index. You are merely a part of his day's work. Besides, he has other patients a lot sicker than you are. As you lay there you wonder how many of those patients got that way through neglect under the "free" state system. And that helps neither your peace of mind nor your recovery.

The efficiency experts may be satisfied with the marvelous statistics that the state medical systems will keep, covering the records of each patient. But as for me, I don't want to be classified. I want to be cured!

Would these doctors treat me quickly and efficiently? I have already partly answered that question. But there are other considerations which will weaken the efficiency of a state system of doctors. We all have friends, lots of them, who imagine they have every disease they hear of. Even under the private medical system, they haunt the offices of their doctors. The only thing which keeps them even now from becoming an overwhelming nuisance is that under the private medical system they are supposed to pay their doctors for services rendered. If the taxpayers were carrying all the costs, I fear that every state medical center would be jammed by people demanding treatment for imaginary ills. When I appeared at the state medical station, the state doctor to whom I had been assigned would just naturally regard me with suspicion. He would first want to discover whether I was really sick or merely faking. Now when I am sick, I do not want to be regarded as a fake or a hypocrite. I want to be treated right off, and cured.

The mere fact that the service was free and state-supported would build up an attitude towards physicians and on the part of physicians that would make honest and efficient treatment difficult. Where the patient formerly sought and respected the physician's advice, he would demand service from his state-supplied medical servant. There is a subtle difference between the two attitudes which cannot be expressed in money values, nor discovered in the statistics compiled by the Committee on the Costs of Medical Care and other groups.

Under a state system, if a doctor told a patient that he didn't need any pills and treatments, he would be suspected of loafing on the job. If he prescribed treatment distasteful to the patient, or if the patient regarded it as inadequate, he would run the chance of being reported to the management, like an impudent hotel bellhop! I don't think this attitude would foster vigorous and scientific medical practice!

I want my doctor to be independent, honest, and individualistic. I do not want his medical advice to be as inane as the political views of the average public barber!

And so I will not be able wholeheartedly and enthusiastically to patronize a free state medical system if one is established. And I doubt if any fees I could pay would secure me the services of any of the few remaining private physicians. The public schools have made private schools into institutions for the wealthy only. Private doctors, too, would be scarce; and with most of the people getting free service, the private physicians would have to depend on the wealthy for their support. Fees would

rise accordingly. I would have no excuse to ask them to lower them for me; would not the free state medical system be available to me?

So many institutions are being socialized today that I believe the private medical system is in danger. There is very little I can do about it. I am only one person in a hundred and twenty million. My lone vote against it is not worth much.

As I read the medical magazines I discover that most of the medical organizations are opposed to state medicine. I also discover that in their own meetings doctors condemn in no uncertain terms the approach of socialization. I wish that the medical organizations, and the doctors in general, could realize that it is their duty, to themselves and to the public, to show the public just why and just how completely state medicine will be harmful to the interests of us all! Then and only then will we have any possibility of escaping from the ills of a completely socialized medical system.

Medical News

Bronx County

Mrs. Julius Ferber spoke before the Bronx County Medical Society on March 18 on the Physicians' Wives League. Dr. Richard Kovacs discussed Physiotherapy in relation to traumatic surgery, and Dr. William Bierman read a paper on Fever Therapy, with discussion by Drs. Herman Bick and Thomas M. Brennan.

Broome County

THE MARCH MEETING of the Broome County Medical Society was largely devoted to a discussion of legislative and economic problems facing the profession.

Cattaraugus County

THE MARCH MEETING of the Cattaraugus County Medical Society included in its program an address by Dr. James K. Quigley, of Rochester, on maternal welfare, a case report by Dr. R. F. Garvey, of Olean, and a report on maternal welfare by Dr. W. M. Smith.

Cayuga County

IT IS ESTIMATED that Dr. James W. Skinner, who died at his home in Genoa Village in February at the age of eighty-

three, brought more than 3,000 babies into the world during the fifty-seven years of his practice. He is said to have officiated at the birth of seven pairs of twins and three sets of triplets.

Chenango County

In ITS TRIBUTE TO Dr. A. Raymond Morse, of Oxford, who died suddenly of a heart attack in February, the Norwich Sun says that he "was one of Chenango county's best known physicians. No day was too stormy nor were the highways too rought for Dr. Morse to travel. He administered to patients many times when perhaps he was more ill than they. He enjoyed a large and lucrative practice and his death is largely due to overwork. He was a skillful doctor and to his patients he was not only their physician but a friend."

Columbia County

THE COLUMBIA AND GREENE County Medical Societies had a series of six postgraduate lectures, ending in March, on general medicine. The concluding lecture was given by Dr. K. R. McAlpin, of the Presbyterian Hospital, New York City, on "Pernicious Anemia."

Erie County

THE ANNUAL DINNER of the Buffalo Academy of Medicine and the Medical Society of the County of Erie will be held at the Hotel Statler, in Buffalo, on April 2. It will be the first annual combined dinner of the medical profession of Western New York.

Spurred by the fact that none of the relief projects have made any provision for medical service in the city of Buffalo, the Medical Society of the County of Erie unanimously adopted a set of resolutions on March 2 authorizing a committee "to negotiate with the State TERA, the Buffalo ERB, and the City Council, for the purpose of setting up a twelve-month medical project with the Buffalo City Hospital as sponsor, having for its objectives the hospital dispensary, and home care of all indigent residents in the city of Buffalo, said project to include the employment of at least 500 doctors per annum, for a period not to exceed thirteen weeks each, at a stipend of \$24 weekly, computed at the rate of \$2 per hour for six days of two hours each, or equivalent. Total, \$156,000, sixty per cent of this amount or \$93,600, to be appropriated by the Council of the City of Buffalo, and forty per cent, or \$62,400, to be granted the City from state funds."

"No applicant for clinic or home service is to be accepted who can afford the services of a private practitioner," and "all applicants who, after investigation, are manifestly able, must employ their own doctors." Every effort will be made to reestablish former doctor-patient relationships, and to maintain such relationships once established. Under this plan the doctors are to rotate in one-month periods in service in wards, out-patient departments, and homecall service. The plan is not intended in any way as a "state-medicine" project, but "conforms in every respect with the suggestions of the Minority Report on the Cost of Medical Care."

Fulton County

Dr. J. E. Grant of Northville, has been reelected President of the Fulton County Tuberculosis and Public Health Society.

Jefferson County

Dr. Isadore L. Green, of Watertown, said to be the oldest practicing physician in the state, celebrated her ninetieth birthday on Feb. 7.

Dr. Frederick Wetherell addressed the Medical Society of Jefferson County at its March meeting on the Gradient Plan, and Dr. W. S. Atkinson read a paper on the operative treatment of cataract.

Kings County

DR. BELA SCHICK, of Manhattan, will speak at the MacNaughton Auditorium at 4:30 on April 3 on "Childhood Tuberculosis."

Dr. E. R. Marzullo addressed the Medical Society of the County of Kings at its meeting on March 17, on "Lead Poisoning" and F. B. Flinn, Ph.D., spoke on "Industrial Arsenical poisoning."

Cancer treatment "has been held back for years by surgery and radiology competing," Dr. W. Edward Chamberlain, professor of radiology at Temple University, Philadelphia, told the Kings County Medical

Society on Feb. 18.

Speaking on "Radiation Therapy in Cancer," Dr. Chamberlain said, "There is no reason for the rivalry of surgery and radiology. They must co-operate, not compete."

Dr. William P. Healy, consulting gynecologist to numerous metropolitan hospitals, spoke on "Deep X-Ray Therapy in Pelvic Neoplasms." He declared that "public pessimism about the value of radiation in cancer treatment" was not justified. He cited cases where radiology had achieved favorable results that, he said, were at first thought impossible.

A portrait of the late Dr. Jacob Fuhs was presented to the society by Dr. Russell S. Fowler on behalf of the Central Medical Council of Brooklyn. It was unveiled by Dr. Milton G. Wasch and accepted for the society by Dr. Edwin P. Maynard, jr.

Dr. Henry Joachim, president, was chair-

man.

Dr. Henry Lerner, president of the board of directors and chief of the medical staff of the Crown Heights Hospital, Brooklyn, died on Mar. 6 of heart disease in his home at 1019 Bushwick Avenue, Brooklyn. He was 49.

Dr. Burton L. Zohman has been elected Fellow of the American College of Physicians.

Nassau County

THE WOMEN'S AUXILIARY of the Medical Society of Nassau County plan to launch a publicity campaign to oppose state medicine.

Answering reports that physicians have been overcharging the County Relief Bureau for services to indigent families, the Nassau Medical Society has issued a statement that the county's 400 or more doctors, each year, devote at least 40 per cent of their professional time to unpaid service.

"While people are about it, trying to discover a few isolated cases where doctors have charged for one or two more calls on relief families than have been made," said J Louis Neff, executive secretary, "let them look at the other side of the picture. We find among the members of the Medical Society, that doctors are paid by only 60 per cent of their patients."

'No doctor has been paid anything for work done at either the Meadowbrook Hos pital, or at Nassau Hospital, and of course,

they do not expect it"

Mr Neff cited one Hempsterd doctor as an example of physicians' unpid time. The doctor he mentioned in 1935 performed 62 major operations in Nassiu and Mendow brook Hospitals Each operation at the minimum fee, was worth an average of \$150 making a total of \$9,300, and performed without compensation to the physician, he claimed

New York County

THE CITY FACES a crisis in its fight against tuberculosis because of a shortage of 2,500 hospital beds, Frank Kiernan, director of the New York Tuberculosis and Health Association, announces

APPROXIMATELY 4,700 doctors are now making calls in the five boroughs for the ERB In one day recently 1,654 families were sent physicians 72 were sent nurses, and 341 were authorized medication

DR WM SEAMAN BAINERIDGE has been decorated by Spain and Yugoslavia for his work in the late war—Cross of the Order of Naval Merit of Spain, and Communder Order of the Crown of Yugoslavia In recognition of his scholastic and scientific attriuments he has been made Honority Member of the Union Medicale Latine, composed of thirty one nations with head-quarters in Paris

DR ARTHUR M FISHBERG addressed the Interne Council of Greater New York on Feb 20 at the Squibb Auditorium, on 'Extrarenal Azotemin' 'At the same meeting it was announced that a bill sponsored by the Interne Council of Greater New York amending the Workmen's Compensation Law to include internes in municipal hospitals has been introduced into the Assembly at Albany Progress was reported in the campaign for salaries for interns at private hospitals

Ontario County

THE CANANDAIGUA MEDICAL Society is having an interesting series of programs which began on March 12 with Dr M R Blakeslee of Shortsville, as host Dr D A Liscline, of that village, spoke on

'Lndoscopy' The next meeting will be on April 9, with Dr W B Clapper, of Victor is host, and Dr M E Missal, of Rochester, as speaker subject, "Chest Pains"

PLIADING GUILTY TO false representation and swearing to false claims for medical care of welfare relief recipients, when arraigned before County Judge Horace W Litch in Canandaigua on February 18 Dr J Kenneth Cole, thirty-nine, of Phelps, was fined \$500 The case is believed to have been the first of its kind in New York State

Rensselaer County

THE PROGRAM or the Medical Society of the County of Rensselaer for its meeting on March 10 included addresses on "The Physician as the Hospital Sees Him," by Miss Grace Allison, superi tendent of the Samantian Hospital "X-ray Consideration of Joint Injuries," by Dr Walter McShane, and "Pregnancy Anemias," by Dr Charles R Lewis

Rockland County

A SPECIAL JOINT meeting and dinner of the Medical Society of the County of Rock lind and the dentists of Rockland County was held at the Hotel St George, Nyack on February 27, with an attendance of sixty three (45 physicians and 18 dentists). The speaker was George H Semken, M D, F A C S of New York City, whose subject was, "A Consideration of Some Diseases of the Mouth and Jaws" Dr Semken's subject was illustrated by lantern sides emphasizing the importance of radical surgery where carcinoma was present about the face and head Discussion was opened by M J Lentz, D D S of Passaic N J

Schenectady County

HLALTH COMMISSIONER Joseph B Garlick, the man who brought pasteurized milk into Schenectady for the first time 20 years ago, one of the city's leading physicians and a past president of the Schenectady County Medical Society, died on February 17 of a heart ailment in the Umatilla hospital at Umatilla, Fla He was 54 years old Death came in the midst of Dr Garlick's annual vacation in Florida where he had gone February 1, expecting to remain two months Dr Garlick, who was unaware he possessed a heart ailment was seized with what he at first believed was a stomach attack while playing golf at Mt Plymouth, Fla, with County Attorney Walter Scott McNab and Evan Cul lings of Schenectady

Books

Books for review should be sent directly to the Book Review Department at 1313 Bedford Avenue, Brooklyn, N. Y. Acknowledgment of receipt will be made in these columns and deemed sufficient notification. Selection for review will be based on merit and the interest to our readers.

Diet Control. By George E. Anderson, M.D. & Paul C. Eschweiler, M.D. Octavo. New York, Press of Fremont Payne, Inc., 1935. Cloth, \$3.50.

This gem of 41 pages and appended diet lists is based upon the best of our modern knowledge of diabetes and the authors' years of experience in the clinics of the Brooklyn, Methodist-Episcopal, and Lutheran Hospitals. Its object is to give to the general practitioner clear and accurate methods in the dietetic treatment of diabetes and other conditions in a form, readily comprehended and time saving. The "Diet Prescription Graph," built on a basic diet of 1085 calories, with carbohydrate, 100 grams, calories, with carbohydrate, 100 grams, protein 70 grams, fat 45 grams is ingenious and so constructed as to permit of quick calculation of any desired combination of calories. Nothing, so much of a multum in parvo, has appeared in recent years, in a form so practically available for the busy physician and possible for trained nurses and even intelligent lay people. What the authors have so ably accomplished will prove a boon to many who have felt the need of just such a book. J. M. VAN COTT

Obstetrical Practice. By Alfred C. Beck, M.D. Quarto of 702 pages, illustrated. Bal-timore, Williams & Wilkins Company, 1935. timore, Wil Cloth, \$7.00.

This excellent work is all that one would expect from a former student of Reuben Peterson, J. W. Williams and John Osborn Polak.

The reviewer has yet to read a work on obstetrics which covers the ground more thoroughly and with so few words.

The many illustrations, most of which are by the author, are splendid, especially those on the mechanism of labor (pages 252-371).

Doctor Beck's book shows how well he realizes that the eye picture is much more instructive than the word picture. The eye and word pictures of placenta previa and accidental hemorrhage are unusually well

The chapter on "Medical and Surgical Complications of Pregnancy" is very complete and yet nor too voluminous. In chapter 30, "Faulty Passages" is a very good summary of the recent work of Caldwell and Moloy on their stereoscopic x-ray studies of the pelvis in relation to obstetrics.

In the chapter on "Rupture of Uterus," the author aptly says "the frequency of its occurrence in any community varies with the quality of obstetric practice in that location."

A few additions which the reviewer would like to see in subsequent printings are (1) illustrations of the steps in the application of Piper forceps for the after-coming head (2) more space and addition of illustrations regarding the use of the Barton and Kielland forceps, which are so successfully used by many obstetricians (3) some discussion and illustrations of the Latzko Cesarean which has a definite place of usefulness in a small group of cases (4) mention of the Brodhead intrauterine packer in the treatment of post-partum hemorrhage (5) discussion and illustrations of the modern methods of resuscitation of the new-born.

"Obstetrical Practice" is a real, practical, worthwhile piece of work.

If obstetrics were practiced as per this volume, there would be an appreciable reduction in Maternal Mortality.

From the reviewer's acquaintance with Skene, Jewett and Polak, Professor Beck's predecessors at the Long Island College of Medicine, he is sure they would join him in saying: "WELL DONE."

Frederick Clark Holden.

The Surgery of the Sympathetic Nervous System. By George E. Gask and J. Paterson Ross. Quarto of 165 pages, illustrated. Baltimore, William Wood & Co., 1934. Cloth, \$4.00.

Another excellent addition to a rapidly accumulating literature on surgery of the sympathetic system. A rather pithy treatment of 165 pages, simply written and lavishly illustrated. One is impressed with the care exercised in the selection of material and the clarity of presentation. For the uninformed this volume offers an easy opportunity for acquiring basic facts.

It is divided into four chapters with the

following titles.

1. Anatomy and Physiology.

2. Sympathectomy for Disorders of the Circulation.

3. Sympathectomy for Disorders of the Visceral Motor Mechanism.

4. Sympathectomy for pain.

Although written as a thesis in surgery it will prove of equal if not greater interest to the internist. HAROLD R. MERWARTH

You Can Always Attend this Convention

This is convention time, when physicians and surgeons meet, exchange ideas and experiences, and examine the exhibits of products valuable in their practice.

Every doctor who can should attend the convention. You will meet some of the finest fellows in the world, and get a wealth of good things from the sessions.

But supplement your attendance with regular visits to the "all-year" convention which the postman brings to your door.

The "all-year" convention for the physicians and surgeons of New York State is THE NEW YORK STATE JOURNAL OF MEDICINE.

The scientific articles give a continuous postgraduate course in the latest developments and discoveries in the field of medicine, and the editorial departments keep you in touch with the work of your state organization and the interesting news of your fellow workers in the profession.

The advertising pages bring equally important news of valuable preparations, devices, equipment, travel facilities, hotels, and many other products and services for your office, practice and personal use.

Start now. After attending the scientific and editorial programs in this instalment of the "all-year" convention, you can stroll down the aisles of the advertising pages, examining the many rich and useful offerings displayed there.

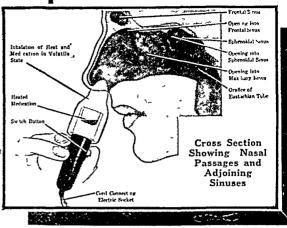

THERMOHALE

HEAT WITH MEDICATION

affords efficient relief to the edematous membranes in

HAY FEVER SINUSITIS

Volatalized oils gently bathe the intricate cavities, the resultant capillary dilatation immediately relieves the distressing congestion.

"Best Book on Differential Diagnosis Ever Written"-Richard C. Cabot

There you have the opinion of America's greatest diagnostician as to the New Fifth 1936 Edition of—

French—Index of Differential Diagnosis

By Nineteen Eminent Physicians and Surgeons. Edited by Herbert French, C.B.E., M.D., F.R.C.P., Consulting Physician to Guy's Hospital, London. Fabrikoid leather-style binding, 6½ x 10½, xii + 1145 pages, 745 illustrations, 196 in color, \$16.00.

Few American physicians or surgeons need to be told what "French" is. To thousands of them it has for many years been the most frequently used and most highly appreciated book they possess. A veritable bible of authority and reliability to which many of them attribute much of their professional success. An unfailing guide in that most important and difficult of all daily problems, prompt and accurate diagnosis. It is indeed an invaluable mainstay in clinical medicine, covering almost the entire field, including surgery, gynecology, ophthalmology, dermatology and neurology.

If you know and use French we need only to point out that the new thoroughly revised fifth edition is just ready. That it is seven years since the fourth edition was published, you have had much more than your money's worth and should promptly order the new edition, also recommend it to friends in the profession. If you are not familiar with the book let us explain that the main body is first an Index of Symptoms, or rather articles describing symptoms arranged alphabetically, second, a Work on Differential Diagnosis discussing the methods of distinguishing between the various diseases in which each symptom may be observed, third, the marvellous General Index, over 200 pages, giving 90,000 references to symptoms listing them under the various diseases in which they occur. Familiarity with the book makes it very easy to use. You will find it the greatest aid and guide to diagnosis you have ever known, especially in really difficult cases. Send along your order. Price is \$2.00 less than last edition. The book pays for itself over and over.

WILLIAM WOOD & COMPANY

Mt. Royal & Guilford Aves., Baltimore, Maryland

Please send one copy of the new fifth revised edition of French: INDEX OF DIFFERENTIAL DIAGNOSIS, price \$16.00, and charge to my account.

FIVE APPROVED SOURCES OF

VIOSTEROL

ABBOTT • MEAD JOHNSON • PARKE, DAVIS SQUIBB • WINTHROP

WITH the appearance of Viosterol seven years ago, bearing the names of these five leading pharmaceutical houses licensed to use the Steenbock Irradiation Process, a scourge of civilization—rickets—lost its threat.

For here was a product that made the bone and tooth-building Vitamin D more readily available in easy-to-administer form. In September, 1924, the Journal of Biological Chemistry carried Dr. Steenbock's first report on the production of Vitamin D by means of ultra-violet irradiation. In the Journal of the American Medical Association of April 11, 1925, he pointed to the use of this process in the preparation of Vitamin D medicinals for prophylactic and therapeutic use.

It was in consultation with many leading pediatricians that Dr. Steenbock was encouraged to initiate the early clinical and experimental studies of Vitamin D. Then came intensive research by clinics and by the pharmaceutical manufacturers, out of which developed the technique for making Viosterol of standard potency, uniformity and stability.

From the beginning the Council on Pharmacy and Chemistry of the American Medical Association took an active and important interest in the research on Steenbock Process Viosterol reviewing the findings of eminent pediatricians and, when the efficacy of the product " demonstrated, permitting distribution and suggesting the name Viosterol.

In the seven years since these five manufacturers were made responsible for producing, distributing and maintaining the quality of Viosterol, they have continued research to insure the integrity of the product. As use and volume have increased, they have twice reduced the price at which it is sold.

Viosterol is identified by five leading pharmaceutical houses, and its quality standards are maintained by them and by this Foundation's continuous service of biological assays.

See the Johns Hopkins Line Test for Vitamin D potency actually demonstrated at our exhibit, space No. 90, at the convention.

Name

AN ASSOCIATION OF PHYSICIANS TO AID PHYSICIANS

The Physicians' Mutual Aid Association, chartered in 1868, has paid over 13/4 millions in death claims since incorporation. A death benefit of \$1000 is paid immediately upon proof of death. Assessments made semi-annually, have never exceeded \$2 per month.

Benevolence Fund provides loans to members in urgent need, without interest charge, without security and without publicity.

MAY LEARN ABOUT PEDI-ATRIC SHOES AT OUR CONVENTION BOOTH NO. 104

Booklet on request!

ALSO BENJAMIN SHOES FOR MEN AND WOMEN DURING the forthcoming N. Y. State Medical Convention at the Waldorf-Astoria Hotel from April 27th to 29th, we will show a full line of our Pedi-Atric Shoes for children—shoes which we have promoted successfully for 15 years and which represent our thoughtful idea of correct shoes for growing feet. We invite your consideration of basic features of design as well as quality of leathers and construction—all points which we believe will be of special interest to you.

JACKSON HEIGHTS......37-42 82nd St. LONG ISLAND CITY.....30-46 Steinway St.

Time to Collect

*A bond has been deposited with the Treesurer of the Medical Society of the State of New York to protect its members against misuse of money collected from their patients

OUT OF COURT

Besides the stigma and questionable publicity generally attending court action to collect from a delinquent, no physician wants to have his practice upset because of having to appear at court hearings.

Even winning a judgment, does not always mean a victory, and seldom is a happy settlement of an account which handled properly can just as well be acquitted satisfactorily out of the courts and without resorting to "Shylock surgery."

This organization does get results without involving its professional clients in legal entanglements—your collection problems are kept out of court.

We will be pleased to have you visit our exhibit in Booth 103 at your 130th Annual Convention.

CHARLES B. TOWNS HOSPITAL

FOR THE EXCLUSIVE TREATMENT OF

ALCOHOLISM and DRUG ADDICTION

This hospital has specialized solely in addictions for over thirty years. Our experience has shown us that best results could not be obtained when associated with any other type of case. Its method of treatment has been fully described in the journal of the American Medical Association and other scientific literature. The treatment is a hospital procedure and provides a definite means of eliminating the craving and the toxic products of alcohol and drugs Emphasizing the after care and with appreciation of the seriousness of the alcoholic problem we devote the convalescent period to minimizing the possibility of relapse. In the classification of the City of New York hospitals this institution has been granted a special license by the Commissioner of Hospitals for the exclusive treatment of alcoholic and drug addiction

Doctors and Schools

Physicians are frequently asked by parents to recommend private schools for their boys and girls, and the medical man will find it advantageous to acquaint himself with various schools in order to be able to recommend the right one for each case. Schools advertised in these pages are always glad to send literature on request describing their special advantages. The custom of sending boys and girls away to school is growing as parents see how it helps the little men and women to prepare themselves to meet the problems of real life.

Attractive Reception Room Furniture

Modern metal furniture—as produced by Doehler—is excellent for reception rooms and has distinct advantages from an economic viewpoint in addition to its charm and beauty.

Clean, flowing lines combine with utmost durability and long life to satisfy the needs of the Doctor whose reception room must be in perfect taste without constant expense for upkeep.

Now that modern metal furniture has taken its place in the decorative scheme, its use in reception rooms and offices demonstrates a forward-looking attitude and the readiness to adopt new ideas when their worth is established.

Members of the Medical Society of New York State are invited to call and will be allowed the usual professional discounts on furniture for their professional or residential requirements.

Doehler, as you undoubtedly know, manufactures a complete line of metal furniture and equipment for hospital private and staff rooms, wards, nurses' stations, operating rooms, etc.

(Continued from page lviii)

sponsored by the Kennel Club of Atlantic City in the ballroom of the Million Dollar Pier. The canines, which will be entered in the various classes, will compete for the \$2,000 in prizes, trophies and ribbons.

Atlantic City, in maintaining its reputation for having the earliest and the latest peak seasons of any resort in the world, is already entertaining large Lenten crowds, and the reservations that are pouring into the hotels for Palm and Easter Sundays, many of them for the entire week, indicate a peak year for the resort in every respect. For many years, now, Atlantic City's boardwalk fashion parade during the Eastern season has been considered an event of national interest. Many famous designers, stars of the stage, screen and radio, and famous people in all walks of public life will be seen along the eight-mile wooden way during the week.

A summer program, more extensive and elaborate than any in the resort's history is rapidly taking shape. Among the list of attractions to be enjoyed are the organized fishing parties, the night baseball games, daily band concerts on boardwalk, week-end sailboat races, in addition to unusually elaborate programs of the hotels, theatres and amusement piers.

Where "English" Is "Foreign"

If you think you are a master of the English language ask a British railroad clerk to direct you to one of those places that makes the British Isles a source of interest and wonder to the American tourist.

Although dialects are dying out, you will still find many unfamiliar words in most counties. Along Clydeside, where the Queen Mary has been built, there are numbers of these. For instance, you will come across many people who live in a 'but and ben,' or a room and kitchen. Should you 'chap' at the door they will invite you 'ben'-that is, into the room, or parlour. In Flemish it is 'binnen-gaan,' to go within: in Scotland, 'to gae ben.'

In the kitchen is the 'jawbox'—the sink and in it are 'sapples,' or soapsuds, with which to wash. The rainwater does not run down

gutters but 'none pipes.'

Perhaps you will eat 'champies and soor doock' and enjoy them no less than mashed potatoes and butter milk. If you are asked to a tea-party it may be called a 'cookie-shine'cookies are soft, round plain buns.

Children play with a 'peerie,' which is what they call a spinning-top. They throw 'chuckiestanes'-pebbles. They call their little finger a 'pinkie.' Should anyone tell tales, he hears himself called 'clype,' tell-tale. In school, cor-

Patronize your N. Y. STATE J. M. advertisers to enhance its value

poral punishment is sometimes inflicted with a 'tawse,' which is a leather strap slit at the end into five fingers. A child does not cry but 'greets.' In the playground the children eatch hands and 'birl' round and round. A drive in a cart is a 'hurl'; if it shakes them about it is not shaky but 'shugglie.' They may be stung by nettles, and will tell you that they have been 'jagged' by 'jaggie-nettles,' or it may be a 'cleg,' a horsefly, which has hurt them.

Every year the villages are invaded by 'tattie-howkers.' These are potato diggers from Ireland. They live in 'bothies,' the wooden

houses in which farm workers live.

If anyone is off-colour and pale he is 'awfu' peelywally.' A 'keelie' is a very low and flashy type of townsman. A turkey is a 'bubblyjock.' A splinter of wood is a 'skelf.' If you evade or trick anyone you 'juke' them. Should you feel disgusted by anything you will have 'ta'en a scunner at it.'

All these words are in everyday use in the villages and towns along the Clyde. Sometimes their origin is traceable, sometimes use has so altered them that it would be very difficult indeed to say from where they originally came.

Reduced Railroad Fares in Switzerland

The Swiss Federal Railroads announces that during the entire year fare reductions up to 45% are granted American tourists staying in Switzerland six days or more.

For trips of less than three hundred kilometers (187 miles) the fare is thirty per cent. For longer trips the saving is forty-five per cent

These tickets must read from frontier to frontier stations and can be made up into any combination of rail, lake steamer and postal motor bus and any class of travel. Stopovers are permitted at any station en route.

There are also 8 and 15 day season tickets for unlimited travel in Switzerland, subject to

a fifteen per cent reduction.

Reduction tickets must be purchased before entering Switzerland and are for sale in New York City at the offices of the Swiss Federal Railroads.

5000th Trip for "Florida Special"

The "Florida Special," passenger train de luxe, operated between Boston, New York and Florida, is in its forty-ninth season, and recently has made its five thousandth trip. This splendid train is known as the "Aristocrat of Winter Trains," and in addition to many modern innovations in equipment and service, a Recreation Car is featured.

Public Health and Medicine in Europe!

ANNOUNCING

A Professionalized Tour Specially Arranged for Members of Organized Medicine

Inquire at Booth No. 114 at your April Convention for full details of this extraordinary tour . . open only to physicians and immediate members of their family. The itinerary includes London, Copenhagen, Stockholm, Helsingfors, Leningrad, Moscow, Kharkov, Kiev, Vienna, Prague and Paris. Arrangements have been concluded in cooperation with the British Medical Association, the Czecho-Sloval, Ministry of Health, the Medical Center of Vienna, the Soviet Commissariat of Health and with Scandinavian Medical authorities, and the party will have an unusually extensive opportunity to study the most illustrative hospitals, spas and medical institutions en route. There will also be personal interviews and discussions with foreign medical leaders. The party will sail from New York on July 11th, and will return before September 1st.

 For literature and complete information on this tour, please address Department NY-4. A complete program of special EDUTRAVEL projects in other fields, will also be sent on request.

"AT YOUR SERVICE." NEW YORK CITY

THE PICCADILLY—a select address for select people. Physicians who live in New York and those here just on a visit enjoy stopping at this modern, 26 story hotel. In the very center of Times Square, within 4 minutes' WALK of "Radio City" and 69 theatres. After-the-theatre-hour, quiet as a country lane. That, plus deep, soft beds results in sound sleep all night long.

(Continued from page lxi)

This train carries an excellent orchestra and provides dancing, bridge and other games, with a well-trained hostess in charge. The recreational features are greatly enjoyed by patrons. The smooth double-track, rock ballasted route of the "Florida Special" makes it practical for these features to be provided.

Off the "Aquitania"

Walter Greenwood, the young English pawnbroker's clerk whose novel and play, "Love on the Dole," has skyrocketed his income from a dole to four figures weekly, derived from royalties, publishing rights, etc., arrived March 10 in the Cunard White Star Liner Aquitania to witness the American presentation of his play at the Shubert Theatre. Besides being an author, Greenwood is active in English politics, being a councilman and member of the British Labor Party.

Less than three years ago Greenwood's novel appeared quietly in all the bookstalls of London. Its fame spread so rapidly that the book came to the attention of Doubleday Doran, who re-published it in this country. One of the novel's successful factors, the reviewers agreed, was its authenticity, for Greenwood had written into it many of his own experiences while living on a dole.

In December, 1933, an English theatrical producer sent a copy of the novel to Ronald Gow, the British playwright, who saw in it material for a fine play. At the end of two months together, Gow and Greenwood saw the completion and immediate production of their play, which is the same "Love on the Dole" that after two years in England is duplicating its London success in New York.

World's Sports Physicians Hold Congress in Berlin Before Olympic Games

An International Sports Physicians Congress will be held by the International Sports Physicians Association in Berlin from July 27th to August 1st, to tie up with the XI Olympic Games. Twenty-one nations, including the United States, have so far accepted the invitation of the international body which has appointed the delegates to represent the various countries.

For the United States, Dr. John Brown, Jr., (Continued on page lxvii)

A FINE WINTER RESORT HOTEL

"PASSED A HUNDRED PER CENT AS A SANCTUARY FOR HAY-FEVER SUFFERERS"

During August, 1935, Professor Frederick H. Hodgson spent several weeks in Bermuda under the auspices of the New York State Journal of Medicine. He was sent there for the sole purpose of making a botanical survey of the Islands with special reference to hay-fever-producing plant forms—to secure an expert, unprejudiced opinion on the occurrence or absence of hay-fever causals in Bermuda.

This survey included a thorough inspection of the plant forms active in August, a careful study of flora active at other times, and interviews with disinterested persons. Professor Hodgson's findings were published in a report which gave new official confirmation of an old truth about Bermuda. To quote from his report: "... the Colony passed a hundred per cent as a sanctuary for hay-fever sufferers."

Frost, too, is unknown in these lovely coral islands. And motor traffic, smoke, and clamour.

Instead, visitors here find a favourable climate the year around. They find splendid golf courses; game-fishing; sailing; tennis courts of turf and en-tout-cas; they find warm beaches of pink sand, and crystal-clear surf for invigourating sea-bathing even while the far-off New York skyline is blurred by cold wind and sleet. Bermuda, in short, is an unsurpassed, twelve-months-in-the-year source of those two treasures—Pleasure and Health.

"BUT CAN I AFFORD BERMUDA?"

The inexpensiveness of a trip to Bermuda always astonishes those making their first visit. Round-trip passage (with private bath) on a luxurious liner costs as low as \$60 for four joyous days at sea. In Bermuda you can secure a splendid room and excellent meals for \$7 a day.

For Booklet: Your travel agent, or The Bermuda Trade Development Board, 500 Fifth Ave., New York. In Canada, Sun Life Bldg., Montreal.

FOR

GENERATIONS

Great Western

America's World Famous Champagne

MERITS THE CONFIDENCE OF THE PROFESSION

Some of the reasons for its continued acceptance are:

- Quality and Purity. Great Western Champagnes are made by the true French method of slow fermentation in the bottle, taking years of time.
- Only American Champagne to win medals in Paris, Brussels and Vienna.
- Because it is made in America you don't pay for import duty, ocean freight, etc.

Good stores everywhere are ready to serve you. Write for our booklet, "The Art of Serving Wines and Champagnes" and leaflet "A Superior Vermouth." Address Dept. NYM-4, Pleasant Valley Wine Co., Rheims, N. Y.

BARR ULTRA-SHORT WAVE RADIOTHERMY UNIT

Model SW-5

ACCEPTED BY THE COUNCIL OF PHYSICAL THERAPY, A.M.A.

POWER: Ample power is available for heating deep seated tissues. Actual experiments conducted on eight subjects showed that the temperature rise, using cuff electrodes, of the deep-lying tissues of the thigh was higher than that obtained with conventional diathermy.

SIMPLICITY: Treatments easily administered—one knob regulates the output of the machine.

MECHANICAL AND ELECTRICAL: Highest quality components used thruout. Constructed by Artisans having many years experience in making this highly specialized type of equipment. This guarantees the physician years of dependable and outstanding performance.

APPEARANCE: Constructed in a solid mahogany vencer floor cabinet. Oversized meter is used to assure easy reading. A worthy addition to a dignified office.

SURGERY: The Barr SW-5 Ultra-Short Wave Unit also has available Monopolar currents for tissue cutting, coagulation and dessication.

Supplementing our SW-5 (council accepted) which has already proven itself by clinical and office use to be the leader in the field of short wave. and ultra short wave therapy, Barr Laboratories presents for your approval the SW-7, SW-9, SW-11. These machines will be exhibited for the first time at booth 69, New York State Convention. Following our usual policy, prices are within the means of the average practitioner.

MAINTAIN MINERAL ALKALI BALANCE

WITH

Kalak

Hypertonic-Alkaline-Carbonated-Not Laxative

The years of experience with physicians who have used Kalak show that the use of a formula containing calcium, magnesium, sodium and potassium salts represents a correctly balanced solution. This is Kalak which, as such, aids in maintaining a balanced base reserve.

How Alkaline Is Kalak?

One liter of Kalak requires more than 700 cc. N/10 HCl for neutralization of bases present as bicarbonates. Kalak is capable of neutralizing approximately three-quarters its volume of decinormal hydrochloric acid.

What Can I Do With Such a Small X-Ray Unit?

● The question is natural when you first see the General Electric Model "F" Office Portable X-Ray Unit.

To answer specifically, this unit will produce radiographs of the average size patient as follows: The chest, at 32" focal-film distance, in 34 second; lateral skull at 20" in 3½ seconds; the pelvis at 25"

As to the quality of these radiographs, we prefer that you be the judge. Simply arrange for a demonstration of the Model "F" in your office, at your convenience, and positively without obligation. The majority of present users of the Model "F" were convinced by actual demonstration.

in 6 seconds.

Shock proof operation, compactness, portability, flexibility, concentrated power and practical diagnostic range—these are features you will appreciate in the Model "F", all made possible by oil immersion of the entire high voltage system.

Fill out and mail this coupon today.

General Electric X-Ray Corporation A54 2012 Jackson Blvd., Chicago, Illinois Please have your representative arrange for a demonstration of the Model "F" X-Ray Unit in my office.

The Baby Regulates Breast Feeding

SAFE WEANING to BOTTLE FEEDING

The Doctor Regulates
Bottle Feeding

INFANTS should be weaned from the breast at eight months. The season of the year is immaterial with modern knowledge of nutrition and hygiene. Gradual weaning is desirable. It is accomplished by progressively increasing the number of bottle feedings in substitution for the breast feedings.

The formula consists of 6 ounces milk, 2 ounces water, 2 teaspoons Karo for each bottle—one the first week; two the second, etc. The schedule for additional foods remains the same as during nursing. But babies unaccustomed to the bottle often refuse it as long as the breast is available. Then abrupt weaning becomes necessary, some person other than the mother giving the feedings.

The formula in abrupt weaning prepared for the entire day consists of 24 ounces milk, 8 ounces water, 3 tablespoons Karo, divided into 4 feedings, 8

Feeding	1st Week	2nd Week	3rd Week	4th Week
6:00 A.M.	Breast	Breast	Breast	Bottle
10:00 A.M.	Breast	Breast	Bottle	Bottle
2:00 P.M.	Breast	Bottle	Bottle	Bottle
6:00 P.M.	Bottle	Bottle	Bottle	Bottle

ounces each, at 4 hour intervals. The formula can be concentrated once the baby is adjusted to the bottle feeding.

Karo is a mixture of dextrins, maltose and dextrose (with a small percentage of sucrose added for flavor) practically free from protein, starch and minerals. Karo is a non-allergic carbohydrate, not readily fermentable, well tolerated, readily digested, effectively utilized and economical for both the baby and the budget.

Corn Products Consulting Service for Physicians is available for further clinical information regarding Karo. Please Address: Corn Products Sales Company, Dept. NM-4, 17 Battery Place, New York City.

IRON • CALCIUM PHOSPHORUS VITAMIN D

in this one delicious high caloric food-drink

DURING convalescence from illness, an operation or childbirth—or when it is advisable to increase the weight of a malnourished child—there is one food-drink which has proved itself exceptionally useful.

That food-drink is Cocomalt. Delicious and tempting, easily digested and quickly assimilated — Cocomalt not only adds easily assimilated Iron to the diet, but also richly provides Calcium, Phosphorus and Vitamin D.

An ounce of Cocomalt (which is the amount used to make one cup or glass) supplies 5 milligrams of Iron in easily assimilated form. Thus three cups of Cocomalt a day supply 15 milligrams—which is the amount of Iron recognized as the normal daily nutritional requirement.

Here, then, is one form in which even a capricious child or a finicky adult will take Iron willingly—and at the same time receive other important food essentials. Prepared as directed, Cocomalt adds 70% more foodenergy value to a glass of milk.

Vitamin D, Calcium, Phosphorus

Cocomalt is fortified with Vitamin D under license granted by the Wisconsin Alumni Research Foundation. Each ounce of Cocomalt contains not less than 81 U.S.P. Vitamin D units.

Cocomalt also has a rich Calcium and Phosphorous content. Each cup or glass of Cocomalt in milk provides .32 gram of Calcium and .28 gram of Phosphorus. Thus Cocomalt supplies in good biological ratio three food essentials required for proper growth and development of bones and teeth: Calcium, Phosphorus and Vitamin D.

FREE TO DOCTORS: We will be glad to send a professional sample of Cocomalt to any doctor requesting it. Simply mail this coupon with your name and address.

ļ	R. B. Davis Co., Dept. 51-D, Hoboken, N. J. Please send me a trial-size can of Cocomalt without charge.

Insurance against Inertia

Someone once remarked that "he who sits back, stays back"—perhaps intimating that contentment breeds inertia.

In verso, discontentment enlivens initiative—and an unsatisfied mind is never inactive. The enterprising mind is ever alert, probing and searching through serious reading, and it is reading with a purpose that develops immunity and insurance against inertia—for the printed thoughts of others engender the will to achieve in one's self.

Purposeful reading of the selected articles and thought-inspiring editorials in every issue of your New YORK STATE JOURNAL OF MEDICINE, inevitably purges the mind of staleness and implants fertility.

Reading the advertisements, as well, keeps you abreast of the times, and wards off slipping into the set ways which so indelibly mark a person as "one who belongs to the past."

INCOME—Read these 165 Words.

Hundreds of physicians are using our unique, quick and amazingly resultful collection service. Hundreds more have responded to our advertisements in your official publications, the New York State Journal of Medicine and the 1936 Medical Directory of New York, New Jersey and Connecticut.

Our collection plan is simple—automatic. It relieves you of the irksome task of writing letters to slow-paying patients. It involves no change in your office routine except to simplify it.

The plan works miracles on physicians' accounts. Checks arrive with apologies. Patients who now avoid you, pay up and return for treatment. The plan is friendly, persuasive, constructive. You do not have to go to court. We do not believe in law suits against patients.

You pay a reasonable fee on results only. No collection—no charge.

Do not bother to write. Just mail a card or prescription blank to get complete details.

We will be pleased to have you visit our exhibit in Booth 103 at your 130th Annual Convention. "Time to Collect"

WHEN HE CUTS YOUR ORDER

Correct Eating

To a physician it is not strange that so many of our common ailments are largely due to faulty diets. Perhaps most common are disorders of digestion, and as each patient is a law unto himself, no general directions can be given as to the regulation of the particular articles of diet. This then, makes it practically imperative that physicians know more about foods than the average person. In fact, the layman would be far better off to forget about calories, vitamins, carbohydrates, etc., and con-

centrate on quality, mastication, and a voidance of over-indulgence. For the physician, it would be well to remember that in some cases a condition may be the result of poor foods as well as wrong foods. A survey of the producers of foods is as important as study of the producets. And it is far, far better to specify actual brands of foods when possible, than to leave selection to the usually poor judgment of the layman.

MEET A CHAMPION

This is Harry Johnson, an Indiana farmer, rated by Purdue University as champion tomato grower of Indiana for 1935. His prize-winning erop, produced and harvested under the careful supervision of Kemp field men, was pressed into Kemp's Sun-Rayed Pure Tomato Juice by the exclusive Kemp proc-

ess (U. S. Pat. 1746657) . . . This process insures high retention of Vitamins A and C, the rich ruby red color and the delicate flavor of fresh vineripened tomatoes. Kemp's Sun-Rayed is a pure undiluted juice which you can recommend with confidence to your patients. Write for Steenbock Report on Feeding Tests, J-36, The Sun-Rayed Co., Frankfort, Indiana.

Harry Johnson headed an Impressive liat of prize-winning tomato growers whose crops were produced and picked under the supervision of Kemp field men—and U. S. Gov't graded when delivered to the Kemp plants, Purdue University has recently awarded the Kemps a trophy for the third successive year for obtaining the best tomatoes from growers.

... and TAKE SOME EXERCISE?

"Exercise" should mean something more to physicians than merely telling a patient to take up some form of "sport," to go to "a gymnasium," or to invest in some sort of a "mechanical exerciser." The very fact that supervision alone is vitally important even to persons not pathological subjects, is sufficient reason to give more than a perfunctory counseling when exercise is indicated, and to have some definite knowledge of "what," "where," and "how much" would be most beneficial in each case.

One thing you should know about *The Health Roof* is that it should not be misconstrued as "a gymnasium" intended for a purpose of developing athletes or building brawn—It is primarily and exclusively equipped to aid, under proper supervision, in restoring and maintaining physical fitness for the normal life of the average man and woman.

ELI LILLY AND COMPANY

FOUNDED 1876

Makers of Medicinal Products

Dependable Ampoules

Solutions to be used in the manufacture of Lilly Ampoules are prepared by dissolving chemicals of the highest degree of purity in water which has been repeatedly distilled. The solution is then assayed and the reaction precisely adjusted, after which the ampoules are filled, sealed, and sterilized. The finished ampoules are again assayed and tests are made to see that the optimum conditions for the administration of the solution remain unchanged. Only those ampoules that are brilliantly clear and have been found to be free from any particle of suspended matter, as examined under a lens with the aid of a powerful beam of light, are approved. In general, this is the record of any ampoule that bears the Lilly Label. Lilly Ampoules are designed, prepared, and tested under the most exacting conditions at all times.

MODERN RENAL SURGERY With Particular Reference to Heminephrectomy

Hospital

OSWALD SWINNEY LOWSLEY, AB, MD, FACS, New York City
From the Department of Urology (James Buchanan Brady Foundation) of the New York

It is the purpose of this article to call attention to the progress made in operations upon the kidney in recent years. Two years ago the author, with his associate Dr. C. C. Bishop, in some experimental problems on the kidney of the dog, proposed a new operation for the repair of renal wounds. From this pre-liminary experimental work, a series of operations on the kidney have been developed in which the same principles have been utilized to repair the kidney following operative or traumatic wounds with equally good results.

Our experience with experimental operations upon rabbits and dogs using plain ribbon gut as a medium with which to close kidney wounds has proven to be entirely satisfactory. Fixing this material in a proper place by threading it through straps in the fibrous capsule is successful in maintaining the ribbon gut in the place desired for proper closure of the kidney wound or wounds.

Thin strips of fat inserted in the kidney wounds have been proven by animal experimentation and clinical observation upon human beings to be the most satis factory material as an aid in hemostasis Bits of muscle have also been utilized, but these are not nearly so effective in causing a cessation of kidney cortical bleeding

Microscopic studies demonstrate the thoroughness with which small particles of fat are incorporated in the healed wounds of the kidney. Large pieces of fat also may be included in the wound, but small ones are just as effective and are more easily absorbed by the healing kidney.

The ribbon gut properly tied around the kidney causes no pressure necrosis and postmorten specimens of animal kidneys show conclusively that there is no destruction to the kidney such as one sees when needles are passed through the cortical substance in the usual manner

Nephropexy is perfectly performed by using three week chromic ribbon gut with needles attached to each end. A sling of this material fixed in position around each pole of the kidney and tied firmly but not too tightly will be effective in holding the elevated kidney in whatever position it is placed at the operating table.

It has been definitely proven by experimental and clinical observation that great destruction of the kidney may occur without rupture of the fibrous kidney capsule. As a matter of fact, pulpifaction of a large part of the kidney cortex may occur without any perirenal infiltration of either blood or urine until many days after the traumatism responsible for the lesion. This may often occur only after the fibrous capsule has been digested by the juices liberated under it.

Our experience with animals, as well as the histories of many human cases, lead us to suggest that every case in

Read at the Annual Meeting of the Medical Society of the State of New York, Albany, May 15, 1935

The author wishes to express his gratitude to the surgeons of the New York Hospital who have allowed their cases to be used in this study and particularly to Dr. Payson Adams for his assistance in the experimental surgery

which renal traumatism is suspected be immediately hospitalized and carefully observed. If blood continues to be passed in the urine longer than twenty-four hours, or if there is lassitude, fever, rapid pulse or any of the ordinary evidences of absorption, an exploratory operation is recommended.

Upon exposure, if subcapsular hemorrhage, evidence of laceration of the kidney cortex, or any other traumatism is noted, it is advisable to open the kidney capsule and drain the damaged portion by means of soft rubber tube or Penrose drain. Bleeding, if still persistent, may then be controlled by inserting small bits of fat and fixing them in position by tying ribbon gut around the kidney and over the affected portions. The gut may be fixed in any desired position by means of three or four straps made in the fibrous kidney capsule.

In none of our cases thus treated has there resulted a death, nor has there been a persistent urinary fistula. On the other hand, in cases where the kidney capsule has not been opened and the traumatized area drained, as in the case of "N.C.", here reported, a complete destruction of the kidney has resulted which also became a great menace to the patient's life; and, except for prompt and efficient surgery, would have resulted in death from hemorrhage and infection.

The present report concerns particularly the operation of heminephrectomy. This procedure may occasionally be performed upon kidneys with one pole destroyed by stone, tumor or nontuberculous infection. In tuberculosis, even if the disease is apparently limited to one pole of the kidney, experience has taught us that nephrectomy is the operation of choice.

The control of hemorrhage is the most important consideration in the performance of heminephrectomy. The author, assisted by Dr. Adams, conducted a series of experiments in the Department of Experimental surgery* upon dogs in 1934 and brief protocols of some of these experiments are as follows:

Dog CO 10. Jan. 16. Anesthesia: Ether. Operation: Heminephrectomy, Kidney exposed in usual manner. Peritoneum stripped to the kidney. One small hole torn in the peritoneum, repaired with plain catgut. Four belt buckles made in the usual manner, an additional buckle made one-half inch above and between the anterior two buckles and posterior buckles and also through the extra buckle placed between the two. It was then placed through the posterior inferior buckle and the additional buckle made. The other catgut tape was placed in through the anterior superior and additional buckle on either side. The lower fourth of the kidney was then removed. A small tab of fat placed in the bed. Two tapes were tied holding fat firmly in place.

At this point the dog ceased to breathe, artificial respirations failing to revive nim. The two kidneys were removed and photographed as shown in Fig. 1.

Cause of death: ether anesthesia.

Dog CO 27. January 23. Anesthesia: Ether. Operation: Heminephrectomy. Left lumbar incision, kidney exposed in the usual manner, peritoneum stripped from the kidney with perforating peritoneum. Eight belt straps made; two double straps were placed on the anterior surface of the kidney. The double straps being about one cm. apart, two double belt straps placed on the posterior surface of the kidney. These were located in about the median portion of the kidney. Split catgut tape about four inches in length placed through each of these double straps and tied loosely. The ends left free for tying purposes, lower fourth of the kidney was then removed. Moderate bleeding encountered except near the renal pedicle where there was marked bleeding, one large spurter. A piece of fat size of thumb nail placed in the had of the little of of the l in the bed of the kidney, the ends of the pre-viously placed tapes were brought over and tied in a criss-cross manner. All bleeding was stopped except near the pedicle. Another small tab of fat was placed over the spurter. A plain number one catgut ligature placed medial to this point, the end being used to tie with one of the pieces of tape holding the fat in place. This did not stop all the bleeding so another catgut suture was placed through and tied; all bleeding points stopped; kidney placed back in bed. Wound closed in usual manner. 150 c.c. of saline injected intraperitoneally. Dog left table in good condition,

Autopsy by Dr. Adams. Dog died March 22 (See Fig. 2). A mid-line incision opening into the peritoneum showed no evidence of peritonitis. Bladder opened; x-ray catheter placed in the ureters; x-rays were taken after injecting five c.c. of Skiodan twenty per cent; autopsy then continued. An incision made through the well-healed scar showed no evidence of infec-tion, kidney was found just beneath the muscle layer fairly adherent to it and otherwise in good condition. There was moderate perirenal reaction but no evidence of infection. The left kidney was about one-half the size of the right kidney. The left kidney was only slightly scarified at the lower pole; catgut was well absorbed and practically all evidence of heminephrectomy was gone except slight dimpling at the lower

^{*}Sincere gratitude is expressed to Professors Heuer and Sweet of the New York Hospital, Cornell Medical College Association for extending the facilities of the Department of Experimental Surgery to the author and his associates.

pole. The right kidney appeared to be hypertrophied. Ureters were normal, not dilated or giving evidence of infection. Heart, liver, lungs, and spleen grossly normal. No definite cause of death was found.

Dog No. 5. January 2. Anesthesia: Ether. Operation: Left Heminephrectomy. Left lumbar incision through skin, superficial fascia and muscles. Renal fascia was incised. Kidney delivered into wound. Peritoneum was dissected free from the kidney and in the process of doing so, one hole was made in the peritoneum; this was closed with number one plain catgut. A fiveeights inch ribbon catgut was split in two and this was used for the repair of the kidney wound. At a point one-third the distance up from the lower pole of the kidney an incision one-half inch in length was made in the kidney capsule. The knife was then placed under the capsule lifting it up and freeing it from the kidney and brought out from the capsule onehalf inch from the first incision forming a strap composed of capsule of the kidney. Three of these straps were made at equal distances about the kidney. The split tape was then brought through these straps and tied about the kidney firmly. An elliptical incision was made in the lower pole of the kidney removing the lower quarter of the kidney. There was profuse bleeding, several large vessels were encountered. A piece of fat was immediately placed in the wound and held firmly for five minutes. Two transverse belts were applied, this was done by making an incision in the capsule of the kidney one-half inch from the cut surface bringing it under the previously placed strap. This was done at the opposite side bringing the tape over the fat and holding it firmly in place. At the end of the procedure all bleeding was entirely stopped, the kidney was placed back in its posi-tion, number one plain catgut used to suture the kidney lumbar incision. Fine silk subcutaneous suture for the skin. Due to the loss of blood encountered during the operation 150 c.c. of normal saline were injected intraperitoneally. The dog was in good condition at the close of the operation.

Cystoscopy: February 13. A number 24 B.B. cystoscope passed into the bladder with considerable difficulty. Both ureteral orifices were made out but neither could be catheterized with either the convex or concave Brown-Buerger cystoscope. The catheter would approach the ureteral orifice but it could not be made to enter the ureter. After an hour of labor the

cystoscopy was discontinued.

Pyelogram: The right pyeloureterogram did
not show up very well. Apparently the calyces
were within normal limits. Pelvis and ureter
within normal limits. The lower pole of the
feft kidney showed no leakage. There was an
extravasation at the ureteropelvic junction. The
remainder of the kidney was within normal
limits. Excellent healing without leakage.

Autopsy by Dr. Adams. Died February 16. The dog was up and about its cage and running about until it was cystoscoped, since then the dog had done very poorly and was sacrificed. An incision was made in the skin which was still opened down to the muscle layers; there was evident infection of the operative wound.

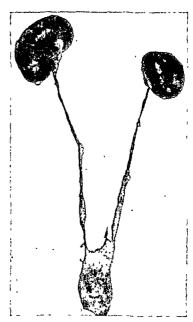

Fig. 1. Dog CO 10

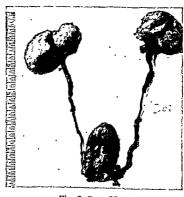

Fig. 2. Dog CO 27

The kidney was found plastered down to the under surface of the muscle layer but otherwise in good position. Catgut sutures were not entirely absorbed the kidney was about twothirds the normal size. No evidence of infection or extravasation of blood. Ureters were normal; liver, spleen, heart, and lungs essentially negative. Midline incision was made, the bladder exposed, and catheters placed in to the ureters and twenty per cent sodium iodide injected about ten c.c. on the left and five on the right. Cause of death: P.O. cystoscopy.

Dog No. 3. January 4. Left Heminephrectomy Ether: Anesthesia. Left linear incision through skin, superficial fascia, and muscles. Kidney exposed and denvered into the wound. Peritoneal cavity was dissected free from the kidney and in doing so one hole was made in the perineum which was repaired with number one plain catgut. Four straps were made in the kidney capsule at a junction of the lower and middle third. The straps being in a transverse direction, these were made by incising the capsule for a distance of one-half inch and lifting the capsule from the cortex and plunging the knife through at a point of one-half inch dis-tance. Half-width kidney tape was used and threaded through from the strap on the under surface of the kidney to the corresponding one on the anterior surface of the kidney. These were put in place and the lower quarter of the kidney removed. Profuse bleeding encountered; two pieces of fat were placed in the bed of the wound and the kidney straps brought over and tied firmly. In the process of tying one of these straps gave way and another kidney cap-sule strap was made. Within three to five minutes after the hemineohrectomy the bleeding was completely under control. Kidney replaced in its bed. Three plain number one catgut sutures for the repair of the deep tissues subcutaneous silk stitches for the skin.

Dog received 150 c.c. normal saline intraperitoneally. Dog left table in good condition.

Autobry by Dr. Adams. Dog died February 8. This dog was in excellent condition following operation. Wound was clean, dog very active, and apparently in excellent condition. Attempt at cystoscopy was satisfactory until the dog ceased to breathe, apparently due to ether anesthesia.

The autopsy showed wound well-healed and numerous adhesions about the kidney which were adherent at the lower pole. The left kidney when exposed looked very near normal except that it was small in size; lower pole had completely healed; there was still some of the catgut tape present. There was no evidence of hemorrhage or infection. The right kidney was normal, otherwise the autopsy was entirely negative.

Dog T-18, January 9. Operation: Left Heminephrectomy. Anesthesia: Ether. Left lumbar incision through skin superficial fascia and muscles, locating the triangle of Petit. The perinephritic fat incised, kidney delivered by spreading the wound and pressure on the abdomen. Peritoneum stripped off the kidney; no holes made in the peritoneum. Four belt straps made in the kidney capsule in a linear direction about the midportion of the kidney. Five-eighths

inch tape catgut split in two; this was laced through two of the previous straps, one on the anterior and one on the posterior surface of the kidney looping over the lower pole. Heminephrectomy of the lower quarter of the kidney; there were at least three vessels encountered which bled profusely with a marked general coze of the raw surface. Flat piece of fat size of a quarter placed on the raw surface and held firmly there, while the previously placed tapes were placed over the fat and tied firmly. In the process of doing so, the posterior superior strap pulled partially loose and bleeding was encountered in this area. One catgut suture was placed at this point and a small tab of fat sutured over this bleeding area which promptly stopped hemorrhaging. Within three to four minutes after the heminephrectomy was done all bleeding was stopped. Kidney placed into its bed. One catgut for deep layers and silk subcutaneous for the skin. No drain in intraperitoneal infusion. Dog left table in good condition.

In the midst of the operation the dog ceased to breathe but several artificial respiratory

movements revived him.

X-ray: The control kidney right showed normal calyces, kidney pelvis, and ureter. The left kidney operated upon (heminephrectomy) showed a deficiency of the lower calyces and an extravasation of the injected material from the ureteropelvic junction apparently. Otherwise it was within normal limits.

It is considered that this was an excellent

healing.

Autopsy by Dr. Adams. Dog died February 16. Midline incision made in peritoneum exposing no evidence of peritonitis. Bladder opened and x-ray catheters placed in the ureters; 15 c.c. of sodium iodide injected (left 7 c.c.; right 8 c.c.). The left lumbar wound was well-healed; this was opened up and only a small amount of liquifying material was found in the incision. No gross evidence of infection. The kidney was very adherent to the under surface of the muscle layers; no evidence of hemorrhage or extravasation. The lower pole of the kidney was irregular, otherwise the kidney appeared grossly normal except that it was about two-thirds normal size. The tape appeared to be fairly well-absorbed except for a few strands remaining. Ureters were normal. Heart, lungs, light processing process. liver, and spleen grossly normal.

Cause of death was undetermined.

Dog S10. January 10. Left heminephrectomy Ethylene Anesthesia. Kidney exposed and delivered into the wound by the usual procedure. Peritoneum stripped from the kidney without tearing into the peritoneum. Three belt straps were made by the usual method running radially about the lower third of the kidney. The lower quarter of the kidney was removed. There were three profuse bleeding points encountered in the bed and one very large spurter near the renal pedicle. Pad of fat size of a five cent piece placed in the bed and held firmly. The catgut tape which had been threaded through the belt straps previously was placed and brought over the fat and tied firmly anteriorly and posteriorly. The posterior inferior belt strap pulled loose in tying and it was

necessary to make another belt strap and the tape brought through and tied again. There was still one bleeding area near the kidney pedicle requiring the catgut tape to be brought around the renal pedicle tying very loosely and not tying off the circulation but holding a small piece of fat at this area. Four or five minutes after removing the lower pole of the kidney, all bleeding points were stopped. Closure in the usual manner. 150 c.c. of saline injected intraperitoneally. Dog left table in good condition.

Autobsy. Dog died January 20. This dog was very much undernourished and rather scrawny looking. Incision was made from the symphysis pubis to the superior sternal notch, peritoneum opened and very many adhesions found throughout the intestinal tract; slight injection of the vessel and intestines, but no definite peritonitis;

no fluid present.

The right kidney was in normal position and grossly normal. The left kidney was found bound down by many adhesions particularly at its lower pole which had previously been nephrectomized. On freeing this kidney there was a large pocket of pus found well walled-off by adhesions, apparently rising from the lower pole of this kidney. Close examination of this kidney revealed much exudate and degenerated fat at the lower pole. The fat was still in place and firmly adhered to the bed of the wound in the kidney. Several small strands of the catgut tape were still present and well-preserved. At one point the tape could be seen still placed through the belt buckles but at other points the tape was not in the original position. Much of this tape which was not in its original position had no doubt been absorbed. The other belt buckles could not be demonstrated but in several places the capsule was absent over small areas which no doubt represented the points at which the straps had previously been made; the rest of the kidney appeared grossly normal. The kidneys were taken and sent to the Pathological Laboratory for gross and microscopical examination. Ureters appeared normal. Lungs, heart, and the viscera appeared normal.

Cause of death: Sepsis from local abscess about the left kidney. Wound was clean and well-healed.

Dog TCO-13, January 12. Left hemisephrectomy. Anesthesia: Ether. Left lumbar incision through skin; superficial fascia. Kidney exposed and delivered into wound. Peritoneum stripped from the kidney and in this process one hole was made in the peritoneum which was sutured with number 0 catgut. Four belt straps made at a point at the junction of the lower and middle third of the kidney running radially split; fiveeighths inch tape placed through two of these straps, one anteriorly and one posteriorly. The straps, one anteriority and one posteriority. And the lower quarter of the kidney was removed, profuse bleeding encountered; flat piece of fat size of thumb nail placed into the kidney bed. Tape brought over and tied, holding the fat first provided in its place. Bleeding stopped within a few minutes effect removing. Chemical profusers are provided to the provided profuser of the provided profusers and the provided profusers are provided profusers. minutes after removing. Closure in the usual manner. Portion of kidney tissue removed was sent to the laboratory for microscopic examination.

No saline intraperitoneal infusion. Dog left table in good condition.

Autopsy. Dog died January 30, Wound was well-healed superficially. It was opened up and a small amount of pus and liquified fat found in the muscular layers but there was no sign of infection about the kidney. Left kidney was bound down by a few friable adhesions. Upon exposing the kidney it was accidently cut. After the kidney was removed it was found to be about three-fourths of normal size. The catgut tane placed at operation was still in place holding a small tab of fat in the bed of the kidney; there was no exudate or evidence of pus or hemorrhage; rest of the kidney appeared grossly normal; ureter was normal. Right kidney was normal, no evidence adhesions. Heart, lungs, liver, and spleen grossly normal,

Cause of death was mild deep seated infection of operative wound. Toxemia.

Dog R. S. January 30, Operation: Left heminephrectomy. Anesthesia: Ether. No preparation. Left lumbar incision, kidney exposed in the usual manner. Peritoneum was opened; this being a small dog the kidney was smaller than usual. Peritoneum was stripped from the kidney. Four double belt straps were made about the midportion of the kidney; two were placed near the pelvis anteriorly and posteriorly and the other two near the periphery anteriorly and posteriorly. Split five-eighths inch catgut tape was placed through each of the double straps and tied firmly; the ends being left long for tying purposes. Lower quarter of the kidney was then removed, care being taken not to make an incision too near the pelvis. Moderate bleeding throughout the bed of the incision with one larger spurter. Small tab of fat the size of the end of thumb nail was placed at the end of the kidney. Ends of the previously placed catgut tape were then tied over the bed of the kidney holding the fat firmly in place. There was still some bleeding at the lowermost portion of the incision necessitating another piece of fat being placed at this point. One of the of tal being placed at this point. One of the capsule and tied, holding this last tab of fat in place. There was only moderate bleeding encountered throughout operation. Closure made in the usual manner. No intraperitoneal clysis.

Dog left operating room table in good con-

Autopsy by Dr. Adams. Dog died February 12. The left lumbar incision was slightly infected. All structures grossly normal except the kidneys. There was a perinephretic abscess about the left kidney containing about 11/2 oz. of thick yellow pus. The heminephrectomy wound was well-healed; most of the catgut tape was absorbed; there was no evidence of hemorrhage whatsoever. The left kidney appeared quite normal except that it was quite small in size and slightly irregular at the lower pole. The right kidney was normal.

Bilateral pyelograms were taken with two number six x-ray catheters placed into the ureters through the bladder at the time of autopsy the kidneys being in their normal position.

Cause of death: Sepsis (Left perinephritic abscess).

On the side of the heminephrectomy at lower pole there was an opening about one cm. in size connecting with the pelvis.

Heminephrectomy will most often be applied to disease of one side of a horseshoe kidney, hence this condition will be discussed thoroughly in this treatise.

Heminephrectomy in Horseshoe Kidney

The literature on horseshoe kidney is extremely voluminous. The most recent monograph concerning it gives 107 references, and makes no pretense of being complete. There is no need therefore, to occupy any time in discussing the anomaly per se.

Operation upon horseshoe kidney is comparatively modern, for, until the era of anesthesia, the anomaly of necessity had remained merely a curious finding at the autopsy table. But, with the patient under an anesthetic, exploration of the renal region became possible, so fused kidneys were now and then brought to light in the living subject. In this way, it was early recognized that anomalous renal organs are at least four times as liable to disease as those normal in contour and position. The elaborate statistics of Botez published in 1912 place the morbidity of fused kidney as opposed to normally placed kidneys at 16¹/₄ per cent, while Beyer, writing in the same year reported the finding, among 265 fused kidneys recorded, of 102 which came under observation because of some pathologic condition, which is almost forty per cent.

The increased liability to disease displayed by the horseshoe kidney is easily explainable when we consider how its anatomical and physiological relations are affected by its anomalous nature. The position of one pelvis must always be anterior and the insertion of one ureter —frequently both—is of necessity abnormal, in that its point of origin is higher than the declining portion of the pelvis. The entire course of one or both ureters may be altered, often making the congenital narrowings of the lumen occur at points peculiarly liable to stricture formation. Frequently too, congenital stricture may be present in addition, and the occurrence of numerous anomalous blood vessels serves still further to increase the liability to stricture and compression of the ureters. The tendency to urinary stasis with its inevitable sequels of stagnation and infection is thus shown to be very much greater than in normal conditions and it is not at all surprising that hydronephrosis and urinary calculus form the largest proportion of the diseases affecting fused or otherwise anomalous kidneys. It is also probable, as Israel long ago maintained, that an anomalous kidney is actually less efficient and less resistant to disease than one in every way normal.

The great advances in urologic diagnosis which the twentieth century has witnessed now make the diagnosis of horseshoe kidney a comparatively easy matter. But, until very recently, this was far from being the case; and the majority of operations done were undertaken in the belief that the pathologic condition was either extra-renal, or situated in an anatomically normal organ. When Papin and Palizolli compiled their statistics in 1909, they found records of eighteen cases of unilateral fused kidney which had undergone operation. Four of these had been removed entirely, the result being the rapid demise of the patient from complete anuria. When the intervention found the fused kidney centrally located, as is the situation of the majority, this fatal error was not so likely to be made, recognition being much easier. Better means of diagnosis, and more complete analysis of the individual case, in more recent times, also assisted in avoiding this error.

The first surgeon who had the hardihood to attempt to remove the diseased half of a horseshoe kidney appears to have been Braun in 1882. He was unsuccessful for the patient was lost, and it was not until six years thereafter that anyone else attempted to emulate him. In 1888, however, Socin succeeded in curing a patient suffering from intermittent hydro-nephrosis, by first opening the dilated kidney pelvis and later, when relief was not afforded, by taking out the entire affected half. Koenig, in 1895, resected a sarcoma from one side of an infant's horseshoe kidney, the case being an interesting side light upon the relation between anomalous viscera and sarcomas of infancy. Five years later, Czerny made a similar attempt to remove an angiosarcoma, but was unsuccessful, death promptly intervening. Lotheissen (1896) failed in attempting to remove a cyst.

With the opening of the twentieth cen-

tury, improvements in diagnosis and technic made operation upon anomalous kidneys somewhat less hazardous and more satisfactory. The inaugural dissertation of Geiss at Marburg in 1899 told of the successful removal of a hydronephrotic left half, after an ineffectual nephrotomy had been first performed. Czerny also, had success in doing a similar intervention. Rümpel and Kümmel are credited with the cure of a calculous pyonephrosis by heminephrectomy (1902), while Barth was the first to accept tuberculosis of one side as an indication for its expiration (1904). In 1908 Israel's monograph on the diagnosis and surgical management of anomalous kidneys listed two successful cases; one, a left hydronephrosis, initially nephrotomwithout benefit, and the other, a second case of renal tuberculosis, wherein patient survived but a fistula remained. Clairmont in 1906 gave an account of heminephrectomy in the horseshoe kidney of a child of two years, who had developed hydronephrosis because of the anomalous position of the ureter.

From that time forward, heminephrectomy in the diseased horseshoe kidney became fairly common. Albarran (1907), Desmaret (1910), and Roysing (1911) (1910) and Gerard (1911) carried their patients safely through the operation, only to see them succumb after a few weeks. Altogether, up to the year 1928 accounts of ninety-two cases have been found in the literature. Since 1920, and during the past five years in particular, the operation has become so well accepted that many operators fail to publish reports. This is very much to be regretted, because, although we now know that the condition is by no means so rare as it was once supposed to be, it remains sufficiently uncommon to be a pitfall for even the most careful diagnostician, so that any information concerning it has an ever-present interest. Only by the continual amassing of such data can a standard practice be worked out and maintained, which can successfully cope with the many manifestations of this renal anomaly.

Operative Technic

Anesthesia Used. The type of anes-

thesia employed by us is spinal; however, there is no objection to any type of local or regional bloc which really anesthetizes. Local anesthesia is to be preferred to every type of general anesthesia.

The operative technic employed by us is as follows:

The patient is placed on the opposite side and held by small metal braces fitted to a kidney elevator which holds the patient in excellent position on a narrow table eighteen inches wide specially constructed for renal operation. The patient's hands are clasped and the elbows approximated as if in an attitude of devotion. The upper leg is stretched out straight, the under knee is drawn as high up as possible. Thus the elbows and the underneath knee serve as braces to hold the patient in such a position that the loin of the affected kidney is straight up and the patient is neither on his back nor his belly but exactly on his side. If this position is not maintained when the elevator is raised, it is corrected by the use of a broad strip of adhesive tape which fixes him firmly on the table in any desired position.

The incision extends from the costavertehral angle parallel to and below the twelfth rib. It is extended downward and mesially until it is about ten inches in length. Care is taken to avoid injury to the twelfth nerve and its branches, and the ilioinguinal and the iliohypogastric nerves are carefully preserved from injury. Occasionally a branch of the twelfth nerve will extend across the incision. When this happens a careful dissection will often allow the nerve to be retracted to the proximal side of the wound and thus prevent injury.

The fascia covering the erector spinae muscles is incised both above and below where it takes part in the formation of the costovertebral ligament. This allows the rib to swing up and makes rib resection unnecessary in most instances. The fascia is incised, the muscles divided, and the deep fascia nicked in the costovertebral angle. This incision is widened and the peritoneum carefully protected as it is stripped back. If it is accidentally injured it is immediately repaired. The surgical crime involved is not in the injury to the peritoneum, but rather lies in not recognizing it or in neglecting to repair it when injured.

Advantage should be taken of the entire length of the wound and if the original incision is not ample it should be increased until there is plenty of room. It must not be forgotten that wounds heal from side to side and not lengthwise. If proper care

is taken there is no reason why a ten inch wound should not heal as rapidly and as

firmly as a four inch wound.

The fatty capsule surrounding the kidney is then grasped well up in the costovertebral angle and opened. This opening is increased by blunt dissection until the cortex of the kidney is seen. The fatty capsule is then separated from the kidney. During this process it will be found necessary to tie off many aberrant vessels because it is a peculiar fact that anomalous kidneys have the faculty of deriving the blood vessel communications directly from the nearest large vessels; and, while the ordinary vessels do exist, the aberrant vessels are numerous and may come from any nearby large vessel.

Having separated the upper pole of the horseshoe kidney and secured the bleeding points, the ureter is then dissected down as far as possible, stump ligated and incised with a cautery or with scissors, and the cut cauterized by carbolic which is neutralized with alcohol,

The dissection is continued and any vessels encountered are secured. The isthmus is recognized and freed from surrounding adhesions of every character. The diseased portion of the horseshoe kidney is then excised by making a V shaped

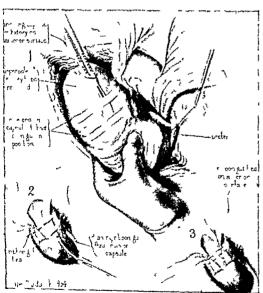

Fig. 3

incision into the isthmus, the apex of the V pointing to the sound side. Upon removal of the excised portion the isthmus is repaired by means of ribbon gut which has already been placed in position through the fibrous capsule by means of the Lowsley needle, with a small bit of fat placed in

the V mentioned above. (Fig. 3, 4, 5.)
Penrose drains are placed down to the excised isthmus and the wound closed by layers, plain catgut being used except in the skin, where silk or silk worm gut is

used in interrupted sutures.

Postoperative care

Postoperative care is that usually given to nephrectomy cases. If a considerable amount of blood has been lost, whole blood transfusions are administered. If the patient does not take fluids well, they may be administered in the form of five per cent glucose intravenously, salt solution by hypodermoclysis or tap water in eight ounce doses per rectum, or all three methods if deemed advisable.

Case Reports

N.C., 1905 (See Table I) Diagnosis. Hydronephrosis, left (Patient shot in left loin several years before and bullet never recovered.) Operation: "Partial nephrectomy (Dr. Bolton). A transverse incision was made in the left loin, two fingers breadth below the twelfth rib and deepened through external and internal obliques and transversalis muscles, cutting across their fibers. The outer edge of the quadratus lumborum was divided and the muscle retracted inward and the perirenal fat exposed. This was torn through and the kidney exnosed It was found largely replaced by a hydronephrotic sac which was opened and a considerable quantity of hydronephrotic fluid evacuated. The calyces were explored and no trace of the bullet found. Large clamps were placed on the sac close to the pelvis of the kidney and the sac cut away and stumps ligated by transfixion with No. 3 plain. A few sutures of No. 2 plain were taken to close over the open stump. Considerable hemorrhage was encountered and was mostly controlled by pressure, and ligature with No. 2 plain. No trace of the bullet was found anywhere about the kidney and the wound was packed with iodoform gauze and the cut ends of the muscles brought together in layers with No. 1 plain and the skin closed with a few interrupted sutures of silk worm gut."

K M., 1914 Diagnosis: Tuberculosis of kidney, left. (Diagnosis not confirmed by pathological report.) Operation: "Resection of kidney (Dr. Gibson). Patient in left lateral position. Incision about six inches long made obliquely on the right side of abdomen between ribs and iliac crest. Incision deepened down to retroperitoneal fat. Kidney located. Apparently normal or

PSYCHIC FACTORS IN GASTROINTESTINAL DISEASE

GEORGE EATON DANIELS, M.D., New York City

The manifestations of gastrointestinal disease that entail psychic factors are so numerous that it would be obviously impossible to cover the whole field in a short communication. One would not only have to deal with psychic factors as a primary cause, but with psychic disorders which are secondary to organic disease of the tract. I will therefore confine myself to a limited aspect of the problem in which psychic factors have a primary importance, but I wish also to emphasize the physiological aspects of certain of these psychic processes which, although displaced and disguised, furnish more than an imaginary basis for so-called functional symptoms. Secondly, I should like to emphasize the continuity of psychiatric pictures which, to the internist or surgeon, may appear disjointed and diffuse.

I have further limited the discussion to psychic disturbances arising from instinctual conflicts, because of the frequency with which such disturbances express themselves in gastrointestinal disorders. To treat the presenting clinical disorder, the underlying instinctual situation must be dealt with. The cases are from routine clinic and hospital practice, and those with a few contacts have been preferred, to avoid detail that would be confusing and only of interest to the specialist. Of the four cases, the first two deal with situations arising at sexual maturity; the last two are related to problems growing out of the decline of reproductory life.

Case I. A Porto Rican girl of nineteen was admitted to the hospital for an emotional reaction following extraction under gas oxygen. During the first two days she showed a general trembling, as though in a constant state of fear. She wept frequently and was uncommunicative except to complain of severe pain in the right shoulder and epigastrium. A surgeon who saw the case emphasized the similarity existing between the epigastric and acromial tenderness. The latter could not be explained as a referred pain in the ordinary sense, and there was no history of recent accident. She vomited on several occasions.

The psychiatrist was impressed with the exaggerated feeling associated with the two foci of pain, for which he was led at once to suspect an emotional over-determination. The patient's distraught mental condition made it impossible to follow this further at the time beyond hearing her own explanation for the pain in her shoulderwhich was that the dentist had given her an injection there prior to the operation. She had explained to him that due to injury to this arm at seven years of age, she had been warned never to have any unnecessary manipulation at this site, and especially to avoid receiving injections there. For this very reason a series of injections which she had had some years later had been given into a leg. In spite of her pleadings and protestations, however, he had insisted and gone ahead.

The patient's parents were dead, and she had come two years before to the United States to live with an aunt and uncle. The uncle, on a visit to the hospital, volunteered information which served to make the real cause for her hysterical outbreak clear. He was much concerned because the patient, who was a virgin, had been pursued over a period of months by a distant relative with, he was sure, no good intentions. Although he had forbidden her to communicate with this man, he was in constant fear that she would overstep.

An inquiry into her attitude toward her uncle and the man described by him was undertaken. Her account of the situation was that she had met the man at her uncle's home while he was on leave from the army of some South American country. The man was married but separated from his wife. During the month he spent in New York he came to the house every day, but the uncle did not suspect the love affair which was rapidly progressing. He returned to South America and they corresponded regularly. One of the letters fell into the hands of the uncle, and on the man's return several months later, he was forbidden the freedom of the house, and she was warned against seeing him. They met and corresponded secretly for two weeks, at which time they announced their intention to marry in a stormy session at her uncle's home. The uncle then became so upset and talked with her so strenuously against this man that she decided to be ruled by him

Read before the Medical Society of the County of New York, April 22, 1935. From the Presbyterian Hospital and Vanderbilt Clinic, Columbia Medical Center, New York City

and to give up her admirer. This she had done two months before admission. The man, however, attempted continually to get in touch with her, and patrolled the front of her house, where he could be seen from the window. She claimed to have lost all affection for him, but it was evident, through her conversation that he was still very much on her mind and related to a general jumpiness which she complained of and exhibited.

Her abdominal symptoms appeared first during a menstrual period the year before at about the time she met this man, and recurred monthly. Six months later she began to have cramp-like, epigastric pain which occurred with, and also independent of periods. During her hospital residence this pain, which had persisted for six days, disappeared with the appearance of her

menstruction

The patient's mental picture cleared rapidly, and her physical symptoms decreased proportionally. Routine stool examinations revealed hook-worm, for which she was treated. This, though undoubtedly a general reducing agent and a factor in her gastro intestinal complaints, could not account for all the abdominal symptoms.

The basis of her hysteria lay in the existing emotional conflict. It is of interest that the conversion symptoms started as menstrual manifestations, later becoming independent of them Gastrointestinal symptoms of the character complained of, frequently appear in the face of strong instinctual temptation On careful and painstaking analysis, they are found to represent a defense against, and a disguised fulfillment of, censored trends within the personality With the patient's Spanish background, to be compromised would invite far-reaching consequences The role of the extraction in precipitating the hysterical episode would be understandable in its deeper emotional significance as representing a violation. both desired and feared To further support this surmise is the curious acromial pain, a twin in its hysterical conversion characteristics to her epigastric pain. This area was, as described by a medical student, an "achilles heel" a tabooed and vulnerable spot, and as such readily utilizable in hysterical fashion to dramatize her phantasies

Shortly after discharge from the hospital, all the patient's symptoms cleared up, only to reappear in the form of intermittent feelings of constriction in, and pain about the chest She spoke of this in the same way in which her earlier complaints had been referred to, and there was a noticeable exacerbation of pain whenever her former sweetheart was mentioned Further resolu-

tion of this affair through psychotherapy was indicated In such a case, intensive and prolonged therapy would be required to resolve not only the immediate situation, but the deeper infantile neurosis serving as its nucleus

Symptoms of abdominal prin, nausea, and coniting which in the last case one can only suspect are related to a conflict over pregnancy, are so with reasonable certainty in the next case to be cited. To demonstrate this definitely would entral months of careful analysis, and I have not opportunity to go into all the evidence at this time. If, however, the physician is to be prepared to deal with a constellation of neurotic symptoms, he must learn to recognize the gross or surface pathology and understand it in terms of histo- or depth psychopathology which he has become familiar with in other cases studied exhaustively.

Case II A young married woman of twenty-six came to the chinic complaning of right lower quadrant and para umbilical pain of nune months duration with discomfort following eating For six months she had suffered from a choking sensation after meals. Vomiting occurred on the average of three times a week. It relieved the choking feeling and also the abdominal pain which was cramp-like. The latter was also relieved by enema.

As in the preceding case, the physican would be tempted to attribute all the patient's gastrointestinal symptoms to hookworm, in the present instance, a history of an appendectomy four years before, with x-ray studies showing some limitation of mobility of the cecum, might blind one to something even more important in the background. The surgeon who was called in consultation lesitated to operate in view of the very meager physical findings, and furthermore, suspected a neurotic etiology. He recommended psychiatric observation and treatment as a preliminary, with operation only as a last resort

The patient, during the first interview, showed a picture of neurosis, and spontaneously frunched into a discussion of her personal problems when given the opportunity. She and her husband were very much in love when they married three years before and had continued to be so. There had been some difficulty in the initial adjustment to the physical act, but this had improved until during the period of her recent illness, when relations had become entirely unsatisfactory and were followed by nervousness and fatigue.

The pain that she complained of, as well as her other symptoms, had been present

during a pregnancy which had ended in a miscarriage at three months. It was then absent for six weeks, and again recurred. The pain was of the same character as that which she had had previous to her appendectomy four years before. Prior to this operation, she had suffered from three or four attacks a year of what was considered appendicitis. The question must be raised whether the first operation may not have been neurotically determined.

The patient's husband gave additional data of importance. Due to economic considerations, they had put off having a child, although the wife had expressed a desire for one. A year before the psychiatric consultation they had decided, in spite of the uncertain outlook, to go ahead. It was with this decision, and with exposure to pregnancy that her symptoms started. The husband believed that this ante-dated actual conception by a month or more. A period of improvement during earlier clinic visits he attributed to daily douches which had been prescribed during this time and later discontinued.

The patient appeared for her second interview with a history of marked improvement of symptoms until that morning when she had had a return on awakening. She further stated that the night before she had had unusually satisfactory coitus, with orgasm, and felt this a proof that sexual maladjustment had nothing to do with her symptoms. A fact that is often lost sight of is that not only does fear of pregnancy interfere with sexual gratification, but that a successful performance may greatly enhance the anxiety and neurosis even though precautions have been taken. This is related to a common belief that conception takes place with orgasm. Though she still expressed a conscious desire to have a child, and sought advice as to whether this would be advisable, a definite conflict on this score was evident.

As indicated, conflict over whether or not to have a child and fears of pregnancy and labor may operate whether pregnancy is a fact or not. Nausea and vomiting of pregnancy, and nausea and vomiting on a purely functional basis may express the same conflict. The gastrointestinal tract, when it becomes the seat of the conflict, acts in a substitute role for the genital tract. In the case presented, psychotherapy directed toward the removal of this conflict should be instituted before another pregnancy, otherwise danger of further miscarriage or increase in the psychic disturbance is to be expected.

The psychiatrist is often asked, as in the previous case, whether he can throw more

light on indications and contraindications for operation when a neurotic element is obvious or suspected. In learning to trust the psychiatrist's judgment, and to weigh it with his own or with those of other contributing specialists, it is important for the surgeon to realize that several apparently unrelated conditions may present a complete unity to the psychiatrist, and that psychic manifestations that may appear secondary to somatic symptoms may represent two different expressions of the same emotional disorder. Additional factors discovered and used by the psychiatrist if he is given even a short period to work with the case may sufficiently change the picture to convince even the skeptical.

Such a case, where the psychiatrist's recommendation was set aside for what appeared to be more important evidence, when a few days delay would not have entailed undue risk and would have avoided serious postoperative complications, is the following:

Case III. A merchant of forty-six entered the hospital suffering from gastrointestinal symptoms of three months duration. During this time he reported feelings of fullness in the epigastrium with occasional slight crampy pain. During this same period he had experienced dizzy spells while at work. Ten days before admission he had quite suddenly been seized with severe epigastric pain, which had remained constant with intermittent crampy increases. In the hospital the patient remained unrelieved by belladonna. Ulcer or neoplasm was suspected. Because the patient had obvious mental trends, the psychiatrist was asked to see him.

Examination showed a small, grey man, appearing older than his chronological age. He was in a state of constant agitation with a generalized tremor and depression. Mental suffering was apparent from his face, manner, and speech. His intestinal complaints were inability to eat, failure of his food to digest, meager, practically negligible evacuations; the marked emotional over-determination of his epigastric pain presented a picture frequently seen in depressions showing somatic symptoms, especially involutional melancholia. The entire symptomatology could be entirely explained on this basis. He gave a further history of having been melancholy and nervous for four years with frequent headaches, and in the last month, he stated that he had wept frequently and felt confused and hopeless. He talked continually of his son as his only interest in life.

The clinical picture was so clear-cut that the psychiatrist urged a period of observation and delay of exploration which was being seriously considered. Preliminary x-ray studies had been negative, and in view of lack of other positive findings, surgical opinion was to delay operation, when further x-rays showed some dilation of the second portion of the duodenum. A decision to go ahead immediately with the operation led to exploration with entirely negative findings. The patient developed a postoperative lung complication, with high fever and transient delusions centering about the recent incision.

After several weeks of convalescence, as his general condition began to improve, a second psychiatric consultation was requested. Additional information about the poor state of the patient's business with numerous reverses in the last few years, was thought of as a probable cause for his depression. The social service had also been told by the patient's wife of a very disturbing situation relative to their oldest child, a daughter, who for two years had shown wayward tendencies which were cause for real alarm.

When seen the second time six weeks after the first interview, the patient presented practically the same picture as on the initial visit. He was less depressed, but more agitated. A constant general trembling was accentuated when he talked about his condition. Without mentioning the information furnished by his wife, he was asked to tell what was actually worrying him. At first he demurred, saying that he couldn't discuss it. When pressed, his tremor became so violent that it resembled an ague, reaching such proportions that it nearly threw him from his seat. Only when removed to a quiet room and further encouraged did the emotional discharge take place with a burst of weeping, and in a few sentences he traced his entire emotional life with its present catastrophe.

He stated that he had been born in Europe, where both his parents died when he was a boy, depriving him early of their love and care. He had come to this country at eighteen, and shortly afterwards married his present wife. They had never been congenial, and when a daughter was born he placed all his love and affection on her. In his own words, "I watched her every step until she was five." He continued the closest association with her throughout childhood. Two years before she had begun to assert her independence by staying away from home for weeks at a time and associating with a crowd of which he entirely disapproved but could do nothing to prevent because of her threat to leave for good. With this his whole world crashed about him. He could think of nothing else but her disaffection and was unable to concentrate or to apply himself to business which needed his best efforts during the business slump. He had been unable for some time to discuss the situation even with his wife, because she became so upset, and he could not talk to anyone outside,

With the emotional catharsis afforded by the interview, his picture cleared considerably. He went away for several weeks convalescent care and when he returned, his epigastric pain had gone. Mentally he appeared fairly natural. When business was touched upon, he made a wry face saying that it was worse than ever but laughing in a philosophical if ironical way. When the matter of his daughter was mentioned, how-

ever, some of the former tenseness reappeared.

On a second visit three weeks later, his mental condition still showed the improvement, but he had begun to have a return of his epigastric pain. In such a case even though little can be done to modify the actual external problem, it is important to encourage discussion and ventilation of the painful affect to prevent reaccumulation of tension and its somatic reverberations.

Diminuation of sexual power in both sexes is often accompanied by emotional conflict expressed through the gastrointestinal tract. Whatever the physiological changes attendant on the climacterium, resolution of this conflict through psychotherapy may markedly influence the symp-

tomatology.

Case IV. A postal clerk of forty-nine was admitted to the medical ward for abdominal distress and pain of eighteen months duration. This pain usually originated at the umbilicus, at times radiating around and up between the scapulae, at others to the back and toward the testes. The only positive finding was some irritability and spacity of the colon by x-ray. A diagnosis of gastric neurosis was made, and the case turned over to the psychiatrist for treatment.

The patient had varied and numerous complaints, feared he had cancer and desired an operation to fix him up. The clinical picture was that of hypochondriasis. With each negative examination, he had been reassured, although disappointed that nothing wrong had been found. Among other complaints was that his penis was bent during erection. He was still smarting at having been told three years before at a urological clinic that nothing was wrong and to forget it. There was something wrong, but the urologist had missed the point; the patient was covertly complaining of his lack of sexual power,

This waning had occurred four years before his hospitalization, coincident with the onset of his wife's menopause, which interferred with his own performance. He attributed the impairment to the bent penis which was really the result.

Still driven to bemoan his loss, the true nature of which his ego would not let him admit, the gastrointestinal tract became involved as the seat of complaints and hoped for restitution. This explains why he was both reassured and disappointed at nega-

tive findings.

After discharge he was followed in the outpatient department for three months, returning twelve times. A premature attempt to give him insight into the real cause of his complaints led to an acute increase of all symptoms. Gradually, however, he was able to accept the situation sufficiently to cut down his anxiety and enable him to renew a more satisfactory sexual life with his wife.

Although he stated that the bend in his penis persisted, his other symptoms gradually faded into the background, and he left the clinic feeling it no longer necessary to continue treatment. Follow-up six months later brought back a report of his having continued to hold this improvement.

In this communication I have endeavored to illustrate psychic disturbances resulting in gastrointestinal symptomatology which have their origin in instinctual conflicts. In several of the cases coincident deviations in the genital system show a physiological counterpart of what would generally be considered complaints of a purely functional nature. The clinical material is not presented as proof, but merely suggestive of a means of approach to the diagnosis and treatment of certain gastric neuroses which, without understanding obtained through intensive and prolonged psychoanalytic investigation of similar situations, would remain obscure.

INTERNATIONAL CARDIOLOGICAL MEETING

Various professional groups of Royat (Auvergne), namely the Medical Society, the Mineral Water Company, the Publicity Commission, the Hotel Syndicate and the Municipalities have decided to organize International Cardiological Meetings Royat at regular intervals.

One question will be discussed at each meeting from the physiological, pathological

and therapeutic point of view.

This question chosen from among the problems of present day science will be discussed by lecturers whose personal research, competence and recognized authority are sure guarantees of the value of these sessions.

The reports will be distributed in the form of brochures, each of which will present a summary of latest developments in the question studied and in all, will constitute a cardiovascular library of great value to the practitioner. They will include unpublished documents, valuable diagnoses, and therapeutic indications to be used in daily practice.

The first meeting will be held in Royat during Whit-sun tide May 31-June 1, 1936. The question to be discussed will be "Vascular Spasm." Professor Vaquez will preside. Reports will be given by Professors C. Heymans (Ghent) and Lucien Brouha (Liege). "Vascular Tonus" Professor Riser (Toulouse): "Vascular Spasm and the Brain." Professors Leriche and Fontaine (Strasbourg): "Vascular Spasm and the Limbs." Professors Maranon and Duque (Madrid): "Vascular Spasm in Relation Professor Endocrinology." (Paris): "Treatment of Vascular Spasm."

"BABIES, JUST BABIES"

German mothers, under appeals to increase the population, have responded with a rise of twenty-three per cent in the birth rate. "This is well enough," says a German medical journal, "but the Third Reich needs at least 1,400,000 new babies a year." Which brings to mind a remarkable passage in a new book called "The Crush of Things to Come," by Malthus Wail, which pictures life in Germany in 1970.

"The schools," it runs, "were bursting.

Thousands of teachers were trampled un-

der foot by the mass of children who swarmed over the desks. In the streets of Berlin it was only possible to move slowly and with infinite caution. Little fingers tugged at one's bootlaces, little arms twined about one's legs. When the aged Führer addressed the crowd in the Sportplatz, he had to be hoisted on the shoulders of two Nazis to keep the younger generation from engulfing him. Even so, babies dangled from his lapels, clutched at his ears and tugged at his moustache."

THE PROGNOSIS OF MODERATE DEAFNESS IN YOUTH

Variations with Disease, Management, and Treatment

EDMUND PRINCE FOWLER, M.D., New York City

Since 1922 thousands of audiograms have been accumulated and data which show the trend of hearing over varying periods of time and under varying conditions of disease, management, and treatment.

Deafness is only a symptom but it is usually the chief symptom in car conditions. Its prognosis depends largely upon the specific lesions causing it, but this is true only in so far as such lesions happen to permanently involve the structures vital to good hearing. Even suppurative otitis media with severe complications is not necessarily followed by deafness, and suppurative of the deafness may have a good or a bad prognosis. In cases of long standing, cure may be accompanied not by an improvement in hearing, but by an increase in deafness. Nevertheless much may be learned by studying the average audiogram curves in different disease groups and their variations with time and treatment. The aim of treatment should, of course, be not only to save life and to cure the disease and avoid complications, but to preserve and to improve the hearing. At times unavoidably but often inexcusably the hearing is

neglected.

Medicine and surgery being, because of so many variables, far from exact sciences, one has become accustomed to rely too much upon isolated cures instead of average results to evaluate the effects of treatment. Average results often damp our enthusiasm but really are of far more importance than the individual results.

These are all clinic cases and consequently not quite as favorable subjects for management and treatment as most private patients. The background of inheritance and care and hygiene, and so on is poor compared to the better-to-do. However, clinic cases constitute the bulk of material and the greater problem.

In these cases continuity of intensive treatment was impracticable. It is generally so for obvious reasons, but the usual methods were used, and in all instances supervision was continued over several years with particular attention to general health and head colds and sinus infections.

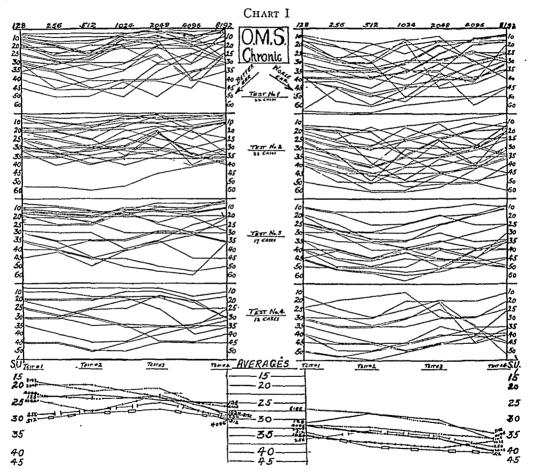

In no instance with cessation of suppuration was there what I consider occlusion of the Eustachian tube. Catheterization was not used in these children. It was not indicated. No nasal packs or sprays were used. They were not indicated. Tonsils and adenoids were removed if there was any suspicion of their having a harmful effect on the ear disease or general health. No sinus operations were done. I have not opened a child's antrum in many years. Too much conservatism may have been shown in these matters. In many children the lack of resistance to head infections persists in spite of all operative procedures, plus vitamins, clothing. hygiene, and other health measures.

It is by no means an unmixed blessing in the very young to remove the tonsils unless they are chronically diseased (not just hypertrophied). These structures, like other lymphoid masses, serve a useful purpose. Their autogenous products are more efficient than any manufactured vaccines. I am of the opinion that unless adenoids (with or without the tonsils) are removed soon after chronicity or recurrence is threatened, and before the child's ninth year, the procedure does not contribute much on the average to immunity from oftiis media.

It is often a nice decision whether one is to do more harm than good in removing tonsils. Some most persistent suppurative ears and severely deafened ears immediately follow tonsil and adenoid operations. More tonsils are removed in clinics than in private practice. This may be advisable but there is no general rule to follow. That indefinable thing called good judgment must ever be the imperfect but best guide.

At this time I shall limit my discussion to four disease groups in the order of their destructive propensities toward ear health and hearing. The worse ear in every case at sometime had harbored chronic, recurrent, healed or past masked suppurative otitis media. The better ears almost without exception also had been the seat of like lesions. The term "past masked" was coined to cover those cases which though giving no history of otitis, showed clinical and otoscopic evidence of otitis media in the past. This fact was covered up (or masked) by time, other diseases,

mastoidectomy. The first, by the absence of typical symptoms and the ages of the patients; the second, by including only those with normal bone conduction; and the third, by placing the mastoid operations in a separate group. All of these will be reported later. These eliminations account for the comparatively small number of cases under each group, plus the tendency of patients to drift away from the clinic, no matter what the results of treat-

or carelessness. The healed cases represent those who gave a definite past history of suppuration. These two groups cover what is usually called (OMCC) otitis media catarrhalis chronica, whatever that means!

. It is practically impossible to select absolutely clear-cut cases because there are always many factors in even the simplest clinical entity, but I have excluded three of the complications which would have greatly confused the picture, namely, otosclerosis, nerve deafness, and

ment may have been.

In order to know what we are talking about it is desirable to qualify the degrees of deafness. My habit is to grade deafness according to Table I.

TABLE I.

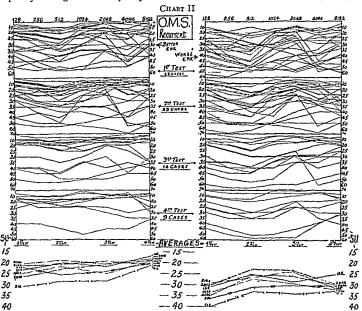

Under 20	S.U. less Slight
20-40	S.U Moderate
	O.O
4061	S.UModerately severe
60-89	S.U Severe*
Over 80	SII Very severe
Ma hanning	for very loud sounds,
No nearing	for very foud sounds,

^{* &}quot;Marked" may be substituted for "severe."

These cases were selected because they were in the moderately deafened group of children who returned for treatment or check-up at least once yearly for several years. The cases present a fair sample. The moderately deafened constitute the largest class of children handicapped by deafness. The hearing charts of the better and worse ears are displayed side by side.

I show audiograms of the ears at yearly intervals, and at the bottom a plot of the frequency averages at each yearly test.*

little with time. The spread of losses, as between frequencies, is greatest at the first test, especially in the better ears. The curves became flatter as time went on. At the second test there is no improvement on the average in either the better or the worse ears. At the third test there is no improvement on the average in the better ears, and a loss on the average in the worse ears. At the fourth test there is a definite loss in both the better and the worse ears. Subsequently seven of these cases improved considerably but the number was too small to warrant plotting.

Summaries of Average Changes Between Tests

Chronic Supparative Otitis Media, 22 Cases, (Chart I). The difference in the level between the better and worse ears is greater than in any of the other three groups. In both the better and the worse ears 8192 is the least depressed tone and 512 the most depressed tone. The curve form changed but

Cases, (Chart II). The difference in the level
between the better and worse is less than in
the chronic suppurative ears but more than
in the non-discharging ears. In both the
better and the worse ears, 512 is the most
depressed tone, and 2048 the least depressed.
The curve form changed considerably withtime. In the better and worse ears it became
flatter. At the second test there is a little
improvement in the better, and a marked improvement, on the average, in the worse
ears. At the third test there is little change
in the better ears and slight loss in the worse
ears. At the fourth test the better ears show

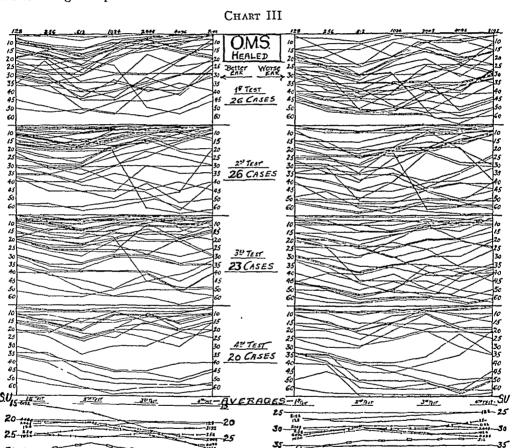

^{*} The audiograms and calculations were done by Miss Marie C. Pless: the graph averages by Dr. J. Aaron Samuelson, both of the New York League for the Hard of Hearing.

marked improvement, the worse ears lost hearing.

Healed Suppurative Otitis Media, 26 Cases, (Chart III). The difference in the level between the better and the worse ears is less than in the suppurative ears, but more than in the past masked ears. In both the better and the worse ears 512 is the most depressed tone. In both the better and the worse ears, 8192 with 128 are the least depressed tones. At the second test there is no change in the better ears. At the second test, there is a slight improvement in the worse

second test there was an improvement in hearing in both the better and worse ears. At the third test the improvement was maintained in both the better and worse ears, although both ears showed a tendency to loss in the higher frequencies.

Chart V shows the averages of the audiograms in each group at yearly intervals. The number of small cross marks on each chart indicates the number of the test. The roman numerals at the ends of each chart also indicate the number of the test.

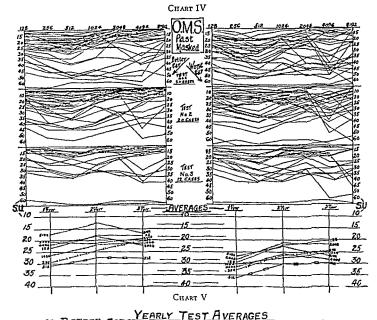

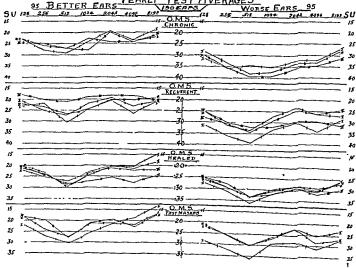

ears. At the third test there is a tendency to go down in the better ears. At the third test there is a tendency to remain stationary in the worse ears. In the fourth test there is a loss in middle and higher frequencies in both the better and worse ears. Otherwise the tendency is to remain stationary in both.

Past Masked Suppurative Otitis Media, 24 Cases, (Chart IV). The difference in the level between the better and the worse ears is less than in any other group. In both the better and the worse ears 512 was the most depressed tones. In the better ears 8192 is the least depressed. In the worse ears 128 and 2048 are the least depressed tones. At the

SUMMARY OF OBSERVATIONS ON THE AVERAGE CHANGES IN THE HEARING FROM YEAR TO YEAR IN FOUR GROUPS OF OTITIS MEDIA (190 EARS).

The better ears are on the average distinctly above the worse ears (5 to 28 db). The difference in levels between the better and worse ears was greatest in OMSC, and diminished on the average in the recurrent and non-discharging groups. The average audiogram curve form, changed but little with time, in the worse ear. In some instances with time the better became the worse and vice versa. Spread of losses as between frequencies was greatest at the first test. In other words, the curves became flatter as time went on, the low tones on the average going up, and the high tones

going down in all the worse ears and markedly in the better healed ears. In all the better and in all the worse ears 512 was the most depressed tone. 512 was most depressed in the recurrent and chronic suppurations. 8192 (with 128 in Hld. & Pst. Mskd. worse ears) was the least depressed tone.

At the second test in all the worse ears except the OMSCh and in the better healed ears there was improvement in the hearing. This can therefore hardly be due entirely to the practice factor. Most of the ears with the exception of the Chronic Suppurative Ears had been tested before coming to the clinic. I have noted that the lower the graph the less the practice factor enters. It may be because on the average these deafer ears are not so much disturbed at the first test by outside masking sounds, as are the better hearing ears.

In the better cars on the average the Recurrent and Past Masked eventually improved. In the better ears on the average the healed and the chronic show loss. In the chronic

better and worse ears, there was a definite tendency downward. In the recurrent better ears there was an improvement, but in the worse ears after the gain at second test, a loss. In the healed better ears there was a definite tendency downward. In the healed worse ears there was a definite tendency (after a primary improvement) to remain stationary. In all Past Masked ears there was a definite tendency to improve and retain this improvement. The better healed ears show the greatest losses with time.

Whereas these charts show the average tendencies, there were many variations, and on the master charts where each case is numbered, many cases show marked improvement although the average shows loss of hearing.

Is it possible to single out a few factors which appear to make for a favorable prognosis? I believe it is. Of primary importance is the early detection of ear disease. In the chronic and recurrent groups loss in hearing was proportional

TABLE II. SUMMARY OF CLINICAL HISTORIES (AGES 5 to 18)

Age limits No. and Av. Age of at First Cases Test	Positive Fam. Hist. of Deafness	T and A Ops.	Diag. Better Ears	Diag, Worse Ears	Subsequent History
22 (6 to 16)	7	16 Out 1 Hyp. 5 Norm.	11 OMSC 7 Rec. 1 Poly. 8 Hld.	OMSCh	With the possible exception of 3, none appeared healed permanently. 50 per cent continued chronic. 7 at the 5th and 6th tests showed better hearing. Others gradually lost hearing.
23 (5 to 18) 10½	10	17 Out 3 Hyp. 3 Norm.	All Rec. but one	OMSRec	In 75 per cent the frequency of recurrence declined. Better ears gained. Worse ears gained at first, then lost.
26 (6 to 18) 9½	3	22 Out 1 Hyp. 3 Norm.	All Hld. or Pst. Mskd.	OMSHId	None developed Ac. Otitis. One Ch. Otitis after pneumonia. All picked up in school tests. Better and worse ears lost in middle and higher frequencies.
24 (6 to 16)	12	20 Out 1 Hyp. 3 Norm.	All Pst, Mskd. but one	OMS- Pst. Mskd.	None developed Ac. Otitis. All picked up in school tests. At 2nd test both better and worse ears gained and maintained this gain over later tests.

With the exception of the Healed Group, the Positive Family Histories increased indirectly with definite histories of previous chronicity. This would imply that in the Healed Group at least, there was little hereditary influence.

On the average the younger the patient when first seen and the more faithful in treatment, the less the recurrences and exacerbations, and the less permanent or progressive the losses in hearing.

to the chronicity and severity of the suppuration; fifty per cent did not heal even temporarily under treatment. These were the cars of largest duration. There were no reliable histories of the severity in the healed ears. The freedom from acute otitis in the healed and past masked ears is significant. Management and treatment did help these cases.

Pain and distress compel attention. Slight and moderate deafness does not. Pain or distress occurs almost wholly in acute otitis. Either is usually transient, soon forgotten, and of less importance from the prognostic viewpoint than deafness, but slight deafness being usually unsensed, they loom large as danger signals.

Be on the lookout for even slight deafness. This is the danger signal so constantly present and so constantly ignored. It is a warning of danger ahead and of danger behind. Repeated, it is a sign of impending progressive deafness, no matter how slight its beginning. It is the healed ear which more often is allowed to drift. Even the slightly deafened healed ear

often goes on to severe and progressive

I sometimes think that infants should be conditioned to a standard sound of say 10 or 15 db above minimum audibility, preferably a low tone (about 256). They certainly are automatically and easily conditioned to sounds they learn associate with feeding preparations. Why not have the mother or nurse use an acumeter or some such sound or a faint whisper at twenty feet, at first before each feeding, and after a month or so, often enough to maintain the association, and to make it possible to detect any change in the baby's hearing acuity. At twenty feet the above sounds reach the ear at about 15 db above average normal minimum audibility in a fairly quiet room. other sound near threshold of normal audibility may be used. Why not try it? It is not so difficult, or so foolish as it seems at first thought.

These graphs indicate that the continuation or recurrence of suppuration is definitely injurious in spite of the fact that while the ear is discharging the hearing may appear better. Many ears healed long ago (whether diagnosed or not) have had repeated inflammatory episodes, and show little further improvement after a primary response to treatment.

The most surprising losses are in the tones above 512 in the healed ears. This is no doubt partly due to the fact that those who returned for the third and fourth tests were mainly those who noted increasing deafness. The others had no urge to return. This urge factor is operative only in ears with compelling symptoms. The healed ears are in reality subject to recurrent inflammations, coincident with and often caused by nose and sinus infections and exacerbations. These influences may be traced throughout all progressive deafness due to otitis media in any form, they were so treated.

In one sense all these children have been neglected children. Hardly without exception they were not brought to the clinic until forced by excessive symptoms, or school hearing surveys.

I am sure that had they been seen earlier the story would have been quite different. It has been so in most instances where early examination and proper care was instituted.

By proper care I mean not only the supervision of recovery from pain and discharging ears, but real treatment and management during and after the pain and inflammation have ceased. Also instructions in the avoidance of recurrences.

Summary

I have shown charts which tell the story of the average child with suppurative ear disease (apparent or masked), and particularly the story of potential and increasing deatness with time, and lack of early and proper treatment. The charts show that this clinic treatment and management is often not satisfactory. The results on the average are not flattering and yet the individual audiograms show that much can be done to prevent deafness. The prognosis on the average is favorable with youth and early treatment. The prognosis is not favorable even in children unless there is early care and treatment.

140 EAST 54TH ST.

A HOSPITAL EPIDEMIC OF DIPHTHERIA

JAMES E. PERKINS, M.D., Dr. P.H., Amsterdam

Epidemiologist, Division of Communicable Diseases, New York State Department of Health

In December 1933 and January 1934, a hospital in a New York State city experienced an epidemic of diphtheria which presented a number of features of special interest. The institution concerned was a 125-bed hospital maintaining an outpatient department and a nurses' training school. The hospital had no pediatric service nor any contagious disease service, and was devoted chiefly to the care of surgical, obstetrical, and emergency cases.

Chronology and General Characteristics of Epidemic

The first known case of diphtheria occurred in a probationary nurse with onset on December 12, 1933. During the ensuing epidemic, which covered a period of about one month, there occurred twenty cases diagnosed as clinical diphtheria. Two of these cases were among patients, and eighteen of them were among the 162 individuals constituting the hospital personnel; fourteen of the eighteen patients were graduate or student nurses. The twenty cases are presented in three-day intervals by date of onset in Table I. During the same period there occurred only four other diphtheria cases outside of the hospital in the city, with a population of 125,000, two of which cases were apparently secondary to the institutional outbreak There were no deaths among the twenty positively diagnosed cases

The control of the epidemic was in charge of the City Department of Health under whose supervision progressively more drastic restrictions were put into effect by the hospital authorities, culminating in the complete evacuation of the hospital on the twenty-fourth day after onset of the first case.

The Division of Communicable Diseases of the New York State Department of Health conducted an intensive epidemiological study of the outbreak. This investigation failed to reveal the exact

method of introduction of the disease into the hospital. Food, however, was quite conclusively eliminated as the mode of transmission. The outbreak was not particularly explosive in nature; there were no significant differences in case and carrier incidence between those consuming large and small amounts of milk or ice cream; the hospital milk and ice cream were pasteurized supplies or made from pasteurized products, and were purchased from concerns supplying a large territory in which there occurred no other outbreaks of diphtheria.

After gaining entrance to the hospital, the infection was probably disseminated solely by personal contact. With the exception of the first two cases, each case and carrier gave a history of prior exposure to a previously recognized hospital case or carrier. Dissemination through personal contact was apparently facilitated by failure of several of the patients, including the first individual attacked, to go off duty promptly after the development of symptoms; by crowded conditions in the student nurses' dormitory; and perhaps by lack of isolation facilities in the hospital and defective technic in the mode of isolation improvised previous to the closing of the hospital.

Clinical Findings: Cases and Carriers

Considering the clinical aspects of the outbreak, there were a sufficient number of frank, typical cases of diphtheria to establish without question the nature of

Read at the Annual Meeting of the Medical Society of the State of New York, Albany, May 14, 1935 the disease. However, all gradations of illness were encountered so that there were several "border-line" cases in which it was difficult to determine whether the individual concerned should be classed as a case or as a carrier. Attending physicians were interviewed concerning the diagnostic criteria of each case or suspected case, and the twenty individuals finally classified as cases were all considered by the physicians who cared for them to have had clinical attacks of diphtheria. With two exceptions, each patient had all of the following signs or symptoms: fever, sore throat, membranous exudate in the nose or throat, and nose or throat cultures positive for diphtheria bacilli. One of the two exceptions was a nurse who claimed no constitutional symptoms and was isolated originally as a carrier, but who subsequently developed a typical nasal diphtheritic membrane. The other exception was a nurse who developed typical diphtheria but from whom no positive cultures were obtained. After three initial negative cultures, no cultures were taken from this patient from the fifth to the seventeenth day of her illness. All twenty patients were treated therapeutically with antitoxin.

None of the forty-six individuals classified as carriers had symptoms which in themselves, justified a clinical diagnosis of diphtheria, and most of the carriers claimed to have had no symptoms whatever. Thirteen of the carriers, however, gave histories of attacks of sore throat of varying severity during the epidemic. In eleven of these thirteen carriers, as shown in Table II, the sore throat occurred within seventy-two hours of the appearance of the first positive culture, although these particular cultures covered a period of twenty-four days, and most of the individuals cultured had had from one to

O Negative culture

[☐] First positive culture

I Onset of sore throat

six negative cultures previous to the joint appearance of the sore throat and the first positive culture. Virulence tests on cultures from thirty of the carriers were positive in twenty-eight instances.

The simultaneous occurrence of a positive culture and a sore throat suggests that the cause of the apparently nonspecific sore throat experienced by some of those designated as "carriers," may have been the diphtheria bacillus. Such an hypothesis does not seem illogical since it is well-known that individuals may be encountered with all gradations of antibody response to the diphtheria bacillus, and in addition, that exposed persons may receive varying dosages of such organisms. It is to be expected that all degrees of response may occur among infected persons, from the development of frank typical cases at one extreme, to carriers with apparently no subjective symptoms or physical signs at the other. Between these two extremes it seems inevitable that instances may occur in which a transitory illness is produced which does not proceed to a stage sufficiently typical for clinical recognition.

As stated above, there were no deaths during the outbreak among persons reported as cases of diphtheria. A post-operative gynecological patient, Patient A, died on December 18 of quinsy and cellulitis of the neck four days after being discharged from the hospital. A throat culture, taken with difficulty from this patient just before death, revealed no diphtheria bacilli. This single case was not regarded as particularly suspicious at the time of its occurrence. However, it is of interest to note that one of the most severe of the twenty diphtheria cases occurred at the same time in another hos-

^{*} Four days after prophylactic antitaxin.

pital patient, Patient B. This case was complicated by a severe quinsy similar to that in Patient A. Patient B was admitted on December 6, two days after Patient A; was operated upon December 6, one day after Patient A; and was discharged on December 15, again one day after Patient A. Both patients developed first symptoms on day of discharge from the hospital.

Incidence in Relation to Immunity Status

One of the features of the outbreak of particular interest was the actual occurrence of an epidemic of diphtheria among a group of adults. The youngest case in the series was that of an individual 18 years of age, with a range of ages for those attacked extending to 45 years.

Inquiries concerning the last Schick test prior to onset of illness revealed other unusual findings. Ten of the twenty patients claimed their Schick tests had previously been negative. Among the other ten, four had had positive tests, and six had not been tested. Thus, ten of the fourteen individuals with a known previous Schick test claimed that the reaction had been negative. Five of the ten individuals claiming negative Schick tests gave histories of having been actively immunized against diphtheria previous to the negative test, three with toxin-antitoxin and two with unprecipitated toxoid.

In an attempt to verify the statements regarding negative Schick tests, physicians known to have performed these tests were interviewed, the student nurses' records in the training school office were examined, and each patient was questioned directly concerning the exact manner in which the test was performed and the reaction which followed. The fact that nine of these ten individuals were nurses, and the tenth an intern, seems to justify placing greater reliance than usual upon such direct questioning. In addition, past immunization records in the nurses' training school office provided an opportunity for verifying the statements made by many of those questioned.

The Schick tests of four individuals were performed more than five years previously, as shown in Table III. Written records were found confirming the

negative readings in two of these tests but because of the lapse of time, the four patients themselves were unable to recall the technic in any detail. The Schick tests of the other six individuals were performed either in the year of the epidemic or the year before. One of these, however, had the test performed only four days after the administration of a prophylactic injection of diphtheria antitoxin so that its interpretation is difficult. In four of the other five cases the negative tests were confirmed by written records, and in all five instances sufficient information was obtained from the individuals themselves and the physicians performing the tests to prove beyond reasonable doubt that the reactions were actually negative. Thus, the statement that the last previous Schick test was negative was apparently confirmed in at least seven of the ten instances in which this claim was made. As to previous active immunization,

ten of the twenty individuals developing diphtheria had received injections of toxin-antitoxin or toxoid prior to onset of illness. Three of these were probationary nurses, one of whom had received only one inoculation of toxoid less than one month previously and the other two had received their second inoculations of toxoid within two days of onset. In this connection it should be stated that the hospital training school had an established program of diphtheria immunization, which included repeating the Schick test on second and third year nurses with additional inoculations if the tests proved This annual program positive. usually not put into effect until about two months after the beginning of the fall term, however, and the second series of inoculations in 1933 had not been completed when the epidemic began.

Passive immunization with 1500 units of antitoxin was widely practiced during the outbreak, a total of eighty-six individuals being so inoculated. Four developed clinical diphtheria subsequent to passive immunization. The intervals in these four cases between the injection of the serum and the onset of symptoms were eight, ten, twelve, and fifteen days respectively; thus, the shortest interval was eight days, and the longest, fifteen days. These intervals apparently were unusually short. The Medical Research

Council, in Chapter X of its 1923 monograph on diphtheria, reviews much of the evidence on this point. In this monograph, after it is shown that, in most instances, cases subsequent to passive immunization occur either within the first forty-eight hours following the immunization, or else several weeks later, the following conclusion is drawn:

No doubt the degree of protection depends upon the degree of exposure, and in any case it is ineffective if the subject is already in the incubation stage of the disease or after a period of some four weeks.

Other Foci of Diphtheria Associated With the Epidemic

Coincident with the epidemic, there occurred outside the institution at least three series of diphtheria cases with definite or suspected association with the hospital outbreak. The three series included a total of eleven cases of diphtheria.

One of these series deserves special mention. Two student nurses, M.K. and D.C., visited D.C's home in a nearby village on the evening of December 14. Neither of these two nurses developed diphtheria, but M.K. was found to be a carrier when first cultured December 17, three days after her visit to the home of D.C. At the time of this visit, the only member of D.C's family at home was her mother, who kissed both girls when they left to return to the hospital. Two days after this visit, on December 16, D.C's mother developed symptoms of what later proved to be diphtheria. On the same day, two groups of relatives arrived to spend the night with D.C's mother, two adult guests from a village in the northern part of the State, and two children from a nearby city. Both of the visiting children and one of the visiting adults subsequently developed diphtheria, which in turn was further transmitted to another child.

Summary

An outbreak of twenty cases of diphtheria among adults occurred in an upstate New York hospital, Eighteen of the twenty cases were among the hospital personnel, and fourteen of these eighteen were among nurses. None of the twenty cases terminated fatally.

The disease was apparently introduced

by a missed case or carrier, and dissemi-

nated through personal contact.

Among the forty-six carriers discovered, there were thirteen who gave histories of a sore throat at the time of the epidemic, and in eleven of these thirteen carriers the onset of the sore throat occurred at approximately the same time as the appearance of the first positive culture, suggesting an etiological relationship.

In ten of the fourteen cases in which there was a history of a previous Schick test, it was claimed the test had been negative, and investigation gave convincing verification of this statement in seven

of these ten instances.

Four of the individuals developing diphtheria had been passively immunized with diphtheria antitoxin from eight to fifteen days prior to onset. Ten of the twenty patients had previously received injections of toxoid or toxin-antitoxin. Three of these individuals, however, had received the injections within the month prior to onset of illness.

Three foci of diphtheria comprising eleven cases were discovered outside of the hospital, each one apparently originating from the institutional outbreak.

The occurrence of such an epidemic among adults, particularly among members of a group with a high percentage giving a history of active or recent passive immunization and negative Schick tests, is rare, and suggests that either a mixed infection was present or that a strain of diphtheria bacilli having unusual characteristics was responsible for the outbreak.

VACATION AND EDUCATION ROLLED INTO ONE

In a few weeks, on May 16, to be exact, the "European Assemblies" of the Interstate Postgraduate Medical Association of North America, made up of about 125 American physicians, will sail on the Cunard White Star liner Georgic for a trip of postgraduate work and sightseeing in some of the leading cities and medical centers of Europe. Before they return on July 9, on the Manhattan of the United States lines, they will visit Dublin, Belfast, Glasgow, Edinburgh, London, The Hague, Amsterdam, Frankfort, Berlin, Vienna, Zurich, Lucerne, Interlaken, Berne, and Paris. In these cities they will attend clinics covering all branches of medical science and each

physician may arrange in advance to attend the clinics of most interest to him. Many of the doctors' wives will accompany the party, and many sightseeing trips are provided. Those who wish may go earlier and join the tour over there, or may linger on and have an independent trip after the main party have sailed for home. The cost of the trip is \$1,175 in cabin accommodations and \$1,075 in tourist accommodations. Passports and visas are extra.

Information can be had from Dr. W. B. Peck, Managing-Director, Freeport, Illinois, or Dr. C. L. Babcock, Manager Travel Department, American Express Company,

65 Broadway, New York, N. Y.

TANGLED IN THE RIDDLE OF SEX

A very large part (probably eighty-five per cent or more) of the public above the age of eighteen is more or less tangled in the riddle of sex, says the Journal of the Indiana State Medical Association. For example, there are the thousands of couples that are unhappily married, and the basis of the unhappiness frequently lies in sexual incompatibilities. There are thousands of others who are not married but who would like above everything else to be married. There are countless numbers of homes in which the children are in jeopardy because the father and the mother are quarrelling over something which is directly or indirectly due to sexual maladjustments. There is a great amount of venereal disease. It is said that there are probably half as many abortions as there are births and that men and women are so pressed with the need of

avoiding conception that the appearance of the menses is coming to have the significance of a national holiday. Parents without number are worried about the sexual behavior of their sons and daughters. The solution of these problems is not entirely in the hands of the medical profession, of course, but the public has a right to look to the physician for leadership in these matters. No other person in the community has the necessary understanding of anatomy, physiology and hygiene relative to this subject. No one else has entre to family life. No one else has the opportunity for service which equals that of the physician. This is our job, and it is an important job. If we do not accept it, we may expect to see ourselves supplanted by someone else who will attempt, at least a solution, and more than likely make a mess of it.

LIPOIDOSIS CUTIS ET MUCOSAE

RALPH N TRIPP, MD, New York City

The condition we are describing in this paper is one allied with the vanthomas and necrobiosis lipoidica diabeticorum As in the latter, the name was given this condition and reported in the German Archives of Dermatology by Urbach 1 On account of the definite clinical picture and the fact that there was no diabetes in any of the cases described I feel we are dealing with a distinct clinical entity

Wiethe² in 1924 described a disease characterized by changes in the skin and mucous membrane Almost from birth hoarseness was noticed followed by stenosis of the larynx, occasionally necessitating a tracheotomy Wiethe³ again in 1926 described the disease He considered the diseased process to be due to local deposits of hyalin In one of our biopsies the report read, "Suggestive of cartilage but without its staining reaction"

Urbach in 1929 described two cases in sisters with lesions almost identical. He concluded the cases to be a Naevogenic process based upon a generalized and localized disturbance of lipoid metabolism probably diabetic in nature. The deposits were found to be lipoids of the acctone soluble phosphatic group, combined with some protein.

Wiethe's cases showed so much similarity to the cases described by Urbach that a re investigation of them was made by Urbach and Wiethe The cases were found to be identical As a result nine cases in four families were very thoroughly studied, and the essential features of the disease described

For the chemistry of the lipoids deposited in the tissues, a worthy contribution is a paper by Michelson and Laymon, and three articles by Wile et al.

In August 1829 a patient came into Dr Bechet's service at the New York Skin and Cancer Hospital, exhibiting a remarkable combination of mucous membrane and skin lesions So far as the author can deternine thus is the first case of this nature to be reported in America

History

The patient was normal at birth The onset was at six months when "deep sores" appeared at the tip of the tongue These soon spread to the mucous membrane of the mouth and throat The child was unable to cry The voice developed as a whisper

The lesions, which were one to four mm in size, spread over the hands, feet, and head The older lesions on the extensor surfaces tended to become vertucous At three years of age he had lost all his hair, although the hair returned one year later when the "sores" had healed

At seven the abdomen became distended with fluid, which lasted about eight months. The legs then became edematous. About eight large ulcers formed on the legs, and large quantities of "pus" were discharged from the "sores." In about a year the legs became normal in size and the ulcers healed

The new lesions came as soft infiltrations which healed with or without breaking down In the first instance they would sometimes take as long as six months to heal, in the latter they absorbed quickly

The lessons, which had a greater tendency to come during the winter, were continuous until coming under our observation

in August 1929

When our patient first came he could talk only in a whisper Over the face he had elevated areas of yellowish infiltration alternating, lace like with pitting Over the extensor surface of ears, eyelids elbow, backs of the fingers around the nuls of the hands and feet he had verrucose lesions The lips were dry and cracked The tongue and mucous membrane of the mouth and throat had many areas of infiltration. The vocal cords were infiltrated The lymphatic glands of the neck were enlarged Scattered thru out the areas of yellowish infiltration were small pea sized lesions which looked as though hemorrhage had occurred into the skin Other lesions were larger with the sluggish appearance of a low grade infection

Under continued observation it appeared that the first stage was a hemorrhage into the skin followed by quick absorption or continuing on to the sluggish lesion which often broke down

Biopsies were taken with the following results

Fig. 1. Showing lesions of the face.

Fig. 2. Showing lesions on elbow.

1. Biopsy from a lymph node showed extensive growth of fibrous tissue with scattered groups of lymphoid cells.

2. Biopsy from the mucous membrane showed a distinct pale staining homogeneous area with no nuclei; suggestion of cartilage but without

its staining reaction.

3. Biopsy from the skin showed an epidermis that was thin with a peculiar bluish discoloration of the connective tissue in parts of the corium. Certain areas looked as though they were deposits of material of undetermined origin. Weigert stain showed an absence of elastic tissue fibers in the areas of this deposit. The deposits took a pale yellow stain with picric acid. Van Gieson stain showed the same yellow deposit. There was a degeneration of the connective tissue fibers.

This merely confirmed our belief that we were dealing with some unusual change.

Not knowing what to do for him, as a matter of routine, we took him off all starches and sugars. The new lesions became less frequent although the weather was colder, and the infiltrations seemed to flatten.

This caused us to do a glucose tolerance test along with a cholesterol and a lecithin determination.

This test showed the flat curve supposed to indicate a diabetic tendency, according to the classification of Johns of Cleveland. The fatty acid showed 200 whole blood.

Lecithin showed 17.1 in place of the normal twelve to fourteen. The cholesterol was never very high (Table I).

We next did a glucose tolerance test cholesterol and fatty acid determination on the mother and father with the following results:

The father and mother both had increased sugar in the blood.

The father showed a high diabetic curve. Cholesterol showed 192. He showed a latent diabetic glycosuria.

The mother had a higher blood sugar and cholesterol but a lower glycosuria. The mother showed the flat diabetic curve.

Both showed marked diabetic tendencies.

TABLE I .- PATIENT'S FATHER AND MOTHER.

CHLORIDES	Chlorides	Urca N.	Uric A.
Father	462.7 479.3	16.9 10.0	1.93
FATTY ACIDS Father Mother	Scrum 266 311	Plasma 263 273

Father urine	2154o/o 1 hr. 246o/o 1 hr.	after injection	of glucos

We then put the patient on five units of insulin twice weekly. New lesions became very scarce and during the following winter ceased to appear. The insulin was discontinued June 1932. In the past four years no lesions have appeared. During the treatment there has been a gradual flattening of the infiltrated areas. Some have entirely disappeared. His voice now has a fair volume. Glucose tolerance tests have been taken yearly. Since 1933 the curves have been quite normal.

Last test was made October 7, 1933 and showed an almost normal sugar tolerance, normal cholesterol and lecithin content.

The chlorides which were high at the beginning of treatment are now normal.

On showing the case at the Hospital Clinical Society, Dr. Throne said Urbach had described several similar cases. This proved to be true and in the following we will compare our case with his reports.

Inheritance

Fanstmann family. Parents healthy Ten children; no miscarriages, The three first born as well as the fifth have lipoidosis. The fourth who died at the age of four, was said to have had severe inflammations of the tongue like his eldest brother. The remaining five children were healthy.

Hornath family. Parents healthy, Of six

children, two showed lipoidosis

Kats family. Parents healthy, are cousins; five children, of which two sisters have hooidosis

Ederer family. Parents healthy, are cousins; glucose tolerance shows mother to be a latent diabetic. Two sisters, the older having

lipoidosis

In our case mother and father healthy, no relationship Glucose tolerance tests showed both parents to be latent diabetics. Alimentary glycosuris more marked in the father. The first child a daughter died of lipoidosis at eight; second child, also a daughter, twenty-five alive and normal; third child a boy twenty-flive alive and normal; fourth child a boy twenty alive and normal, fifth child a boy, seventeen is the case under discussion here; one miscarriage

On the basis of the above facts, we can consider the disease to be familial but not definitely hereditary.

Clinical features

The most prominent feature m all of Urbach and Wiethe's cases and in our own was a marked degree of hoarseness, which usually appeared within the first weeks of life, and at the latest in the second year. With some, there was a story of repeated attacks of soreness of the mouth and throat. The skin changes followed those of the mucous membrane. The Wassermann reaction in all cases, including the parents, was negative The beard in the male patients

was as a rule sparse, while other secondary sexual characteristics were normal. In three of these cases, the upper lateral incisors were missing. In our case the lateral incisors were present

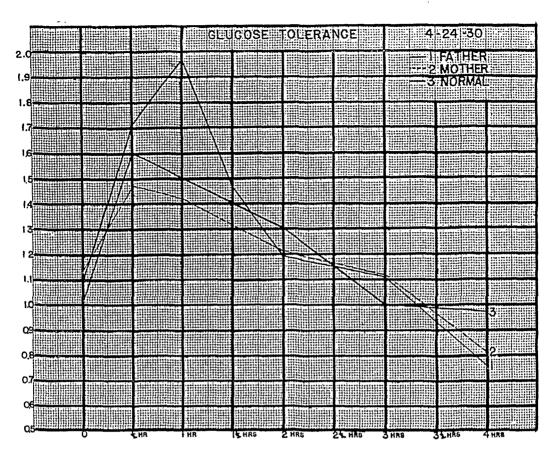

The skin changes consist of yellowish white nodular masses and of hyperkeratotic lesions, the former being present especially on the face, the latter on the extremities. Both types of skin changes always appear in the same person, but differ in intensity. On the lid margins, the masses were whitish in color and arranged like a string of pearls. In our case, these masses on the lid margins were somewhat verrucose in appearance. Between the yellowish white masses on the

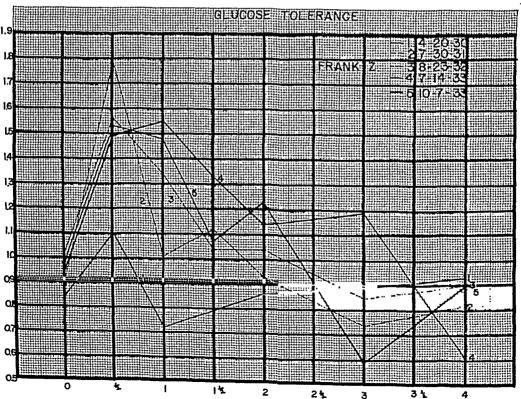

Fig. 3. Showing lesions of the mucous membrane of the mouth.

Fig. 4. Showing lesions of the lips and tongue,

face are found numerous white irregularly bounded bean-sized areas of which clinically, it is difficult to say whether they are at the same level as the normal skin or below it. Histological examinations show indeed scar like atrophic changes.

The vermilion border of the lips is almost always dry and shows many crack-like furrows, especially in the region of the angles of the mouth; similar notching appears at the vestibulum nasi. The place vestibuli is similarly lined with whitish yellow millet seed-sized nodules. Our case showed the nose lesions but they have now cleared.

In three of these cases, there were present on the elbow partly brownish violet, partly yellowish white elevations, made up of single nodules which shaded off into pigmented skin. (In our case there was

infiltration and scaring.)

As regards the remaining skin changes, there were a few variations depending upon whether the nodules or the hypertrophic changes were predominant. In all the cases, there were observed over the proximal interphalangeal joints of the fingers, numerous fine pin point-sized growths, with a mulberry like surface, only slightly raised, giving a nutuneg grater like effect. In our case in addition, there were similar mulberry like vertucose lesions. The tip of the toes near the nail were subject to irritation.

Especially remarkable were the uniform mucous membrane changes. The lips-in all cases the lower more marked than the upper -showed on their inner surfaces, beginning from the edge of the vermilion border to the gum (never diseased) somewhat hard, yellowish white deposits, irregularly uneven covered by normal epithelium and gradually passing over at the edges into millet seedsized nodules, while the mucosa of the cheeks was relatively slightly affected. The soft palate, the fauces, and the uvula showed a massive yellowish infiltration, with elevations alternating with scar-like depressions. The hard palate was not always, and then only slightly, infiltrated.

The tongue changes were characteristic. It was wood-like and movable only with difficulty. These changes indicated a deeply placed infiltration, which histologically was shown to be true. The papillae of the anterior portion were atrophic. The circumvallate papillae are only recognizable because of their V-shaped appearance. There was a widespread whitish infiltration of the lower surface of the tongue with marked thickening of the lower ligaments. Because of the latter changes, the tongue could be protruded only as far as the lips. In our case the lower ligaments were not infiltrated and the tongue could be protruded normally.

The faucial tonsils were covered en cuirasse with a whitish hard translucent mass. The lingual tonsils, the adenoids, occasionally, and the posterior pharyngeal wall were also affected.

Fig. 5. Condition after treatment.

Fig. 6. Showing normal tissue displaced by the deposits in the mucous membrane.

Marked changes were always present in the epiglottis, which with the tissue surrounding it, was of a yellowish red uniform color. The under surface of the epiglottis was thickened to almost double its size by

Fig 7. Showing tissues of the skin lesions displaced by the deposit.

Fig 8. Showing displacement in the normal lymphatic gland tissue.

irregularly elevated deposits. The aryepiglottic folds were greatly widened, more or less symmetrically. The vocal cords were thickened by the infiltration of grayish yellow masses, more pronounced posteriorly, giving rise to the hoarseness so early observed. In our case the base of the epiglottis was affected but the epiglottis not involved

One of Urbach and Wiethe's patients had similar changes on the inner aspect of the labia majora, and about the urethral orifice. Another had yellowish white nodular deposits in both axillae, with dirty green hyperkeratosis over the elbow and knees. The scrotum and gluteal folds were covered with sage-like yellowish white nodules. Scrotum and penis were normal in our case.

Histology

The essential changes were a homogeneous thickening of the vessel walls and an infiltration of the cutis and subcutis with lipoid deposits. The apparently normal skin and mucous membrane also showed changes of a slight degree, consisting of some endothelial proliferation of the sub-papillary vessels and of a homogeneous thickening of the walls of the deeper vessels, especially noticeable with the Mallory stain.

Early changes in the nodular lesions were an edema of the cutis, containing a dense homogeneous connective tissue, with many capillaries having proliferated endothelial linings and walls surrounded by more or less wide homogeneous layers. Numerous capillaries were filled with dark red homo-

geneous masses.

In a more advanced stage, there is predominent, in the histological picture, the presence of numerous apparently homogenmostly circular ı eddish staining masses, with only a few poorly staining nuclei and numerous variably sized fissures and gaps. These fissures and gaps are artificially produced caused by the action of the alcohol used in the preparation. The surrounding tissue showed a loosened connective tissue, with here and there completely homogeneous portions with similar fissures and gaps.

The warty excrescences on the fingers and the hyperkeratoses on the elbows and knees showed vessel changes corresponding to the early stages of the nodular lesions. The papillae were considerably widened due to an increase of the blood vessels in the papillary layer with considerable hyperkeratosis and increase in width of the granular layer. In many places could be seen homogeneous, vacuolated reddish staining bands running perpendicularly to the surface.

The mucosa showed similar changes. Directly under the epithelium of the

pharyngeal mucosa and tonsils were large homogeneous masses, free of nuclei, distinctly vacuolated with numerous fissures and gaps The subepithelial tissue of the soft palate was replaced by a reddish staining mass, containing many capillaries. The vocal cords and inferior surface of the tongue showed a loose tissue, devoid of nuclei, with numerous dilated vessels whose walls were homogeneous and stained red

In our case, in addition to tissue from the skin and mucosa, a lymph node was removed from the neck It showed almost complete replacement of the lymphoid tissue

With the Van Gieson stain, the homogeneous masses stained vellowish to brown, being easily differentiated from the reddish

staining fibrous tissue
The Weigert elastic tissue stain showed an almost complete lack of elastic tissue in the homogeneous masses. The subpapillary elastic tissue was diminished and only the larger vessels showed a thin elastic periphery about the homogenous walls

Histochemistry of the Infiltration

Frozen sections stained with Sudan III showed the spaces above referred to almost completely filled with dark orange-yellow homogeneous masses, showing that the fissures and gaps in the hematoxylin cosin stain were artefacts due to the solvent action of the alcohol Similar hemogeneous orangevellow deposits were seen as long bands. running in the deeper sections of the cutis and surrounding the blood vessels. In the early stages the lipoid material was found within the proliferated endothelium. The masses in the mucous membrane lesions stained similarly contrasting with the light red color of the neutral fats

Osmic acid did not stain the infiltrations.

whereas it colored black the fat in the sebaceous glands and subcutaneous tissues

By the staining methods of Ciaccio and Smith-Dietrich for lipoids, the infiltrating masses were shown to belong to that class of substances They stained orange-yellow by the former and deep blue black by the latter method

The digitonin test for cholesterol was negative

The lipoid was soluble in hot alcohol and in hot acetone, the lipoid in santhoma deposits is soluble in hot alcohol but not in hot acetone This is the essential difference between the two Inasmuch as hot alcohol and hot acetone did not remove the entire contents of the infiltrating masses, the latter must be composed of two substances, probably an albumen in physical combination with the lipoid

By the method of Smith-Dietrich, after Kutchera-Aichbergen, in which glycerin esters, cholesterm esters, free fatty acids and free cholesterin are unstained but lipoid of the phosphatide group are stained, the lipoids present were shown to belong to

the latter group

Metabolic Investigations

In all the cases, there was either an increased fasting sugar value or a pathological glucose tolerance curve. In three of Urbach and Wiethe's cases, there was a pronounced almentary glycosuria

Tables I-II show briefly the reports of the blood chemistry and glucose tolerance test The glucose tolerance curve was measured by the oral administration of 175 grams of pure glucose per pound of body weight

To determine whether a disturbed fat or carbohy drate metabolism was at the basis of

the disease, one patient was for four weeks given a fat free diet and ten units of insulin daily, but no change for the better resulted. She was then fed for four weeks on a low carbohydrate diet with the same dose of insulin with very marked improvement, showing that the diabetic disturbance had an etiological relationship with the disease.

Treatment

Insulin with a low carbohydrate diet has produced the greatest improvement. Radium was of no value. The nodules in the larynx can be removed by operation. The verrucose lesions around the eyelids were curretted.

Conclusions

1. The condition is systemic occurring in potential and not true diabetics, and in this differs from necrobiosis lipoidica diabeticorum.

2. The deposits are soluble in hot alcohol and hot acetone, whereas in the xanthomas the lipoid is only soluble in hot alcohol.

3. The deposit is apparently a phos-

phatic lipoid present as lecithin.

4. It appears to respond to treatment by a low carbohydrate diet and small doses of insulin.

Acknowledgment: For the pathological work we are indebted to Dr. E. A. Barthel; for the chemistry to Dr. C. N. Myers, and for the German translation to Dr. S. Monash.

Discussion

Dr. Paul E. Bechet, New York City-Dr. Tripp is to be congratulated for the excellent presentation of a symptom complex, most difficult of interpretation, because of its rarity and its varied manifestationsclinically, histologically, and histochemically. This dermatosis will require further investigation before it can be definitely classified; as it is, Erich Urbach of the University of Vienna has already divided the lipoidoses, clinically, into nine groups, and histochemically, into eight. Examples of these various groups have been reported by Oppenheim, Urbach, Wiethe, Burger, and Grutz in Europe, and Michelson and Layman, and Zeisler and Caro in this country.

Urbach's group, and Tripp's case point definitely to a familial tendency and a diabetic potentiality in either or both immediate parents. I agree with Dr. Tripp in the opinion that necrobiosis lipoidica diabeticorum is an allied condition, despite the fact that Zeisler and Caro's case presented many different symptoms. In Tripp's case the extraordinary reticulated, yellowish lace like patches on the face, with variola-like pitting, was most striking, as also the great degree of hoarseness. The patient however did have discolored hemorrhagic nodules which occasionally broke down, thereby somewhat resembling the clinical appearance of the lesions on the legs in Zeisler and Caro's patient. It is to be hoped that as reports of new cases reach the literature, recognition of the new disease will thereby be greatly enhanced, with the result that it will be more easily observed and studied, and accurately classified.

LEAGUE FOR HARD OF HEARING EXTENDS INVITATION

The New York League for the Hard of Hearing, situated in the neighborhood of the Waldorf-Astoria on the eleventh floor of the Grand Central Palace cordially invites otologists, pediatricians and other members of the Medical Society of the State of New York to visit its headquarters and observe its work. There is a permanent exhibit on its premises of all of the approved hearing aids, both electrical and nonelectrical.

The League is the pioneer organization in this country, originating the present nation-wide movement in behalf of early medical care and enlightened medical provision for the hard of hearing child under

the leadership of the late Wendell C. Phillips, M.D., a former President of the Society. The League's Otological Clinic for the Study and Treatment of Diseases of the Ear, Edmund Prince Fowler, M.D., Director, holds its sessions at Manhattan Eye, Ear and Throat Hospital, Tuesday, Thursday, and Saturday afternoons at 1:30.

Arrangements may be made with the League staff for visits to the survey for conservation of children's hearing now in operation in the New York public schools through cooperation of Federal authorities and the League whose address is 480 Lexington Ave.; Telephone Wickersham 2-1853.

CONCENTRATED ANTIPNEUMOCOCCUS SERUM IN TYPE I PNEUMONIA

Control of Dosage by Skin Tests with Type-specific Polysaccharide

THEODORE J. ABLENETHY, M.D., New York City From the Hospital of the Rockefeller Institute for Medical Research

In 1929, Cole1 reported the results of serum treatment in Type I pneumococcus pneumonia, based on sixteen years' experience at the Hospital of the Rockefeller Institute. It was shown that, of 1256 cases of lobar pneumonia of all types, 431 were definitely found to be due to pneumococcus Type I. In 371 of these patients, as soon as possible after entry, intensive treatment with Type I unconcentrated horse serum was begun, and was continued at intervals of eight hours until clinical improvement of the patient had occurred, as manifested by reduction in the height of the temperature and lessening of the signs of toxemia. Large amounts of serum were given, the average amount used per patient being 420 c.c. In one case, as much as 2,000 c.c. of serum was necessary. Under this regimen, which was employed in 371 cases of Type I infection, thirty-nine patients died-a mortality rate of 10.5 per cent.

Since the beginning of this work, certain advances have been made in the serum therapy of Type I pneumonia. Efforts have largely been expended in certain laboratories along the lines of concentrating and refining the pneumococcus antibody to the highest possible potency. The methods of purification, as well as the clinical trial of such concentrated sera, have been fully outlined in the publications of Felton,2 Cecil.8-4 Park, Bullowa, and others. 7-9 Recently a definite advance in the treatment of Type I pneumonia has been made, with the observations of Francis10 that skin reactions to the Type I capsular polysaccharide may be a useful guide to the amount of serum necessary to terminate the disease.

In March 1934, a sample of Type I concentrated horse serum was made available to us through the courtesy of Dr. Augustus B. Wadsworth, of the Division of Laboratories and Research, New York State Department of Health. Since that

time, thirty cases of Type I pneumococcus lobar pneumonia have been admitted to the hospital. Twenty-five of these individuals have received concentrated antipneumococcus serum. Of the remaining five cases, two were given the uncon-centrated Type I serum with prompt response, a third was given an artificial pneumothorax, the disease in another was mild, and in the fifth patient, a sevenyear-old boy, serum was withheld because of the mildness of the disease. With these five exceptions, concentrated serum was given to every case of Type I infection as soon as possible after admission to the hospital. The results have been highly satisfactory, in that response to serum has been prompt and often dramatic, the complications have been few, and not one death has occurred in the series. It seemed of interest to report upon an analysis of our experiences with this concentrated serum.

The cases which have made possible this study were all admitted to the hospital through the usual channel-upon recommendation of outside physicians. As has been the custom at this hospital for many years, an attempt was made to admit the cases as early as possible following the onset of the disease. Typing was done soon after entry, making use of the Neufeld reaction first introduced in this country at the Rockefeller Hospital by Dr. Kenneth Goodner. By means of this reaction we have obtained typings directly from the sputum in twenty-one of these twenty-five cases soon after entry. The early typing has enabled us to give serum within a period of one or two hours after admission.

By far the greater number of patients in this series were young adults under the age of thirty. It has frequently been pointed out that Type I pneumonia is most often found in this particular age group. The cases in this series may be tabulated as follows:

Age of Patient	No.	of	Case
1-10 years		1	
11-20 years		10	
21-30 years		4	
31–40 years		3	
41-50 years		6	
51-60 years		0	
61–70 years		1	
	_		
Total		25	

Nine of the patients were females and sixteen were males. Five of these individuals did "heavy" work, thirteen did "light" work, and seven were unemployed.

Day of admission. In the majority of instances, patients were admitted to the hospital early in the course of their disease. While serum therapy almost always followed soon after admission, there were occasional instances in which treatment was delayed, either by failure to obtain satisfactory sputum or because of other therapeutic procedures such as pneumothorax. A comparison of the day of admission with the day of first serum treatment is given in Table I.

Comparison of the figures from the present series with the earlier ones from this hospital shows several interesting facts. It will be seen from Table II that a greater percentage of patients were admitted before the first three days of disease. This, we believe, reflects the increasing consciousness, on the part of the laity and physicians alike, of the possibilities of early diagnosis and serum treatment of pneumonia. It will be seen also from this table that the average case of Type I infection is being treated earlier. This we believe to be the result of our use of the Neufeld reaction, which ensures a prompt and accurate diagnosis.

Severity of disease. Although it was obviously difficult to gauge accurately the

various factors which determined the severity of each patient's illness, nevertheless a definite clinical impression was gained that the majority of the patients were acutely ill upon admission. The disease in twenty-one of the twenty-five cases was ushered in by an abrupt onset, usually by pleural pain, fever, or cough, with bloody sputum. When admitted there was high fever and consolidation of one or more lobes in each case. Bacteriemia was present in five cases when first seen. In one case, the number of colonies in the blood increased from less than one colony per two c.c. on admission to fifty-one colonies per c.c. the following day. In spite of bacteriemia these patients responded to serum therapy. The five cases with bacteriemia are tabulated in Table III.

Duration of acute symptoms before and after serum therapy. In every one of the twenty-five cases it was possible to note with a certain degree of accuracy the exact time of onset of the disease. This was usually taken to be the time of the initial chill, the first occurrence of pleural pain, the initial expectoration of bloody sputum, or a sudden change in the patient's condition for the worse following an upper respiratory infection.

Likewise it was possible to determine the cessation of the acute disease once serum therapy had begun. This was determined in every case by making frequent use of the Type I capsular polysaccharide as a skin test during the course serum therapy. As Tillett of Francis¹¹ originally showed, when the recovery processes have been initiated the skin gives a positive reaction to .01 mgm. of Type I polysaccharide, in the form of a wheal and erythema, which reaches its maximum intensity in fifteen to thirty minutes. Moreover, it was further shown

³⁰ Cases Type I Pneumonia R.I.H. March 1934-January 1936

by Francis, in a large series of Type I cases treated with unconcentrated serum, that specific therapy could be safely terminated upon the development of the pos-

itive skin test.

The cessation of the acute disease after specific therapy had been instituted was considered to be the time of first appearance of the positive skin test. While development of the latter was usually accompanied by an improvement in the patient's condition, there were a few cases in which the duration of disease had to be considered as the number of hours temperature had clapsing until the reached normal. These cases were few in . number, however, and in this group there was usually a delay of several hours after the skin test had become positive before general improvement of the patient occurred. In properly evaluating the effects of therapy it seemed only fair to make this distinction.

Computation of the records in the twenty-five cases has shown that 53.8 hours was the average elapsed time after onset before serum therapy was instituted. In other words, the average case was treated early in the third day of disease. Once serum treatment was given, however, an abrupt termination of the disease usually took place. In twenty-three patients crisis occurred and in the remaining two the temperature fell by lysis. The average elapsed time from the beginning of therapy to the first indication of recovery was only 22.6 hours.

Method of Therapy

Serum sensitivity tests. As soon as possible after the typing had been determined the patients were tested for sensitivity to horse serum. This was done in the usual manner by injecting .1 c.c. of 1:10 dilution normal horse serum into the skin of the forearm, with .1 c.c. of normal salt solution as control. At the same time one drop of the diluted normal horse serum was placed in the conjunctival sac of one eye. Sensitivity to horse serum was considered to be present if a wheal or erythema larger than 1 cm. in diameter occurred at the site of injected skin in fifteen to thirty minutes, or if the eye showed a conjunctivitis with lacrimation and itching. The skin test was done in all twenty-five cases, the eye test in twenty-one.

There were three patients who gave markedly positive skin tests. As events subsequently showed, these patients were sensitive to horse serum to a marked degree. In two other patients, slight sensitivity to horse serum was indicated by the skin test. However, in only one of these two patients did reaction to serum occur during the course of therapy, and the symptoms were relatively mild. There were eight patients who gave negative skin tests who, during serum administration, developed transient urticaria, flushing of face, fullness of head. cyanosis, lumbar pain or chill. These reactions were not alarming, and were readily controlled by small doses of adrenalin. It was difficult to know whether these reactions represented mild, but specific, sensitivity to horse serum protein, or were caused by toxic products in the serum. It has frequently been maintained that the conjunctival test is a much more reliable method of demonstrating serum sensitivity. claimed that slight degrees of sensitivity may be picked up by the eye test and that the difficulties of interpreting the doubtful skin reactions which not infrequently occur are thus obviated.

In our experience the eye test was of little value in telling the degree of sensitivity. In none of twenty-one cases was the test positive, and this series included the three patients who were later proved to be

markedly sensitive to serum.

Desensitization. Following the reading of the skin and conjunctival tests, and as a preliminary to the injection of concentrated serum, a small amount of diluted serum was given intravenously in nearly every case. This was usually one or two c.c. of a 1:10 dilution, but in some instances when the sensitivity tests were negative, as much as ten c.c. of a 1:10 dilution were given. In general, no deleterious effects from this procedure were observed. One of the three cases showing a markedly positive skin test to horse serum gave a slight reaction to this initial intravenous dose. The other two cases, however, failed to react to the small preliminary dose, but did give alarming delayed reactions when larger amounts of serum were given subsequently. In the light of these latter observations, it might have been advisable to proceed more cautiously with the administration of serum, i.e., desensitization with increasing amounts subcutaneously. But, in general, we

TABLE III

Case	No.	Day of Disease	Number of Colonies

have not found this procedure necessary. A preliminary skin test and an initial intravenous dose of dilute serum, have, in our experience, been not only safe but an adequate guide to the administration of specific serum.

Serum administration. Concentrated serum was administered to all the patients in this series in doses of thirty c.c. every four hours.* Each dose of serum in most of the cases was given diluted with a small amount of normal salt solution (average 125 c.c.). This not only insured the slow and safe administration of serum but enabled the giving of extra amounts of fluid by vein. In a few cases the concentrated serum was given intravenously without dilution. When this was done, using the earlier lots of serum, technical difficulties were encountered on account of the high viscosity of the serum, the syringe not infrequently becoming jammed. However, under the present methods of preparation12 the viscosity of the serum has been materially reduced and technical difficulties have obviated.

Serum therapy was pushed at fourhourly intervals until the skin reaction to Type I SSS had become positive. It is well to point out that in the earlier series of cases reported from this hospital, the unconcentrated serum was given at intervals of eight hours, and large amounts were necessary. By frequent use of the skin test during the course of therapy, it was possible to give a minimal amount of serum. An initial skin test with SSS was done before therapy, and the test repeated at intervals of four hours, immediately preceding the next injection of serum. Five patients only received an extra amount of serum despite the development of a positive SSS test. These were given additional serum because their condition seemed unusually critical.

It was found that the average amount of serum given per patient in these twentyfive cases was eighty-three c.c. (335,000 units). However, in this group, there were three patients whose disease terminated abruptly following upon a severe serum reaction. One of these three patients received a total of twenty-one c.c. after a prolonged course of intravenous desensitization; another was given but five c.c., and another only two c.c. before a severe serum reaction supervened. Omitting these three cases, the average amount of serum given per patient in the remaining twenty-two cases was ninety-three c.c., or 376,000 units.

It was frequently possible to bring about cessation of the acute disease after one or two injections of thirty c.c. of serum. There were eight patients, however, who required more than the average of ninety-three c.c. of serum. Careful inquiry into these instances has thrown a possible light on why the additional amounts of serum were necessary. In every case some complicating factor was present. If these eight cases are excluded from the series in addition to the three cited above, it is seen that the amount of serum necessary to treat the average uncomplicated case of Type I pneumonia is fifty-seven c.c., or 203,000 units. An analysis of the complicating factors in each of these eight cases is as follows:

Case No. 9023 was given 150 c.c. (450,000 units). Treatment, begun on the fourth day, was complicated by the development of sterile serofibrinous pleurisy.

Case No. 9098 was given 100 c.c. (300,000 units). Bacteriemia was present on admission, less than one colony per two c.c. Treatment

was begun late in the disease, on the fifth day. Case No. 9300 received 180 c.c. (540,000

units). A low white blood count was present on admission and persisted for several days.

Case No. 9349. 120 c.c. (360,000 units) were given to this patient. A low white blood count of 4,600, and bacteriemia of ten colonies per

c.c., were found on admission.

Case No. 9445. This patient was a chronic alcoholic. Although treatment was started on the second day, therapy was interrupted for twentyfour hours because of an insufficient supply of

serum. 160 c.c., or 480,000 units, were given. Case No. 9464. This patient was treated by pneumothorax shortly after admission. The admission blood culture, on the third day, was positive, less than one colony per two c.c. By the next day there were fifty-one colonies per c.c. in the blood. At this point it was felt that specific therapy could no longer be delayed. Treatment was then begun on the fourth day, and a total of 200 c.c. (1,200,000 units) was necessary to bring about improvement in his condition.

Case No. 9529 was an individual treated late in the course of his disease, on the fifth day. Alcoholism was present to a moderate degree. (840,000 units were given.)

Case No. 9567. This natient had a low admission white count of 6.520. The count remained below 10,000 for three days. The acute febrile period was complicated by an active alcoholic delirium. A sterile pleural effusion developed early in the course of his disease. (1,170,000 units were given.)

In the 1929 report of 371 cases treated with unconcentrated serum, the average amount of serum employed was 420 c.c. per patient, although some received much

^{*}The estimated potency of this serum as determined by the mouse protection test was 3,000 units per c.c. in most of the lots used. One lot of serum, however, contained 6,000 units per c.c.¹²

more than this amount. The unit value of these earlier lots of serum according to the present method of standardization is not known, but it is obvious that the actual volume of concentrated serum required is much less. On the other hand. the amount of serum employed, and especially the number of units required, in this series, was much larger than that recommended by certain other observers For instance, Lord and Heffron state that thirty cc of serum, containing 60,000 units, is sufficient for the early treatment of mild or moderate infections, although additional injections of 20 000 to 40,000 units may be required. The experience of the present series indicates that these amounts are not sufficiently large, and that the method we have employed, namely, 90,000 units for the first dose and the same dose repeated every four hours for as many doses as is necessary, gives more satisfactory results

It has long been recognized that the number of leukocytes in the circulating blood may often be an indication of the patient's response to the infection. A low leukocyte count usually means a severe

infection and poor response on the part of the host. A high admission white count, on the other hand, is generally considered to be a more favorable prognostic sign

We have been interested to determine whether or not the existence of a complicating factor such as a low leukocyte count alters in any way the patient's response to serum In the light of Goodner's observations¹³ upon certain host factors in pneumococcal infection of mice and rabbits, it seemed of interest to chart in these twenty-five cases the relation between the admission leukocyte count and the total amount of serum used (Charts I and II)

It will be seen from Chart I that the majority of the points fall within a particular zone. This zone is bounded by a horizontal line, representing the average amount of serum (93 cc.) given to twenty-two patients, and also by a hypothetical vertical line dividing a good leukocyte response (10,000 or above) from a poor one

Chart II depicts the relation between the admission leukocyte count and the total amount of serum used according to

the number of units. As in the previous chart, the horizontal line represents the average amount of serum (376,000 units) given to twenty-two patients. In these charts it will be seen that there are eight points falling outside of the rectangular zone. These are the eight patients cited above, in whom some complicating factor was known to be present.

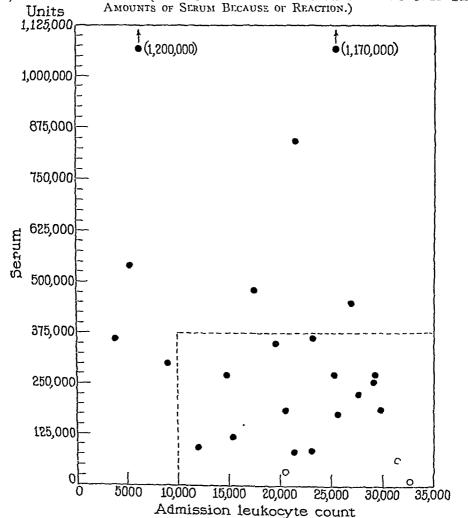

Control of Dosage

Skin tests, capsular polysaccharide. This test has been of great value, not only as a guide to serum therapy, but as a prognostic sign. The technic of the test is simple; it can be read quickly and very easily, and rarely gives equivocal results. Francis¹⁰ originally reported on use of the test in fifty-three cases of Type I

pneumococcus lobar pneumonia, fortyeight of which were treated with unconcentrated Type I serum. Our experience
with the test in twenty-five cases of pneumonia treated with concentrated serum,
while not as large, is in agreement with
his findings. However, we have elaborated the test to a certain extent by performing the injections at more frequent
intervals. We have done tests, not only
before therapy was instituted, but frequently during serum administration and
afterward.

The explanation of the positive skin reaction obtained in these Type I cases, once the recovery processes have been initiated, is still obscure. It has been assumed that two factors are necessary for positive reactivity of the skin: active

CHART II.—THE RELATION OF THE ADMISSON LEUKOCYTE COUNT TO THE TOTAL AMOUNT OF SERUM, EXPRESSED IN UNITS. (OPEN CIRCLES REPRESENT CASES RECEIVING ONLY SMALL AMOUNTS OF SERUM BECAUSE OF REACTION)

tissues, and type specific antibodies, and that the absence of either factor results in failure to react. Of these two, only one lends itself to quantitative demonstration, namely, the specific agglutinins in the serum. It has been shown repeatedly that the development of type specific agglutinins is associated with the processes of recovery. There is no accurate gauge, however, of the state of reactivity of the issue cells nor of the various factors that influence this reactivity. It is believed that in patients with profound toxenia or in moribund condition there is a depression of the cellular reactivity.

Frequent observations upon the skin test with Type I SSS during various stages of lobar pneumonia have demonstrated interesting phenomena, and while their significance is not yet understood, nevertheless they may throw some light on tissue reactivity in general These may be mentioned briefly as follows

be mentioned briefly as follows

1 Spontaneous appearance of positive test at site of previously moculited SSS This occurred in two patients during the course of therapy (No 9445 and No 9344)

2 Spontaneous appearance of positive test at site of previously inoculited SSS stimulated by another injection of SSS. This occurred in one patient (No 9349)

3 Disappearance of positive test after therapy has been stopped and its subsequent reappearance later in convolescence. This occurred in three patients (No 9291, No 9300 and No 9464)

4 Reactivation of positive test at site of previous inoculations of SSS during serum disease. This was discovered in two patients (No 9464 and No 9529)

These aberrations in no way vitiate the value of the skin test, since in the majority of cases serum therapy was stopped at the appearance of the first positive reaction to SSS

Serum disease Serum disease was con sidered to be present if any of the characteristic manifestations of fever, skin lesions, joint involvement, or lymphadenopathy were noted Of the twenty five cases, seventeen (68 per cent) showed some sign of serum disease Light patients, some of whom had had large amounts of serum, showed no signs what ever While the incidence of serum sickness was found to be relatively high, the nature of the disease was mild in the majority of the cases In seventy per cent

of the nationts the manifestations were mild and in the remaining thirty per cent they were severe. The average time claps mg between the beginning of therapy and the appearance of the first symptoms was 78 days. It appeared as early as the third day, and as late as the fifteenth day following serum. The average duration was 34 days There was no tendency for serum disease to develop earlier than usual in the patients who were sensitive to serum In fact, in one of the patients who gave a marked initial reaction, no serum disease occurred No correlation was found in this series between the total amount of serum given and the occurrence and nature of the serum disease

By far the most common finding was involvement of the joints. This occurred in twelve individuals, and was severe in seven cases. All of the joints might be affected. There was apparently no predulection for any particular joint. The arthralgia was readily controlled by

aspırın or pyramıdon

Fever, varying between 100° and 105° Γ , occurred in twelve of the seventeen

patients with serum disease

Skin lesions manifest were of two types one, a fine, macular eruption, sometimes scarlatiniform in nature, which did not itch and usually lasted about twenty-four hours. This was seen in three patients. The other was the classical urticaria which occurred in only seven individuals, in none of whom was the urticaria troublesome.

Lymphadenopathy was detected in

three patients, but was not severe

In this series of cases, the incidence of serum disease was apparently much greater than that found by other observers employing concentrated serum Lord and Heffron, for instance, in the Massachusetts Pneumonia Study, found that serum disease occurred in only eighteen per cent of their cases. It should be borne in mind, however, that unless particular attention is given to the matter, mild symptoms may be overlooked In our series of hospitalized cases, all symptoms which might be ascribed to serum disease have been recorded as due to this cause Accurate statistics regarding the frequency of occurrence of these symptoms following the administration of whole serum are not available. While the incidence of serum disease in the cases treated with concentrated serum was apparently not decreased as compared with the cases receiving whole serum, the impression gained by all those having experience with the two methods was that the symptoms were considerably milder concentrated serum the when employed.

Complications. Complications in this series of twenty-five cases were relatively infrequent. A serofibrinous pleurisy developed in seven cases. In five of these the fluid was present to a degree sufficient to indicate thoracentesis. A sterile effusion was found in each case. No instance of empyema occurred. One patient developed a femoral thrombophlebitis and underwent a long convalescence following pulmonary infarction.

Summary

- 1. Twenty-five cases of Type I pneumonia have been treated with Type I concentrated antipneumococcus serum, with no fatalities.
- 2. Use of the Neufeld typing reaction has made possible the beginning of treatment at an average of 53.8 hours after the onset of the disease.

- 3. Response to serum has been prompt, the cessation of the acute disease occurring at an average of 22.6 hours after the beginning of serum administration.
- 4. By use of the skin test with Type I capsular polysaccharide, it was possible to give a minimal amount of serum; eighty-three c.c., or 335,000 units, was the average amount of serum given per patient. It was found that fifty-seven c.c., equivalent to 203,000 units, was the amount of serum necessary to treat the average uncomplicated case of Type I pneumonia.
- The existence of complicating factors, particularly a low leukocytic reaction, was found to alter the patient's response to serum therapy.
- 6. Serum disease occurred in sixtyeight per cent of the twenty-five treated cases. It was mild in seventy per cent of the patients. Involvement of the joints was the most common symptom. Urticaria was of mild degree.
- 7. Complications were few; sterile serofibrinous pleurisy occurring in seven patients. Empyema was not encountered in this series.

CHECKS DANGLED BEFORE THE DOCTOR'S EYE

In an effort to unearth new writing talent in the non-fiction field, the Reader's Digest announces five prizes of \$1,000 each for unpublished, non-fiction articles by persons who never have contributed to national periodicals. In addition to these prizes, \$500 will be paid for each manuscript judged acceptable for publication.

"There are people in all walks of life," according to the announcement, "who, thanks to unusual experience, observation or reflection, might well write magazine articles of lasting interest and significance, but for lack of encouragement have never done so." Physicians, surgeons, all members of the medical profession are cited as offering promise as sources of new writing talent.

"An illuminating experience, a special knowledge of some phase of American life, or an unusual opportunity to observe human nature may be had by individuals in any occupational field." Full details will be mailed upon request by addressing the editors at Pleasantville, New York.

A surprise awaited the thief whom Dr. Joseph Wrana, gynecologist, of Kew Gardens, Queens, reported to police had stolen

from his car a reel of motion picture film depicting unusual cases in gynecology and obstetrics work.

TUMORS AT THE BASE OF THE SKULL

S BERNARD WORTIS, M D and SAMUEL BROCK, M D, New York City

From the Neurological Service of Bellevue Hospital, the New York Neurological Institute and the Department of Neurology. New York University College of Medicinic II e are indebted to Dr. Foster Kennedy and Dr. Thos. K. Davis for permission to report these cases.

Tumors at the base of the skull are often difficult to diagnose early. The type of neoplasm may be lymphoepithelioma, branchiogenic carcinoma (squamous cell epithelial growths), malignant growths spreading from the nearby sinuses, benign bony growths and rarely basilar glandular enlargements and infiltrations that occur in Hodgkin's disease. The bones of the middle crainal fossa are the commonest site of invasion.

We are reporting a series of ten tumors of varied pathology involving the base of the skull. The first two instances are the so called lymphoepitheliomata. Schmincke (1921)¹ first described this group of tumors arising in the posterior naso pharynx. Six years later Ewing² pointed out that lymphoepitheliomata are really transitional cell carcinomata and recommended their treatment by radiation New, Harmer and Glas, Woltman, Crow and Baylor, and Gardham lave described similar tumors of the naso pharynx

Case I PK, male aged fifty five was admitted to Bellevue Hospital September 10 1932 Eight months previously he began to spit blood, this was followed two months later by bilateral timitus. Two months later he noticed that the left nostril felt 'stuffed', smell and taste were defective. Six weeks before admission he noted en larged panless cervical lymph glands. Six days before admission he experienced double vision and dysphagra. For one month prior, he had vonited daily.

Examination showed a left ptosis and a left pupil greater than the right There was left ophthalmoplegia (internal and external) with paralysis of the muscles of mastication on the left and of the face on the left Hearing was diminished on the left, con duction deafness Paralysis of the left palate and tongue were noted

X ray of the skull was negative Other laboratory tests were negative. The patient failed rapidly and death occurred October 10 one month after admittance to Bellevue Autopsy showed infiltration of the left Gas.

sering ganglion with a gray opique tumor which filled both maxillary antra and in vaded the roof of the mouth and the pharing

Histological examination of the tumor showed it to be a lymphoepithelioma originating or extending into both maxillary antra and the posterior nasopharyinx Section of one of the upper cervical lymph nodes showed the same metastatic epitheliomatus cells

Case II DB, male forty eight years, was admitted to Bellevue Hospital August 10, 1934 His illness began with headache in August 1933, this was followed by the appearance of a firm mass low in the left side of the neck which increased in size In February 1934 part of this tumor was excised and found to be a branchiogenic carcinoma (plexiform epithelial type) Later the left clavicle was invided and there was loss of power in the left upper extremity, attributable to brachial plexus involvement Diabetes mellitus was discovered in February 1934 In May he had double vision, this was followed by weakness of the right face and pain in the right upper face

Examination revealed paralysis of the right external rectus and the right muscles of mastication. There was right upper facial hyperesthesia, right eighth nerve deafness, right sternomastoid and upper trapezius weakness (11th nerve), right palatal (9th nerve) and tongue (12th nerve) weakness. Weakness and diminished reflexes were found in the right upper extremity

The laboratory findings were negative except for glycosuria and acetonuria

X ray therapy was given

Further course of the case is unknown since the patient has not returned for follow up study

Case III JN, aged twenty one, entered the N Y Neurological Institute January 17, 1931 His present lustory begin in February 1930, he began to suffer with pains around the left orbit which radiated to other parts of the left side of the face After three months, facril sensation was impaired on the left and vision in the left eye was diminished One month before admission the patient noticed tunnitus in his left ear

February 6, 1930. Two years before admission his symptoms began with pain in the right temporal region and swelling of the right cheek. A bloody discharge from the right nostril had existed for several months. Two weeks before entry his right eye became blind and generalized weakness set in.

Examination revealed a firm full infiltration of the right temporal region and a serosanguineous discharge from the right nostril. The right half of the palate presented a hard mass, projecting into the naso- and oropharynx. There was exophthalmos, amaurosis and primary optic atrophy on the right side. The pupils were unequal, the right larger than the left. Right external rectus weakness and right middle ear deafness were present. The tongue deviated to the right side, the palate to the left; speech was nasal. The patient was cachetic.

X-rays showed erosion of the right maxilla and a dense shadow in the right antrum. Radiation therapy was given. He died four months after admission (i.e. two and a half years after the onset of symptoms).

Autopsy showed a firm elastic tumor, the size of a lemon, bulging upward into the middle half of the right middle fossa. The tumor arose from the right antrum and invaded the right ethmoid, the sella turcica and eroded the right clinoid processes; the medial half of the petrous part of the right temporal bone was destroyed. It eroded the right orbit; the right eye was proptosed but itself uninvolved.

The histological diagnosis was plexiform epithelioma originating in the nasal sinus epithelium.

Case VIII. I.C., female, aged twenty-eight, was admitted to the N. Y. Neurological Institute March 28, 1934. In September 1933 she had a sensation that the right ear was "full of water"; there was buzzing, roaring, and hissing in the right ear. In December 1933 she had pain in the right external auditory canal and the right face. A sensation of falling to the right was experienced. Slight swelling of the right side of the face and enlargement of the right upper cervical lymph nodes were noted.

Examination revealed conduction deafness on the right. Sensation was diminished to pinprick over the second and third divisions of the right trigeminal nerve. There was slight increase in the deep reflexes on the left side. The right abdominal reflexes were greater than the left. Sensation over the anterior two-thirds of the tongue was diminished on both sides. Vestibular reactions were negative.

X-rays of the skull showed a large irregular defect on the floor of the right middle fossa. This defect involved the inner anterior portion of the petrous pyramid and the foramen ovale. In addition, there appeared to be some destruction of the right lateral border of the basisphenoid. The right jugular foramen was quite large. The foramen lacerum on the right also formed a part of the defect in the middle fossa. The x-ray diagnosis was malignant growth destroying the floor of the right middle fossa.

All other laboratory tests including spinal fluid and serology were negative. A neoplasm was discovered in the nasopharynx: a biopsy was taken. Histological study showed it to be a lymphoepithelioma.

The patient was given two courses of deep radiation consisting of thirty and fifteen treatments in each series. X-ray therapy produced remarkable improvement.

Skull x-rays made nine months after the first showed:

(1) The bony defect in the greater wing of the sphenoid is about the same in its extent as before; in some places it presents several motheaten areas. There is new bone production at the petrous tip on the right. It seems to be more definite in outline and has more calcification than seen previously. The examination points to a gradually healing process at the base.

The patient now shows no abnormal neurological signs. Her deafness and tinnitus have cleared up entirely and there is no sensory defect on the skin of the right face. She has resumed her work.

Case IX. M.G., male, aged twenty-one, was admitted to Bellevue Hospital April 21, 1933 and discharged unimproved on May 12. His illness began seven years ago with the sudden onset of left facial paralysis which cleared up rapidly. Five years ago he had a left radical mastoidectomy and two weeks after the operation his facial paralysis reappeared and persisted. Three years ago he began to complain of headache which was exaggerated by motion of the head and right-sided attacks of hypertonicity which came on once a month. At this time his left mastoid was reexplored at the N. Y. Polyclinic Hospital and a tumor was found filling the mastoid defect. Histological study showed it to be a lymphangioma. The patient was given radium therapy locally. Two years ago he began to have generalized convulsive seizures occurring once a week; these attacks have persisted to the time of admission.

Examination revealed a left peripheral facial paralysis, nerve deafness on the left, and atrophy and fibrillations of the left half of the tongue. Paralysis of the left half of

the soft palate was evident. There was no trigeminal nerve involvement and the deep reflexes on the right side were over active. Later, paralysis of the left external rectus muscle and horizontal nystagmus super-

Encephalograms were attempted but only a small amount of air was found to enter the ventricular system. The roentgenograms showed calcification in a tumor near the left

netrous bone.

The patient was given radiotherapy and discharged home. As we have been unsuccessful in our attempts to locate the patient since his discharge, his present status is not known.

Case X. J.S., a man twenty-five years of age, was admitted to Bellevue Hospital August 10, 1934. Five months prior to admission he noticed "soreness" in the right cheek. Later, defective hearing on the right side was noted and headache supervened. Ten days before admission the right cheek became numb and he saw double when his right eye "turned in."

Examination showed paralysis of the right external rectus muscle. There was diminution of sensation over the middle part of the right side of the face (maxillary branch of the right trigeminal nerve). Later, internal and external ophthalmoplegia and ptosis set in; right third nerve paralysis followed, and finally complete right motor and sensory trigeminal paralysis. An infiltrating mass was found projecting into the right naso-pharynx.

X-rays of the skull were negative. X-rays of the sinuses showed haziness in the right maxillary, ethmoid and frontal sinuses. Other laboratory tests were negative.

Biopsy of the nasopharyngeal tumor made at the Memorial Hospital showed it to be carcinoma of salivary gland origin. The patient received x-ray therapy but died December 24, 1934. Autopsy was not permitted. The pathologist commented on the fact that he had never before seen salivary gland carcinoma extend to involve the structures at the base of the brain.

To our knowledge the only other case of salivary gland carcinoma invading the structures at the base of the skull was reported by Scarff* in 1934. The clinical course of his case was similar to ours and the tumor material was seen by Dr. James Ewing and identified as salivary gland tumor.

Discussion

Several points of importance may be emphasized in considering these cases. Certain facts in the history were of particular significance. All of our patients were adults. Most of them had continuous pain and numbness in one side of the face or about the ear. A history of sinusitis commonly coexisted and sometimes misled the physician. Epistaxis, double vision, and unilateral tinnitus or deafness were other symptoms. The patient sometimes noticed enlargement of the upper cervical lymph nodes.

The examination frequently disclosed impairment of all forms of sensation over the cheek, lower eyelid, upper lip, and the corresponding mucous membranes on one side (i.e. maxillary or second division of the trigeminal nerve). The muscles of mastication were involved (motor branches of the third division of the trigeminal nerve) producing deviation of the lower jaw toward the affected side.

Paralysis of the extrinsic eye muscles, especially the external rectus muscle,

often resulted in diplopia,

One sided deafness with or without tinnitus usually proved to be of conduction type. Gardham has emphasized this point and believed it was due to invasion or compression of the Eustachian tube by the neoplasm.

Examination of the oral cavity sometimes revealed a palpable bulging of the soft palate produced by the new growth.

One of the most characteristic physical signs was early bilateral enlargement of the upper cervical lymph nodes which were filled with tumor cells.

Three special examinations proved essential for early diagnosis. Inspection of the posterior nasopharynx revealed a small laterally placed tumor near the Eustachian orifice in some cases. X-rays of the base of the skull should be taken to determine the presence of erosion of the petrous bone or the greater wing of the sphenoid bone. Cloudiness of the sinuses may be due to tumor growth.

Tissue should be removed from the tumor in the nasopharynx or one of the enlarged cervical glands. Histological study of this material gives the final

diagnosis.

Early recognition of these cases is of especial importance because many of the tumors (the lymphoepitheliomata as in Case VIII—i.e. transitional cell carcinomata), the lymphogranulomata (Hodgkin's disease), and some lymphosarco-

mata respond remarkably well to radiation therapy. Repeated courses of radiation are necessary and should be applied at regular intervals. If these patients remain untreated, or if the tumor is not radio-sensitive, it progresses rapidly to involve the structures in the orbit, middle and anterior fossae, etc. (as in Cases I, V and

The terminal cachexia of these patients is partly caused by difficulty in swallowing

Treating these patients by ordinary surgical methods is useless because of the inaccessibility of the tumor.

Discussion

pancreas, and other sources; sarcomata of the body of the sphenoid, and of the retroorbital region; chordomata; neoplasm of the Gasserian ganglion, and of the optic chiasm; acoustic neurofibromata; osteomata; osteogenic hyperplasia associated with some meningeomata; hemangiomatous growths; and hypophyseal adenomata. Aneurysms of the basal vessels are at times difficult to differentiate from neoplasms.

Most of the above mentioned tumors erode or alter bony structures and are. therefore, detectable by x-ray studies. Such neoplasms make it imperative to appraise the integrity of cranial nerve functions as well as other neurologic symptoms and signs. Persistent pain or numbness about the head or face warrants inspection of every nook and cranny of the head for primary malignant disease. Biopsies should be done whenever possible.

Drs. Wortis and Brock are to be congratulated for arousing our interest in the rare but serious pitfalls to be found in some growths at the base of the skull.

Dr. Lloyd H. Ziegler, Albany-This in-

teresting paper presents to our Society a fine collection of rather rare and unusual cases encountered in the practice of medicine. As neurologists we are reasonably familiar with such syndromes. Because patients with such diseases often consult ophthalmologists, oto-laryngologists, dental surgeons early in their illnesses, this report should be of much importance to them.

Three things mentioned are somewhat out of the ordinary—the salivary gland tumor that metastasized to the base, the relatively early age of onset of most of the growths, and the marked improvement of one patient under deep x-ray therapy. Carcinoma arising in the nasopharynx, mucous membranes of the nose and accessory sinuses, or portions of the face and scalp, may extend and erode through the base of the skull to produce meningitis or multiple cranial nerve palsies. In addition to these, I have seen the following malignant and benign growths at the base: metastatic neoplasms originating from the prostate, breast, bone marrow,

MEDICAL RADIO BROADCASTS

The Medical Information Bureau of the New York Academy of Medicine announces following broadcasts from WABC and the Columbia Broadcasting System network:

Thursday, April 16, 1:45 p.m.—Speaker: Dr. Armitage Whitman, Associate Professor of Orthopedic Surgery at Post Graduate Hospital. Subject: "History of Orthopedic Surgery."

Thursday, April 23, 1:45 P.M.—Speaker: Dr. Frederic E. Sondern, President of the Medical Society of the State of New York. Subject: "Medicine-Trade or Profession."

NU SIGMA NU ALUMNI DINNER

The Annual Dinner of the New York Alumni Association of Nu Sigma Nu will be held at the Yale Club at 7 P.M. Wednesday evening, April 29.

Seating will be according to chapters, therefore all alumni are requested to mail their professional card with Class and Chapter to the Secretary so that invitations may be mailed, and reservations made by return postcard.

Don't fail to register at the Nu Sigma Nu desk at the Annual Meeting of the Medical Society of the State of New York at the Waldorf Astoria, April 27, 28, 29.

The New York City address of the Nu Sigma Nu Alumni Association is Room 2207, 730 Fifth Avenue.

ERYTHROBLASTIC ANEMIA Clinical Observations In An Adult

ELLERY G. ALLEN, M.D., and DONALD S. CHILDS, M.D., Syracuse

From the Departments of Medicine and Radiology, Syracuse University College of Medicine.

Aided by a grant from the Hendrick's Research Fund.

The differential diagnosis and classification of anemic patients with spleno-megalia frequently presents great difficulties; particularly is this true when there is also evidence of a variable degree of jaundice, immature blood corpuscles in the circulation, and, possibly, roentgeno-logic bone changes. The studies of Cooley and his associates have done much to clarify our knowledge on this subject and it now seems certain that his term, Erythroblastic Anemia, refers to a definite clinical entity, as follows.⁶

In view of recent knowledge, it seems probable that similar cases have been regarded previously as instances of Von Jaksch's Anemia, Pernicious Anemia, Sickle-Cell Anemia, Hemolytic Jaundice and other unusual forms of splenic anemia.

It is not the purpose of this report to summarize the clinical features of crythroblastic anemia, such as are adequately described elsewhere^{1-16, 83} but to present some similar observations in one of the few adult cases thus far recorded.

Case History

married. Italian pharmacist, aged twenty-four, was first examined on October 2, 1931. His complaint at that time was a varying degree of "yellow color" since child-hood. The family history was noncontributory; one brother, whose blood was studied, showed no hematologic abnormalities. He had suffered no other serious illness and had never been confined to bed for as long as a week. His present complaint dated from his earliest remembrance, declaring that never during his boyhood did he have a ruddy color like most of his companions; his parents said that he had been pale and, at times, "yellow" since the approximate age of two years. His growth was normal, he exhibited proficiency in his studies and graduated from college. He had always been able to work hard without undue fatigue and competed in athletics. For three or four months he had noted that the left upper portion of his abdomen had been more prominent than formerly and, on occasions, he had experienced a "pulling sensation" in this region.

The patient was well-developed, ade-

quately nourished, weighed 165 pounds and measured seventy inches in height. The skin was pale and definitely icteric, the facial appearance was hardly that of an Italian, due to some prominence of the frontal bosses and malar eminences. The blood pressure, pulse, and temperature were normal. The epitrochlear and inguinal glands were palpable but otherwise not remarkable. The left upper quadrant contained a firm, nontender, smooth mass, which extended to the level of the umbilicus with inspiration. A systolic nurmur was heard over the precordium, loudest at the pulmonic area and in the fourth left intercostal space, close to the sternum.

The red blood cells were 4,405,000, white blood cells 6,650, hemoglobin 7.5 grams, color index and volume index .6. The differential count was not remarkable, except that an occasional myelocyte and an increase in the nonfilamented polys was noted. Three normoblasts were noted while counting 250 white blood cells. The smears showed extreme poikilocytosis, hypochromasia, stippling and a fair number of microcytes (Fig. 1). The reticulocytes numbered 6.2 per cent. The icterus index was twenty-two with an indirect Van den Bergh reaction. The bleeding and clotting times were normal. The fragility test showed an increased resistance of the erythrocytes, hemolysis being completed in .26 per cent sodium chloride solution. Gastric analysis, after 1/2 mg. histamine, showed normal values for free hydrochloric acid; blood cholesterol 100 mg.; the patient's blood serum did not agglutinate his own red blood cells. The Wassermann and Kahn tests were negative. Several urine analyses were negative, except for the rare presence of an increase of urobilinogen.

Clinical Course: A tentative diagnosis of atypical hemolytic anemia was made and splenectomy was advised. The patient refused operation and the following therapeutic measures, all without definite hematologic improvement, were attempted: iron and ammonium citrate, ninety grains a day for six months; iron and ammonium citrate, ninety grains a day, and copper carbonate, 1/16 grain a day, for three months; intramuscular liver extract (Parke, Davis, 2 c.c. = 10 grams liver), two c.c. every other day for six weeks; intramuscular liver extract

47

(Lederle's, 3 c.c. = 100 grams liver), three c.c. twice a week for two weeks.

The patient was studied by Dr. H. Z. Giffin at the Mayo Clinic. A summary of his findings is as follows:

Blood count on April 11, 1933, showed 7.2 grams hemoglobin, 3,810,000 erythrocytes, and 6,100 leukocytes. Occasional metamyelocytes, myelocytes, and promyelocytes were found in the smears but no stem cells. The smears presented a most unusual picture. There was extreme poikilocytosis, almost suggestive of fragmentation of the red cells, marked hypochro-

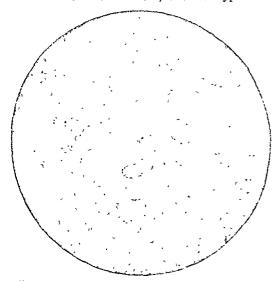

Fig. 1. Stained erythrocytes prior to splenectomy. X-1200.

masia and anachromasia, stippling, and there were many microcytes, although these were biconcave, not spherical. There was a definite left shift of the neutrophils and an occasional normoblast was seen. Reticulated cell percentage was 6.6. A wet smear for sickle cells was negative; platelet count, by the direct method from the ear, was 148,000 and the bleeding time two minutes. The viscosity of the blood was 3, compared with our normal of 4.5. Fragility test showed a definite increase in maximal resistance. Liver function test did not show any dye retention. Serum bilirubin was 2.8 with an indirect reaction. Serum viscosity was 1.7 and plasma viscosity 1.5. The hematocrit showed a red cell percentage of 26. The albumin globulin ratio was 2.4:1. The whole blood volume was 84.3 c.c. per kg., compared with a normal of 89 c.c. A peculiar feature of the blood was failure of sedimentation at the end of one hour. Blood urea estimation was normal. Blood group was four, Moss classification; serologic test for syphilis and urine analysis were negative. X-ray examination of the chest was negative. The stomach was displaced to the right. X-ray examination of the skull, hip, and end of femur showed a generalized, granular type of osteo-porosis, not typical of Gaucher's disease. A splenectomy was performed by Dr. John de J. Pemberton on April 14, 1933. The spleen weighed 1,450 grams; there were many ad-hesions about it (Fig. 2). The gall bladder was distended but thin-walled and no stones could be felt. The liver was normal in appearance and color but possibly a little larger than normal. Pathologic examination of the spleen showed chronic splenitis, peri-splenitis, malpighian bodies hyperplastic, capillaries dilated, moderate congestion.

Two weeks after splenectomy blood studies

Fig. 2. Spleen removed at operation.

showed 7.9 grams hemoglobin, 4,290,000 erythrocytes, and 11,000 leukocytes. Occasional promyelocytes, myelocytes, and metamyelocytes were found, but no stem cells. A large percentage of monocytes were present, 14.5. Study of the smears indicated that some of these monocytes were immature. Marked poikilocytosis, stippling, and hypochromasia were still present. Platelet counts done directly on the plasma showed the usual marked rise after splenctomy. The count the morning of operation was 81,000, on the eighth day 405,000, on the eleventh day about 2,000,000. The coagulation time of the plasma became very short, but in spite of these findings, there was no evidence of thrombophlebitis. Postoperative platelet counts by the direct method were, however, never higher than \$82,000.

Two weeks after splenectomy, sixty-nine normoblasts were found while counting 200 white cells; five weeks following the operation these cells numbered approximately 40,000 per cu. mm., and then gradually increased to the level of 80,000 per cu. mm. (seven months after extirpation of the spleen). Studies made on Oct. 4, 1933, showed eight grams hemoglobin, 4,530,000 erythrocytes, 4,522 leukocytes, 52,000 normoblasts, erythrocyte volume per cent of twenty-nine, blood calcium eleven mg., blood cholesterol 180 mg. There was a definite left shift of the neutrophils, a few myelocytes were present and the monocytes numbered eleven per cent. The red cells showed marked variation in size and shape, occasional cells with polychromasia and stippling, remarkable distortion of some of the cells with hypochromasia and anachromasia (Figs. 3 and 4). The reticulated erythrocytes numbered seventy-four per cent (Fig. 5). Roentgenograms of the bones taken in February 1934, showed a similar degree of

Fig. 3. Stained erythrocytes seven months after splenectomy, X-1200,

osteoporosis, thickening of the skull and prominence of the medullary trabeculations (pelvis) as compared to the condition noted prior to splenectomy.

Various therapeutic measures, including soluble iron, fetal liver and cholesterol by the oral route were instituted, but the blood picture, except for the signs of increased marrow activity, remained essentially the same for more than a year following splenectomy, at which time our last observations were made. On Jan. 26, 1935, Dr. L. W. Gorham examined the patient's blood and kindly forwarded us the following report:

Hemoglobin 45 per cent (N), red blood cells 3,836,000, white blood cells 10,000. Fragility test—no hemolysis after two hours. A questionable change in the .28 per cent tube after six

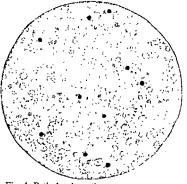

Fig. 4. Reticulated erythrocytes seven months after splenectomy. (Cresyl Violet) X-1200.

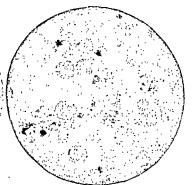

Fig. 5. Stained erythrocytes seven months after splenectomy. Low power.

الم المعربين

hours. Differential count: Eosinophils 0 per cent, basophils 1 per cent, myelocytes 1 per cent, juveniles 8 per cent, stabs 0 per cent, lymphocytes 40 per cent, polys 35 per cent, monocytes 15 per cent. Icterus index 26.4, reticulocytes 7 per cent. Van den Bergh direct—slight positive—delayed, indirect—negative. Bleeding time 5 minutes, sedimentation time 1 mm. (Wintrobe and Walton), erythrocyte volume per cent was 35. 225 normoblasts were seen while counting 100 white blood cells.

Discussion

It must be admitted that cases of this particular type are rarely seen in adults, yet from the clinical aspect, the condition bears some similarity to various so-called entities." The diagnosis "disease chronic hemolytic jaundice is hardly tenable, considering the type of erythrocyte and the increased resistance to hypotonic saline solutions. Furthermore, liver extract in large doses17 and other medical measures failed to affect the anemia, and splenectomy was not followed by the clinical and hemotologic improvement expected in most cases of chronic hemolytic jaundice. Wet smears for sickle cells gave negative information. The erythroblastosis of chronic steatorrhea, described by Bennett, Hunter, and Vaughan,18 may be considered in differential diagnosis but their cases presented abnormal bowel function and pathological stools; furthermore, those patients had no splenomegalia or jaundice

The osseous roentgenograms revealed a granular type of osteoporosis, not definitely characteristic of, any disease entity. In addition, some thickening of the skull, probably due to marrow hyperplasia, was evident. The prominence of the medullary trabeculations, producing the so-called "mosaic appearance,"33 was especially to be noted in the bones of the pelvis. It is our impression that rather similar roentgenologic bony changes may be encountered in a variety of well known clinical conditions. It has been pointed out6,9 that in chronic hemolytic jaundice and sickle-cell anemia, less extensive abnormal bony variations, as compared to the situation in erythroblastic anemia, may occasionally occur. Cooley and his associates4 interpreted the porous appearance in their roentgenograms as representing marrow hyperplasia, whereas in the terminal stages, the pronounced striations indicated, they believed, replacement of exhausted marrow by new bone, as found at autopsies. It is of importance to remember that x-ray information19-23 on the subject of erythroblastic anemia particularly stresses the picture rather late in the disease, or in the more severe cases. Although the striations are rather constantly found in such instances, it is well to recall that in early cases, or in less severe cases, medullary thickening and osteoporosis are the striking features.4,0,33 Some of Vaughan's24 cases of celiac disease showed a normoblastic type of anemia and osteoporosis, but no splenomegalia was present. It should also be remembered that the osseous changes in hyperparathyroidism²⁵ and aleukemic myelosis²⁶ may present x-ray appearances that might be confused with the osteoporosis seen in the early stage of erythroblastic anemia. Chapman's27 second type of osteosclerosis (myelosclerosis) included cases with splenomegalia, myelophthisic anemia and evidence of active hematopoiesis, although there was no evidence of an hemolytic process and his bone roentgenograms showed a moderately increased density but with most of the cortex still evident. The osteolytic lesions of Gaucher's disease might possibly bear some similarity to the condition noted in the patient described, although pathological examination of the spleen revealed no characteristic vesicular cells, presumed to designate Gaucher's splenomegalia as an entity.

The age of the patient, and the fact that prior to splenectomy, he showed, on rare occasions, a white cell count between 4,050 and 5,000, might be legitimately offered as arguments against a diagnosis of erythroblastic anemia (Cooley's type). Cooley²⁸ has not observed leukopenia in this condition and he has stated² that subjects with this disease are not known to reach adult life. Some of the cases observed by Baty, Blackfan, and Diamond⁷ showed no definite leukocytosis and it is noteworthy that similar cases, described as having elevated white cell blood counts actually may not have had, since the nucleated erythrocytes, retaining their nucleus in the acidified white cell diluent, might easily be mistaken for leukocytes and thus serve to give one an erroneous figure for the white cell count.

The morphologic abnormalities noted in the blood bore a striking resemblance to those seen in Cooley's erythroblastic anemia; referring to the latter, Baty, Blackfan, and Diamond declared that such patients present a "memorable blood picture" and more recently detailed cytologic information on the subject has been contributed by Kato and Downey 29 The fact that no very young normoblasts were noted in the smears might argue against of Cooley's anemia, the diagnosis Downey³⁰ thought, although the distribution of the hemoglobin in the red cells is somewhat typical and suggests the condition described by Cooley. The normoblastic crisis, such as our patient presented following splenectomy, is apparently constantly seen in cases of erythroblastic anemia, and, as has been pointed out,216 may last for years. The persistence of the increase in these cells in our adult patient is of considerable interest, although another somewhat similar situation was noted in Stillman's case³¹ for a period of seventeen years after splenectomy. 82

Although it can not be definitely declared that the case described is one of Cooley's erythroblastic anemia, it seems justifiable to regard it as belonging to that group of hematologic disorder, although possibly atypical It must be admitted that one might expect a different blood picture in an adult than one would find in a child, even though both were affected with the same fundamental disorder Again, there can be no serious objection to the possibility that such an infant might survive and reach adult life Whether this patient will later show hematologic improvement cannot

stated although it is certain that no therapeutic measures thus far instituted have had any demonstrable favorable effect on the red cell and hemoglobin levels It is of interest that the reticulocytes and white cell count have, two years after splenectomy, returned to approximately the same figures as were noted prior to the operation. The normoblasts are still considerably increased, as compared to their number present before splenectomy, although they are now hardly as numerous as noted a year ago.

Summary

A case of adult erythroblastic anemia, bearing a striking resemblance to the condition occurring in infants and children, is presented. The clinical features were iaundice. pallor, and splenomegalia Hematologic studies showed anemia with low color and volume indices, decreased erythrocyte fragility, distinctive appearance of the stained red blood cells, elevated icteric index, indirect Van den Bergh reaction, a neutrophilic shift to the left, and a normoblastic crisis persisting two years after splenectomy. Osseous roentgenograms revealed a granular type of osteoporosis, notably in the skull, pelvis, and end of the femur. In addition, the pelvic medullary trabeculations were unduly prominent and the cranial bones revealed definite thickening. All therapeutic measures attempted, including splenectomy, were of no avail in definitely increasing the red cell and hemoglobin levels, and the jaundice persists MFUICAL ARTS BLDG

CHRONIC LYMPHOID LEUKEMIA WITH A LEUKEMIC PHLEBITIS

H. H. HAFT, M.D., WILLIAM A. GROAT, M.D., AND TYREE C. WYATT, M.D., Syracuse From the College of Medicine, Syracuse University

Recently a patient came under observation (Dr. Haft), who had what seemed to be an acute phlebitis of the femoral vein and part of the saphenous vein, and who subsequently was shown to have a leukemia. The leukemic process appears to have been an etiologic factor in the phlebitis.

Leukemic thromboses have been described, particularly in the sinusoids of the liver and spleen, and in the corpora cavenosa causing priapism, and embolic infarctions have developed from them, and brief mentions of leukemic thromboses in peripheral veins have been made.

We are reporting this case, not because we consider it a new clinical entity, or that it is necessarily rare, but because of its clinical and pathological interest and the possible bearing upon unsettled questions as to the relation of the leukemias to the sarcomata.

Case Report Summary

T.K., age forty-five, single, white, female, seen November 24, 1935.

History: Chief complaint, pain over the internal aspect of the upper right thigh. Duration, one week. Progress, none, getting

Present illness: For a week patient has had discomfort and pain along the inner side of right thigh, with redness and thickening extending straight downward.

No similar swellings or pain elsewhere on the body; or of any trauma to toes or legs. For about three weeks there has been a gradually increasing dyspnea, not disabling enough to prevent simple activities. Appetite rather poor of late. Some palpitation on exertion with swelling of her ankles at evening. Her main concern was the pain, swelling, and redness in upper right thigh.

Past history: Essentially unimportant and no known varicosities of the legs, or any pelvic inflammatory disease admitted. No operations, accidents, injuries, skin eruptions or bleeding.

Brief summary of physical examination: Extreme pallor of skin and membranes. In the upper right thigh there is a tender, red, swollen, indurated mass, evidently the femoral vein. No evidence of involvement of other veins. No evidence of injuries such as abrasions or cuts in lower extremities.

There was extensive bilateral inguinal, axillary and cervical adenopathy.

A large mass, evidently the spleen, extended three fingers below the left costal margin and the liver appeared somewhat enlarged.

Blood count showed Red cells 2,300,000, Hemoglobin 5.5 grams (36%), White cells 425,000. Differential: (200 cells), Polys 3.0, Lymphs 95.5, Lymphoblasts 1.5.

Stained films showed slight achromia, an occasional microcyte and macrocyte; but monocytes, basophils and eosinophils were extremely rare. Most of the lymphocytic types were small, deep staining, with little cytoplasm. The platelets did not appear to

be reduced.

Diagnosis: Chronic lymphoid leukemia;
acute phlebitis of the femoral vein.

The patient was transferred to Syracuse Memorial Hospital for purposes of transfusions and subsequent roentgenological treatment.

While there, in preparation for transfusion, it seemed wise to investigate the nature of the seemingly inflammatory and thrombotic condition in such a large vein because of the possibilities of embolus; so with her consent a biopsy was done by Dr. A. G. Swift, who later did a blood transfusion. Roentgen ray treatment to the spleen followed.

Abstract of the microscopic findings in the vein: Several different blocks were cut from the portion of vein removed at operation. Sections from different blocks presented somewhat different pictures. Lumen of vein in some sections contained a thrombic mass consisting almost entirely of closely packed leukemia cells. This thrombus resembled very much so-called "tumor cell thrombi" frequently seen as a result of infiltration of a vein wall by a malignant tumor. (Fig. 1.). In other sections only the peripheral portion of the thrombus was made up of such cells arranged in a layer which appeared to be closely adherent to the vein wall. (Figures 2 and 3.) The wall of the vein itself showed considerable infiltration with similar leukemia cells scattered among the muscle and connective tissue cells. (Figures 3 and 4.)

Comment

Syphilis of the veins has been described; actinomycosis of veins, secondary to involvement of the liver has occurred in several instances; tuberculosis of the

vems is not a rarity, but proved leukemic infiltration of the wall of a vein resembling a true malignant tumor apparently has not been described in literature

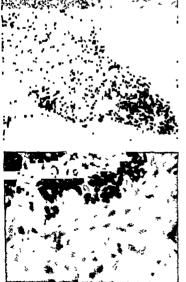

Microscopic findings as described in the biopsy report in the wall and lumen of a large peripheral vein in a case of leukemia are not particularly surprising when the tumor-like character of leukemia cells is considered, and it seems likely that they must occur more frequently than the references in the literature and text books would indicate. In the absence of massive invasion of the vein wall and growth directly into the lumen of the vessel, such as occurs with malignant tumors, the exact origin of the large solid masses of cells in the lumen is not entirely clear. In a case of acute leukemia in a child which was recently studied and will be included in a group of cases soon to be reported by two of us (Wyatt and Groat) there was an unusual finding in the capillaries of the bone marrow, spleen, kidneys and lymph nodes which may have a bearing on the matter of

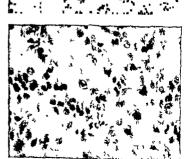

Fig 1 Leukemia cell thrombus in lumen

thrombosis in leukemia in general In that case there was a sudden rise in the number of leukocytes in the circulating blood from a relatively low count to 163,-000 on the second day before death, falling on the day before death to 6,300 In the capillaries and blood sinuses of the tissues named, particularly in the bone marrow, there were found very numerous rounded or elongated clumps of leukocytes, tending to be somewhat fragmented Some of these clumps were quite large and completely filled large capillaries and sinusoids. They did not seem to be in phagocytes. This finding would suggest that in connection with the sudden falls in the number of circulating leukocytes which frequently occur, there may be considerable clumping or agglutination of the lenkocytes in the various capillary fields, and that such clumps if they occlude a sufficient number of capillaries may explain the beginning of a growing thrombus which may reach a vein of considerable size

CASE REPORT

SUBCUTANEOUS EMPHYSEMA COMPLICATING LABOR

HAROLD F. HULBERT, M.D., Dansville

The occurrence of subcutaneous emphysema is a rare complication of labor and of sufficient interest to warrant the report of this case.

B. S., primipara, age twenty-four, started in labor at five A.M. June 17, 1935. Pains were poor and progress slow during the first twenty-four hours. She was admitted to the Dansville General Hospital on the afternoon of June 18, at which time the head was engaged but still high in the pelvis, and the cervix was very rigid. As the patient was making slow progress, becoming nervous, restless and using her pains very poorly, she was given morphine grs. 1/4. After several hours rest the pains returned, being much stronger and more effective. She made slow but steady progress, the cervix being much softer and dilatable. At about seven A.M. June 19, I was called to the hospital to see her because of swelling of the face. Her right eye was swollen half shut and the right side of her face was swollen. On pressure the swollen area gave the sensation of crepitation or crackling of air in the tissues. On pelvic examination the fetal head could be felt well down, position left occiput anterior with the cervix fully dilated. The fetal heart sounds were 120, heard best in the left lower quadrant. Under ether anesthesia the baby was delivered with forceps. A second degree tear of the perineum was repaired. The baby weighed 834 pounds and breathed poorly at first but responded favorably to insufflation of carbon dioxide and oxygen. The placenta separated in forty-five minutes and was expressed by the Crede maneuver with some difficulty. The duration of labor was, first stage fifty-two hours, second stage three hours, third stage forty-five minutes. There was only a moderate amount of hemorrhage during labor.

The patient had to be catheterized for the first twenty-four hours following delivery. The swelling spread during the next twelve hours so that both eyes were nearly swollen shut. Both sides of face, neck, anterior chest and shoulders also were swollen, giving a very grotesque appearance. For the first twenty-four hours the temperature varied from 100.2 to 101.2 rectal, pulse 100 to 136, and respirations 22. The temperature never went any higher than 101 rectal and dropped to normal on the third day. The pulse remained rapid 110 to 120, gradually quieting down about the fifth day to 90 and remained

within normal limits thereafter. There was no organic heart murmur, irregularity or evidence of pre-existing heart disease. Examination of the lungs showed no evidence of pulmonary disease. No rales were heard in the chest. She complained of only slight pain, a feeling of tension in the tissues, shortness of breath, and a feeling of anxiety. There was no discoloration or cvanosis of the swollen area. An x-ray of the chest was taken immediately after delivery and showed air in the subcutaneous tissue of chest and neck, but no evidence of pneumothorax or pathology in the lung. There was no evidence of bone injury of the chest wall. The swelling began to subside on the third day and was completely gone on the seventh day.

Her past history was essentially negative. She had visited the office at regular intervals during her pregnancy and at no time did she show any indication of complication. Blood pressure and urine analysis were normal throughout. Pelvic measurements, intercristal diameter twenty-eight cm., intertrochanteric diameter thirty cm., interspinous diameter twenty-four cm., external conjugate diameter eighteen cm.

Convalescence was uneventful except that on the tenth day she developed some tenderness along the left femoral vein, no edema, temperature 100. This subsided within a week and recovery was complete for both

mother and baby.

Subcutaneous emphysema in labor is a rare occurrence. Reckett⁴ in 1922 reporting a case stated that in fifty years practice, twenty-five years of it in the British army including charge of hospitals for soldiers wives at home and abroad, he had never encountered a case previously. Charbonnet⁵ in 1925 in reporting a case stated that he had never heard of a similar case. The condition was first reported by Simmons in 1783. Kosmak⁶ in 1905 in reporting a case made a review of the literature and was able to find seventy-seven cases reported up to that time. Gordon1 reported two cases in 1927 and made an extensive review of the literature and was able to find record of only one hundred and thirty cases in the entire medical literature up to that date. There have been about a dozen cases reported since then. Maroney2 reported a case in 1933.

Subcutaneous emphysema complicating labor usually occurs in primiparae, although

it has occurred in multiparae. No previous pathology or history of pulmonary lesions have been found in the majority of cases. For the most part it has occurred in healthy, strong, normal women with no previous complication. The condition usually comes on in the second stage of labor, but sometimes occurs in the first stage and in some cases has occurred following the delivery. Dystocia with a long hard labor, especially a prolonged first stage with hard expulsive efforts, seems to be the usual history in the majority of cases. Only a few have been comparatively easy deliveries, so that it is believed that dystocia due to rigid cervix, disproportion, contracted pelvis, dry labor,

etc., is a definite causative factor. Undoubtedly in the violent expulsive efforts of labor with the associated deep breathing and holding of the breath the air passages, trachea, bronchi and pulmonary alveoli are under great pressure. Some believe the escape of air might occur from rupture of a pulmonary alveolus with passage under the pleura to the base of the lung, opening a path through the sheaths of the great vessels, infiltrating the mediastinum and following the vessels to the trachea into the neck from where it finds its way into the cellular tissues of the face, neck, and chest. Gordon stated in his paper that the trachea may rupture as occurs sometimes in whooping cough with the escape of air into the tissues. Some observers believe it may be due to rupture of the nasolacrimal duct. Viana7 cites a case which he believes might have been due to such a phenomenon. Only clinical deductions are possible as but two cases in the literature terminated fatally and only one of these came to autopsy which

showed ruptured pulmonary alveoli. Little or no experimental work has been done.

The swelling appears first on the face and neck and may extend down to the chest, shoulders, and arms, and infrequently to the abdomen and remainder of the body. On palpation the swelling gives a characteristic feeling of crepitation or crackling of air in the subcutaneous tissues. There is usually no discoloration, redness or cyanosis. Pneumothorax was not reported in a single case. The chief subjective symptoms are a feeling of tension, occasionally pain, some difficulty in breathing, a choking sensation, difficulty in swallowing, stiffness, cough but rarely aphonia. The patient seldom complains of much discomfort and does not usually appear very sick. The temperature may or may not be elevated. The pulse is usually accelerated. Only a few cases have had marked dyspnea and respiratory dis-

The prognosis has been good in the cases reported. No special treatment is neces-However in cases in which the emphysema is becoming worse or eyanosis and respiratory distress are present, the patient should be delivered without delay. The condition usually clears up in from five to fourteen days.

THE AUXILIARY "HORBY SHOW"

The Woman's Auxiliary to the Medical Society of the State of New York, of which Mrs. John L. Bauer is President, will hold a "Hobby Show" in conjunction with the Annual Meeting of the State Medical Society, at the Waldorf-Astoria Hotel, from April 27 to 29. Any county within the State which shall have a Woman's Auxiliary may exhibit. We shall be pleased to exhibit the hobbies of the Doctor or his wife, which may include anything.

Will each exhibitor please observe the

The March issue of the Radiologic Review and Mississippi Valley Medical Jour-nal (Quincy, Ill.) is the ninth annual "Radium Number" of that publication. It is entirely devoted to Radium, containing ten original articles, especially written for this issue by leading American radium

following rules: 1. Give each exhibit a "Title." 2. Label each exhibit with the owner's name and home address. 3. Place a money value on each exhibit and this statement must be signed by the owner. 4, Please deliver and call for all exhibits on the days, and at the place the committee shall specify.

The committee is asking your hearty cooperation in making this first "Hobby Show" a huge success. For any further details please call or write to Mrs. Edwin A. Griffin, General Chairman.

therapists on various phases of radium therapy. There are contributions by Jones of Cleveland, Schreiner and Wehr of Buffalo, Soiland of Los Angeles, Murphy of Minneapolis, Fox of Dallas, Levin and Sittenfield of New York, Swanberg of Quincy, Simpson of Chicago, etc.

BETWEEN MENTAL HEALTH AND MENTAL DISEASE

B. LIBER, M.D., DR. P.H., New York City

Editorial Note: Under this title will appear short summaries of "transition cases" from the service of this author in the New York Polyclinic Medical School and Hospital. The descriptions are not complete clinical studies, but will accentuate situations from the point of view of individual mental hygiene such as crop up in the every day practice of medicine

Impending Danger

A woman of twenty-four, married three months, complains of being "run down." She believes she has cancer because her mother died four months before of cancer. She is slim, much underweight, probably due to fear of food. She thinks she must diet herself in order to avoid her mother's fate. Nothing abnormal is found physically, which she is told in the friendliest, but most emphatic and convincing manner. She is told what cancer means and that her mother's condition will not necessarily bring about a similar state in her daughter. The need of more food and more nourishing food is accentuated.

Within a short time this patient actually gains some weight and improves all around. But a few months later, being away from the doctor and his influence, she falls back into her old fear of cancer and avoidance of food. She is also restless, unhappy, and cries much. This time her conversation suggests some mental disturbance, which soon, after a few sessions, unfolds itself clearly. One may call it a situation neurosis or, since it is not a characteristic symptom complex, it may be left nameless; it is best to leave it so and not allow it to develop.

Her husband is sexually indifferent and although intercourse takes place from time to time, at comparatively rare intervals, it is performed in a prosaic, and to this patient, in an unpleasant and unsatisfactory way. Something new, however, comes to gradually replace the necessity for the sexual act. The husband's sister, single and older than the patient, is flirting with her more and more and attracting her attention to a novel gratification. At first, the patient is astonished. She had never heard of such things. Kissing and embracing between the two women become frequent, although the

patient seems to dislike it. Then, one day the seducer takes her victim to a theatre show where such relations between women are clearly expounded on the stage. This has the effect of authoritative conviction and the patient submits now without muttering to the caresses of her female sweetheart. But not for long. After a while she cannot endure it and comes to see the doctor again. Not that she had failed to consult physicians, always believing that somebody will give her a more direct and more drastic remedy—a "medicine" she says—than "mere talks." The other doctors, hearing her complain about "gas, indigestion, sleeplessness" and similar symptoms, searched honestly, but, not going deeper into the problem, failed to help her.

The situation is finally this:

The husband, being unsatisfactory, has caused his wife, who is naive and of average intelligence only, to accept homosexual love. But the latter is repulsive to her and, what is more, even less gratifying than the weak heterosexual activity. As the patient has schizophrenic tendencies which, under unfavorable conditions, may change into a real psychopathic trouble, she begins to feel "uncomfortable in crowds where her sister is present" and later "uncomfortable in crowds" anywhere.

A frank eye-opening talk with the husband helps to improve the condition immensely. Also meeting his sister and telling her how much she is contributing to an impending disaster, makes her leave the city.

The result, several months later, is still good. The patient, now pregnant, is happy, talkative, and dreaming about the future.

611 West 158 St.

A BULLSEYE

A telling spear-thrust at state medicine is delivered in three crisp sentences by Dr. Oscar H. Bohm in the Yonkers Medical News:

"The Complaint in this country is not with the quality of medical care but with the inability of a considerable portion of the

population to purchase same. The same difficulty exists with respect to food, clothing and sanitary housing. Obviously the remedy is to increase the purchasing power of labor rather than lower the standards of medical service and demolish the economic opportunities of the physician."

Special Historical Article

THE MEDICAL HISTORY OF SCHENECTADY COUNTY

ELLIS KELLERT, M.D., Schenectady

Christopher Columbus made four voyages to the new world and an account of the second voyage was written by Doctor Chanca, physician to the fleet. On that first glorious adventure across the "sea of darkness," there was no medical attendant but the second expedition was more carefully planned, much larger and had colonizing aims. Doctor Chanca was thus in the year 1493, the first physician to visit America, having left Cadiz, September 25, 1493, and landed in the new world November 3, 1493, on an island not previously visited by Columbus. He described minutely the land, vegetation, and inhabitants; the journeys into the interior, and the astonishment of the natives at the sight of the Spanish vessels. We thus have from the pen of a physician a record of one of the most important events in the history of civilization.

One hundred and thirty-eight years later, in 1631, a physician from Holland landed at New Amsterdam, journeyed up the Hudson to Fort Orange, the present Albany, and from there, with two companions, explored the Mohawk valley as far as Oneida. He made the journey during the winter months and the account of that exploration in his own handwriting was discovered in 1895 in Amsterdam, Holland. From that document, we learn that Harmen Meyndertsz Van den Bogaerdt, surgeon to the ship, Endracht, left Fort Orange in December 1631, with Jeronimus de la Croix and Willem Tomassen. These three kindred spirits set out on foot to explore the Mohawk valley; traveled up the river about 120 miles and we like to think that their first bivouac was in Schenectady, then, of course, a primeval wilderness. This event was years before Van Curler paid his first visit to the Schenectady area and reported it as a "most beautiful land."

The Van den Bogaerdt journal is the earliest written description of the Mohawk valley and is of such interest that parts of it are here given as translated. The journey was made because of the reports that the French Indians had made a truce with the Maquas and also a trade agreement, and that the Maguas wanted as much for their animal skins as did the French Indians. The journey began December 11, 1631, and the next day, starting out three hours before

daybreak, the explorers proceeded on a breakfast of dry bread, for the dogs had eaten their meat and cheese. They marched on and stopped at an Indian castle at one o'clock in the evening, only because they could no longer move their feet. On December 13, they arrived at a castle where there were bark houses arranged in rows like streets and where they saw iron hinges, nails, chains and hoops. The chiefs had isolated themselves because of the presence of smallpox; but one, named Andriochten, came, in response to a message, and bade them welcome. They are cooked venison and "in the evening Willem Tomassen, whose legs were swollen from the march, had a few cuts made with a knife therein and after that had them rubbed with bear grease."

December 14, "went to shoot turkeys with the chief but could not get any. This chief showed me his idol; it was a male cat's head, with the teeth sticking out; it was dressed in duffel cloth." On December 16, they ate beaver meat with the famous hunter, Sickarus, who had 120 beaver skins for sale.

December 17, the Indians showed them sulphur which they believed good against

many maladies.

December 20 .- "they lent me this evening a lion skin to cover myself; but in the morning I had more than a hundred lice." On December 22, they visited more houses filled with corn and beans and were objects of great curiosity to the savages. December 23, "bought some bread baked with nuts and cherries and dry blue berries and the grains of the sunflower."

December 24. "It was Sunday. I saw in one of the houses a sick man. He had invited two of their doctors that could cure him-they call them simachkoes; and as soon as they came, they began to sing and to light a big fire. They closed the house most carefully everywhere, so that the breeze did not come in and after that each of them wrapped a snake-skin around his head. They washed their hands and faces, lifted the sick man from his place and laid him alongside the big fire. Then they took a bucket of water, put some medicine in it and washed in this water a stick about a yard long, and kept sticking it in their

throats so that no end of it was to be seen; and then they spat on the patient's head and all over his body; and after that they made all sorts of farces, as shouting and raving, slapping of the hands; so their perspiration ran down on all sides." Note the detailed record of this medical procedure. How agreeable it would be if in these days the doctors, in treating cases, would themselves take the hypodermic injections.

December 25.—They could not march because of the snow and lack of help to carry their goods. December 27—stopped at a little cabin in the woods where it was so cold that he slept only two hours. December 30—went to the Sinnekens castle where they saw many scalps. The houses there had fronts painted with all sorts of beasts and the natives slept on elevated boards. Dried salmon were hanging in the houses. January 3-"Some old men came to us and told us they wanted to be our friends, and they said we need not be afraid. And I replied we were not afraid, and in the afternoon the council sat here—in all, 24 men—and after consulting for a long while, an old man approached me and laid his hand upon my heart to feel it beat; and then he shouted we really were not afraid at all."

January 4—"Two savages came, inviting us to come and see how they used to drive away the devil." January 10—"Jeronimus burned the greater part of his pantaloons, that dropped in the fire during the night, and the chief's mother gave him cloth to repair it, and Willem Tomassen repaired it." On January 12, they departed with their accumulated beaver skins. On January 15, for some reason he could not make a fire and was obliged to walk the whole night to keep warm.

On January 21, 1632, these explorers returned to Fort Orange and reported what they had seen. It is quite possible that this report subsequently came to the attention of Van Curler and led to the founding of Schenectady in June 1661 by Van Curler and fourteen others who bought the site of Schenectady from the Indians by the payment, in 1672, of "foure hundred hands of wampum, 30 barrels of lead, 3 bagges of Powder. More for a present, 3 ankers good beere, one koatt duffels, together with the above mentioned rundlet of brandy."

The original name was Schau-naughta-da, which in the Iroquois language meant "over the pine plains" and was probably the Indian name for Fort Orange, the present Albany. This fact should be borne in mind, for if the three large cities in this area should ever merge into one supercity, then the logical name for the new metropolis would be Schenectady. It was in 1753

that the Rev. Gideon Hawley visited Schenectady and referred to it as a town in some respects similar to Albany and very pleasant. Little is known of the subsequent activities of Van den Bogaerdt except that he remained in the colony and was probably the first surgeon to practice in New York City. He also was commissary to the fort at Albany in 1633, and is said to have been killed by the Indians. He was an irritable man and had no respect for authority, for he once attempted to throw the directorgeneral of the colony out of a boat on the Hudson river. Van den Bogaerdt had a son, Frans, born in 1640 who was killed in the Schenectady massacre of 1690, and a grandson, Frans, Jr., killed in the Beukendaal massacre of 1784. His descendents still live and practice medicine in Schenectady, 304 years after that first memorable tour, surely a unique record in American history.

In 1773, there died in Schencetady Dr. Richard Shuckburgh, author of the verses of Yankee Doodle, written in 1758, at Fort Crailo, Rensselaer. Shuckburgh was born in England and served as an officer in the British army. After the French and Indian wars, he was made secretary of Indian affairs by Sir William Johnson and resided for a brief period in Detroit after which he

came to Schenectady.

Even in the early days, New York was the leader in medical legislation. In 1760, the state or colony required a medical candidate to satisfy a commission as to ability and in 1806, all candidates were obliged to undergo four years' apprenticeship, included in which could be a year in a medical school or college. There were then thirty-five county medical societies and they were authorized to conduct examinations and license physicians. Schenectady county was formed from Albany county March 7, 1809 and under the legislative enactment of 1806, the Medical Society of the County of Schenectady was organized and the first meeting held June 11, 1810 in the Court Room. A constitution and set of by-laws were adopted, from which the following interesting items are taken: The initiation fee was one dollar and dues two dollars, payable quarterly. For non-attendance at regular meetings a fine of one dollar was levied. Members were enjoined from holding any nostrum or specific for the cure of a disease under penalty of forfeiting his seat. Thus, there was an early attempt to control unethical advertising.

At the meeting held September 11, 1810, "Joseph F. Yates presented himself as a candidate for the Practice of Physic and Surgery and was immediately examined on the various branches of medicine and was

found sufficiently qualified for the Practice of same and therefore admitted." He thus became the first physician to be licensed by

the County Medical Society.

The first officers of the Society were: Archibald II. Adams, president; Wm. Anderson, vice-president; Alex G. Fonda, secretary, and Corns. Vrooman, treasurer. Meetings were scheduled to be held quarterly but there were long periods when none were held. At the anniversary meeting of June 9, 1835 an amendment to the by-laws stated that at the meeting one year after his election, the president shall "Deliver to the society a dissertation upon some appropriate subject", a custom which still prevails.

Meetings were held most often in the city but occasionally in the outlying towns at the homes of the members. Usually there was a dinner followed by the business and scientific sessions. What marvelous discussions they must have had for none knew much about scientific medicine and each considered his own theories correct and his remedies curative. They were vigorous, outspoken men and cared little about the other fellow's feelings when in scientific debate. Many of these men were born psychologists and realized the value of the positive and assured bed-side manner. When, however, a similar attitude was adopted toward their confreres, violent antagonisms arose for each knew the limitations of the others. In fact, unofficial records refer to occasional physical combat. This must have been very disturbing to the society for the attendance diminished and in 1836, Dr. Prime, secretary, notes "when the members gathered together, not enough staved long enough to form a quorum; after an hour of waiting the officers retired." The internal dissensions became so serious that in 1841, meetings ceased for a period of twenty-eight years. At that time, there was considerable discussion as to whether a certain doctor had not obtained his diploma fraudulently.

The society was reorganized January 19, 1869 and a new constitution, set of by-laws and code of ethics adopted. Those who reorganized the society were A. M. Vedder, L. Ellwood, J. D. Jones, C. Hammer, Q. Fuller, W. D. Cheesman, B. Mynderse, G. Van Voast, W. Duane, Meetings were held not only in Schenectady but in Duanesburgh, Quaker Street, and Pattersonville. social phase of the meetings must have been greatly enjoyed for an early minute states that "The society then repaired to the din-ing room of Dr. Ennos when a collation was served which the society seemed to appreciate by the very satisfactory manner in which this order of business was

despatched."

Many members were elected in the years that followed. In 1873, the first move toward a county medical library was made, for the society appropriated \$25.00 for medical and surgical journals. In the same year the fee bill was revised and it was resolved "that hereafter it will be considered as a demeanor on the part of any member of this society who shall receive a student of medicine in his office who does not present previous to beginning his studies a certificate from the censors of the society certifying to his possession of a proper preliminary education and qualifications." There was thus in vogue the very valuable system of precentorship which was recently abolished in a furore of reform in medical education but the virtues of which are again realized and in a measure to be restored.

Few formal papers were read at the meetings and apparently seldom by outside physicians. Case reports were presented and we find recorded, cases of embolism, tracheotomy, diphtheria, intestinal obstruction, puerperal septicemia, and the use of the new antipyretics. It is interesting to note how this type of practice has largely disappeared. In 1883, the society voted that the city physician and the health officer were inadequately paid. In 1885, a request from the Society for the Care of the Insane was received asking that a committee be formed to report on the care of the insane in the county. There must have been some criticism of the care of mental cases for it was in 1861, that a brick addition to the west side of the poorhouse was erected for the care of the insane, at a cost of \$3,000. In 1886, it was voted to issue a "dead-beat" list and so it appears that medical economics at that time presented problems quite similar to those of today.

Although he was not a practicing physician in Schenectady we cannot refrain from special mention of one who was born and educated here and subsequently acquired an international reputation by virtue of his accomplishments. Dr. Theodric Romeyn Beck was born in Schenectady August 11. 1791, one of five sons, two of whom were physicians. He graduated from Union College in 1807 at the age of sixteen and studied medicine in New York City under the famous Dr. David Hosack. Beck married at the age of twenty-three and a year later was made Professor of the Institutes of Medicine and Lecturer on Medical Jurisprudence in the College of Physicians and Surgeons for the Western District of New York, located at Fairfield in Herkimer County. When not lecturing at the school, he practiced in Albany. He gave up practice in 1817 and became principal of the Albany

Academy. In 1829 as president of the State Society, he delivered an address on "Medical Evidence" in which he urged the appointment of trained and experienced medical men to perform postmortem examinations. In a subsequent address he urged the special study of pathology, anatomy, and chemistry and pointed out the falsity of many medical theories. His last annual discourse dealt with the subject of smallpox and he, most vigorously, urged compulsory vaccination. Beck is best known for his book on Medical Jurisprudence, first work of its kind in English and published in 1823. This work ran through ten editions and was translated into many foreign languages. For years it was the authority on medical jurisprudence and gave to Beck world-wide renown. In it was a chapter on infanticide by his brother John, also an eminent physician.

Small-pox, yellow fever, and cholera were the great decimators of the day. Water was suspected to be a vector of contagion and there were crude attempts at public hygiene. In the old days there were public and private wells and officials known as well masters were appointed and "strictly enjoined to see to it that no water is poured out near the wells and that no rinsing is done there in the space around the wells which is to be paved." Apparently, carelessness and indifference on the part of a few individuals led to early restrictive laws and the appointment of these first public health officials in October 1679. Subsequently additional laws were enacted such as those relating to the throwing of filth into the streets.

In 1826, the county poor house was opened and Dr. John La Tonelier appointed physician at an annual salary of seventy-five dollars.

Schenectady was incorporated as a city April 29, 1833, and in that year the office of city physician was created. He was health officer of the Board of Health and required to render surgical aid and assistance to all indigent persons within the city and to keep himself supplied with kine pock matter for the indigent.

The drinking water in the settlements was generally polluted and consequently much beer and wine were consumed. It was realized that water close to habitations bore some relation to intestinal disease, and yet simple methods of purification were neglected. In 1832, the medical fraternity of the city lost a golden opportunity to acquire great fame for in that year Chester Averill, A.M., wrote an open letter to Mayor John I. De Graff, in which were presented "Facts regarding the disinfecting Powers of Chlorine with an explanation of the mode in

which it operates and with directions how it should be applied." At that time chlorine was recognized as "the most powerful agent hitherto discovered to counteract contagion and all kinds of noxious effluvia and its sanatative powers appear equally extraordinary." "When it is desirable to purify the water of a cistern—dissolve 8 ounces of the chloride of lime in a pail full of water and disperse it into the cistern."

[Volume 36

What an unfortunate circumstance that this letter was not seized upon by the doctors of the city and the method urged in the interest of public health. Had this been done, many thousands of deaths from intestinal infections would have been avoided, and the Hudson and Mohawk valleys would have missed the unenviable reputation for typhoid fever, which was so prevalent in the latter part of the nineteenth century. Averill's letter was published as a pamphlet by Isaac Riggs and appears to be the earliest reference in the American literature on the chlorination of water, a method which became popular in recent years and is now universally employed. It was in 1896 that George W. Fuller first applied chloride of lime to the raw water flowing over experimental sand filters in Louisville, Kentucky.

In 1832, Asiatic cholera, prevalent in Canada and the colonies, visited Schenectady. As might be expected from the character of the water supplies, it proved particularly deadly and funerals "took place almost hourly for a considerable time." The old brick college building was fitted up as a temporary isolation hospital and the health officer, Dr. Tonelier, assisted by Drs. Mc-Dougall, McGriffin, and Toll, attempted to combat the epidemic. Not knowing the cause or mode of spread of the disease, they accomplished little; but what a different story would be told, had they followed Chester Averill's suggestion and used chloride of lime in the well waters. Soon, however, nature proved the best ally for with the approach of frost and the consequent freezing of the ground, pollution of the wells ceased and the epidemic faded out.

In 1868, Wm. J. McAlpine, C.E., rendered a report to the water commissioners on the advantages of a public water supply. He wished to abolish the cisterns and wells, claiming that a better quality of water in the form of a public supply would be possible and money saved to the community by abolishing disease. Subsequently, a water company was formed and water taken from a spring and conducted through wooden pipes which were simply logs with a three inch hole bored through them. In 1869, as a result of the citizens voting down a municipal water works, a new company was

1.5 × 3

formed and water taken from the river was filtered by the Holley system and supplied to the city. It was only in 1872 that hydrant water for extinguishing fires became available. The water, although abundant was highly polluted and considerable typhoid

fever prevailed in the city.

The present water works at Rotterdam were established in 1895 and an adequate supply of pure water of high sanitary quality supplied to the city where water-bourne disease is now unknown. In 1914, an equalizing reservoir with a capacity of 20,000,000 gallons was constructed. About 15,500,000 gallons of water are pumped daily, the water coming from a gravel bed underlying the valley, and estimated to contain sixty-three billions of gallons of water, primarily that of rainfall.

The largest medical institution in the county is the Ellis Hospital, which opened March 27, 1893 in a building on Jay Street, but now demolished. Originally a small institution, built with a bequest by Charles G. Ellis of manufacturing fame in the city, it received its first considerable endowment from a physician, Dr. Robert Fuller. Prior to the founding of the Ellis Hospital, there existed a smaller institution, called the Schenectady Hospital and Free Dispensary. These two organizations merged under the name and control of the Hospital Association of the City of Schenectady. The present building, under the management of this association, was opened October 13, 1906 and the original thirty bed hospital has developed into an institution containing 285 beds, a nurse's training school, extensive laboratories, x-ray and physiotherapy departments and specialized clinics of various kinds, treating over 7,000 in-patients and 12,000 outpatients annually,

The Glenridge Sanatorium, devoted to the care of tuberculous patients, was established in May 1908, and consisted of tents erected on the present site of the Maqua Company building. It was then known as the Red Cross Day Camp. In November 1909, the camp was moved to Craig near Aqueduct when it was taken over by the county. In 1911, it was moved to its present site and

consisted of crude wooden buildings. The present elaborate modern institution was erected in 1929, a fine testimonial to the health consciousness of Schenectady County residents. It contains 132 beds and is perfectly appointed for its type of work,

The city hospital for contagious diseases is an institution of thirty-six beds and was first organized in 1906 and enlarged in 1926. It is conducted on the cubical plan and well-

equipped for cases of contagious disease.

The Physicians Hospital was organized in 1907, and in 1913 taken over by the Sisters of Mercy, who renamed it Mercy Hospital, but the following year it was transferred back to the original association. This hospital accommodated thirty patients and had a capable staff and managers, but was closed in 1916.

Dr. Janet Murray was elected to membership in 1893, and thus became the first woman to join the society. Dr. Murray still graces the meetings with her presence.

Schenectady contributions to medical science were practically dormant from the time of Beck to the present era, when the great research laboratory of the General Electric Company was established. Bedside discoveries ceased many years ago, and advances in medicine are made chiefly by aids to the special senses. One of the most important of these methods is the x-ray, and medicine is greatly indebted to the inventions and discoveries of Dr. W. D. Coolidge for enabling us to see more clearly what takes place within the body in diseased conditions, and for effective equipment for successfully treating malignant tumors; to Dr. Willis R. Whitney for the development of fever-inducing machines to combat the ravages of infectious disease: to Dr. Irving Langmuir for better types of lamps with which to peer into the body cavities and to vield health-producing ultraviolet light; to Dr. L. T. Robinson, for the development of a portable electrocardiograph. These men. like Pasteur, are not physicians, but they give us tools which enormously enhance the good that doctors may do, and they are part of the medical history of Schenectady County.

AN INTERNATIONAL COMPLIMENT

A dispatch from Melbourne, Australia, tells us that international cooperation and good-will soon will enable a three-year-old Melbourne boy who swallowed a packing nail with a large head to visit America for treatment.

Two operations having failed to dislodge the nail from the boy's lung, Professor Chevalier Jackson of Temple University,

Philadelphia, has agreed to operate free of

charge,

United States Government waive immigration laws to allow the boy and his mother to remain as long as necessary, the Roosevelt Line of New York is providing free passage to America and return and a Melbourne philanthropist is paying all incidental expenses.

EDITORIALS

The Annual Meeting

The Annual Meeting is almost at hand, offering to physicians the state over an opportunity to combine graduate study with relaxation and amusement. The session which will open at the Waldorf-Astoria Hotel in New York City on April twenty-seventh promises to rival the most brilliant conventions of the past in its wide range of intellectual and social interests.

The modern medical meeting cannot rest on its scientific program alone. Social and economic trends have an enormous influence on the conditions of practice and physicians must continually reorient themselves in relation to changing forms of government and community life. This has never been more true than today. when ill-advised social theories and bureaucratic tendencies threaten the very existence of the private practitioner. In such circumstances it is imperative that the profession appraise its position each year and reaffirm or revise its policies in accordance with the dictates of its fundamental interests.

The program for the Annual Meeting of the State Society gives due consideration to all these factors. A series of carefully chosen papers will survey the various branches of medicine, evaluating new methods and reporting authentic new data. These formal presentations will be supplemented by exhibits illustrating timely points in theory and procedure. At the executive sessions many problems directly affecting the course of practice and the welfare of the practitioner will be considered and policies adopted for the forthcoming twelve months. The membership will have an opportunity to review past activities and help shape future ones, in conformity with the democratic principles of the State Society.

Bearing in mind that this is a vacation as well as a study course for many busy practitioners, the Committee on Arrangements has not neglected the social aspects of the session. The Annual Dinner and a number of other events provide occasion for convivial diversion at the meeting, with all New York at hand for those who desire more mundane amusement. Members who have not yet made their reservations should immediately do so, as there is every indication of a banner attendance.

Syphilis Control

In a current article, which is a report prepared in cooperation between the Social Hygiene Committee of the New York Tuberculosis and Health Association, the Commissioner of Health of New York City, and Dr. Jacob A. Goldberg, there is much that must make thoughtful physicians ponder. If the report is correct in estimating that five per cent of the population of the United States have syphilis at a given time, and of this number only one tenth have medical care, there is here

presented a problem whose intense seriousness cannot be overestimated.

Nevertheless, the report seems to indicate that private physicians play but a small role in the syphilis control thus far.

Our purpose in calling attention to this report lies in the fact that it is a factual study of conditions solely. We await suggestive comments as to what we are to do about it. Constructive corrective measures are desirable, and organized medicine will cooperate to cope with the situation reported.

In this regard, attention is again directed to an illuminating article in our JOURNAL of March 15, (page 451) containing the report of a subcommittee on Public Health Relations of the New York Academy of Medicine. Here possibilities of control, and the organization of treatment facilities are discussed.

Law with Justice

Two bills sponsored by Senator Kleinfeld promise to remove the opprobrium which now attaches to the determination of insanity in criminal actions. Senate Introductory No. 1399 authorizes the judge to appoint a disinterested commission of investigation whenever a plea of insanity is made or there is reason to suspect mental infirmity in a defendant. A corollary act—Introductory No. 1534—provides for the certification of psychiatrists qualified to participate in such cases.

The need for legislation of this type is patent and great. At the present time the plea of insanity is a trump card which unscrupulous attorneys produce whenever the case against their clients is too strong to be broken by other means. A shyster lawyer can always find a quack doctor to back him up; and reputable members of both professions are helpless and ashamed before the resultant travesty of justice.

Introductory No. 1399 removes the important question of sanity from the realm of opportunitism. If it is adopted this issue will no longer be admissible in the emotional atmosphere of the courtroom but will have to be settled in advance. A defendant who is really insane will be

spared the strain and anguish of trial. The mentally sound will have to assume responsibility of their acts.

In the long run a law of this type can be no better than the psychiatrists who help administer it. To ensure competence and integrity in testifying alienists, the second Kleinfeld bill sets standards for psychiatrists and provides for the certification of those who satisfy the prescribed requirements. This would prevent self-styled experts of no particular training or experience from exploiting the issue of mental soundness and discourage the prostitution of professional judgment.

For many years organized medicine has pointed out the flaws inherent in the juridicial determination of insanity under the present laws and has urged appropriate reforms. The Kleinfeld Acts offer an effective and practicable remedy. The Bar Association should join with the official medical societies in support of these bills.

Floods, Water Supply, and a Suggestion

The recent floods upstate have presented the officials in charge of the water works of the various communities affected with a serious problem in preventing the spread of water-borne diseases. Thanks to the foresight of the State Department of Health a warning was issued in advance that floods could be expected when the large amount of accumulated snow and thick ice in the rivers and streams throughout the state began to thaw. The necessity for placing the filtration and chlorination plants in first class condition was urgently stressed in order that the expected threat to the water supply could be met quickly and adequately.

It is appalling to reflect upon what might have happened had this precautionary advice not been forthcoming. The suddenness of the tragedies in various localities would have added epidemics of disease to the enormous loss of life and property. It would have taxed the medical profession in affected areas to properly cope with the unexpected increase in the number of sick people. As it happily

turned out, the water-works officials heeded the advice of the Health Department and were prepared for eventualities.

Different cities and villages were each presented with different problems. In some, pumping was discontinued and the reserve water supply was drawn upon. In others, the turbidity of the water necessitated bypassing the filters for several hours. In all areas which were affected by the rising waters, the chlorine dosage of the drinking water was increased heavily so as to counteract pollution. In addition, the inhabitants of the stricken areas were instructed to boil the water before drinking

What the medical profession has done for the community at large in the field of preventive medicine it desires to perform for the individual. It is to be hoped that the time is not far off when disease in the individual can be prevented as effectively as disease in a community. Were the individual as cooperative as the community in which he lives, preventive medicine would make far more rapid strides than hitherto. While it is true that the functions of the Health Department are directed toward the preservation of the health of the people in a broad sense. we believe that the influence of this official body would go far toward popularizing the importance of periodic health examinations. The money spent by the State in informing the public, through the medium of newspaper advertisements, of the value of milk as the great "alkalizer" and pick-me-up for the "morning after" would be put to much better use in disseminating the value of medical examinations at regular intervals to the end that morbidity may be reduced to a minimum.

Pathogenesis of Actinomycosis

The pathogenesis of acrinomycosis is one of the uncertainties of medicine. The etiological factor is known to be the actinomyces of the Wolff-Israel type. Organisms of this variety have never been demonstrated as existing outside of the human or animal body and it is ex-

tremely doubtful that they propagate in the outside world under ordinary conditions.

Since the most common site of actinomycosis is the region about the head and neck it seems but natural that the buccal cavity should be suspected as providing the portal of entry. This view is further substantiated by the frequent occurence of abdominal actinomycosis. On this assumption, the flora of the normal mouth was studied by Lord1,3 and Naeslund² with the idea of isolating the Wolff-Israel type of actinomyces. Both succeeded in obtaining organisms which bore a close morphologic and cultural relationship to the causative agent of actinomycosis. In addition, each was able to produce in animals, by the inoculation of these organisms, actinomycotic lesions which showed the typical club-bearing granules characteristic of this lesion.

Lord and Trevett,3 in attempting a recheck upon the work of Naeslund as well as their own, again were able to isolate these organisms from the tartar about the teeth and from carious cavities in the otherwise normal mouth. This time, however, the cultural characteristics were different from those of the Wolff-Israel type in that the former were both anaerobic and aerobic whereas the latter is an Nevertheless, these observers feel that Naeslund definitely has established the fact that actinomycosis originates from organisms which are normal inhabtiants of the mouth. Confirmation is needed only to determine whether the cultures isolated by them are in reality the Wolff-Israel actinomyces. They believe that trauma to the tissues of the mouth or intestinal canal may be the motivating factor in these bodies gaining entrance to the surrounding structure and establishing their characteristic pathological lesions.

There also remains to be determined the role played by other organisms as syner-

^{1.} Lord, F. T.: J. A. M. A., 55:1261, 1910. 2. Naeslund: Acta Path. et Microbiol. Scandanav., 2:110, 1925. 3. Lord, F. T. and Trevett, L. D.: Infect Dis., 58:115, 1936.

gistic agents in the production of this disease. The growth obtained by Lord and Trevett would seem to resemble old cultures of the Wolff-Israel actinomyces. It seems possible, from their latest report, that under anaerobic conditions the Wolff-Israel type may adjust itself culturally to its environment whereas once having feigned access to the tissues of the body it adopts a different mode of life. What factors, if any, are capable of producing this change still remain to be determined.

CURRENT COMMENT

"MEDICAL EDUCATION AND THE CANCER PROBLEM" is the topic of an article in the St. Louis County Medical Society Bulletin. We quote from it in part. "In the case of the scattered members of the profession the problem has been more difficult. The general practitioner who sees only two or three cases of cancer in the course of a year's practice is not particularly concerned about the hundreds of thousands of cancer cases which do not come in contact with him. It has been his experience, especially if he is among the older members of the profession, that such cases as he does see are advanced and usually past the stage where he can be of much real assistance. He has been inclined therefore to view cancer with a more or less fatalistic attitude.

For the past six years the American Society for the Control of Cancer has planned and executed campaigns of education to correct this point of view. By its surveys of states and certain municipal areas, undertaken at the request of and in cooperation with local medical societies, it has made real progress. It has amassed a large amount of information concerning the incidence, diagnosis, and treatment of cancer and has placed this confidentially at the disposal of the profession. * * * The public and the profession needs immediately an awakened and enlightened attitude on the part of medical faculties to save and to utilize in the training of future generations of the profession the actual advances which have been made in the conquest of this disease.'

"PLAYED BUT NOT HEARD," an article by Robert Littell in the March 21 issue of Today speaks at some length about the "infra-listeners" to the radio. He describes this category of listeners thusly: "An infralistener is one who somehow feels happier in the presence of a certain noise, but who doesn't really like the noise well enough to

pay conscious attention to it." He tells of the household wherein the radio plays all day and concludes with: "Not long ago, two psychologists (Hadley Cantrile of Teachers College and Gordon W. Allport of Harvard) tried to find out just what effect the constant campus blare of radio was having on the acquisition of knowledge by the young. They got up a questionnaire. The answers to two of their questions are very instructive, and flatter neither the race of students nor the profession of broadcasting. The students were asked if they studied with the radio on. Sixty-eight per cent answered yes. Then they were asked if they thought they studied less effectively with the radio on. Sixty-eight per cent answered ves. This may be called 'infra-listening' with a vengeance."

"IT IS HIGH TIME that we doctors begin to realize the distinction between medical care as a luxury and medical care as a necessity. If the rich still insist on 'shooting the works' in medical diagnoses and treatment, that is their privilege and presupposes their ability and their desire to

The indigent have been well provided for; the so-called great middle class is supposedly our immediate problem. Is the highly developed medical science of today beyond their ability to obtain? This is the burning question that has stimulated 'reformers' to loudly demand a change in the

present medical set-up.

The answer should not be difficult. We must supply medical service to fit the pocketbook in a way that there need be no sacrifice of medical efficiency. Obviously there should be less laboratory work, less hospitalization, less expensive drugs, and less of all dispensable accessories that increase the price of medical service and add little or nothing to their ultimate efficiency. We got along without the 'trimmings' be-fore, and good medicine was practiced. The 'trimmings' are only refinements that need not be added to every case but only to those individual cases where knotty problems present themselves. In a ward, we must distinguish between the practice of medicine as a science and the practice of medicine as a pseudo-science. * * *

There is room for the exercise of sound judgment in medical practice so that the so-called middle class will receive only what is necessary. A fine sense of medical judgment along these lines will be a potent factor in reducing the 'high cost of medica.'

If medicine is to be regarded as a luxury it can be found very expensive for those able to pay. If it is to be regarded as a necessity, it can be made less expensive for those less able to pay. In either case, it still can be efficient. The pendulum has swung too far in the direction of pseudo-science. With our help to science and common sense let it swing back."—Polk County Medical Society in the St. Louis County Medical Society Bulletin.

"THE PRESIDENT REMARKED the other day that the Federal housing program was in such a mess that it was doubtful whether anything could be done about it very soon. Well, if it's in a mess, that's the best of reasons for doing something about it soon. The President's discussion of it at a press conference accomplished one thing, at any rate. For the first time, so far as we know, the Administration made it clear that there are two separate problems which should never be confused or allowed to overlap, but which somehow have become horribly mixed up in the public mind. One job is to provide housing for those who are povertystricken; the other, utterly different, is to encourage the building of small homes for the average American family which is able and anxious to pay its own way."-By the editors of Today in the March 21 issue.

Before the American Psychiatric Association last May Dr. Charles A. Rymer called attention to the "Psychology Racket." Medical Record of March 18 comments on the situation and on Dr. Rymer's paper. "These charlatans utilize every manner of scientific and pseudo-scientific material that they can assimilate, and pour out to the uncritical public an amazing mass of jargon. The food faddist, the 'yogi,' the faith healer, the 'practical psychologist,' and a host of similar dispensers of health and hope, are brothers under the skin. The 'dynamics' and magnetism of their personality, their oratory, their spectacular false generalizations, their emphasis on sex and on 'natural' methods, their peculiar dietetic systems, their brazen panaceas, classify them with the patent medicine man and snake oil vendor of yesterday.

Dr. Rymer cites in detail some of the absurd groupings of human nature and the human constitution which some of these quacks advocate, and gives many details of their 'scientific' and business tactics. * * * Psychological quacks represent an echoing of the modern stress on mental hygiene, psychoanalysis, endocrinology, mineral balance, and the vitamins. The dissembler will be with us until the public learns to be rational and critical, and that is a long way off; or until physicians are able to offer specific and certain remedies for all ailments, and that is equally remote."

In its article on "Typhoid Carrier

Record for 1935," the Health News of March 30 among other facts, states that: "Careful epidemiological investigations of all typhoid cases resulted in an increased proportion of cases in which a carrier was shown to be the probable source of infection. * * * During the year there has been an increased effort to detect the development of the chronic carrier condition in persons attacked with typhoid fever. * * * The chronic carrier condition was detected in a greater proportion of recovered cases than in any previous year. * * *"

"Thorough tests have demonstrated that it is harder for children to learn the answer to the question, 'Two and what make seven?' than the question, 'Two from seven leaves what?' It is easier to learn decomposition than construction, the psychologists gravely explain. Which is a depressing thought, but one that seems to rhyme with the history of this befuddled, bungling race."—From the editors of Today in the issue of March 28.

In the Jackson County Medical Journal of Kansas City, Missouri, we read, "It is axiomatic that nothing received for nothing is worth nothing. . . . But on the other hand, there has been no time in the history of the country when true charity is more needed in medical work, as a patriotic and humanitarian obligation, than the present. It must be administered with care and thoughtfulness, with tact, and with a strict sense of its objective-helping others to help themselves—or a medical paternalistic empire will be created that eventually will undermine the finest things in medicine and react with untold losses to everybody concerned."

FIFTEEN YEARS AGO, in his inaugural address as President of the Medical Society of the County of New York, Dr. George Gray Ward voiced some opinions and sentiments from which we feel we may quote as still being very timely today. "Even to the casual observer there is a trend of events that, like the handwriting on the wall, points a warning that socialization of the profession and State medicine are at our very threshold. We are confronted not only with a threatened socialization, but with a tendency to paternalism which I believe is detrimental to the independence of scientific thought and action, that is undemocratic and therefore un-American. It behooves the profession then to act in unity through its organizations such as this one, to combat the various agencies which, through misguided zeal or for personal aggrandizement are attempting to destroy all that has been gained by the profession of medicine in the centuries of progress toward the highest ideals."

Astoria, L. I., N. Y.

To the Editor:

The address of E. Fullerton Cook, "A Pharmacopeia for Today's Needs," printed in your Journal No. 5 [page 361] has been of great interest to me. It seems indeed necessary to give some information about preparations as to their combination, compatibility, and palatableness. County Societies and the A.M.A. have already made such efforts; but it cannot be done in one hour's lecture; pharmacy is too great a field. May I quote a lecture given by Prof. Wimmer to the Queens County Society and papers of Dr. Fantus, Chicago, the latter papers concerning new combinations published in the N F VI? Strange enough, however, I experienced indifference on the part of pharmacists, and more than once I was told to "stick to the good old drugs."

Graduated in Europe I had to learn different ways of prescription writing; I have become acquainted with drugs unknown or rather not used in Europe. Whenever I asked a pharmacist about vehicles, Syrup of Squill has been highly recommended which is branded as obsolete in the Epitone of the U.S.P. and N F (published by the A.M.A.). Squill was known to me only as Bulbus Scillae used as heart stimulant. On the other hand, when I asked a pharmacist as to whether he has Eriodictyou in stock, (Eriodictyou was unknown to me and I cannot recall its having been mentioned even in lectures), the frequent reply was: "What do you want that obsolete thing for?" Although I do not know Dr. Fantus, I do not doubt his knowledge where medicine and pharmacy are concerned, and I rather rely upon him as being competent, because I figure that the A.M.A. would not publish his papers otherwise; and he recommended Syrup Eriodicty. Aromat. I can understand why some pharmacists do not want to bother with such things. During lunch hours it is often hard to get a prescription filled. On the other hand pharmacists are unwilling to stock items for which there is hardly a call-but it might be the other way that physicians do not prescribe them because the pharmacists do not have the drug in question. They dislike to stock new preparations-that means new expenseswith the uncertainty as to whether there will be a call for them.

Pharmacists blame the public and the increased demand for patent medicines for their decreasing prescription business; I believe, however, that the pharmacists have to shoulder the blame themselves. The right thing to do would be to ask for laws which require prescriptions for a greater number of drugs, sold at present time over the counter without prescription, and to refuse to be agents for quacks and patent medicines of more than doubtful value. Instead of cooperation with the A.M.A. which issues pamphlets for the enlightenment of laity (compare No. 9, Vol. 106, Journal A.M.A., page 36) they rather display advertisements of nostrums-because there is money in it; but there is more money in compounding prescriptions !

I should appreciate the cooperation between all pharmacists and all physicians and the opportunity of exhibits for medical groups as planned.

NAME OMITTED UPON REQUEST March 10, 1936.

To the Editor:

In connection with your article [page 352, March 15 issue], concerning the appointment of a layman by Dr. Jesse Williams, it might be interesting to check up a condition of which I have heard much, in Dr. Williams' own department in Teachers College.

I am told on the authority of the students who have been examined that a lay worker, a physical education teacher (I think her name is Miss Scheer), examined the hearts by means of stethescopic examination and determines whether or not the student is in good health and able to participate in physical education activities. She told a patient of mine that she "had serious heart trouble" which was not at all true. The girl became much alarmed and consulted the cardiac service at Mt. Sinai and was assured that nothing was the matter with her heart but she was still debarred on the authority alone of this lay person's diagnosis.

I cannot disclose my name because I am connected in the educational field and I cannot afford rebounds. Will you please check these statements? Six students have con-

firmed the facts to me.

Society Activities

Committee on Legislation

Bulletin No. 11

April 1, 1936

The Assembly committees were discharged on last Thursday and they have finally reported their action upon bills. There follows a list of those that were defeated:

ASSEMBLY INT.

61-Wadsworth-transfer of TERA to Social Welfare Department. 83—Doyle—antivivisection bill. 93—McCaffrey—Workmen's Comp., physical exam. of employees. 204—Otto-employment of local health officer. 332—Justiceemployees, State hospitals, hours of employment. 446—Steingut—extending TERA to February 15, 1937. 511—Lo Re—transportation of physically handicapped children. 550—Fitzpatrick—hours of labor, employees all hospitals. 623—Breitbart—marriage license, blood tests. 835—Williams—medical and hospital expenses for firemen. 889—McCreery—Decedent Estate Law firemen. 889-McCreery-Decedent Estate Law, negligence cases, proceeds. 920-E. S. Moranemployment of physicians by hospitals. 1026—Breitbart—Criminal Code, blood-grouping tests. 1055-Bush-Mental Hygiene Law, private ins., zoning ordinances. 1134—Milmoe—sale of drugs by duly authorized persons. 1170—Potter—hospital lien bill. 1201—Cariello—payment of undertakers' accounts. 1394—W. Schwartz—Public Health Law, acceptance of Federal funds. 1445—Crews—sale of proprietary medicines. 1683—Neustein—clinical thermometers. 1706—Marble—acceptance certain person from even Marble—exempting certain person from exam. to practice optometry. 1720—Neustein—clinical thermometers. 1765 — Canney — Workmen's Comp., medical care, violating provisions. 1778 —Milmoe—persons who may sell poisonous drugs. 1871 — Breitbart — Domestic Relations Law, blood-grouping tests. 1934-Farenga-administration of certain parts of Federal Social S. Act. 1979—Rossi-Hospital medical superintendents, unauthorized. 1993-Dooling-adm. of certain parts of Federal Social Security Act. 2045-Lo Re-adm. of certain parts of Federal Social Security Act.

New Bills Introduced. Senate Int. 1740—Buckley; Assembly Int. 2102—Steingut; appropriates \$3,890,000 for Social Welfare Department for old-age assistance, dependent children, blind, child welfare, maternal and child health and crippled children, and \$25,000 to Education Department for vocational rehabilitation of physically handicapped. Referred to the Finance Committee.

Senate Int. 1770—Livingston; Assembly Int. 2158—Shelton; amends section 621, Education Law, requiring parent or guardian of any minor between ages of three and eighteen who because of deafness or im-

paired hearing is unable to benefit materially by public school instruction, to send such minor to school where deaf or hard of hearing are given full-time instruction. Referred to the Education Committee.

Senate Int. 1771—Livingston; Assembly Int. 2130—Keogh; adds new section 320-a, Public Health Law, requiring immediate report by physician, nurse, parent or guardian in charge of any minor under six years who is totally deaf or whose hearing is impaired, health officer being required to have scientific test made by an otologist; also to provide such treatment as is needed if parent is unable to meet the cost. Referred to the Health Committee.

Senate Int. 1812—Schwartzwald, adds new section 336, Public Health Law, for licensing and regulation by State Pharmacy Board of all advertising of appliances, drugs or medical preparations for prevention of venereal diseases. Referred to the Health Committee.

Senate Int. 1834—Warner; Assembly Int. 2188—Marble; adds new section 189, Lien Law, giving physicians lien on verdict or judgment or proceeds of settlement or compromise for treatment of persons injured or killed as result of negligence of any other person or corporation. Referred to the Judiciary Committee.

Comment: This bill was introduced in both Houses at the request of the Medical Society.

Senate Int. 1855—Dunnigan; Assembly Int. 2220—Wadsworth; adds new Art. 1-a, amends section 2, Public Welfare Law; repeals sections 10 to 14 and 18, State Charities Law, for reorganizing State Department of Social Welfare and for transferring thereto the functions of Temporary Emergency Relief Administration. Referred to the Relief and Welfare Committee.

to the Relief and Welfare Committee.

Assembly Int. 2175—McConnell, amends section 383, Public Health Law, by providing birth certificate shall contain photograph of fingerprints of mother and footprints of child.

Assembly Int. 2241—Miss. Todd, adds new Art. 59, Education Law, for regulating the practice of beauty culture.

The optometry bill has been amended by striking out paragraph 4 on page 14, and in this amended form the bill has been approved by the Committee.

Bulletin No. 12

April 2, 1936

The two Houses of the Legislature, finding it impossible to agree upon a budget for next year's State expenses, have appointed a conference committee from members of both Houses to attempt to settle the difficulty. In the meanwhile, both Houses are marking time; most of the legislators have gone home and active work will not be resumed until after Easter and probably not before the week of April 20.

This is a very excellent time for every chairman to cinch the matter with his legislators as to how they shall represent him on the chiropractic bill. You have received the latest print and know that the bill is in the hands of the Assembly Committee on Rules. If each county chairman can secure a promise of opposition from his Assemblyman, the bill will be defeated. This is very important and we hope that it will be considered so by every chairman. We are pleased to state that already we have had reports from quite a number of chairmen, most of whom have gotten a definite promise of cooperation from their legislators.

There follows a statement of the present status of each bill that we are following that has been acted upon by its reference committee. You will recall that quite a few bills were killed in the Assembly by the reference committees, while others were referred to the Committee on Rules. In the Senate, bills may remain with reference committees until the close of the session. In this report you will find a statement of the present position of all bills that have been reported out by the reference committees in both Houses:

PRESENT STATUS OF BILLS Senate Int.

12-Buckley-Jury duty, amended. 219-Schwartzwald-State Health Dept. to supply blanks for marriage licenses, chapter 163, 220-Schwartzwald—Vital statistics, still-births, to Governor. 233—Budget Bill—TERA—\$10,000, 000, chapter 88. 348—Twomey—Extension of TERA (2/15/37), 3rd rdg. 377—Quinn— Bringing indigent into State, to Governor, 535 -Schwartzwald-Requirements for residency in St., to Governor. 536-Schwartzwald-Powers of State Health Comsr., to Governor, 855-Schwartzwald-Reports, communicable diseases, to Governor, 867-Twomey-Mnf, and sale of prop. medicine, 3rd rdg. 898—Wicks—Practice of optician, amended. 1084—Schwartzwald— Silicosis, compensation, recommitted. 1181-Bontecou-Diseased cattle, indemnities, recommitted. 1185—Doyle—Practice of optometry, amended. 1248—Byrne—Exam. physician, personal injury action, 3rd rdg. 1259—Nunan—Welfare Law, medical care, passed Sen. 1316—Dunnigan—Name, Onconta T. B. Hospital, passed Sen. 1317—Dunnigan—Social security bill, passed Sen. 1404—Schwartzwald—Narcotic drugs, wholesaler, 3rd rdg. 1431—Dunkel— Poisonous medicine, sale of, passed Sen. 1522— Quinn—Licenses, maternity hosps, N. Y. C., passed Sen. 1569—Feld—Practice of podiatry, amended on 3rd reading. 1589-Livingston-Tests, defective hearing, reported. 1770-Livingston-Deaf children, educating, reported.

Assembly Int.

30—E. F. Moran—Jury duty, stricken from cal. 115—Fitzpatrick— Hours, employees, State ins., reported, 136—Taylor—Testimony, physi-cians, chapter 139. 483—Whitney—Bovine animals, diseases, passed As. 654-Potter-Hours, nurses, State hospitals, passed As. 814-Swartz -Sick prisoners, custody, to Governor, 833-Ostertag-Hours, employees, State ins., passed Ostertag—Frours, employees, some many properties, amended, 919—E. S. Moran—Medical care, indemnity, amended. 963—Parsons—Hospital Lien bill, put over to 4/20. 988—Miss Byrne—Workmen's Comp., interns, passed As. 1158—Swartz to Governor. -Supt. Napanoch institution, to Governor. 1375—Piper—Practice of optometry, amended. 1510—Conway—Foreign physicians, licenses, put over to 4/20, 1511—Conway—Foreign physicians, licenses, amended. 1613 — Sherman — Name, Oneonta T. B. Hospital, passed As.; on 3rd rdg. in Senate. 1690-Bush-Narcotic drugs, wholesaler. Reported. 1793—Robinson—Board of psychiatric examiners, passed As. 1794—Robinson—Criminal Code, insanity of defendant, passed As. 1797—Labor Com.—Workmen's Compensation, silicosis. passed As. 1823—Breitbart—Blood-grouping tests, N.Y.C., and S. 1823—Breitbart passed As. 1832—Canney—Occupational diseases, reports, put over to 4/20. 1872—Breitbart -Civil, blood-grouping tests, passed As. 1884-Brownell-Licenses, maternity hospitals, N. C., passed As. 2011-Rapp-Motor vehicles, vision test for learners, passed As.

> HARRY ARANOW B. B. BERKOWITZ B. WALLACE HAMILTON JAMES F. ROONEY LEO F. SIMPSON

Postgraduate Lecture Courses

conducted by

The Committee on Public Health and Medical Education

Doctor Robert Barber addressed the Sullivan County Medical Society on March 18, on "Vascular Diseases of the Extremities" in Liberty. His talk was well received, and regarded as very practical, and well presented. This was the third of a series of lectures given to this County Society. On April 1, Doctor Lambert Krahulik spoke to this group on "Rheumatism and Rheumatic Carditis in Childhood," and on April 8, Doctor Charles A. Weymuller concluded the course with a lecture on "Diabetes in Child-hood." This course on General Medicine was organized by Doctor Luther Warren, of Brooklyn, from the faculty of the Long Island College of Medicine.

On April 1 a course on General Medicine opened in Elmira for the Chemung County. The lectures are to be given on six consecutive Wednesday evenings in April and May (omitting that Wednesday falling during the meeting of the State Society), alternately at the two hospitals in Elmira. The subjects and the speakers for the various

dates are as follows:

April 1....Dr. O. W. H. Mitchell Staphylococcic Diseases

Woman's Auxiliary

The meeting to organize the Woman's Auxiliary to the Medical Society of the State of New York was held on March 11, 1936, in the Waldorf-Astoria Hotel in New

York City.

Mrs. John L. Bauer, the organizing President, was in the chair. Mrs. Rogers N. Herbert of Nashville, Tenn., President of the Woman's Auxiliary to the American Medical Association, and Mrs. Samuel C. Red of Houston, Texas, the founder of the Woman's Auxiliary to the American Medical Association, were present. Representatives, in the proportion of one for each twentyfive members, or fraction thereof, from the six organized county auxiliaries, with the exception of Albany county, were in attendance. A Constitution was signed by everyone present and By-Laws were adopted. The following officers were elected to serve until the Annual Convention in 1937:

Mrs. John L. Bauer (Kings County) President Mrs. Francis R. Irving (Onondaga County)

President-Elect Mrs. Edward A. Flemming (Queens County)

1st Vice-President DOCTOR'S WIFE

Pneumonia

April 15......Dr. James K. Quigley Practical, Everyday Obstetrics

April 22......Dr. Thomas P. Farmer The Newer Endocrinology and Gynecology

Diseases from the Standpoint of the General Practitioner

May 13......Dr. Clayton W. Greene The Management of Hypertension

A general course is being arranged for the St. Lawrence and Jefferson County Medical Societies, with lectures to be given in Ogdensburg and Watertown respectively, on Thursdays in April and May. The meetings in Ogdensburg will be held at 1:00 p.m., and in Watertown at 8:00 P.M. The subjects and speakers for the different dates will be announced later.

Mrs. Frederic E. Elliott (Kings County) 2nd Vice-President

Mrs. Henry L. Hirsch (Nassau County) Rccording Secretary

Mrs. Irving J. Sands (Kings County) Corresponding Secretary (App'd. by Pres.)
Mrs. Daniel J. Swan (Queens County) Treas-

DIRECTORS

Three years: Mrs. Charles H. Goodrich (Kings County) and Mrs. Albert M. Bell (Nassau County).

Two years: Mrs. Harry S. Bull (Cayuga County) and Mrs. John W. Pennock (Onon-

daga County).
One year: Mrs. Edwin A. Griffin (Kings County) and Mrs. Bernard B. Berkowitz (Kings County).

Dr. Frederic E. Sondern, Mrs. Rogers N. Herbert, and Mrs. Samuel C. Red addressed

the assembly at luncheon.

A very cordial invitation is extended to the wives of all the members of the Medical Society of the State of New York to visit the headquarters of the Woman's Auxiliary in the Waldorf-Astoria during the convertion.

GETS ADVICE

The life of a doctor is shorter than that of other professional men, and it is the duty of the doctor's wife to increase his life span, Health Commissioner John L. Rice told 750 women at the first annual luncheon meeting of the women's auxiliary of the Kings County Medical Society, held at the St. George Hotel, Brooklyn.

"A study of the life span of professional men reveals the fact that doctors are the shortest lived," Dr. Rice said.

"Analysis and thorough study should be made of this fact. It is a good chance for you wives to extend your husbands' life span.

"Your husband has to go on a call when it comes; he is subject to many hardships. When vacation time comes he says, 'Oh, what's the use' and stays at his job. You have the power to make your husbands go on vacation. This should be your job."

Public Health News

THE BURDEN OF SYPHILIS IN NEW YORK CITY

JOHN L. RICE, M.D., JACOB A. GOLDBERG, PH.D., New York City

This report was prepared with the cooperation of the Social Hygiene Committee of the New York Tuberculosis and Health Association

In planning a program for syphilis control it is important first of all to know the size of the problem. To this end, censuses of cases under medical care have been made in many cities and some counties in the United States, under the joint auspices of the United States Public Health Service and the American Social Hygiene Association, in cooperation with county medical societies and other local agencies. These studies, covering areas which total more than 27,000,000 population, have furnished a basis for estimating the number of cases of syphilis under medical supervision in the United States at any given time, and the annual incidence rate of new cases. These and other data have enabled us also to arrive at the estimate that, conservatively, five per cent of the population of the United States, roughly 6,000,000 persons, have syphilis at any given time. Of this number of cases it is estimated that only about one-tenth are under medical care by private physicians and institutions. The enormous proportion of cases not under medical supervision, of which a considerable percentage is in an infectious state, constitutes one of the major

problems in public health.

In June 1935, the Department of Health of New York City in cooperation with the United States Public Health Service undertook a census of cases of syphilis under medical care in the city. It was hoped that the data secured would serve as a basis of comparison with those of an earlier survey made in 1928 and thus show the trend. Unfortunately, the returns were not sufficiently complete to serve this purpose. The returns are, however, significant and impressive and give at least a partial concept of the burden

of syphilis in New York City.

A letter was written to every practicing physician and to all hospitals and clinics in the city requesting their cooperation in the census of cases, and forms for making the reports were furnished. The information requested was:

 The number of early and of late cases of syphilis diagnosed for the first time during the month of June.

(2) The number of early and of late cases

diagnosed before June first but treated or observed during the month of June. The figures were to be given separately for males and females. "Early" means a duration of less than one year; "Late" means a duration of more than one year.

Reports of cases were sought from three sources: (a) Department of Health Clinics, (b) Public and private hospital clinics, (c) Private physicians.

Health Department Clinics

Table I presents the cases of syphilis reported from the five clinics of the City Health Department.

It is observed that the five Health Department Clinics treated 5733 cases of syphilis during the month of June, of which 542 were early cases. If this rate of new cases prevailed through the twelve months of the year, it would mean a total of 6504 new cases diagnosed in the Health Department clinics alone during the year.

We see that of the total cases handled, 3124 or 54.5 per cent were males and 2609

or 45.5 per cent were females.

The significance of this total of patients treated by the Health Department clinics is, that these patients represent an economic status which does not enable them to pay for treatment and who are receiving treatment This service is a very strategic one in view of the great need for free treatment of indigent patients in the city and the fact that the only other regular source of free treatments is the clinics of the city hospitals. The question has been raised whether it should be a function of the Health Department to maintain treatment centers, whether it should not confine its service to the diagnostic and epidemiological aspects of venereal disease control. It is pointed out that such clinics are best maintained in connection with the outpatient departments of hospitals where all the necessary services are available. Whatever the answer ultimately may be, the great inadequacy in free treatment facilities that now prevails in the city does not yet permit any discontinuance of, or reduction in, the treatment service rendered by the Health Department.

Public and Private Hospitals

Requests for data were sent to 210 institutions. Replies were received from 132 or sixty-three per cent. Of these, eighty-three supplied part or all of the data asked for. The rest reported "no cases under treatment" or "do not treat syphilis." It is probable that a large proportion of the institutions which did not reply do not handle syphilis cases.

Table II presents the cases of syphilis reported by the public and private hospitals.

Of this group of eighty-three institutions which reported cases under treatment (not including the Health Department clinics), nine were city hospitals in the clinics of which venereal disease treatments are furnished free. These institutions carry a large case load. The rest of this group are private institutions which make a moderate charge for treatments but many of which carry free a proportion of cases which cannot afford to pay. Most of these private clinics have a comparatively small case load.

It is seen that this group of eighty-three institutions treated 12,068 patients during the month of June, of which 1201 were early cases, diagnosed for the first time during that month. Of these patients, 7008 were males and 5060 were females. It is

noteworthy that the five Health Department clinics alone carried almost half as many patients as did the group of eighty-three city and private institutions. It is obvious, therefore, that much larger provisions for free treatment of venereal cases will have to be made in connection with city and private hospitals before the Health Department can wisely consider the discontinuance of its special treatment centers. However, this desirable reorganization of services should be brought about as early as possible so that treatment for venereal diseases may be conducted in connection with the full complement of services provided in an outpatient department of a hospital and which modern ideas and methods demand. Such a readjustment would enable the Health Department to focus upon its special task of diagnosis and epidemiological service which aims at prevention of the spread of disease.

Private Physicians

Approximately 10,000 questionnaires were sent to physicians in the city. Of these, 5741 or 57.4 per cent were returned. Of those returned, 1547 report cases under treatment; the rest either have no cases, or do not treat syphilis, or are not in practice. Some were deceased or not found. While it is probable that the great majority of the

more than 4000 physicians who failed to report had no cases to report, the number of cases reported can only be taken as a partial report of cases under treatment by private physicians. Table III shows the

cases reported by physicians. We observe that the private physicians reported a total of 3828 syphilis patients treated in the month of June. This is less than eighteen per cent of the total of cases reported. More than eighty-two per cent of the cases reported were under medical care in hospitals and clinics. Even if we assume that another 3000 cases might have been reported by the 4000 physicians who failed to report, it would still leave the private physicians of the city playing a meager role in syphilis control, when compared with the figures from the extensive censuses of cases that have been made in the United States. These show that on the average, about sixtyfive per cent of cases of syphilis under medical care are in the hands of private physicians. The situation in New York suggests that the medical societies and the public health authorities need to address themselves to the promotion of a larger participation in syphilis control by the private physicians.

All Sources Combined

Table IV shows the total of cases reported

from all sources.

We note that there was reported in this census a total of 21,629 cases of syphilis under medical care in New York City during the month of June 1935. Of this number, 2785 were new cases. Assuming this monthly rate of new cases to hold for the year, it would give a total of 33,420 new cases of syphilis under medical supervision during the year. These figures are impressive, and more so when we remind ourselves that the census figure represents only a partial report of cases.

It has been stated that extensive surveys in the United States indicate that only about one-tenth of those infected with syphilis at any given time are under medical supervision. Assuming this rate to hold for New York City, even the incomplete figures of the census would suggest the existence of at least 334,200 cases of syphilis in New York

City in 1935.

In comparison with the 33,420 cases of syphilis reported in this partial census of

The psychologists have made a discovery. Lovers' tiffs have a real purpose during the period of courtship and should not be interpreted as having too serious an import, Dr. Harry A. Steckel, director of the Syracuse State Psychopathic Hospital, advised students at the third session of the marriage

cases, there were reported to the Department of Health for the same year 47,659 cases. While this figure doubtless includes a certain proportion of duplication, the figure may be fairly taken as a basis of estimating the total prevalence for the city inasmuch as it is well-known that of all reports of infectious diseases the reports of syphilis and gonorrhea are the most notoriously incomplete. If only one-tenth of the existing cases of syphilis are under treatment, the 47,659 reported cases would suggest a prevalence of 476,590 cases of syphilis in New York City in the year 1935.

It is of interest to note that of the 21,629 cases reported in the city census, 58.5 per cent were males and 41.5 per cent were

females.

Summary

The returns of the census are incomplete and hence do not show the total number of cases of syphilis under medical care, or the whole burden of syphilis in New York City.

Based on the census, there were 33,420 cases of syphilis under medical supervision in New York in 1935. The number of cases reported to the Department of Health during

the year is 47,659.

On the basis of data for the United States which indicate that only one-tenth of existing cases of syphilis are under treatment, the census figure suggests a prevalence of 334,200 cases of syphilis in New York City in the year 1935; and number of cases re-ported to the Department of Health suggests a prevalence of 476,590 cases in the City of New York in 1935.

We shall probably be justified in estimating the total number of those infected with syphilis at about five per cent of the popu-

Of all cases reported, 58.5 per cent were men and 41.5 per cent were women.

The demand for free treatment of indigent patients is shown by the fact that of the 21,629 cases of syphilis reported from all sources for the month of June, 5733 cases were treated by the five clinics of the Health Department alone.

The small proportion of cases reported in the hands of private physicians indicates that in New York City the private physicians play as yet but a small role in syphilis control, as compared with reports from other

cities and the country as a whole.

et to a

course in Hendricks Chapel in Syracuse on March 13.

Dr. Steckel, discussing, "The Emotional Aspects of Mating," told the 363 students that quarrels during the courtship period are a natural sequence to tension and uncertainty.

Bronx County

A HEALTH EXHIBIT will be held in the Bronx County Building, 161st St. and Concourse, during the week of April 27, which has been designated as "Better Health Week," under the joint auspices of Bronx medical, dental and health organizations.

The purpose of "Better Health Week" is to educate the public to the necessity of caring for the human body before illness sets in. During the exhibit, guides and workers will explain the program to visitors

and answer all questions.

Organizations sponsoring the "Week" include the Bronx County Medical Society, the Bronx County Dental Society, the Northern Dental Society, Bronx County Pharmaceutical Assn. and the Bronx Tuberculosis and Health Committee.

ALDERMAN JOSEPH E. KINSLEY, of the Bronx, has written a letter to James E. Finegan, President of the Municipal Civil Service Commission, protesting against the selection of eight out-of-town residents among the eleven new candidates for district health officers of the Department of Health. Alderman Kinsley regards it as preposterous that with thousands of experienced medical men close at hand, the city should go outside for health experts.

He declared that "stripped of all the folde-rol, any well-trained physician of New York City can meet the requirements for District Health Officer. Experience in our own Health Department gives such a man far greater qualifications to do this work than those possessed by the threatened importations from the remote hamlets on your list, towns whose populations of 3,000 to 10,000 could be tucked away in one block of our congested areas. I am in receipt of a letter from Dr. E. C. Podvin, executive officer of the Bronx County Medical Society, in which he informed me that that body went on record endorsing the position I have taken. I am also informed by members of the other county societies that similar action will probably be taken by them."

Broome County

Dr. George Albert Swift, professor of surgery at Syracuse University, was the guest-speaker at the March meeting of the Binghamton Academy of Medicine in Johnson City. Dr. Swift's subject was "Intestinal Obstructions." A buffet supper was served.

Cattaraugus County

DR. J. E. K. Morris, senior members of the staff of the Olean General Hospital, was honored by his colleagues and many other friends at a banquet at the Olean House on March 10, the golden anniversary of his medical practise in Olean. The principal address of the evening was delivered by the Rev. C. Clark Shedd, pastor of the First Methodist Episcopal Church, while others paid affectionate and sincere tribute to Dr. Morris, "a man who has done so much, and still does so much, with an alertness many younger men and women must envy." His son, the late Dr. Raymand B. Morris, was recently President of the Eighth District Branch.

Chautauqua County

THE PROPOSAL SPONSORED by the medical advisory staff of Jamestown General Hospital and endorsed by the board of public welfare, providing for abolishment of the office of city physician and substitution of a new plan for giving medical relief to welfare clients, by which persons on relief might call any physician, was abruptly tabled by City council on Mar. 16 at the request of its sponsors. The target of heavy criticism since it was first proposed, the plan was referred for study to a committee composed of three councilmen, three members of the board of public welfare and three members of the hospital advisory staff. Acceptance of the plan would have entailed a change in the city charter.

Chenango County

GOVERNOR LEHMAN has appointed Dr. Louis W. Abbamonte, of Norwich, as coroner for Chenango county, to fill the vacancy created by the death of Dr. A. R. Morse, of Oxford.

Dutchess County

Dr. James Rooney of Albany, former president of the New York State Medical Society, was one of the speakers at a dinner meeting of the Dutchess County Medical Society at Poughkeepsie on March 17. Dr. Joseph Lawrence, executive officer of the state society, also was present. About seventy-five members attended.

Erie County

THE ADMINISTRATION OF anesthesia is a part of the practice of medicine, and should

therefore be conducted by graduate physicians, said Dr. L. F. Anderson in a paper on "Anesthesia—Physician or Nurses" read before the Medical Society of the County of Erre on March 16. This is strictly in the best interest of the welfare of the patient, he said for a continual diagnosing of the patient's condition is necessary during the administration of anesthesia, and that is a part of the practice of medicine Dr. Anderson's paper was followed by an exhibitive discussion by surgeous employing physician anesthetists and those employing nurses. At the close of the discussion these resolutions were adopted unanimously

Whereas We realize that the abuses existing in medical practice due to unlawful acts, are causing an economic condition in which non licensed persons are practicing medicine and depriving physicians of their rights, especially in presidence but thereby.

in anesthesia, he it hereby

Resolved 1-The Medical Society of the County of Eric condemns this practice and urges all of its members to do everything in their power to correct the abuses connected therewith.

2-The delegates to our State Medical Society shall be instructed to vote as a body to secure legislation prohibiting this infringement on our property rights.

3-The committee on mesthesia shall be in structed to call on all hospitals and surgeons using nurse anesthetists and ask their co-operation in correcting this evil.

4-A copy of these resolutions shall be sent to the Medical Society of the State of New York and the American Medical Association with the request that a Section on Anesthesia be established in both these societies

At the same meeting a motion was made seconded, and carried that the president call the attention of both the junior and Senior Chambers of Commerce in Buffalo to the fact that the Medical Society of the County of Erie would suggest and urge that their chairman of their Public Health Committees be physician members rather than lay members

A one day postcraduate clinical meeting of the alumni association of the University of Buffalo School of Medicine will be held at the Hotel Statler in Buffalo on April 18 The program will include papers on important medical and surgical topics by Dr Donald C Balfour, Chief of Surgery of the Mayo Foundation, Dr Walter C Alvarez, Professor of Medicine, Graduate School, University of Minnesota, Dr Charles A Elsberg, Professor of Neuro Surgery, Co lumbia University, Dr Nicholson J Eastman, Professor of Obstetrics, Johns Hopkins, Dr Ernest E Irons, Professor of

Medicine, Rush Medical College, Dr Philip D Wilson, Director of Surgery, New York Hospital for Ruptured and Crippled, and Dr Francis F Schwentker, Assoc, in Pediatrics, Johns Hopkins The annual dinner will be hild in the evening, with an address by Dr Reginald Fitz, of Boston, on Dr Watson of the Sherlock Holmes stories

Jefferson County

FIGHTY-FIVE PHYSICIANS attended the March meeting of the Medical Society of Jefferson county at the Black River Valley club in Watertown Dr Stanley W Sayer of Gouverneur, district health officer, was a guest Dinner was served at 6 30 Dr Frederick E Elliott of New York spoke on "The Gradient Plan"

Kings County

ALTHOUGH LEAD AND Arsenic poisoning are decreasing industrially, there has been a decided rise in the number of home cases, members of the Kings County Medical Society were told on March 17 by Dr. Frederick B. Flinn, director of industrial hygiene at the College of Physicians and Surgeons, Institute of Public Health

Dr Flinn declared that industrial cases in England had dropped from 1,048 in 1900 to 104 in 1931 Arsenic poisonings in the homes have risen in recent years, however, because of the illegal spraying of fruits and vegetables. Canned goods are comparatively safe, he said.

Dr Eugene R Marzullo, assistant clinical professor of medicine of the Long Island College of Medicine, spoke on "Lead Poisoning"

Announcement was made of a new program of lectures, on the first and third Wednesdays, to be accompanied by motion pictures in natural color

The prevalence or so much misleading medicinal advertising was termed a "great misfortune" by Dr. Elmer V McCollum, Professor of Biochemistry at Johns Hopkins University and discoverer of Virtumin D, in a lecture before more than 400 physicians at the headquarters of the Kings County Medical Society, Brooklyn on March 20 He urged the medical profession to forestall the "extravagant claims" of retulers for the qualities of their medicinal preparations by thoroughly investigating all important new scientific discoveries

New York County

PLANS FOR A \$1,000,000 medical college behind the present Flower Fifth Avenue Hospital between 105th and 106th Streets, were reveiled on March 16 by Dr Claude A. Burett, dean of the New York Medical College and Flower Hospital, at an alumni dinner at the Hotel St. Moritz.

Dr. John L. Rice, Health Commissioner, announces that 700 nurses from the city's Bureau of Nursing are making a field study of home conditions in an effort to improve the home relief food situation. The nurses, Dr. Rice explained, are instructing housewives how to make their allowances fit their needs and at the same time provide their families with the kind and amount of food necessary for health.

"While detailed food lists, showing how a family can live on a certain amount of money each week, no doubt have value," said Dr. Rice, "we have found that such lists do not solve the problem for many housewives. More individual guidance is needed and this we aim to supply through

our nurses.

"By having each of the Health Department nurses fitted to teach housewives on relief not only the nutritional value of foodstuffs, but how appetizing and healthful meals may be prepared from low cost foods we believe we are making much progress in keeping such families in health."

Niagara County

The value of chest clinics in discovering cases of tuberculosis in their early stages were stressed by Dr. Arthur N. Aitken, superintendent of the Niagara Sanatorium, in a talk to members of the Niagara County Medical society at their March meeting at the Sanatorium near Lockport. About 35 physicians attended and were introduced to Miss Margaret E. Newman, new executive secretary of the Niagara County Health association. Miss Newman spoke briefly on the health association program for the coming year and showed a talking motion picture entitled "Contacts," a drama of tuberculosis.

At the Meeting of the Medical Society of the County of Niagara on March 10 in Lockport Dr. A. N. Aitken, superintendent of the sanatorium delivered an address on Clinic Case-Finding. Preceding the address, Miss Margaret E. Newman, executive secretary of the Niagara County Health Association, presented a movie entitled, "Contacts," a drama on tuberculosis.

Oneida County

A JOINT DINNER MEETING of the Utica Academy of Medicine and the Utica Dental Society is slated for the evening of April 15 at the Yahnundasis Golf Club. Dr. Waugh, professor of orthodontia, Columbia

University, will speak and show colored motion pictures of life in the Hudson Bay region and in Alaska. A dance will follow.

Onondaga County

SIXTY-FIVE HUNDRED YEARS of medicine passed in review before 250 Central New York physicians in the ballroom of the Onondaga in Syracuse on the evening of March 17.

The history of the profession, from Em-Herep, who lived 4,500 years before Christ, to Sir William Osler, was portrayed in a medical masque, "Down Thru the Centuries," at a dinner meeting of the Syracuse Academy of Medicine. The masque opened with the appearance of Aesculapius, god of the healing art and son of Apollo. The part was played by Dr. Charles D. Reid, director of the play. Dr. William F. Mitchell took the part of Em-Herep and told how he used hyoscyamus, soother of pain, in ministering to the sick.

Hippocrates, in the person of Dr. Gordon D. Hoople, related his part in the history of medicine. He kept the first case histories, and after his death no records of note appeared for another 1,700 years. Galen, thru the voice of Dr. C. J. Wells, unfolded his discoveries and works on the four classic symptoms. He also described his treatment of inflammation, aneurysm and forms of phthisis and proved that he was the first to show that the arteries contained blood.

Dr. W. D. Ayer appeared as Vesalius, the Brussels anatomist, upon whose experiments the study of anatomy was developed. Dr. W. B. Siewers, in the correct costume of the period, was William Harvey, first to show that the heart acts as a muscular force pump to help the flow of blood along. Dr. A. B. Yeckel, wearing the fancy clothes of the late 18th century, was Edward Jenner, who performed the first vaccination in 1796 upon an English country boy who had been stricken with what was then known as "cow" pox.

The character of Lord Lister, whose work in a septic surgery forms the basis for all the modern developments of surgery in hollow cavities of the body, was portrayed by Dr. P. K. Menzies. The part of Sir William Osler, pioneer in anaesthesia and sanitation, was taken by Dr. H. W. Retan.

After the dinner and before the play, the doctors offered "My Wild Irish Rose," "Long, Long Trail" and "I've Been Working on the Railroad."

The program closed with a technical address by the guest of honor, Dr. Warfield T. Longcope, physician-in-chief to the Johns

Hopkins hospital, Baltimore. Dr. O. W. H. Mitchell was chairman.

DR. F. J. KAUFMAN, of Syracuse, who dided a few weeks ago at the age of seventy-two was said to have been a personal friend of Emperor Franz Josef of Austria. For many years he served as Consul of Austria in Central New York. From the emperor he received two of the government's highest honors, the Order of the Cross of Malta and the Order of Franz Josef. The third honor conferred by the emperor was the Hoche Deutsche Dritte Or hung.

Oueens County

THE MEDICAL BOARD OF Flushing Hospital and Dispensary announces that it wishes to register its emphatic disapproval at the present time of the tentative Revised Curriculum drawn up by the New Curriculum Committee of the National League for Nursing Education, requiring two years of preliminary college work.

THE AUXILIARY OF THE Medical Society of the County of Queens, Inc., is making extensive plans for a May Day Program to be held at the Society's Building, on Friday afternoon, May 1. This program is the introduction of a movement for the improvement of health conditions in Queens County and for the welfare of the youth of the Borough. Noted representatives of various health organizations and the City's Health Department will participate in this program.

The FOLLOWING SUBJECTS and speakers are slated for the scientific session of the Medical Society of the County of Queens on Tuesday, April 21, at 8.30 p.m.: "A Study of Organized Medical Care in the Metropolitan Area"—By Haven Emerson, M.D., Professor of Public Health Practice, College of Physicians and Surgeons. "Present-Day Hospital Problems"—By Harry P. Mencken, M.D.

Rensselaer County

THE RENSSELARR COUNTY Medical Society heard an interesting paper at its March meeting by Miss Grace E. Allison, R.N., R.S., Superintendent of the Samaritan Hospital, on "The Physician as the Hospital Sees Him."

Steuben County

A JOINT MEETING OF the Steuben County wedical Society and the Steuben County Health Officers Association was held in Corning on March 12, at the Baron Steuben Hotel.

The subjects were: Clinical Aspects and Use of Type I Anti-pneumococcus Serum, Dr. Norman Moore, Ithaca; Description of

Laboratory Service, Dr. R. J. Shafer, Corning; Discussion of Organization for Control, Dr. E. S. Rogers, Albany.

Tioga County

A SHARP CRITICISM of the way medical relief moneys for old age recipients are handled in Tioga County was made in resolutions adopted by the County Medical Society on March 3. Such moneys are now paid directly to the client, who is often incapable of handling them and unfit to determine the need or urgency of medical care. A change is demanded. The meeting also expressed opposition to the chiropractic bills now up at Albany. Dr. John Love, of the Wilson Memorial Hospital, spoke on Research and Therapy with the Bacteriophage.

Westchester County

DR. STANTON CURRY, one of the oldest practicing physicians in Peekskill, was guest of honor on March 9 at a meeting and banquet of the Peekskill Medical Society at the Bonnie Brook Inn. Practically all the physicians in Peekskill and vicinity were in attendance. Dr. Curry has been in the general practice of medicine in Peekskill for thirtyeight years.

THE WESTCHESTER COUNTY Medical Society urges public support for a legislative measure which it claims would result in an annual saving of more than \$100,000 to Westchester taxpayers and the financial supporters of the county's 15 general hospitals. The measure is senate introductory bill No. 829, introduced by Senator William T. Byrne of Albany, The bill would permit the filing of a lien by the hospital, the attending physician and private nurse for reasonable charges for their services rendered to patients injured and hospitalized as a result of automobile accidents-such liens apply against damages subsequently awarded by insurance companies, should the injured carry accident insurance. An exemption of \$300 would be allowed the patient before such liens would become effective.

The County Medical Society in its statement reported that "surveys conducted in recent years indicate that the hospitals in Westchester County alone lose annually over \$100,000 in charges for services delivered to these emergency cases. The patients are discharged, only to return to their homes, usually outside the county, leaving the hospital, the physicians and nurses who restored them to health, 'whistling' for their well-earned fees. When damages are subsequently awarded there is now no way to enforce payment of these fees except by civil suit."

Medicolegal

LORENZ J. BROSNAN, ESQ.

Counsel, Medical Society of the State of New York

Practice of Medicine By a Corporation

The highest Court of one of the midwestern states, a few weeks ago had before it the question of whether a corporation could engage in the practice of medicine and handed down a decision which should be of

interest to organized medicine.*

The corporation involved in these proceedings was known as United Medical Service and had been incorporated as a Corporation for profit in 1930. It had an authorized capital of four hundred shares of common stock with a par value of \$100 per share. Its articles of incorporation set forth a number of objects for which it was organized, one of which was designated as "the promotion of individual and public health through the study and prevention of disease."

The Corporation in 1933 established a clinic for the avowed purpose of rendering low cost medical service for a fixed fee. It set up fully equipped offices to provide for the examination and treatment of physical and mental ailments of all sorts. Since that date it had continuously operated its clinic and offices, and apparently all the medical and surgical services rendered by or under the said institution, was rendered solely by physicians and surgeons duly licensed and registered to practice in the state. From time to time since the organization of the institution it had inserted in the public press, various paid advertisements. At least one of said advertisements had declared that the Corporation was not a charity, nor was it associated with any charity, or any philanthropic or educational institution. The said advertisement had specifically stated that the organization was operated for profit. The advertisement had set forth the amount of charges made by United Medical Service for examinations of the heart, lungs, eyes, ears, nose and throat and for other similar examinations, for laboratory examinations and x-ray examinations. It appeared that persons seeking examinations and treatment contracted for such services with the Corporation and paid direct to it the specified fees. The physicians and surgeons who actually rendered the care to the patients were employed on a salary basis by the Corporation. The Corporation itself had never made any attempt to obtain the license

to practice medicine.

A proceeding was instituted by the Attorney General on behalf of the people of the State in the nature of a so called quo warranto proceeding against United Medical Service, for the purpose of requiring the respondent to show by what right it was engaged in the practice of medicine. After various technical applications to the Court the parties to the proceeding stipulated to an agreed set of facts which were submitted to a Trial Judge. The Court after conducting an extended hearing determined that the respondent was guilty as charged and that under the law it was not entitled to engage in the practice of medicine. An appeal was taken by the Corporation from the judgment of ouster which was rendered against it, and upon said appeal the judgment was affirmed.

The Court in so ruling, said in the course

of its opinion:

The respondent Corporation earnestly contends that the ownership of a clinic, with offices where the treatment of disease is engaged in solely by licensed and registered physicians and surgeons who are employed by the Corporation, which receives the fee charged the patients, does not constitute the practice of medicine by the Corporation. The respondent argues that the fact that the contract of payment for the medical services to be rendered is made between the Corporation and the patient does not change the professional relationship between the patient and the various licensed and registered practitioners who treat him in the Corporation's office. * * *

In the recent case of Dr. A., dentist, v. A. (196 N. E. 799) this Court observed that the practice of a profession is subject to licensing and regulation and is not subject to commercialization or exploitation. "To practice a profession," the Court said, "requires something more than the financial ability to hire competent persons to do the actual work. It can be done only by a duly qualified human being, and to qualify something more than mere knowledge or skill is essential. No Corporation can qualify."

Our attention is directed to the fact that no provision of the Business Corporation Act, or of any other Statute of this State prohibits a Corporation organized for profit from rendering any and all medical services by duly licensed and registered physicians and surgeons. The misuse of power sought to be coerced in this case is a right and privilege which individuals

^{*} People v. United Medical Service (200 N. E. 157).

only may obtain by compliance with the provisions of the Medical Practice Act. * * * Manifestly the Business Corporation Act in authorizing the formation of corporations for any lawful purpose' does not purport to include the practice of the learned professions such as

medicine and law.

The final contention of the respondent Corporation, which requires consideration, is that in so far as the Medical Practice Act prohibits it from practicing medicine by employing licensed physicians and surgeons, to that end the Act is an unreasonable exercise of the police power and transcends the due process of law clauses of Sections 2 and 14 of Article II of the Constitution of this State and the first section of the Fourteenth Amendment to the Federal Constitution. The police power of the State includes power to enact comprehensive, detailed, and rigid regulations for the practice of medicine, surgery, and dentistry. There is no right to practice medicine which is not subordinate to police power. The Medical Practice Act of 1923 recognizes the different methods of treating human ailments and prescribes reasonable and uniform regulations for testing the qualifications of persons who desire to practice medicine in all its branches, and persons who desire to practice some limited form of treating human ailments.

It is interesting to note that only a month previous to the decision in the United Medical Service case, the Supreme Court of another midwestern state made a ruling very similar to that case which affected the practice of dentistry.* In that case alayman was convicted of being a partner in the operation of a dental parlor, without being licensed as a dentist. The records showed that the accused had for a number of years operated a dental parlor under the name, "New System Dentist." In spite of the fact that all dental work done at the said dental parlor was performed by regularly licensed dentists, three of whom were in the employ

Regular inspection of all students, regardless of age, by teachers at Shore Road Academy each morning makes the health record of the school "pretty hard to beat," Dr. Charles M. Fisher, academy physician, declared on March 20 at a Parent-Teacher Association meeting in the school, 9249 Shore Road, Brooklyn.

Describing the system of inspection, he said: "Rarely does an ill student here infect an entire class. Our bus drivers are trained to estimate the physical condition of the students in the morning. He does not allow a student to leave the bus until the student has been inspected by Miss Helen E. Red-

of the accused, the Court sustained the judgment of conviction, holding that he had engaged in the practice of dentistry contrary to law.

Treatment of Lymphosarcoma

A woman, fifty-five years of age, consulted a physician who specialized in x-ray and radium work with respect to complaints of swelling in the neck and around the nose.

Upon examining her he diagnosed her condition as lymphosarcoma. He suggested radium and x-ray treatment and administered to her over a period of nearly a year sixty radon treatments. The condition of the patient, however, did not improve by reason of the incurable nature of the condition from which she was suffering. Finally she stopped coming for treatments.

Shortly after the last treatment rendered to her by the doctor, a malpractice action was instituted against the doctor in which the charge was made that the treatment by radium and x-ray had aggravated her condi-

tion and had made an invalid of her.

Before the case could ever be reached for trial, however, the patient died, approximately a year and a half after the doctor last saw her professionally.

Shortly after the said death the same attornev instituted another action against the doctor in which the plaintiff was the administrator of the patient, charging him with having wrongfully caused the death of the patient by reason of the alleged negligent treatment.

Just as said case was about to be assigned to a Trial Judge the plaintiff's attorney agreed to discontinue the case, thereby indicating that he was unable to establish by proper proof that the treatment complained of had caused the death of the patient.

ding, co-headmistress.

"Miss Redding looks for pallor, or red eyes, and immediately telephones the doctor if she is suspicious. Should she miss a student, the latter is inspected again in the classroom by the teacher, who is well acquainted with the student's normal physical condition."

Not only are the students inspected, Dr. Fisher said, but also the help in the kitchen and the teachers.

"Many ailments have been traced to the kitchen," he said. "Watch those who cook your food, and especially those who handle uncooked food."

^{*} People v. Carroll (261 N. W. 861).

Across the Desk

New York's Rich Menu of Diversions

It is a pretty safe bet that few doctors from out of town who attend the state medical meeting will go home without seeing some fine theatrical performance, or a rattling good show, or a concert or athletic exhibition, or without eating at some of the famous hotels, restaurans, night clubs, and colorful dining and dancing rendezvous.

New York offers its best at this time of year, for the successes are still running, and the second-rate offerings have been weeded-out. The streets are not lashed by winter's gales, or baked by summer's heat, and everything is at the visitor's command. A good plan will be to come a day or so early and stay the entire week, in order to give proper attention to the splendid scientific medical program, yet take this rare chance to enjoy New York's attractions. The home practice will go all the better for a little relaxation.

The Leading Plays and Shows

The theatrical menu is really remarkable. Helen Hayes is drawing capacity audiences at the Broadhurst Theater in "Victoria Regina," and another stage star, Jane Cowl, is appearing at the Music Box in "First Lady." An excellent Bernard Shaw play is on at the Martin Beck Theater, where Katharine Cornell presents "Saint Joan." George M. Cohan, a perennial favorite, is to be seen at the Alvin in "Dear Old Darling," and Richard Barthelmess, whom we all have admired on the screen, appears in person at the Lyceum in "The Postman Always Rings Twice."

We can never go far wrong in taking in a play put on by the Theatre Guild, and we now have two—"Call it a Day," with Gladys Cooper and Philip Merivale, at the Morosco, and "End of a Summer," with Ina Claire and Osgood Perkins, at the Guild Theatre. Both are comedies. An hilarious farce called "Three Men on a Horse" is at the Playhouse, and a very funny knockabout Hollywood lampoon, "Boy Meets Girl," is playing at the Cort. Those who like a gangster play will find a spectacular thriller entitled "Dead End"

producing shivers at the Belasco. "Lady Precious Stream," at the 49th Street Theatre, is so popular that it has to play three matinees a week.

The "Ziegfeld Follies" disports itself at the Winter Garden and "George White's Scandals" does the same at the New Amsterdam Theatre.

So there is something to suit every taste in the theatrical line. The best shows are often "sold out" at the box office window, but tickets may be still available at the various hotels. The seats may cost more, but this device keeps the city folks from taking all the best places.

A star musical event on the 29th will be a farewell concert to Toscanini at Carnegie Hall. There will also be a concert at Carnegie Hall on the 27th by the National Orchestral Association.

The circus will be in full swing all the week at the Madison Square Garden.

Crack Places to Dine and Dance

The big town has so many glamorous places to eat, dance, and listen to music that a few bits of information are absolutely essential to the stranger within the gates, to save time and save getting into the wrong ones. As the convention meets at the Waldorf-Astoria, it might be mentioned that this hotel has three dining rooms-the North Grill, where breakfast may be had for \$1; lunch, \$1.50; and dinner, \$2; the Empire Room, with dinner, dancing, and entertainment, at \$2.50 or a la carte; and the Sert Room, lunch and dinner a la carte, with music. Members who visit the Plaza will find in the Persian Room one of the smartest and most charming places for supper dancing in town. Evening dress is expected. Dinner is \$3.50, lunch \$2.

Pierre's is of course one of the crack hostelries; luncheon and dinner in the main dining room, with music, are \$1.50 and \$3; while dinner a la carte, with orchestra and dancing, will be found in the Neptune Room. Better dress. The Stork Club, at 3 East 53d St., is a noisy and popular after-theatre rendezvous that will not

be soon forgotten. A visit is worth while, too, at the St Regis, where dining with orchestra, dancing and entertainment will be found in the King Cole Room and the Maisonette Russ at \$3.50 and \$3, and a la carte after the theatre, with \$1.50 cover charge. The Savoy Plaza serves luncheon, dinner and supper a la carte in the Cafe Lounge, with dancing during the cocktail hour and after the theatre. The minimum check at supper is \$1.50 on week days and \$2.50 Saturdays. In the Savoy Room luncheon and dinner are served at \$2 and \$3. and also a la carte, with concert music during dinner. In the Breakfast Room breakfast runs from 75 cents to \$1.25, luncheon is \$2, and dinner \$3, or a la carte.

Guy Lombardo and his orchestra are playing at the Roosevelt Grill, where dinner is served at \$2; luncheon in the main dining room is \$1. At the Barclay an excellent luncheon, with music, is priced at \$1-\$1.50 and dinner, with music, at \$1.50-\$2.50. The Lexington has a wide range, from lunch at 60 and 85 cents, to dinner at \$1.25-\$2. The Montclair has dinner at \$1.25 up with two orchestras, dancing,

and entertainment; luncheon, 65 cents up. The Shelton has an a la carte dinner in the grill with music, a \$1 dinner in the main dining room, and luncheon at 45 to 75 cents.

Colorful Corners for the Later Hours

Greenwich Village has an atmosphere all its own. Some of its spots worth mentioning are Mori's, at 144 Bleecker St.; the Black Cat, at 557 West Broadway; the Village Barn, at 52 West 8th St.; and the Greenwich Village Inn, at 5 Sheridan Square. Among the Harlem clubs we might pick the Cotton Club, at Lenox Ave., and 142d St.; the Ubangi Club, at 7th Ave. and 131st St.; and Dickie Wells, at 169 West 133d St. Those who like a foreign atmosphere will find a bit of Cuba at El Toreador, 7 West 110th St.; a glimpse of Montmarte at Bal Musette Bedou, 301 West 46th St.: a breath of Russia at the Russian Kretchma, 244 East 14th St.; a taste of Scandinavia at Valhalla, 141 West 54th St.; and a whiff of Spain at El Chico, 80 Grove St., and Dimitri's Club Gaucho, at 245 Sullivan St. Late evening is the time for all of these.

Suicide of European Scholarship

A RECENT ADDRESS by President William A. Neilson, of Smith College, is of interest to all members of the learned professions, and especially to those engaged in scientific pursuits, such as medicine. For President Neilson has the vision to look across the world and see the changes affecting the men of learning in all lands, and how they react upon our own position in this country. He spoke before the American Association for the Advancement of Science, under the auspices of the National Council of Phi Beta Kappa, and had the happy idea of harking back nearly a hundred years to the address of Ralph Waldo Emerson before the Harvard Chapter of Phi Beta Kappa on "The American Scholar."

Emerson looked forward to the time when "our day of dependence, our long apprenticeship to the learning of other lands," would draw to a close, and President Neilson rejoices that "the day he foresaw has arrived, and American scholarship now stands on its own feet." Indeed, "in many branches, especially in the field of science and invention, it has taken the lead." "Tragic factors" also are contributing to our own advance.

For one thing, the terrific slaughter of the flower of European youth in the officer class in the World War took the very men who today would be enriching the ranks of scholars and scientists over there, while our own country suffered no comparable loss. Again, "in Italy and Germany and Russia forms of government have established themselves that require for their maintenance an attitude toward freedom of thought and speech which is devastating in its effect on intellectual progress."

The "poisonous procedures" of those governments are having "baneful effects on the science and scholarship of nations that were formerly leaders in these fields." They are "committing national intellectual suicide," and "the torch is falling from their hands."

Genius Knocking at Our Door

Not only that, but "hundreds of the ablest and freest spirits are fleeing from those unhappy countries" to benefit America and other lands. Many are knocking at our doors, and it will be "a profound mistake" if we fail to offer generous hospitality to these "who come to us stript and ruined, but with hands laden with the inestimable riches of the spirit." So we have the double advantage of an accession of scholars from the Old World and of a new army of native scholars flooding into our schools, libraries and laboratories in numbers the world has never seen before, and as a result "we find ourselves faced by a challenge so stupendous that it is inconceivable that a worthy effort will not be made to meet it."

Men often are strangely blind to the changes going on around them, which are seen more clearly by historians of a later time, and we are fortunate to have a man like President Neilson who can see and reveal the world currents and cross-currents sweeping around us.

A Danger to the Medical Specialist

Emerson foresaw, too, a hundred years ago, a danger of advancing scholarship which threatens the medical scientist of today, the danger of becoming immersed in a specialty, of becoming merely a fine piece of mental scientific apparatus. Emerson put it in terms of everyday life. "The planter," he said, "who is Man sent out into the field to gather food, is seldom cheered by any idea of the true dignity of his ministry. He sees his bushel and his cart, and nothing beyond, and sinks into the farmer, instead of Man on the farm. The tradesman scarcely ever gives an ideal worth to his work, but is ridden by the routine of his craft, and the soul is subject to dollars. The priest becomes a form; the attorney, a statute-book; the mechanic, a machine; the sailor, a rope of the ship. In this distribution of functions, the scholar is the delegated intellect. In the right state, he is Man Thinking."

This applies particularly to the medical scientist. The vast increase of medical knowledge tends to crowd all other interests out of his life. The individual worker, unable to master everything, becomes a specialist, he "knows more and more about less and less." He is driven "into a smaller and smaller corner of the field," says President Neilson, and he urges that "all the more necessary, therefore, is Emerson's exhortation to him to seek a variety of interest, to take time to stand back from his detailed activities and see them in relation to the whole progress of knowledge, to stand back from the acquisition of knowledge and see it in relation to the needs of society as a whole and to himself as a complete man."

The Public's Right to Know

Another problem facing the medical scientist is the question of popularizing the results of his work. It comes up continually, and confronts not only the physician, but scholars in every field. It is natural and right that the investigator "should seek his first audience among his fellow scholars." submit to their judgment and desire their approval, says President Neilson. Until he has that approval, we are warned, there is danger in appealing to the lay public. But, adds President Neilson, the intelligent public has its rights too. It has its right to share the results of scientific inquiry, and to be given this share "by the leaders of science instead of by the camp-followers." Society "ought to be protected against a merely journalistic presentation of what is discovered." Scientific men sometimes speak unjustly of the "vulgarization" of reports of scientific progress. If such reports are vulgarized, it is because the scientist will not or can not provide a readable account for publication, for the newspapers and magazines always prefer to quote a first-hand authority.

If the scientist will not speak for himself, then the press and public will be served by someone else—"if not by those who know, then by those who half-know." That the laity be correctly informed is of immense importance, and "that it can be done with dignity and no sacrifice of scholarly integrity is abundantly proved by the example of such men as Tyndall, Faraday, and Huxley."

Literary "Hocus-pocus" and "Jargon"

You may say that many scientific matters are too difficult to explain to the general reader, but President Neilson makes the rather neat retort that "the most difficult ideas to explain to the layman are often those that are obscure also in the mind of the professional." We may think, too, that the scientific terminology is unintelligible to the laity, but he replies again that "it is often unnecessary hocus-pocus." He gives a dig at certain medical practitioners who seek to "gain prestige among the ignorant by using Greek and Latin terms for phenomena with perfectly good English names," while "the sociologists are building up a terrible jargon, though I have yet to find in their books an idea which is not capable of being explained in standard English." And he

declares, as a matter of fact, that the attempt to write for the laymen "can be a powerful agent in clarifying the thought and purifying the style of almost every branch of study."

Now if some medical man will give a free

and frank expose of the rights, duties, and shortcomings of college presidents, perhaps that will be a slight return for the undoubted service that President Neilson has done for the medical and other professions

REVIEWED

Handbook of Anaesthetics. By J. Stuart Ross, M.B., and H. P. Fairlie, M.D. Fourth edition. Duodecimo of 299 pages, illustrated. Baltimore, William Wood & Company, 1935. Cloth, \$4.00.

Evidently a study book for there are blank pages for notes—a good idea by the way. The thirty pages on local and the twelve on spinal anesthesia are mere inclusions. The distinction of the book lies in the attention given to the usually insufficiently stated subject of the difficulties and dangers whose discovery and treatment are the really essential trick in artistic anesthesia. It is this which is so properly emphasized. "We propose to discuss all the changes observable in the patient's condition, the causation of which can be traced to the surgical condition present or the procedure of the surgeon," is a neat way of sharing responsibility. Thirty-eight pages are given to the care of the patient:—his preparation for the anesthesia and observation during, interference with his safety and susceptibility to the various agents. It makes interesting reading to discover the author's (Dr. Ross assumes the responsibility for this edition) practice in handling the important operations. To Anoxemia thirteen pages are devoted; to Accidents, eleven; to Sequelae, ten. Thus seventy-two pages in all are taken up with consideration of the safety of the patient. Rather curiously, no mention is made of Charting, so important a means to learn and remember the changes of condition—what might be called the physiopa-thology of anesthesia. The tree of knowledge has many leaves. Even the mere recording of the course of an anesthesia is as valuable a job (how many regard it as such!) as is the postanesthetic study. Magill's nasal tubes are not mentioned, nor resuscitation apparatus, nor Cyclopane.
A. F. Erdmann

The Biochemistry of Medicine. By A. T. Cameron, M.A., and C. R. Gilmour, M.D. Second edition. Octavo of 518 pages, illus-Baltimore, William Wood & Com-

pany. 1935. Cloth, \$6.00.

Among the large number of text books on biochemistry it is difficult to select one which would suit the practicing physician better than this volume. Written under the combined authorship of a biochemist and a physician it naturally presents the picture of the applications of biochemistry to medicine. Almost one-half of the book is devoted to a description of energy metabolism and the pathological chemistry of carbohydrates in diabetes. Another important section of the book deals with salt, water and protein

metabolism and their direct bearing upon the picture of nephritis. There are small sections devoted to the inorganic constituents of blood, the subject of respiration, endocrines and vitamins. Every chapter closes with a short and useful summary. The book is very well written and nicely arranged. W. S. COLLENS

Clinical Tuberculosis. Edited by Benjamin Goldberg, M.D. Two volumes Fully Illustrated with over 640 Half-Tone and Line Engravings and 9 Full-Page Color Plates.

Octavo. Philadelphia, F. A. Davis Company, 1935. Cloth, \$22.00.

This work spendidly conceived is even more splendidly executed. In two octavo volumes of over 700 pages each the subject of tuberculosis in all its phases is presented by a group of specialists in every branch of medicine and surgery under the able editorship of Benjamin Goldberg of the University of Illinois College of Medicine. In the limits of this review it is possible to comment on only a few of the many excellent chapters in this exhaustive treatise.

G. J. Drolet discussed the epidemiology of tuberculosis, emphasizing the facts of sex, age, urbanization, color, occupation, housing and race, and proving by his presentation that there may be a fascination in

statistics.

R. Mellon reviews the morphology of the tubercle bacillus from the standpoint of its

newer biology.

Pol. Coryllos (chapter V) discusses the pathologic physiology of the tuberculous lung, according to present day thought and presents the facts of the disturbances of gas exchange, circulation, mechanics and physiochemistry.

Chapters VI-XI are devoted to diagnosis in its several phases: Laboratory tests, physical diagnosis and X-ray findings. In the latter, H. E. Potter of Chicago recognized three types of earliest demonstrable lesions, namely, simple diffuse homogeneous shadow density, single blotchy area, and granular or flocculent shadows of numerous tiny consolidations. The value of stereo films is compared with that of two films in greater than stereo shift to be viewed separately and the opinion given, that the two methods are equally diagnostic. An adequate test by a number of experienced observers in a large series failed to establish any essential difference in the reading for tuberculosis. Needless to say, the stereo method is of material aid in orientating superimposed lesions.

Edgar Mayer contributes a chapter on the Salt restricted diets of Gerson and HerrNumber 81 BOOKS 6

manusdorfer-Sauerbruch. The details of these diets are given, their ultimate value frankly not stated in view of the need of further research, but the personal opinion is advanced that these dietaries represent an alternative therapy which is capable of rais-

ing the resistance of patients.
Surgical measures suggested in the hope of providing more functional rest as well as the closing of cavities are discussed in the next few chapters by R. C. Matson, R. W. Matson, Pol. Coryllos and C. A. Hedblom. The treatments described are Artificial pneumothorax, Intrapleural pneumolysis, Oleothorax, Phrenic neurectomy, Apical collapse, and Extrapleural thoracoplasty.

These chapters constitute a very fine feature of this important publication. R. C. Matson's summary of the value of pneumothorax treatment is sound, well-balanced and yet stimulating. The results of this treatment appear to justify the utilizing of pneumothorax treatment carlier in the course of inherculosis than has been generally customary.

Mayer on Heliotherapy (Chapter XXV) stresses the cautions to be observed in the use of sunlight, quartz and carbon are therapy in active pulmonary lesions, namely, only in the late stages of the disease and never in cases with high temperatures.

Blatt and Greengard contribute a special chapter on the Tuberculosis of Children and this is followed by a splendid account of Tuberculosis Meningitis by Abraham Levinson. He emphasizes the observation that this tragic disease is practically never primary, but is secondary to foci in other parts of the body.

Other chapters follow on Tuberculosis of the pleura, intestinal tract, anus, peritoneum, urogenital tract, ear, sinuses and pharynx, eye, skin, bones and joints; and chapters on Tuberculosis in association with pregnancy, Diabetes, Thyroid gland, and Cardiovascular system. And a final chapter on the Psychopathology of the tuberculosis.

In sum, a work splendidly conceived and

even more splendidly executed.

FRANK B. CROSS

The Autonomic Nervous System. Anatomy, Physiology and Surgical Treatment. By James C. White, M.D. Octavo of 386 pages, illustrated, New York, The Macmillan Company, 1935. Cloth, \$7.00.

A monograph carefully planned and equally carefully executed which the reviewer has read with considerable pleasure. All individuals contributing towards the publication of this volume should feel a just pride in its consummation. It is a credit to both the author and publisher.

In its general plan it is divided into three parts dealing with the historical development of the knowledge of the involuntary nervous system (Part I); the consideration of the various clinical conditions (Part II); and a detailed presentation of the operative technique. (Part III.) The author possesses the capacity for pithy condensation in a rare degree, presenting in a direct simple fashion within 382 pages a stupendous amount of information.

No pains have been spared to increase its value to the student. It is illustrated in an extraordinarily generous fashion, a total of 96 pertinent, instructive, original drawings and greatly modified copies being placed appropriately throughout the various pages. The free use of drawings must add greatly to the cost of publication, but form a real feature of the book.

Numerous references to the literature are appended to each chapter, a delight to every student to whom this "Textbook" should prove to be highly instructive.

HAROLD R. MERWARTH

Puerperal Gynecology, By J. L. Bubis, M.D. Octavo of 199 pages, illustrated. Baltimore, William Wood & Company, 1935. Cloth, \$3.50. Dr. Bubis has attempted a complete re-

view of this subject with which he has had

an unusual experience since 1916.

His book is subdivided into four sections to conform with his interpretation of modern obstetrics. First, the prenatal period, in which abnormalities and infections should be recognized and treated. The second period is relegated to the delivery; in this section he makes a comprehensive review anesthesias and analgesias, and the indications for all types of operative procedures. Following the birth of the child comes the very important phase, namely, examination and repair of the genitalia not only for new lacerations but also old lacerations. Thus the author feels that he is saving the individual years of invalidism and cutting down on the cost of the subsequent operation. The fourth phase is the after care of said patient. Here the author outlines the treatment of the various complications which . might occur.

He has had many subsequent deliveries following extensive repair without any serious complications,

In this book the author minutely describes his operative procedures using illustrations where possible.

The book should be interesting particularly to those doing obstetrics.

MORRIS GLASS

The Treatment of Rheumatism in General Practice. By W. S. C. Copeman, M.A. Second edition. Octavo of 228 pages. Baltimore, William Wood & Company. 1935. Cloth,

\$3.25.

The author has included much of value Acute rheumatic fever and chorea with treatment is discussed in part one. Part two treats in general terms of more chronic conditions usually involving pain and disability, acute muscular rheumatism, lumbago, sciatica, neuritis, rheumatoid arthritis, osteo-arthritis and spondylitis. This is indeed a broad field.

In part three the author ably discusses the methods to be used to benefit these patients who present themselves for care. All means used to relieve or cure these conditions are given; medicinal, dietetic, vaccines and non-specific protein therapy, physical methods, manipulation, baths, endocrine therapy, in fact all aspects of methods of treatment.

This volume is up-to-date and comprehensive and will prove of value to anyone who will review these conditions with the author. HENRY M. Moses

The Medical Man and the Witch During the Renaissance. By Gregory Zilboorg, M.D. Third series, volume 2. Duodecimo of 215 pages, illustrated. Baltimore, The Johns Hopkins Press, 1935. Cloth, \$2.50.

The period of the Renaissance presents a most gruesome picture in the annals of history as regards witchcraft and the maniacal persecution of witches. In this book, a series of three lectures, Dr. Zilboorg treats with thoroughness the subject of witchcraft and the birth of modern

psychiatry.

The first lecture covers the factors stimulating the propagation of demonology through the influence of the teachings of Luther and St. Augustine. The greater part of this discourse is devoted to a book, Malleus Maleficarum (The Witches' Hammer), written by two Dominican monks, Johann Sprenger and Heinrich Kraemer, members of the Inquisitors appointed by Pope Innocent VIII to try witches. This publication was endorsed by the Dean and Faculty of the University of Cologne in 1487. These monks attempted to prove the existence of witchcraft and witches, setting forth cases for purposes of demonstration and elaborating fully on the prosecution and sentencing of culprits in the name of Justice to the extreme penalties of torture and burning at the stake.

The second lecture embraces the relative positions of medicine and sorcery during the sixteenth century. Although much time was devoted by the scholars and teachers of this period to scientific research in medicine and to the rediscovery and translation of ancient

texts, nevertheless, very little progress was made in the study of mental diseases and the development of a sound medical psychology. In fact, the differentiation between the mentally sick and witches became increasingly obscure, and eventually the two terms became synonymous in the minds of the laity. The medical profession at the close of the sixteenth century had either shied and avoided the problem or had left it to the jurist and the public at large. Among the few pioneers who combatted the universal psychosis of demonic philosophy were Juan Luis Vives (1492-1540), Levinus Lemnius (1505-1568) and Cornelius Agrippa (1486-1535), teacher of Johann Weyer (1515-1588).

The life of Johann Weyer, the father of psychiatry, his teachings struggles are delineated in the last lecture. Weyer studied under Cornelius Agrippa until he was nineteen years of age. He then went to Paris where, under the pseudonym of Johannes Piscinarius, he wrote his first masterpiece, De Praestigiis Dacmonum, in 1562. In this book, he thoroughly and carefully exposed the true nature of witches and the possessed. Weyer refuted the traditional references based on Biblical extracts and tried to convince his contemporaries that being bewitched was not a crime but a disease requiring medical attention. He was the first physician to point out the relationship between psychology and medicine. Although he is usually characterized as a humanitarian, he was also a clinician of no mean ability.

This book should prove of great value to the student of the history of medical psychology. WILLIAM RACHLIN

Recent Advances in Diseases of Children. By Wilfred J. Pearson, D.M., M. C. & W. G. Wyllie, M.D. Third edition. Duodecimo of 566 pages, illustrated. Philadelphia, P. Blakiston's Son & Co., 1935. Cloth, \$5.00.

This is a nicely written book which shows adequate acquaintance with American Pediatric literature as well as that of the authors'

own country.

If one wishes a brief review of general pediatrics, from the English standpoint, he

can get it here.

The conservatism of the authors in feeding may be purely temperamental but one wonders whether American children do not have a better nutritive chance because materials are actually unavailable in England or limited by financial reasons.

On the whole their feedings differ from ours, no more than ours from each other, but most of us would not be satisfied with beginning "Cod Liver Oil by the end of the third month" nor with "2 teaspoonfuls of orange juice 2 or 3 times a day."

W. D. Ludlum

CHARLES B. TOWNS HOSPITAL

FOR THE EXCLUSIVE TREATMENT OF

ALCOHOLISM and DRUG ADDICTION

This hospital has specialized solely in addictions for over thirty years. Our experience has shown us that best results could not be obtained when associated with any other type of case. Its method of treatment has been fully described in the journal of the American Medical Association and other scientific literature. The treatment is a hospital procedure and provides a definite means of eliminating the craving and the toxic products of alcohol and drugs. Emphasizing the after care and with appreciation of the seriousness of the alcoholic problem we devote the convalescent period to minimizing the possibility of relapse. In the classification of the City of New York hospitals this institution has been granted a special license by the Commissioner of Hospitals for the exclusive treatment of alcoholic and drug addiction.

THE TRUTH ABOUT CIGARETTES

In cases of congestion of some portion of the upper respiratory tract, the safest course is discontinuance of smoking. The next best advice is "Smoke Philip Morris", the only cigarette scientifically proved by independent outside research to be less irritating.*

> Proc. Soc. Exp. Biol. and Med., 1934, 32, 241-245★ N. Y. State Jour. Med. 1935, 35—No. 11,590 Laryngoscope 1935 XLV, 149-154

In Philip Morris cigarettes, only diethylene glycol is used as the hygroscopic agent. To any Doctor who wishes to test the cigarettes for himself, the Philip Morris Company will gladly mail a sufficient sample on request below.**

Special Schools

Little has been said here about the special schools which train the young man or woman to a high degree of excellence in some particular line. They are well worth our consideration. Take one example, the school of dramatic art. Some think of such a school as desirable only if one intends to take up acting as a profession; that is a great error.

We are all actors, in a sense, in all our contacts and relationships of life. We wish to appear at our best before the world, and, as a matter of fact, if we have faults of voice, manner, expression, carriage, or what not, they may mar our success at some critical time. A few months training at a dramatic school may easily give the polish and finish needed.

Then, too, our social life is full of little efforts at drama, and the man or woman who knows how to manage such affairs, train the cast, and arrange the scenery and lighting, will always be in demand.

Says the catalogue of a dramatic school:

The work of the Academy is both educative and practical; it cultivates not only the intellectual and physical faculties and functions, but the powers of personality itself—the inner and deeper natures-which are little considered in the usual school and college curriculum, that is, the temperamental, imaginative, instinctive and conceptively original powers of feeling.

The best education for every man and woman is at basis that of the actor, who ideally is the perfected human being, and "is, all that is, at will."

Theatrical skill and knowledge and stage technique, while forming a necessary part of the training of the professional actor, are but a part, and not the largest part, of his preparatory education. The study and practice of the means and modes of expression are important, but the discovery and development of the powers of human nature itself are more so. A human being can express only what he holds in actual possession. Such possession, in all the faculties, can be increased and the channels of expressive use opened and freed through dramatic educative processes.

The studies of the Academy are of use to all who seek personal improvement in all forms of expression. They have been found to be of special value in professions and occupations other than those of the theatre. The writer, the teacher, the entertainer, the clergyman, the man of affairs, and, indeed, all who are called upon to use speech and action expressively can find in the Academy courses means for development of their gifts and resources.

Travel and Resorts

Health Springs Bubble in Switzerland

Nature has endowed Switzerland with a marvelous group of mineral springs, the use of many dating back to the very beginning of civilization. The wide range of these hydro-mineral resources and individual characteristics of each as to therapeutic value, are rivalled by but a few watering places in other countries.

The springs of St Moritz in the Upper Engadine, according to Dr. med H. Keller, furnish indisputable proof of great antiquity, for when their pipes were replaced in 1853 there was found

at three and a half feet below the surface of the earth, well-preserved hollowed out trunks of three mighty larches which had obviously been employed for the springs. In these treetrunks, a number of bronze objects, swords, knives, needles, etc., were discovered. Scientists estimated them to be about 3000 years old, and

similar prehistorical finds were made in Baden (Argovie), Loéche-les-Bains (Valais), and Yverdon (Vaud).

The period of the Roman occupation, beginning in the year 58 B.C., represents the second stage of development of watering places in Switzerland. Spas flourished to a high degree, not only through the use of medicinal springs already known but also through discovery of others and particularly through the progress made in technical equipment and bath fittings. The thermal baths at Baden are an outstanding example of this. The bath hospital and the numerous surgical instruments dis-

covered there show how well the Romans understood how to utilize natural healing methods available through baths and even to combine them with surgery.

After invasions from the north put an end to Roman influences, appreciation of mineral springs suffered a temporary setback, but dur-

CANADIAN PACIFIC HOTELS

VISIT CANADA - YOUR FRIENDLY NEIGHBOR

ing the reign of Charlemagne, the baths increased in vogue. In the monastery of St. Gall there is still preserved the plan of a building of the year 820 in which a bathing establishment is designed. In the later Middle Ages and particularly at the time of the Renaissance, baths taken by people in normal health were considered as one of the chief "amenities of life."

Watering places now increased rapidly and in addition to spas of prehistoric foundation, there are records of the establishment of Ragaz-Pfaefers in 1038 and 1384; Tarasp and Val Sinestra, Lower Engadine, in the 15th Century; Bex, Vaud, salt spring in 1554 and sulphur spring in 1717; and Gurnigle near Berne, in 1561. The springs of Passug near Chur, were known in 1562 and rediscovered in 1863. The mineral spring of Rheinfelden, called Kapuzinerquelle, was in use as early as 1664, and exploitation of the Rheinfelden saltmines and opening of the brine baths dates from 1846.

There are one hundred spas in the Alpine regions, twenty-six in the Jura region, and thirty in the Swiss high plateau. Springs with over 20 degrees centigrade are called thermal waters, and those with lower temperature, cold springs.

The mineral constituents of these springs are chiefly—calcium, potassium, sodium, lithium, magnesium, iron silicum, aluminum, sulphur, phosphorous, borax, chloride, bromide, iodine, fluoride, carbonic acids, sulphuretted hydrogen, and nitrogen. The bases and the acids can be disassociated from one another or compounded with salts. The most important of these are common or kitchen salt, carbonate of soda, magnesium and iron, sulphate of soda, sulphate of sodium, gypsum and sulphate of magnesium, iodine salts and arsenic compounds. The importance of borax and lithium has not yet been sufficiently investigated.

Where the mineral waters come in contact with organic substances on the surface of the earth and slowly spread, they deposit a part of their salts; in this way mud and peat are formed, which are both used for baths and local applications.

The majority of the springs are radio-active, having emanations either in the water itself, in their sediments or their gasses. Radio-active springs contain but little mineral substance, and are connected with the deepest strata of the earth.

The ten classified kinds of mineral waters, according to degree of mineralization, predominant element, and temperature, are—

(1) Feebly mineralized or simple cold waters, containing less than 0.5 gr. of solid constitu-

ents per litre, and less than 1.0 gr. of carbonic acid. Switzerland has forty such springs, the most important of which are Aigle, Disentis, Knutwil, Romanel, and Weissbad.

(2) Akrato-thermal or simple thermal waters, "Wildbäder," containing to the liter less than 0.5 gr. of solid constituents, and a temperature above 20 degrees centigrade. Ragaz - Pfäfers features such a spring which compares with Badenweil, Gastein, Wildbad, and a number of other spas in foreign countries.

(3) Earthy vaters, containing over 0.5 gr. of solid constituents to the liter. These are divided into carbonate and gypsum waters, according to the predominance of

carbonic and sulphuric earth. Some of the most important watering places with these features are Hennicz-les-Bains, Montreaux, Meltingen, Sissach, Reinfelden-Kapuziner and Magdener, Yverdon, Tenigerbad, Andeer, Grimmialp, Loéche-les-Bains, and Vals-Platz. The springs in the last two resorts are thermal. This category of spas compares with such foreign watering places as Thonan, Vittel, Wildungen, etc.

(4) Alkaline waters, containing over 0.5 gr. of solid constituents per liter. The predominant salt is carbonate of sodium. Several of these springs contain iron, bromide, iodine, borax, and lithium. There are nine of these in Switzerland. Tarasp-Schuls-Vulpera, Passug, and Oberiberg, are the most important. Neuenahr, Vichy, Enis, Franzensbad, Karlsbad, Marienbad, etc., are rivals with similar properties in other countries.

(5) Sulphur waters, containing sulphate of sodium, sulphate of calcium, and sulphuretted hydrogen. Some are cold and others warm, often containing chloride and sulphate. There are sixty-eight springs of this nature, of which twenty-four are warm. Among the most important are Baden, Schinznach, Lavey-les-Bains, Yverdon, Alvaneu, Bex-les-Bains, Gurnigel, Lenk, Lostorf, Heustrich, and Schwefelberg Bad.

Magnificent Tamina Gorge near Ragaz-Spa in Eastern Switzerland—an outstanding tourist attraction.

(6) Common salt or brine baths, containing over 1 gr. of common salt to the liter. Bromide, iodine, and carbonic acid are often found in these springs. Such saturated waters in Switzerland are found at Bex-les-Bains, Rheinfelden. Rheinfelden-Ryburg, a n d Schweizerhall, which are used for the extraction of salt as well as for brine baths. They compare, for instance, with Baden-Paden, Biarritz, Homburg, Ischl, Kissingen, Nauheim, Wiesbaden, and other such foreign springs.

(7) Iodine waters, containing at least 0.001 gr. of iodine salts to the liter. The iodine is mostly found compounded with chloride of sodium in common salt, alkaline,

and earthy waters found at Tarasp-Schuls-Vulpera, Rheinfelden, Passugg, Bex-les-Bains, and Schinznach.

(8) Chalybeate or iron waters, containing 0.01 gr. and more of farruginous salts, in which iron is the main curative agent. In Swiss springs the iron is found in the form of bicarbonate. They are classed as alkaline, earthy, muriatic, saline, and carbonic waters, according to predominating element. Iron waters are very numerous in Switzerland, especially in the Alpine regions, and particularly in the Grisons. Most important of this type of spa are St. Moritz, Tarasp-Schuls-Vulpera, Passugg, Fideris, Lenk, Morgins, Acquarossa, and Franzensbad is one of the foreign rivals.

(9) Arsenical waters, containing at least 0.0002 gr. of arsenic. In Switzerland arsenic is found with the carbonates and sulphates of alkalis, alkaline earth, and iron. Val Sinestra and Acquarossa feature such springs.

(10) Springs containing crown salts are found in the little spa of Birmenstorf near Brugg.

(11) Peat and moor baths. They are classified according to their mineral and vegetable substances. In some localities the mud of the mineral waters is used for the packings. This is the case at St. Moritz, Schinznach, Andeer,

and Acquarossa. Sand baths with alluvial sand from the Rhone are methodically employed at Lavey-les-Bains. Elster, Franzensbad and Marienbad number among non-Swiss rivals.

The manifold healing agents which Nature has so lavishly placed at mankind's disposal in Switzerland are combined with the forces and laws of physics, hygiene, and dietetics. Mineral springs, pure air, and sunshine, form a matchless combination, and all the leading resorts feature the latest and best installations for any special treatments which a physician may deem necessary for a patient.

Transportation and hotel rates have been reduced so drastically in Switzerland that a sojourn at one of its spas is now within easy reach of any purse.

Railway Boosts Motor Travel

Recognizing the rapid growth of automobile touring, the Canadian Pacific Railway has issued, this month, a new rotogravure booklet, "Motoring to Canada," edited by Col. Walter W. Hubbard, former Dominion resident.

The brochure, which is being distributed free, contains valuable information regarding motor vehicle regulations, customs and immigration laws, hunting and fishing in the eastern provinces, sports and recreation, as well as a listing of worth-while bungalow camps, hotels, inns and summer resorts. It may be obtained free on request from automobile clubs, chambers of commerce, or the Canadian Pacific offices in Buffalo and New York City.

Thrifty Traveling

The Red Star Line, alert to the needs of a cultured class of ocean travelers, inaugurated the "Tourist" mode of transatlantic travel several years ago.

Since then there has been a widespread acceptance of Tourist Class to meet the demands of a discerning group of travelers. Time was, when for the well-bred person of limited means, a trip to Europe was out of question, a burden of expense, or a sacrifice of comfort and pride. Today, the thrifty or those with a moderate vacation budget, book "Tourist" and find they have the run of the ship and as good accommodations and cuisine as anyone else.

The "one class" way of crossing has become very popular with professional and business people, vacationists, students, teachers, and other purposeful travelers.

Most Remarkable Resort in the World

Atlantic City, perhaps the most universally known vacation resort in the world, is also the most remarkable

Its resident population is not as big as the smallest assembly district in Manhattan, yet it has at times almost as many people as the total population of that borough New York City has a total of 509 hotels—Atlantic City has 1.200

The famous boardwalk stretches eight miles in length and is sixty feet wide. The city has several miles of sandy white bathing beach, six great recreation piers, and it is estimated that more than 15 million visitors spend three times that number of days within its enchanting limits.

It is the most northerly city on the east coast that enjoys temperate weather all year around due to the Gulf Stream. There is little fog, and the high average of sunshine makes it a favor able resort for convolescents as well as amusement seekers.

Many Happy Return

Easter visitors to Bermuda, back home again wreathed in smiles, make us feel that we have missed the best travel feature of early spring

Bermuda naturally is a particularly attractive image during winters frigidity, but its residents will extol the marvels of springtime in Bermuda until the American listener feels completely dejected about the last remnant of weather pride he has enshrined since the first balmy American spring day he can remember

"Of course," these Bermudans will console him, "you want to get away in winter when your weather is so bad and not wait until spring, which must be rather nice But the ideal months here in the islands include April and May Then the Easter likes are in bloom, all our flowers break forth in a riot of colors, the vegetation is brilliantly green, and the weather is perfect."

A little spring fever, even under leaden skies with chilly breezes flapping around the edges of spring coats, is akin to a mild dose of winderlust. To clippety clop behind a span of horses over Bermuda's white coral roads in golden sunshine is a most complete disassociation from harassed daily existence in northern cities. You'll come to distrust and dislike the half dozen motor trucks which are the only automobiles in all Bermuda. You'll be charmed with the absurdity of Bermuda's toy railway and sympathize understandingly with the years of effort devoted to gaining acceptance of it

as a necessity. And, if you wait too long, you may see it abolished as an unnecessary adjunct to cycling and the carriages.

The climate attractions and beauties of Bermuda are unsurpassable in the spring. Regular sailings and special cruises follow the special ones over the Easter holidays. Disappointed "left-overs" will find accommodations and just as good times on any post-Easter sailings or cruises.

Railway Official Forecasts Heaviest Scottish Season

Scotland is preparing for the greatest travel season in her history. The large gains of 1935 over 1934 in travel to Scotland, are regarded as mere indications, beginnings of a huge wave of travel to the ancient Kingdom, which it is believed will reach an all-time peak this year.

"The hardy Scot, it is said, roams the whole world, and perhaps it is just as well, for it leaves room for the rest of the world to go to Scotland," declares Arthur Towle, Hotels' Controller of the London, Midland and Scottish Railway Company.

"For centuries the ancient kingdom has been a travelers' paradise. Nowhere else could be found a happier combination of stern mountain beauty with the sudden warmth of little vales, lovely, hidden and remote.

"Scotland has always been a Mecca of the very rich as well as of the thousands of tourists visiting her annually. Wealthy Americans and English rent estates, castles, moors for hunting, by the season. The kings of England vacation there, as do many of the distinguished of the entire Western Hemisphere."

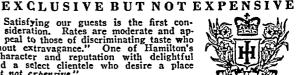

Intended as a resort for the average well-todiscriminating traveler, Gleneagles, a famous hotel opened on Perthshire by the London, Midland and Scottish Railway, soon began to attract many "castle" and "estate" people whose admiration for things medieval did not include the absence of heating methods and plumbing. So it became the recognized travel center of Scotland and its fame spread rapidly to all parts of the Empire and to other countries. Visitors to Gleneagles were predominantly Anglo-Saxon, and first rate provision

was made for all of the popular sports of that race.

In addition to its own unsurpassed dispositions for all the popular sports, it centers the most famous golf, riding, hunting, fishing, tennis, scenic, and historical sections of Scotland. Since its founding a little over twelve years ago, it has become one of the most celebrated resorts in the world.

Scottish hotel, resort and railroad men anticipate the best season in history, straining their respective services to capacity.

Summer Events in Canada

The calendar of events in Canada this coming summer will reveal the growth of the Dominion in the fifty years since it was first spanned by the Canadian Pacific Railway. Most comprehensive of all will be the Vancouver Golden Jubilee, from July 1st to September 7th, showing the romance of that city's progress since its original selection as Pacific terminus of the railway and its emergence as one of the leading ports in the Orient trade

In the Banff-Lake Louise area, the Trail Riders and the Sky Line Trail Hikers of the Canadian Rockies will be active, and the Stoney tribe will stage its annual Indian Days at Banff.

In early July, the Calgary Stampede will re-enact in rodeo form the pioneer days of the Canadian West.

A schedule in detail will be published in a later issue.

Our National Parks via the Great Lakes

There are at least a half dozen different ways of visiting our famous National Parks, but none that offer a more promising way of seeing other marvels en route than the two suggested by the Great Lakes Transit Corporation.

Never before have the eyes and thoughts of the American people been so directed upon a

National Park vacation.

If you have missed the thrills of the great Western National Parks, you have yet to learn of the grandeur of America. Here is scenery not duplicated anywhere else in the world. Coloring of many hues like a giant spectrum scrumbled by the mist. An upland playground of unmatched charm where just to breathe is to rejuvenate. Tonic sunshine in the cool of snow-capped peaks; flowered meadows; twisting mountain trails; grandeur; recreation; health

AND CALIFORNIA

A new Grace "Sonto" sails every two weeks—all outside rooms with private balhs; outdoor, built-in tilled swimming pools; dining rooms with roll-back domes which open to the sky; Dorathy Gray Seouly Salons; pre-release talkies; gymnasiums; club-bars.

Tel: Gramercy 5-4320

Throughout the Western National Parks is found scenic beauty of rare grandeur where Nature's miracles and sensations present a landscape dazzling and thrilling. Worth rounding the world to see.

Addressing the country over a nation-wide radio broadcast, on the occasion of his first visit to the National Parks, President Roose-velt said:

"... There is nothing so American as our National Parks. Perhaps I can best express my thrill and delight by saying that I wish every American, old and young, could have been with me today.

"The scenery and wild life are native and the fundamental idea behind the parks is native.

"With all the carnestness at my command, I express to you the hope that each and every one of you who can possibly find the means and opportunity for so doing, will visit our National Parks."

Now the Great Lakes Transit Corporation helps you to find the means through more economical ways, easier travel, and more interesting routes—helps to bring the opportunity practically to your door.

You can drive to Buffalo, load your car on a luxurious lake steamer and enjoy the relaxation

Maintain Mineral Alkali Balance

WITH

Kalak

Hypertonic - Alkaline - Carbonated - Not Laxative

The years of experience with physicians who have used Kalak show that the use of a formula containing calcium, magnesium, sodium and potassium salts represents a correctly balanced solution. This is Kalak which, as such, aids in maintaining a balanced base reserve.

How Alkaline Is Kalak?

One liter of Kalak requires more than 700 cc. N/10 HCl for neutralization of bases present as bicarbonates. Kalak is capable of neutralizing approximately three-quarters its volume of decinormal hydrochloric acid.

IN PREGNANCY AND LOW-CALORIE DIETS

and wherever vitamins A and D are required with minimum added calories

RESTRICTED diet regimens, as for the obese, know no season for vitamin therapy. Because of the frequent drain on the mother's stores and the added requirement of the fetus, the need for vitamins A and D is increased during pregnancy. Yet, it is in just such cases that there may be an aversion or intolerance to fats. In the obese, who studiously avoid butter, cream and other good sources of vitamin A, the deficiency should be made up. This can be

done in a convenient and highly acceptable manner by prescribing Mead's Capsules of Oleum Percomorphum, which combine a high potency of both vitamins A and D. Each 10-drop capsule supplies natural vitamins in amounts not less than 13,300 A units and 1,850 D units (U.S.P.). Every capsule represents more than 5 teaspoonfuls of cod liver oil* in vitamins A and D. These vitamins, moreover, are in the same ratio as in cod liver oil.*

*U.S.P. XI Minimum Standard

For physicians who prefer Mead's Viosterol in Halibut Liver Oil, 3-minim capsules containing not less than 8,500 vitamin A units and 1,700 vitamin D units (U.S.P.) are available.

"Past Regrets and Future Fears"

In addition to difficulty in putting away the cares and worries of "dead yesterday" and "unborn tomorrow" some of your sleepless patients have the additional hurdle of fear. Fear—engendered by recollection of other sleepless nights—that sleep, so much needed, will again clude them; fear that continued loss of sleep will break down health.

Insomnia, whatever its cause, may easily become chronic, and establishment of normal sleep habits frequently requires temporary use of a hypnotic.

Ortal Sodium is effective—one five-grain capsule will usually induce quiet, restful sleep (a 3-grain capsule is often sufficient). Its effect is not unduly prolonged; the patient is usually alert and refreshed the following morning.

Ortal Sodium (Sodium hexyl-ethyl barbiturate) is supplied in capsules of 3/4, 3, and 5 grains, in bottles of 25, 100, and 500.

For the prevention and treatment of staphylococcic infections

STAPHYLOCOCCUS TOXOID

Lederle

STAPHYLOCOCCUS TOXOID has assumed an importance in the field of biologic therapy which merits recognition.

With its aid physicians are successfully treating recurrent and chronic staphylococcic infections which were formerly considered to be intractable.

Murray (Lancet, 1935,1,303) reports the following results of its use:

Condition Treated	Recove	red	Impro	vement	Slight	or No Benefit
Acne	3 cas	es	21	cases	6	cases
Blepharitis	8 "	,	6	**	1	"
Furunculosis	25 "	•	14	"	-	"
Carbuncles	3 "		1	u		**
Others	12 "		14	"	2	**
	-		_		-	
Total	51		56		9	

C E. Dolman (Lancet, Feb. 9, 1935,306) reported successful results in 72 out of 81 cases of intractable staphylococcic infections with a series of injections of Staphylococcus Toxoid.

Each preparation of Staphylococcus Toxoid *Lederle* is tested for antigenic potency before release.

For complete information and literature, address:

The strict control which is exercised in the manufacture of Petrolagar is one of the chief reasons for its efficiency. Every step in the process of making Petrolagar, from tests of raw materials on through each phase in its production, literally comes under the exacting scrutiny of the microscope. Because of this control Petrolagar can always be relied upon for its uniform consistency and action.

Petrolagar is a palatable emulsion of pure liquid petrolatum, (65% by volume) and number One Silver White Kobe Agar-agar, accepted by the Council on Pharmacy and Chemistry of The American Medical Association for the treatment of constipation

After school—what?

Schools and internship are but a beginning in the study of medicine, serving only as a foundation. Setting up a practice is the continuation school that never ends until complete retirement.

Each day new problems—new discoveries—new knowledge from practical experience. Each day delving into the serious study of medical journals. Keeping up with the continual advance of the medical profession. Taking an extension course in general medicine, general surgery, or one of the many sections. Thus after scholastic education ends—the medical journal becomes an important text book. From the scientific pages comes solution of the problems that hang over a physician's head. From the advertising pages—the lore of his "tools of trade."

Now rated widely as one of "the" medical journals of merit, the New York STATE JOURNAL OF MEDICINE is an "after school" manual of instruction.

The physician who does not realize the importance of a thorough reading of each issue—cover to cover—has yet to learn that real progress, through continuous study, begins after school.

Membership vs. Fellowship

There is considerable confusion relative to Membership and Fellowship in the American Medical Association

A member of a county medical society automatically becomes a member of the State Society and the American Medical Association but not a Fellow of the American Medical Association. To become a Fellow of the A.M. A he must make special application and pay to the American Medical Association the annual dues of \$7.00.

Only around 60% of the members of the Medical Society of the State of New York were Fellows of the American Medical Association at the time of the Atlantic City meeting. It is the hope of the officers of the Medical Society of the State of New York to increase the percentage of Fellows by the time of the Kansas City session.

Only Fellows may register or take part in the annual meetings of the A. M. A.

American Medical Association

535 North Dearborn Street, Chicago

APPLICATION FOR FELLOWSHIP

I hereby make application for Fellowship in the AMERICAN MEDICAL ASSOCIATION and subscribe for The Journal for one year from date. I am a member in good standing

County Medical Society a component

of the

DIAMON OF TH				110 1012

Qualifications for Fellowship—The members in good standing of the constituent state and territorial medical associations of the American Medical Association shall be members of the A M $\,$ A

Any (1) member of the Association who on the prescribed form (2) shall apply for Fellowsh p and subscribe for The Journal (3) paying the annual dues for the current year shall be a Fellow

Congratulations, Medical So

THE KNORR SANITARIUM

For Nervous, Alcoholic, Bed Patients, Cardiac, and Narcotic Cases

Rochester's oldest and most reliable sanitarium. Ideally located, offering expert service by registered nurses with many years of practical experience assures the utmost in care to convalescents, elderly people, and those afflicted with nervous and chronic ailments. Reasonable rates. Modern equipment.

Patients accepted only on physicians' recommendations

139 Troup St. Rochester, N. Y.

The acclamation of Rochester is for this year's outstanding medical convention. We add our congratulations to the many you must be receiving on the efficiency and magnitude of your 130th Annual Meeting which so strikingly portrayed the universal advance of medicine, as well as the great progress of our own state's medical

CANNED FOODS AND THE PUBLIC HEALTH

IV. BOTULISM

 Several of our readers have inquired as to the possibility of botulism resulting from the consumption of commercially canned foods. The canning industry is proud of the part it has played in the eradication from its products of this deadly type of food intoxication. We are glad to devote this space to a discussion of this important tonic.

During recent years, the daily press periodically carries reports relating how one or more members of a family, or a group of persons, were stricken after a meal, usually with fatal results. Sometimes these accounts describe how an "anti-toxin" was rushed to the scene—an indication that botulism was involved. These press reports often include the statement that a "canned food" was incriminated as the cause of the illness.

We wish to emphasize that as far as the records go, these outbred's without exception are not attributed to foods commercially canned in this country. In practically every instance, it was found that the foods—usually of a non-acid or semi-acid nature—had been preserved at home by the use of inadequate heat sterilization processes (1). These press reports, by not stating correctly the type of food involved, have done much to cast unwarranted suspicion on commercially canned foods as possible causes of botulism.

Botulism, or acute toxemia due to clostridium botulinum, is by no means a maffiction. As early as 1802 — ninety-five years before van Ermengem discovered the true cause of the intoxication—warnings were issued against botulism. However, not until severe outhreaks occurred in this country some fifteen years ago, was it re alized that cognizance should be taken of

the fact that faods canned by the methods used in those days could become contaminated with the toxin of this organism. This fact having been realized, the canning industry took immediate steps to prevent such contamination of their products.

Research was inaugurated and has been continued to which the industry has contributed not only financially, but also by the studies of scientists associated directly with the canning industry (2). The end result of these researches was the development of scientific methods of determination of heat sterilization treatments, or heat processes as they are known to the industry, which would he adequate to insure the safety of canned foods from the standpoint of botulism (3).

The effectiveness of the measures generally adopted by the canning industry of the United States is evidenced by the fact that no case of botulism attributable to an American commercially canned food has occurred during the past ten years (la). Foods packed in commercial canneries are heat processed not only to insure protection from bacterial spoilage causing merely the loss of the food, but to render them safe from the standpoint of botulism, as well. In fact, a sterilizing process sufficient to insure the destruction of the most heat resistant strain of Cl. botulinum ever isolated is considered the minimum requirement of heat treatment of commercially canned foods. The National Canners Association has issued lists of scientifically determined processes for non-acid canned foods with which canners comply (4).

Such are the facts. The American canning industry offers its products to the consuming public for what they are; namely, wholesome and nutritious foods.

INTRACRANIAL HEMORRHAGE

Its Anatomical Forms and Some of Their Clinical Features
Joseph H Globus, M.D., New Yorl City

Associate Neurologist and Neuropathologist The Mount Sinai Hospital Associate professor of Neuroanatomy New York University and Bellevile Hospital Medical College

The term intracranial hemorrhage is chosen to designate in this contribution a variety of conditions commonly spoken of as cerebral hemorrhage, but in which not only the brain substance but any of the several spaces within the cranial cavity are primary sites of hemorrhage. The designation intracranial hemorrhage, is considered preferable to the often misused term, cerebral hemorrhage, which for obvious reasons should be restricted in its application to bleeding primary in the brain substance.

Intracranial hemorrhage thus includes several forms of bleeding, such as (1) hemorrhage into the subdural space (the so called subdural hematoma), (2) hemorrhage into the subarachnoid space, (3) hemorrhage into the ventricular compartments, and (4) hemorrhage into the brain substance with or without extension into the intra- or extracerebral spaces

The anatomical alterations the clinical manifestations, and often the causative factors show a uniformity distinctive of each of the several forms of intracramial hemorrhage Moreover, the constellations of signs and symptoms assume the character of syndromes which make accurate recognition of the inture and site of the disease process not only a certainty but a duty which any physician in general practice can not and must not evade. This grave responsibility, however, is well compensated by the service that may thus be rendered, since accurate diagnosis

offers an excellent opportunity for successful treatment and obviates fatal therapeutic errors. To meet and discharge this responsibility, it is imperative to be fully informed as to the clinical manifestations and the underlying pathological changes which chiracterize any of the several forms of intracranial bleeding.

Subdural Hemorrhage (Subdural Hematoma)

By subdural bleeding is understood the accumulation of extravasated blood in the space between the arachnoid and dura. In the great majority of instances, particularly those which present diagnostic difficulties, the bleeding is slow and cumulative. It assumes the character of oozing, and this leads to the formation of an encapsulated collection of partly organized and partly liquid blood for which the term, chronic subdural hematoma is now commonly used.

In a large proportion of cases, particularly those which come into consideration here, the precipitating factor is violence to the skull, accidental or otherwise, which in many instances had occurred—and this is highly significant—at some distant time prior to the onset of cerebral symptoms. Of no lesser importance is the fact that frequently a trauma to the skull, which is most commonly found to be the cause of the bleeding, is so slight as to be completely disregarded at the time of its occurrence. This, however, does not exclude, as a precipitating cause

From the Neurological Service and the Direction of Laboratories, The Mount Sinas Hospital Read at the Annual Meeting of the Medical Society of the State of New York, Albany May 14 1935 of subdural hemorrhage, severe traumas such as are followed immediately by variable periods of unconsciousness. But whatever the immediate results of the blow to the skull, accurate knowledge of the occurrence of violence and the fact that minimal injuries are more frequently associated with subdural hematoma should be borne in mind in considering the diagnosis.

The slowness with which the blood

accumulates readily explains the almost constant occurrence of a relatively long asymptomatic period between the time of the injury and the appearance of alarming cerebral symptoms. This so-called latent period may be limited to a few hours or may, as it more frequently does, extend over a period of months. The semi-fluid character of the encapsulated sanguineous mass is often responsible for fluctuations in the clinical manifestations

TABLE I

ANATOMICAL FORMS OF INTRACRANIAL HEMORRHAGE AND SOME CLINICAL FEATURES

	Subdural	Subarachnoid	Intraventricular	Cerebral
Precipitating Factors	Violence to the skull.	Overexertion, sudden rise of blood pressure or spontaneous rupt- ure of a diseased ves- sel.	Hemorrhage in an adjacent structure (cerebral or subarachnoid).	
PATHOLOGY AND SOME MECHANICAL FACTORS	Injury to, or rupture of, a vein at the point of its entrance into a venous sinus. Blood enters the subdural space. May enter subarachnoid space in small amounts.	or in diseased vessel. Blood spreads through subarachnoid	breaks through strip of diseased tissue into ventricle and fills en- tire ventricular sys- tem, often reaching the subarachnoid space. Also blood in subarachnoid space	vessels in area of soft ening ruptures and fills potential space with blood; ofter breaks into ventri- cular system through narrow strip of de- generated brain tis- sue.
Onset	Abrupt after a latent period (from the time of injury to the skull to the appearance of cerebral signs and symptoms) of relative freedom from symp- toms.	a short prodromal period in which vio- lent headache, vomit- ing, dizziness, and	subarachnoid hem- orrhage.	short prodroma
EVOLUTION OF THE CLINICAL PICTURE	After a latent period, manifestations of increased intracranial tension: headache, dizziness, mental changes, slow pulse, and manifestations of focal brain disorder. Laboratory Findings	Cerebrospinal fluid xanthochromic or bloody; occasionally clear.	Cerebrospinal fluid un- der increased pres- sure, bloody or xan- thochromic; albumin- uria.	Bloody cerebrospinal fluid.	Bloody (?) cerebrospinal fluid.
THERAPY	Surgery.	Drainage and sedatives.	Supportive.	Supportive.
Prognosis	If diagnosed and treated surgically, outlook promising, if no concurrent brain damage.	When diagnosed and treated by judicious	Fatal.	Fatal.

and is probably due to the admixture of cerebrospinal fluid which inhibits coagulation.

Among the symptoms to be considered in order of their importance and constancy are: headache, disturbances of consciousness, and other manifestations of increased intracranial tension. Mental changes, ocular and visual disturbances, convulsive seizures, and pupillary changes are among the less regularly encountered

findings (see table).

The recognition of this condition is not difficult if a reliable history of trauma

not difficult if a reliable history of trauma is obtained. However, the localization of the hematoma is much more difficult, particularly if it covers both hemispheres or when the brain, although compressed, does not give rise to symptoms of focal brain disruption. Very disquieting are also conditions in which, due to contracoup phenomena, signs of focal brain disturbance appear on the side ipsilateral with the hematoma. To meet these difficulties there are two very useful diagnostic procedures which may be carried out concomitantly: ventriculography or encephalography and trephining of skull. The former, by showing displacement of the ventricular system and by demonstrating alterations in all the aspects of the ipsilateral ventricle, will indicate the seat of the hematoma. The trephining procedures will substantiate the ventriculographic findings as to the location and will also yield the important information as to the hemorrhagic character of the lesion. Once the lesion is recognized and localized, surgery is the only therapeutic measure of avail.

Reports of cases

CASE 1. The following case exemplifies a typical instance of a clinically diagnosed subdural hematoma in which operative interference verified the diagnosis and resulted in complete recovery

History. The patient was a schoolboy, aged seventeen years. He was well until February 1932, when he met with what was considered to be a minor accident: he struck his head on a cross beam in a barn. He was dazed for a moment and experienced slight pain During the following three days he appeared to be well and then suddenly vomited. In the course of the next two months he remained apparently well, returned to school, and participated in games and other activities. From time to time.

however, he would experience headaches and vonit. The headache became more intense as time progressed and was accentuated by sudden movements of the head. Four days prior to admission to the hospital, the headache became unbearable.

Clinical findings and course. The patient was first seen by the author at the Southside Hospital (Bayshore, Long Island), where he was found distressed by headache and repeated vomiting. Examination revealed skull tenderness on percussion over the right parietal region, neck rigidity, bilateral papilledema, left facial asymmetry,

Fig. 1. Subdural hematoma, (case 2). The dura is reflected displaying the organized blood clot and the area of discoloration over the exposed subjacent part of the brain.

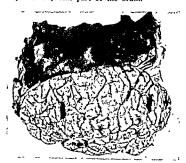

Fig. 2 Subdural hematoma, (case 3). The organized clot is adherent to the reflected dura.

depressed deep and superficial reflexes, and an inconstant Babinski sign on the left side. In view of the history of trauma, the latent interval and the above-quoted clinical manifestations, the author made the diagnosis of subdural hematoma and advised immediate transfer to The Mount Sinai Hospital for further observation and surgical intervention. A lumbar puncture there yielded xanthochromic cerebrospinal fluid. The character of the cerebrospinal fluid substantiated the diagnosis of subdural bleeding, and a craniotomy was performed by Dr. Ira Cohen. A trephine opening was made in the posterior parietal region on the right side. The dura was incised and a chronic subdural hematoma was found. It was first drained of its fluid blood. A flap was then turned down and the encapsulated hematoma, found spread over the entire hemisphere from the frontal to the occipital pole from the region of the sagittal sinuses down to the base of the brain, was removed in fragments as it was found adherent at some points to the underlying arachnoid membrane. Soon after the operation the patient developed more marked rigidity of the neck and continued to complain of headache. The convalescence was rather stormy but finally gradual improvement set in and all of the objective neurological findings have disappeared. A recent note from the patient stated that "he could not feel any better" and that at no time since he left the hospital was he ill.

Comment. This case illustrates how a minor injury to the head, almost negligible at the time of its occurrence, was productive of an extensive hematoma. It was apparently gradual in its formation, due to slow oozing of blood and, therefore, insidious in the production of the neurological manifestations. The diagnosis was not particularly difficult in view of the fact that the occurrence of head trauma was known and a lumbar puncture disclosed xanthochromic cerebrospinal fluid. The presence of the left Babinski sign and of the left facial weakness pointed to a right-sided lesion. This enabled the surgeon to proceed with security in selecting the right side for exploration.

Case 2. This is another case of subdural hematoma in which, however, the latent interval was a brief one.

History. A woman, forty-two years of age, tripped, fell, and struck her head lightly against some object. The accident was not witnessed by anyone and hence it is not known whether she lost consciousness at that time. She apparently continued with her house work, as her husband, on returning home that evening, found her apparently

well. The same evening, however, she suddenly passed through a convulsive seizure during which her eyes rolled upward, her mouth twitched over to the left, and there were jerky movements of the flexed left arm while the lower extremities were in rigid extension. The seizure was not accompanied by a loss of consciousness and lasted only a few seconds. Since then, similar seizures occurred hourly. The night before admission to the hospital, she was awakened from her sleep by a profuse nosebleed. She entered the hospital on the fourth day after the fall.

Clinical findings and course. Examination disclosed weakness of the left face and left hand, twitchings of the left face and arm, increased deep reflexes on the left side, and

astereognosis in the left hand.

In the evening of the first day in the hospital she had another severe nosebleed. At midnight there was an epileptiform attack, Jacksonian in character, and the pulse rate dropped to 48. She soon passed into stupor; her pulse suddenly became im-

perceptible, and she ceased.

Necropsy. There was no evidence of fracture of the skull. On reflecting the dura an organized blood clot was found over the right parietal region. It was easily separated from the dura and the underlying brain. Its removal left a depression in the hemisphere (Fig. 1). The depressed area in the brain was discolored, and there appeared to be some subarachnoid bleeding at that point.

CASE 3. In the following case the diagnosis was somewhat obscured by the uncertain history of injury, the recurrent headache of long standing and the negative cerebrospinal fluid finding on the first lum-

bar puncture.

History. A sixty-two year old man came to the hospital giving a history uneventful as to injury. He stated that over a period of twenty years he was subject to headaches which were relieved only by massive doses of bromoseltzer. Two weeks before admission he became dizzy and is said to have fallen. Soon after his headaches became more intense so that he could no longer go on with his work. He became somewhat sompolent and began to talk "neculiarly."

somnolent and began to talk "peculiarly."

Clinical findings and course. The left pupil was greater than the right. The deep reflexes were elicited on the right side only. The abdominal reflexes were absent. There was a Babinski sign on the left and an equivocal plantar response on the right side. The pulse ranged between sixty and seventy per minute. His temperature was normal. The cerebrospinal fluid was under normal pressure (110 mm. of water) and clear.

Soon after admission the patient passed into semi-stupor and a right hemiparesis became evident. The stupor gradually increased and another lumbar puncture was performed. It yielded xanthochromic cerebrospinal fluid with pressure at this time 210 mm. of water. The diagnosis of subdural hematoma was then made and the lesion was exposed at operation. Immediately following the operation the patient's stupor deepened. He died the following day.

Comment. The autopsy disclosed an extensive hematoma adherent to the dura (Fig. 2). The underlying cerebral hemisphere was found somewhat depressed. The reduction of the size of the left hemisphere is better seen in section (Fig. 3.). Here also the ipsilateral ventricle is shown to be smaller than its contralateral companion. Both lateral ventricles are somewhat displaced to the right side. This change in the size and position of the ventricles, when verified by encephalography, is often useful in determining the site of the hematoma, which may be clinically quite obscure.

Subarachnoid Hemorrhage (Spontaneous)

In this contribution the term, subarachnoid hemorrhage, is employed to designate massive bleeding into the space between the pia and arachnoid membranes (subarachnoid space) caused by spontaneous rupture of a diseased blood vessel traversing that space. We shall not include hemorrhages in the same location when they are the result of trauma and laceration of the brain tissue.

It is now agreed by most observers that this form of intracranial bleeding is caused by a defect in a vessel which pre-exists its rupture and the resultant extravasation. The pre-existing disease is commonly of the arteriosclerotic variety with or without aneurysmal formation. Syphilis and other inflammatory disease changes, as well as congenital weakness of vessels in the brain, are less common pathologic factors.

This condition has come to be recognized with excellent diagnostic precision. The sudden development of headache and vomiting, accompanied occasionally by an equally sudden loss of consciousness and followed by distressing signs of meningeal irritation, by a slight rise of temperature, and by slowing of the pulse, immediately arouses the suspicion of spontaneous subarachnoid bleeding. A lumbar puncture yielding bloody or

fluid verifies the diagnosis. It is readily differentiated from cerebral hemorrhage by the presence of meningeal signs and the frequent involvement of the cranial nerves (papilledema, ocular palsies, etc.).

The therapeutic steps are then definitely indicated. Drainage of cerebrospinal fluid carefully carried out will in the majority of cases relieve headache. Sedatives should be generously administered to keep the patient at rest and in comfort.

Reports of cases

CASE 4. History. R.H., a woman, aged fity-four years, was known to have had hypertension for a period of twelve years, and to have had a severe epistaxis on one occasion. Five days prior to her admission to The Mount Sinai Hospital, she was found unconscious on the floor. Severe headache, general weakness, and repeated vomiting marked the following twenty-four hours Her blood pressure at that time was 210 systolic and 140 diastolic.

Clinical findings and course. The neurologic status at the hospital showed rigidity of the neck, blurred optic disks, retinal hemorrhages in the right fundus, slight right facial weakness, depressed deep reflexes, absent right abdominal reflexes, and a right equivocal plantar response.

A lumbar puncture yielded uniformly bloody cerebrospinal fluid under increased pressure. The blood Wassermann test was negative. The urine contained a trace of albumin. The temperature on the day of admission varied between 99 and 100° F.; on the second day it rose to 103° F. The patient's decline was rapid and death ensued on the fifth day in the hospital.

Necropsy. The subarachnoid space contained a large quantity of blood. The right middle cerebral artery about 2.5 cm. from its origin, revealed an aneurysm (Fig. 4). It measured about one cm. in diameter. The vessels at the base of the brain showed a moderate degree of atherosclerosis.

On microscopic examination the wall of the middle cerebral artery close to the aneurysm showed pronounced degenerative changes in all of its coats (Fig. 5). The intima was thickened and showed alternately areas of proliferative and degenerative changes. There were splitting of the elastic and thinning and degeneration of the media.

Comment. This case exemplifies a typical instance of spontaneous subarachnoid hemorrhage precipitated by rupture of a pre-existing aneurysm. The underlying cause of the formation and ultimate rupture of the subary in its unquestionably the degeneral

įį

tive changes in cerebral vessels, a local manifestation of the general vascular disease. The direct cause of the rupture of the vessel is undetermined, but is of little significance as a spontaneous break in a degenerated, unprotected vessel (the vessel is free in the subarachnoid space) may

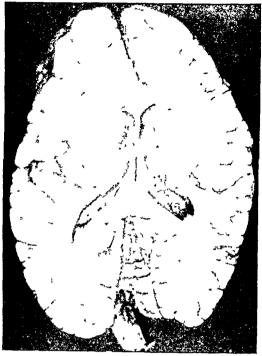

Fig. 3. Brain in section, showing the asymmetry and dislodgement of ventricles by a left-sided subdural hematoma, (case 3)

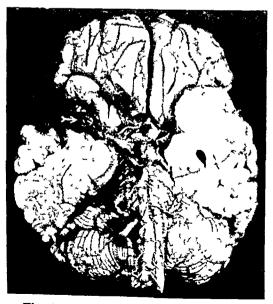

Fig. 4 Subarachnoid hemorrhage, (case 4) Arrow points to the ruptured aneurysm

occur with or without demonstrable provocation.

CASE 5. History. SK, a woman, aged forty-three years, was for some time complaining of increasing dyspnea, palpitation on exertion and edema of the legs. Six days before admission to The Mount Sinai Hospital, she suddenly became dizzy. She recovered sufficiently to walk up a flight of stairs unaided, but soon after complained of severe headache in the occipital region, vomited several times, and became alternately drowsy and restless.

Clinical findings and course. There were moderate rigidity of the neck and a bilateral Kernig sign. The pupils were small and unequal; the right was larger. The fundi showed moderate blurring of the disks and several retinal hemorrhages. The blood pressure was 170 systolic and 105 diastolic.

The diagnosis of subarachnoid hemorphage was made and confirmed by a lumbar puncture which showed uniformly bloody cerebrospinal fluid. The white blood cell count was 18,000; polymorphonuclear leukocytes, eighty-eight per cent. The blood Wassermann test was negative.

The temperature ranged between 100 and 101° F. For the first three weeks in the hospital the patient seemed to improve. The blood pressure came down to 120 systolic and 80 diastolic, but then the patient suddenly collapsed, and within a few minutes passed into deep coma, the breathing becoming shallow and the pulse rate dropping to sixty. The blood pressure at this time rose to 200 systolic and 120 diastolic. A lumbar puncture yielded clear cerebrospinal fluid under increased pressure. The patient died within a few hours.

Necropsy. When the dura was reflected, an extensive blood clot was found over the

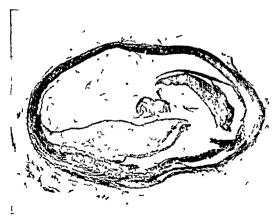

Fig. 5 Photomicrograph, showing the advanced disorganization of the wall of the vessel close to the point of rupture, (case 4).

left frontoparietal region. As it was washed away, an extensive subarachnoid hemorrhage was noted, covering approximately the same cerebral territory (Fig. 6). Running transversely across the upper margin of the Sylvian fissure there was a break in the thickened arachnoid, measuring about three cm., and marking the communication between the subarachnoid and subdural collections of blood. This large circumscribed subarachnoid hemorrhage could be traced to the depth of the left lateral fissure where it occupied the entire insular region and caused marked displacement of the cortex (Fig. 7).

Vessels in the region of the henorrhage, when examined microscopically, showed advanced degenerative changes. One vessel, with coats undergoing massive degeneration, showed at one point a rent in its wall which probably was responsible, in part at least,

for the hemorrhage (Fig 8)

Comment. Of particular significance in this case is the restriction of the subarachnoid bleeding to a circumscribed area in the subarachnoid space. Not without interest is the occurrence of a break in the arachnoid membrane leading to a concurrent subdural hemorrhage. The cause is, of course, evident from the condition of the vessels revealed at the site of the subarachnoid bleeding.

CASE 6. History. A. D., a woman, aged thirty-six years, seven years before admission to the hospital, while under the stress of a violent emotional outburst, had developed intense pain in the left frontal region with restlessness and insomnia Two months later she suddenly experienced

Fig 6. Subarachnoid hemorrhage, (case 5). The extravasation is limited to a small area of the pia-arachnoid space.

transient double vision and pain over the left eye. Two weeks prior to admission, the pain in the left frontal region suddenly returned, and she became stiff "all over" and exceedingly weak. The headache now became generalized and the pain spread down the spine and along the left forearm. This was accompanied by elevation of temperature and an occasional chilly sensation.

Clinical findings and coinse. The left pupil was dilated and fixed to light. There were marked rigidity of the neck, a bilateral Kering sign depressed deep reflexes, and

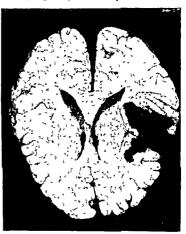

Fig. 7. Subarachnoid hemorrhage, (case 5). Section of the brain showing the limitation of the hemorrhage to the lateral and circular fissures and the compression of the island of

Fig. 8 Disrupted vessel wall of an artery found in the hemorrhagic zone (case 5).

slight weakness and tremor of the left hand. A lumbar puncture yielded uniformly bloody cerebrospinal fluid which showed xanthochromia on standing. The blood pressure was 142 systolic and 90 diastolic. The Wassermann tests of the blood and cerebrospinal fluid were negative. The urine contained only a trace of albumin. The blood count showed white blood cells, 11,400; polymorphonuclear leukocytes, sixty-six per cent.

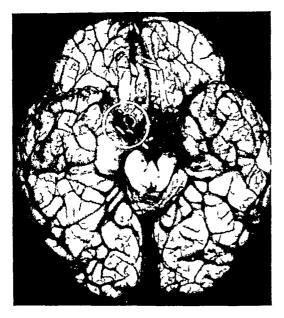

Fig. 9. Ruptured aneurysm (in the white circle) (case 6).

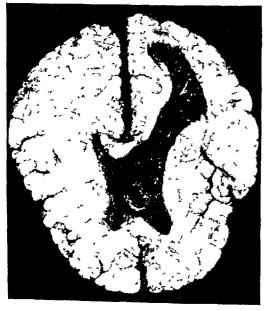

Fig 10 Intraventricular hemorrhage (case 6).

The patient did not convalesce satisfactorily, and on the twenty-third day in the hospital she suddenly passed into stupor. The pulse became unusually slow and a lumbar puncture at this time revealed bloody fluid. She died several hours later.

Necropsy. The brain was voluminous; the gyri were flattened. The meninges were dull and showed patchy discoloration, particularly of the left frontoparietal region, where there was a large amount of blood in the subarachnoid space. In an attempt to dissect structures in the interpeduncular space, old adhesions were found, especially on the left side, making it difficult to separate the left branches of the circle of Willis. The left posterior communicating artery was surrounded by dense granulation tissue and was adherent to the adjacent inferior surface of the left temporal lobe. In the course of dissection a small sac broke off from the somewhat thickened posterior artery (Fig. 9). The inferior surface of the left temporal lobe showed marked softening and through a small opening, most likely artificially produced, blood escaped on the slightest pressure on that lobe. ventricles were greatly distended with blood (Fig. 10). A section of the vessel close to the aneurysm displayed advanced disorganization of its structure (Fig. 11).

Comment. Aneurysmal formations cerebral blood vessels are not uncommon in younger individuals. The greater activity of such patients predisposes them to more frequent rupture of such aneurysms. In this case the aneurysm whose rupture caused the fatal issue probably existed for a period of years, as the history of headache and diplopia would indicate. The adhesion found in the regions acted as a protective coat for the degenerated wall of the aneurysm and held off the terminal hemorrhage. The blood in the ventricles was very likely due to retrograde movement of the blood through the foramen of Magendie into the ventricular system.

CASE 7. History. C. G., a colored man, aged twenty-seven years, was subject during the past year to frequent and severe headache. He had had a chancre five years previously. Three weeks prior to admission to the hospital, he was suddenly seized with a convulsive attack, lasting fifteen minutes, accompanied by loss of consciousness. He was confined to bed for two weeks and seemed to improve but complained of diplopia. At the Outpatient department his blood Wassermann reaction was found positive. He received a course of antisyphilitic therapy and improved sufficiently to return to work. At the end of one week, however.

severe headache returned, and he was ad-

mitted to the hospital.

Clinical findings and course. The patient was drowsy. There was rigidity of the neck and a bilateral Kernig sign. The pupils were unequal; the left was larger; both were fixed to light. There was limitation of the eve movements in all directions, with skew deviation and ptosis of the left eyelid. The tongue deviated to the right, and there was a right central facial paresis. The deep and superficial reflexes were depressed. The disks were blurred, and a linear retinal hemorrhage was noted. A lumbar puncture revealed bloody cerebrospinal fluid under increased pressure. The Wassermann reaction of the blood was reported four plus. The Wassermann reaction of the cerebrospinal fluid was negative (in spite of its being bloody). The temperature was 100° F. and the pulse rate was sixty-six.

The signs of meningeal irritation and the presence of blood in the cerebrospinal fluid pointed to the diagnosis of subarachnoid hemorrhage due to rupture of an ancurysm Repeated, carefully carried out fumbar punctures and the administration of antisyphilitic therapy led to a gradual improvement. The patient became more aleit; the headache became less severe, although the objective symptoms did not change.

On the seventh day in the hospital while at stool, the patient suddenly complained of sudden pain in the back of the neck, and soon became drowsy, the pulse rate dropping to fifty-two. He remained in this condition for several days. A lumbar puncture again showed bloody fluid, under increased pressure (530 mm.). The antisyphilitic treatment was resumed, and the patient began to improve. The meningeal signs abated The ocular movements gamed in range, but three weeks later, while receiving an enema, the patient suddenly sank into deep coma, and died six hours later.

Necropsy. A large amount of blood was found in the subarachnoid space, particularly at the base of the brain (Fig. 12). There was moderate distention of the ventricles with a small amount of coagulated blood in the third ventricle, in the right posterior horn of the lateral ventricle, and in the aqueduct of Sylvius.

The meninges, meningeal blood vessels, ependymal lining of the ventricle and the basilar artery showed the anatomic alterations of meningovascular syphilis. The basilar artery presented features typical of the Huebner endarteritis obliterans, and on tracing it downward to the vertebral arteries, the ruptured ancurysm (Fig. 13) was disclosed.

Comment. Here we have an aneurysm,

which was unquestionably due to syphilis, and the rupture of which caused the fatal hemorrhage. Syphilis, for some unknown reason, is not a frequent factor in the production of subarachnoid bleeding Other inflammatory lesions affecting blood vessels are similarly capable of the production of spontaneous subarachnoid bleeding. This is particularly true of mycotic aneurysms in rheumatic disease and of periarteritis nodosa.

Intraventricular hemorrhage

The importance of intraventricular hemorrhage has been over-estimated in textbook discussions. It is seldom, if ever, primary. It is almost always a terminal event in either cerebral or subarachnoid bleedings and hardly deserves mention from the clinical point of view. Most

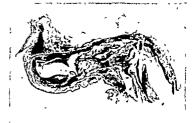

Fig. 11. Disorganization of wall in part of the vessel adjacent to the aneurysm (case 6).

Fig 12. Subarachnoid hemorrhage (case 7).

commonly it occurs as an extension of a hemorrhage in structures adjacent to any of the ventricular compartments whence the blood spreads rapidly and fills all of the ventricular subdivisions. This results in an ever-deepening loss of the patient's consciousness. If there was partial loss of power earlier in the clinical course, there will now appear paralysis in all extremities with unilateral or generalized convulsions. The site of the primary cerebral hemorrhage may still be recognized by the presence of rigidity in the extremities on the contralateral side. Bradycardia, subnormal temperature, Cheyne-Stoke's respiration, a rapid and small pulse, contracted pupils which later become dilated and fixed are among the signs pointing to intraventricular hemorrhage. A lumbar puncture, of course, would have yielded bloody cerebrospinal fluid.

Report of a case

CASE 8. *History*. N. V., a fifty-seven year old male, suddenly lost consciousness while buying cigars and was brought to the hospi-

tal in deep coma.

Clinical findings and course. The patient was unconscious, cyanotic, and had stertorous breathing. There was no evidence of trauma. There were many retinal hemorrhages along the course of the artery. The heart was enlarged to the left, There was marked peripheral vascular sclerosis. The right pupil was pinpoint, the left moderately dilated; neither responded to light. The deep reflexes were hyperactive, particularly on the left side. The left abdominal reflexes were absent. There were a Babinski sign and ankle clonus on the left side. The blood

pressure was 300 systolic and 140 diastolic.

The deep reflexes soon disappeared and bilateral Babinski signs appeared. Cheyne-Stoke's breathing set in. The urine showed albumin ++. The patient ceased 1½ hours after admission.

Comment. Here the diagnosis of cerebral hemorrhage was made and verified by autopsy (Fig. 14; see also Fig. 10).

Cerebral hemorrhage

Clinically this condition is not unlike intraventricular hemorrhage. It also is but a final event in a long chain of disease changes in the brain. Nevertheless it deserves discussion, for its causation needs elucidation, and it should be differentiated from the other less malignant forms of bleeding.

The term should be applied only to conditions in which the hemorrhage occurs in the brain as its primary seat. It should not be used, as is often erroneously done, to designate vascular insults in the brain in which the lesion is in the nature of softening. It is this misuse of the term that is responsible for the belief that cerebral hemorrhage is often followed by recovery. It is most likely that the instances of recovered, so-called cerebral hemorrhage were cases of cerebral thrombosis. There a transient vascular stasis, edema or a small area of encephalomalacia is responsible for the clinical manifestations, which in the early stage of the vascular insult are almost indistinguishable from those in cerebral hemorrhage.

It should be emphasized that cerebral

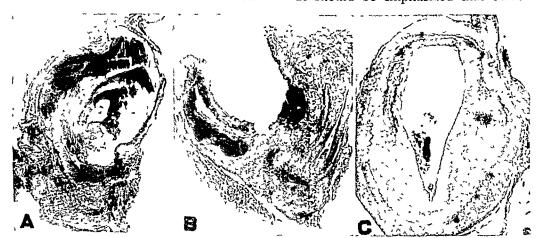

Fig. 13. (a) Section showing unruptured degenerated wall of the aneurysm, (b) section showing ruptured part of the aneurysm, (c) section showing luetic character of the lesion in an adjacent vessel. (Case 7)

hemorrhage is a terminal event, that it occurs only when certain pre-existing pathological conditions have paved the way for the rupture of a vessel and for the free flow of blood from such a vessel into a potential cavity. The pre-existing conditions in question include: (a) an area of softening caused by partial or complete closure of blood vessels supplying the involved territory; (b) a diseased blood vessel, exposed or naked because of the dissolution of neighboring tissue by an antecedent vascular inadequacy; (c) rise in blood pressure to affect rupture of the diseased blood vessel or a sudden break in vessels without obvious external cause.

The clinical manifestations of cerebral hemorthage are not clearly delineated it is understood that cerebral hemorrhage is but a final event which follows in the from those of cerebral softening. But once wake of softening, then the problem finds a simple solution. It is realized then that the destructive lesion in the brain due to softening is responsible for a group of signs and symptoms which, when extravasation takes place into that zone, are first intensified and then terminate in a fatal issue as the blood spreads beyond the limits of the area of softening into the ventricular system. Lumbar puncture, were it practiced more frequently in such circumstances, would disclose the blood in the cerebrospinal fluid as an aid in the diagnosis Without such a finding the distinction between softening and hemorrhage can be made only on somewhat uncertain observations such as: (1) the history of previous apoplectic attack; (2) the deep reddish hue of the patient's face; (3) the very pronounced cardiovascular disease; (4) the advanced age of the patient; (5) the deepening coma; (6) the respiratory embarrassment; and (7) the fixation of the rather wide pupils, all of speak in favor of cerebral which hemorrhage.

Reports of cases

CASE 9. History. S. N., a woman, aged forty-five years, was known to have had high blood pressure for a period of seven years preceding the illness. Six weeks prior to admission to the hospital, while at work, she suddenly became dizzy, lost consciousness, and fell to the floor. She vomited repeatedly and on examination by a physician

showed a complete left-sided paralysis. For the next four weeks, she showed slight improvement, but at the end of that time she suddenly became delirious and passed into stupor.

Clinical findings and course. The pupils were equal and reacted well to light and accommodation. The eyes were in conjugate deviation to the right. There was a left hemiplegia. The cerebrospinal fluid was clear, 'colorless, under increased pressure and contained thirty-nine cells per cubic millimeter. The patient declined gradually and died eighteen days after admission to the hospital.

Necropsy. The right cerebral hemisphere

Fig. 14. Intraventricular hemorrhage, secondary to cerebral hemorrhage (case 8),

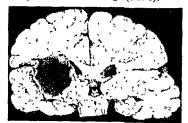

Fig 15 Cerebral hemorrhage (case 9).

Fig. 16. Cavity displaying a naked blood vessel (case 9).

showed in the depth of the Sylvian fissure a large fluctuating mass covered by a thin layer of cerebral cortex. A large cavity filled with blood was found, replacing almost all of the island of Reil and a major part of the adjacent basal ganglia (Fig. 15). On removal of the coagulated blood, the wall of the cavity was found to consist of a wide zone of necrotic tissue, and a medium sized, naked blood vessel was noted crossing the cavity (Fig. 16).

The microscopic as well as the gross anatomical findings in this case fully support the view that the apparently spontaneous massive cerebral hemorrhage is but a terminal phase in a sequence of events which have their beginning in a more or less generalized disease of cerebral vessels, resulting in the closure of one or more of such vessels in a limited area of the brain. This created an ischemic zone and a corresponding area of softening cephalomalacia). The softened area may be regarded as a potential cavity, within limits a poorly protected diseased blood vessel may, with or without demonstrable provocation, rupture and fill without hindrance the cavity with blood. This concept is supported by the presence of generalized vascular disease in the affected individual, by the presence of glial proliferation in such brains, indicating the chronicity of the process, by the existence of an organized wall about the so-called hemorrhagic cysts, by the presence of exposed vessels in the hemorrhagic areas, and by some clinical features as depicted in the

CASE 10. History. R.H., a housewife, aged forty-eight years, was first admitted to the hospital on January 10, 1928. She complained of headache and lethargy of two months duration; the lethargy was constant and if undisturbed, she would readily fall asleep at any opportunity. One month later, occasional vomiting appeared and she continually experienced a sensation of "numbness and coldness" all over the body.

Clinical findings and course. Examination on admission showed marked dulling of intellect, slightly unequal pupils, bilateral external rectus paresis, bilateral Babinski sign, and impairment of pain and temperature sensations on the entire left side of the body. There was no loss of power. The blood and spinal fluid Wassermann tests were reported as four plus. The colloidal gold curve was paretic in type. Cerebrospinal syphilis involving mainly the chiasmatic region was diagnosed. She was referred to the outpatient department for antiluctic therapy.

On February 23 she suddenly collapsed

at her home, fell to the floor, and became stuporous. She was brought to the hospital in deep coma. The deep reflexes were hyperactive; abdominal reflexes were absent. There was a bilateral Hoffman and Babinski sign. The pupils were somewhat contracted and unequal. The blood pressure was 200 systolic and 100 diastolic.

A lumbar tap showed almost pure blood. On these findings a diagnosis of intraventricular hemorrhage was made. The patient soon developed Cheyne-Stoke's breathing and died about twelve hours after

ollapse.

Necropsy. The brain was small and showed evidence of increased intracranial tension. The pia-arachnoid, particularly at the base of the brain, was distended with blood. On sectioning the brain, the ventricles were seen to be filled with blood. The third ventricle was distended with blood which escaped into it from an area of softening in the left thalamus. The lesion also extended into the posterior portion of the corpus striatum.

Microscopic studies revealed intense arteriosclerotic changes in the cortical vessels with very marked inflammatory reaction consisting of perivascular accumulation of polynuclear, mononuclear, and gitter cells. Extensive areas of degeneration and hemorrhage were seen everywhere. There were likewise areas of marked

gliosis.

Comment. In this case it may be assumed that in the first attack, the lesion was mainly in the nature of cerebral softening. It paved the way for the second vascular insult which took the form of a hemorrhage into the softened area.

Summary

- 1. There is need of a more precise identification of the several forms of intracranial hemorrhage as each one demands individual evaluation and treatment. The accompanying table indicates some of the more obvious points in differential diagnosis.
- 2. Subdural hematoma is not an uncommon condition occurring in the wake of negligible trauma. It demands surgical treatment which can be successfully employed only when the character and seat of the lesion are established.
- 3. Subarachnoid hemorrhage is another form of intracranial bleeding which can be readily recognized. It should be suspected in every case of abrupt development of headache, vomiting, loss of consciousness, and signs of meningeal

irritation, particularly in patients with known hypertension. A lumber puncture will substantiate the diagnosis by revealing frankly bloody or xanthochromic cerebrospinal fluid. When identified, it often yields to the only available therapeutic measure judicious removal of small amounts of singuineous cerebrospinal fluid in the early stage and the misurance of a quiescent state for the patient.

4 Intraventricular hemorrhage is but a final event in a progressive vascular disease of the brain and is of interest only from the prognostic point of view

5 Cerebral hemorrhage is also a terminal event in an advancing vascular discase of the brain. It should not be confused with other forms of intracranial

bleeding It should not be dingnosed when the cerebral lesson is in the nature of softening. The latter, however, is a condition which predisposes to the cerebral hemorrhage. A naked blood vessel traversing such an area of softening and its rupture due to inherent weakness or as the result of an added load caused by a sudden increase in blood pressure are two important factors which may convert the less dangerous area of softening into a fatal cerebral hemorrhage.

Discussion

DR LASALLE ARCHAMBAULT, Albany—I well remember that several years ago, at a meeting of the American Neurological Association, Dr Globus together with Dr Strauss called attention to the fact that intracerbral hemorrhage was a terminal event in a long series of autecedent degen erative changes in the bruin substance resulting from disturbances of vascular irrigation, and that disintegration of the paren chymn actual necrosis or softening of the perivascular area, took place causing an already more or less oval shaped cavity to prepare itself for the reception of the eventual extravasation of blood

I believe that this view is now fairly unanimously accepted. However, it hardly seems to me to account for intracerebral hemorrhage occurring in children in connection with whooping cough, in connection with intracerebral hemorrhage in children and young adults during the course of or after pneumonia scarlet fever, and even other forms of septicemia. I presume that

the explanation in the latter group of cases is to be found in an acute degeneration of the vascular wall produced by bacterial toxins

As regards the treatment of spontaneous subarachnoid hemorrhage, I believe that in every instance a diagnostic lumbar punc ture should be done, but I am formally opposed to the repeated daily puncture ad vocated by some as a form of spinal drain age destined to remove the effused blood which has been believed to exert actual toxic effects on the brain substance much as in many cases the condition results from a leak in an aneurysmal sac, I have had more than once the impression that I was tapping an aneurysm and in some cases when I stopped my meddlesome behavior my patients went on to recovery In other words, Mother Nature takes excellent care of some sick people and perhaps the most judicious thing to do is to let the patient strictly alone

RISING TIDE OF LEPROSY

That the number of lepers in the British Empire has increased by 700,000 in the last twelve years wis revealed the other evening in London before the British Empire Leprosy Relief Association by its committee's chairman, Sir Edward Gait

Sir Edward said investigation had shown

Sir Edward said investigation had shown that leprosy was far more widespread than formerly thought, and their 1924 estimate of 1,300 000 lepers in the British Empire had been increased to a minimum of 2,000 - 000 today

Active branches of the Relief Association have been formed in all the Indian provinces and many of the States, hundreds of clinics opened, many hundreds of doctors trained, and hundreds of thousands of lepers treated By active propaganda the people of India have been roused to help in stamping out leprosy

DIABETES IN GENERAL PRACTICE

JAMES RALPH SCOTT, M.D., F.A.C.P., New York City

Diabetes mellitus is too frequently regarded as a disease to be treated by specialists. Consequently there has been a tendency in the past on the part of the general practitioner either to manage the diabetic patient in an inadequate rule of thumb fashion or to refer each case as it arises to a specialist. Either course is unwise, and the author is happy to say that the younger men are manifesting a growing desire to place the routine care of the diabetic where it belongs; i. e., in the hands of the family physician.

It has been estimated that ninety per cent of all illness can be successfully treated by the family physician. Diabetes should be included in this category. Many medical men, however, do not know how to manage the diabetic patient scientifically and at the same time practically and safely. They need more accurate information, not only as to recent advances in our knowledge of the disease, but also as to its application to the patient in actual practice.

Moreover, this need is not confined to the family physician, for the surgeon, the pediatrist, the gastroenterologist, and other specialists are from time to time confronted with the problem of what to do with the diabetic patient, and are often at a loss as to the proper management of the patient while under their care.

There is a need, therefore, among the profession as a whole for a clear, scientific, and practical discussion of the actual management of the diabetic patient. It is in an attempt to meet this need that the present paper has been prepared.

Cause

As an introduction a few remarks regarding our knowledge of the cause of diabetes may be appropriate. The cause of diabetes is still unknown. In 1889 diabetes was proved to be associated with pancreatic function, and in 1900 it was shown to follow degeneration of the islets of Langerhans. It was assumed on the basis of these studies, therefore, that the

disease was caused by a deficiency in the production of insulin by diseased islet tissue.

This simple hypothesis, however, apparently fails to explain all the facts. More and more, we are coming gradually to believe that hyperglycemia is due not so much to lack of insulin as to its ineffectiveness. Antagonistic forces come into play, whether nervous, toxic or glandular, which inhibit the formation of insulin by normal islets of Langerhans or neutralize it after it is formed.

To explain why this change in opinion is taking place, it is only necessary to review some of the facts that have come to light in the study of diabetes during the past ten years.

We know that almost total destruction of the islets of Langerhans is necessary to produce coma by this means, for it has been shown that nine-tenths of the pancreas can be removed without producing hyperglycemia. Yet many persons dying in diabetic coma show little or no destruction of the islets of Langerhans. Nervous or emotional excitement inhibits the action of insulin. The toxemia of fever neutralizes the effect of insulin making it necessary to give much larger amounts to maintain a normal blood sugar than is necessary in the absertever.

Endocrine disturbances particul preciction fluence the potency or production insulin. In the presence of mest chyper roidism, diabetic patients sho ar girls development insulin resistance. Diabetic able rance at a diminishing glucose toled oints onset of menstruation.

onset of menstruation.

Pituitary hyperfunction is ac an nd co by an elevated blood sugar. A wirted to versely, total diabetes can be averaged depancreatized dogs by the removal study of the hypophysis. Finally adrenalin, the study of the hypophysis. Finally adrenalin, the study of the hypophysis. Finally adrenalin, the insulin that it is employed in the transfer ment of insulin shock. Obviously the endocrine system is involved in diabetes, and further research in this field may

reveal its cause and yield new weapons for its conquest

Diagnosis

The diagnosis of diabetes mellitus is easy, and depends upon the performance of two tests, viz, a determination of the amount of glucose in the blood and in the urine. A listory of the symptoms of diabetes should lead one to perform these tests.

The typical symptoms are (1) Polyphigia, (2) polydipsia, (3) polyuria, (4) loss of weight, (5) boils and carbuncles, (6) dermatitis and pruritus, (7) cataract and failing vision, (8) gangrene,

(9) coma

Any one of these symptoms can accompany other conditions, and is, therefore, only suggestive, but the conclusive evidence of the presence of diabetes is to be found in testing the blood and urine for sugar The urmalysis alone is usually sufficient, but not always. The presence of glucose in the urine does not always indicate diabetes mellitus, for in renal glycosuria glucose appears in the urine, although the blood sugar findings are normal There are also conditions in which the reducing substance in the urine may not be glucose at all but pentose or levulose or lactose Although these conditions will bear watching, they are relatively harmless

On the other hand, a negative test for glucose in the urine does not always exclude diabetes melhtus, for in the presence of kidney damage, blood sugar values are frequently found as high as 200 to 300 mg, with no glucose appearing in the urine. These persons have diabetes, but it could not be diagnosed on a urinalysis alone. When sugar is found in the urine, therefore, a fasting blood sugar determination should be done to clinich the diagnosis. If sugar is found in the urine and the fasting blood sugar is over 125 mg, per 100 cc, a diagnosis of

diabetes mellitus is justified

Both of these tests are within the reach of the modern general practitioner A urinalysis can be done in the office in five minutes. For the blood sugar determination five cc of blood is collected from a vein and placed in a bottle contaming a few grains of sodium citrate powder. It is then sent to the nearest

biological laboratory where a report can be obtained in one hour. If the specimen is to be sent a distance by mail, two drops of forty per cent formaldehyde should be added to prevent fermentation and consequent destruction of the sugar. The author wishes to emphasize that the diagnosis of diabetes mellitus depends upon these two simple tests, and that they are both capable of being performed by the general practitioner.

Treatment

When confronted with the treatment of diabetes, the average general practitioner, because of the multiplicity of calones, carbohydrates, gram scales, and food charts becomes panic stricken and helpless This should not be so, for when properly conducted, the routine of the treatment is the task of the patient, and the physician acts only in the capacity of a consultant It is properly so, for until the patient or some member of his family becomes interested enough to be responsible for the routine management of his case, he cannot be successfully treated by any physician The physician, to be sure, must be familiar with the principles and criteria of successful treatment, but these can be acquired in so short a time that the author is in hopes that they may be communicated in the present article

It should be understood from the Just that none but the nuldest cases can be successfully treated except by calculation of the diet by some means or other This is the foundation stone of successful treatment Portunately it is not necessary or even desirable for the physician to take over this task. The author has not for years, personally, calculated a diet, but misists that his pitients do so daily Among them are farmers, teachers, lawyers, housewives, and even children who calculate their diet, test their unine, and give themselves insulin as well as it can be done in a hospital

But how do they learn in the first place? A competent dietitian can teach anyone in an hour how to go about it After that the patient can learn only by doing it himself. The author has even engaged one diabetic patient to teach another, and hardly any community is or remote that such a person cannot be reached. To be sure, there are in every

large city dietitians, office nurses or even diabetic patients who would be willing for a moderate fee to do this work for the physicians of the community.

The criteria of successful treatment are simple: (1) A sugar-free urine; (2) a normal blood sugar; (3) a weight within ten per cent below the average for age, height, and sex.

By maintaining, with the aid of insulin, a sugar-free urine and a normal blood sugar, it will be found that the glucose tolerance of the patient will improve and the diet can be increased or the insulin decreased. The modern low fat diets will confine the cholesterol, within normal limits and avert the early onset of arteriosclerosis which was formerly a constant finding in diabetics. Since obesity is such a frequent precursor to diabetes and overnourishment is positively dangerous, the reason for the weight limitation is obvious.

Education of the Patient

The first step then in treatment is the education of the patient in the management of his own case. He is not safe until this has been accomplished. He or some member of his family must be taught to do three things: (1) Test his urine for sugar; (2) calculate his diet; (3) give himself insulin.

The equipment required for this is simple. A bottle of Benedict's qualitative solution, a test tube, a 500-gram food scale and a table of food values. The urine is tested four times daily—before breakfast and one hour after each meal. Insulin is given according to these tests.

To exemplify the outline of a patient's routine, the following paragraphs are quoted from a previous article by the author:

- 1. He tests his urine for sugar before breakfast and one hour after each meal, and records the results in a notebook kept for the purpose. The results of the test are recorded as blue, green, yellow, or orange. This gives a roughly quantitative record of the amount of sugar in the urine, and is a reliable index of the amount of insulin required, as well as at what time of day it is most needed.
- 2. He weighs and calculates his diet until he has become familiar with the prescribed amounts of each article of food. He is then

allowed to dine at a restaurant where he has to estimate the quantity of food, after which he does a urine test to see how close he came to his allowance. This can become a fascinating game.

3. He gives himself insulin as prescribed by his physician. After following the effects of insulin on his tests, he is allowed to increase or decrease the insulin one or two units a dose as indicated by his tests.

4. He visits the office anywhere from twice a week to once a month depending upon the severity of his case. All patients should be seen at least once a month. On each visit the patient should bring a specimen of urine—usually the first in the morning-to be tested for sugar and acctone. He should bring the notebook in which is recorded each day's diet, the results of the four daily urine tests, and the insulin dosage. The patient's weight is taken and recorded on the chart to compare with his theoretical normal, and instructions given as to diet and insulin. A blood-sugar determination should be done every week until the patient is stabilized as to diet, weight, and insulin; then once a month, A well-trained patient not on insulin need not submit to a blood test oftener than once in two or three months.

Diet

The prescription of the diet for a diabetic is really quite simple. A fastidious calculation of the theoretical calory needs of the patient is unnecessary. Only the protein requirement must be known. The protein requirement of adults is one gram per kilogram of ideal body weight per twenty-four hours. That of children is from 1.5 to three grams per kilogram. This is the only calculation the physician needs to make. After the protein requirement is calculated, the necessary calory content of the diet is obtained by adding enough carbohydrate and fat to maintain the patient at his ideal weight, always giving more carbohydrate than roughly in the proportion of two to one.

Even this calculation can be avoided by adopting a single beginning diet for adults and three for children, depending on the age. This has been the practice both on my service at St. Luke's and in my office for the past two years.

As soon as the patient becomes sugarfree on this diet, with or without the aid of insulin, the allowance of carbohydrate and fat is increased or decreased depending upon whether one desires the patient to gain or lose weight. The patient's weight is the best guide to his calory requirements, and his four daily urine tests are the best guide to his insulin requirements. The protein of the diet is not increased much above the ideal theoretical needs.

The figures for these four diets (which can be carried about on a prescription blank) are all one needs to begin the treatment of any diabetic patient not having fever or severe acidosis. These diets contain adequate amounts of protein, liberal carbohydrate, and relatively low fat. Theoretically even a lower fat content would be desirable, but the practical difficulties of calculating the extremely low fat diets have argued against them. These diets represent the considered result of ten years of experiment in the wards of St. Luke's Hospital, and their use has simplified and improved the care of the diabetic on the wards, in the clinic, and in the diet kitchen. (Table I.)

These are beginning diets. How much do they have to be increased to maintain the patient at his ideal weight? It differs with each individual patient. The author has one patient, a woman, a hard-working school teacher, who has maintained her weight and health for the past three years on less than 1,000 calories daily. Another

TABLE I .- BEGINNING DIABETIC DIETS*

	С	P	F Calories
Adults	120	65	50 1190
	90	45	20 720
8 yrs	100	60	30 910
12 yrs	110	75	40 1100

^{*}These should be increased to maintenance requirements as soon as the diabetes is controlled. A main tenance diet is one which keeps a patient at his ideal weight, and it differs for each individual. The patient's weight is the only reliable guide to his calory

5	PM.	Buttermilk 6 oz	٠.
7	P M	Orange spice	
9	P M	Buttermilk 6 oz	

Skimmed milk may be substituted for buttermilk, and ginger ale for orange juice with no change in food value. Water, clear broth and tea or coffee (with out cream or sugar) are allowed as desired. Insulin is given by the "color formula" with this diet.

patient, a man, after a severe and wasting infection, required over 3,000 calories to bring him up to his normal weight and needs almost that much to maintain him at his optimum weight. In general, however, for both adults and children the carbohydrate need not go above 200 grams, with the fat about half of that.

For the patient first seen in fever a fluid diet is necessary. This is even more simple than the above diets for it is prescribed by the glassful. It consists of buttermilk and orange juice given in six ounce amounts alternately q. 2 h. for eight feedings-four of each. Skimmed milk may be substituted for buttermilk if desired with no change in food value. Other fluids such as water or clear broth, tea, and coffee (without cream or sugar) should be given liberally. This diet is used in the presence of fever from any cause. It is also the fluid diet used after operations and following coma treatment. (Table II.)

Insulin

The amount, frequency, and method of determining the dosage of insulin depends upon the particular phase of diabets which is being treated. There are four types of cases that have to be considered because the method of giving insulin differs in each: (1) the ambulatory patient; (2) the fever patient (mild acidosis); (3) the operative patient; (4) the coma patient (severe acidosis).

1. The Ambulatory Patient. The four daily urine tests are the basis of insulin dosage for the ambulatory patient. If sugar appears after any meal, five units of insulin are given before that meal on the following day. If the specimen before breakfast shows sugar, three to five units of insulin is given either at 11 P.M. or 4 A.M. An alarm clock is part of the regular equipment if the latter is necessary. An average adult diabetic can begin on five units before each meal and raise or lower it (depending upon the tests) until the proper dose is established. The insulin given at night is not increased above five units at any time. The average patient, when stabilized, can get along on two doses daily, before breakfast and before supper. Young children should begin on two or three units before meals and work up Ordinarily the insulin dosage should be raised or lowered both in adults and children not faster than two units a dose. Older patients with arteriosclerotic kidneys will sometimes show blood sugar values up to 300 mg. with sugar-free urine. Therefore, frequent blood sugar determinations should be done on these patients, in addition to the urine tests. Insulin should be given cautiously to these patients because of the possible presence of coronary disease in which insulin reactions may be fatal.

- 2. The Fever Patient. During fever the glucose tolerance of the patient varies so greatly from hour to hour that the usual method of giving insulin is impracticable. A more flexible method is necessary. All fever patients, therefore, have their urine tested with Benedict's solution every two or three hours and insulin is given by the "color formula." This is the method of choice whenever the fluid diet is given whether it be during a fever, after operation or following the coma treatment. The "color formula" is shown in Table III.
- 3. The Operative Patient. This patient needs stored glucose to combat the acidosis that in some degree follows any operation whether due to liver damage from anesthetic, starvation, or both. Of necessity no food can be taken by mouth immediately preceding the operation.

It is my routine practice now to give two or three hours before the operation an infusion of 1,000 c.c. physiological saline solution with fifty grams of glucose. Twenty-five units of insulin are given sub-cutaneously at the same time. Should the patient be in shock this procedure is repeated after the operation. The patient is then placed on the fluid diet.

4. The Coma Patient. The principle to be followed here is a large first dose of insulin and frequent subsequent doses. The initial dose of insulin in coma is one unit per kilogram of body weight. This will be at least fifty units for the average adult. Then give twenty units every half hour until the urine (which is tested every half hour by Benedict's solution) is "green" or the blood sugar is 200 mg. Then the urine can be tested every one or two hours, and insulin given by the "color formula."

TABLE III.—COLOR FORMULA FOR GIVING INSULIN

The urine is tested with Benedict's qualitative solution every 2 or 3 hours and insulin given as below.

Coma

Diabetic acidosis requires prompt and careful treatment at all times, but when it has progressed so far as coma, a real emergency exists. The hospital is the only place where these patients can receive adequate care. Temporizing is dis-

First, be sure the coma is due to diabetic acidosis. The only infallible test is a blood sugar and CO2 determination. If the blood sugar is 300 mg. or more and the CO2 is below twenty-five vol. per cent, the coma may be regarded as

due to diabetic acidosis.

Occasionally it is difficult in a diabetic to distinguish between coma from acidosis and coma from hyperinsulinism. The presence of sugar in the first specimen of urine does not exclude insulin coma, for hypoglycemia develops rapidly, and the sugar may have been excreted before the hypoglycemia occurred. The inclusion of some glucose in the first infusion will clear up almost immediately a coma due to hyperinsulinism and will not materially harm a patient suffering from acidosis. Hence, it is always to be used when in doubt.

The history is valuable in differentiating between these two conditions. Coma due to acidosis (diabetic coma) is always caused by one of three conditions: (1) Overindulgence in food; (2) sudden withdrawal of insulin; or (3) infection. The onset is slow with increasing fatigue over a day or two. The person is tired. This is followed by drowsiness, vomiting, and coma with "air hunger" and acetone breath.

Coma due to overdosage of insulin is sudden in onset, almost a matter of minutes, and when profound is accompanied by epileptiform seizures. A normal dose of insulin will cause reactions if followed by: (1) Undue exercise; (2) omission of the meal following the insulin; or (3) vomiting the meal following the insulin.

The treatment of coma due to hyperinsulinism is one c.c. of adrenalin at once to be followed at once by intravenous glucose. The cure is prompt and dramatic. Lesser grades of insulin reactions can be cleared up by taking the juice of one orange or two lumps of sugar by mouth.

Treatment of coma due to acidosis should be vigorous and prompt. The im-

If the test is orange give 15 units of insulin. If the test is yellow give 10 units of insulin. If the test is green give 5 units of insulin. If the test is blue give 4 oz. of orange juice.

Do not continue giving orange juice according to this formula if the test remains blue.

mediate and indispensable need is fluid. It is more important than insulin, for insulin is ineffective until the body fluid

is restored. Upon admission a specimen of blood should be taken for a sugar and CO2 determination. While waiting for this report, 1,000 c.c. of physiological saline should be given at once intravenously or subcutaneously and repeated in six or eight hours. In severe cases, a continuous infusion is advisable up to 3,000 c.c. or even 5,000 c.c. Insulin should be given as outlined above. The patient must be kept warm. If there is evidence of gastric distention a lavage should be done, a cleansing enema given, followed by six ounces of hot black coffee or normal saline by rectum q. 3 h. When the patient becomes conscious hot broth or coffee is given by mouth in frequent small amounts-1/2 glass every half hour.

Glucose is not administered during this early intensive treatment of coma. The patient is already saturated with it and more will only delay recovery. There is one exception to this procedure. That is when doubt exists as to whether the coma is due to hyperglycemia or hyperinsulinism. In this event fifty grams of glucose with the first infusion covered with the initial dose of insulin should be given. The insulin should not be given however until twenty minutes after the

infusion is begun.

In from two to six hours after this treatment, the acidosis will be under control. The patient is then placed on the fluid diet and insulin is given by the "color formula." If the coma has been unusually prolonged or severe, however, the patient may die in spite of normal blood-sugar and CO₂ findings. Hence, the importance of prompt and vigorous treatment from the start.

Diabetic Surgery

Finally, just a word about diabetic surgery. Carbuncle and gangrene are the most frequent surgical complications of diabetes. A carbuncle presents no unusual surgical problems. The treatment of gangrene, however, frequently requires wise judgment on the part of the surgeon. A small beginning gangrene of the toe will sometimes clear up on bed rest and control of the diabetes alone. Should

the gangrene persist, surgery is indicated. An open sore of six weeks' duration suggests the presence of osteomyelitis. X-ray of the toe at this time will usually show destruction of the bone.

The question is whether to resort to radical or conservative treatment. In general, if the foot is warm with no pain and there is good pulsation of the dorsalis pedis artery, conservative surgery is indicated. That means amputation of the toe well above the area of infection. If pain is a prominent symptom with a cold foot and absence of a pulsating artery, amputation of the foot is indicated. A moist gangrene with spreading cellulitis and lymphangitis up the leg calls for more radical surgery. The most conservative treatment under these conditions is an immediate thigh amputation.

The management of the usual acute surgical emergencies, such as appendicitis, in a diabetic patient is a special problem. These cases are usually admitted in severe acidosis, and if possible two or three hours should be devoted to controlling this condition before operating. This does not add to the surgical risk but reduces it, for these patients are often dehydrated and in shock, and measures directed toward overcoming the acidosis will at the same time combat the state

of shock.

A blood-sugar and CO₂ determination should be done at once. During the hour it requires to report on these, an infusion of 1,000 c.c. of saline is given with fifty grams of glucose and twenty-five units of insulin. After this the urine is tested every half hour and twenty units of insulin given each half hour until the urine test is "green." In this way 105 units can be given in the two hours preceding operation, and the patient will be a much safer operative risk. A similar infusion after the operation with the same glucose and insulin is often helpful. The patient is then placed on the fluid diet and insulin given every two or three hours by the color formula."

It has been shown that wounds heal more quickly with a slightly increased protein allowance. Therefore, as soon as solid food can be taken the patient receives the standard adult diet with 1½ grams of protein per kilo. of body weight instead of the usual one gram.

Summary

- 1. The diagnosis of diabetes is easy, and depends upon the performance of two tests, which can be carried out by the general practitioner.
- 2. The successful treatment of diabetes depends upon ability to interest and educate the patient in the management of his own case. This consists of teaching him: (1) To calculate his diet; (2) to test his urine for sugar; and (3) to give himself insulin. He is not safe until this is accomplished. The dietitians, nurses, and other diabetic patients of the community are the persons best fitted to undertake this task.
- 3. The criteria of successful treatment are: (1) A sugar-free urine; (2) a normal blood sugar; and (3) a weight within ten per cent below the average for age, height, and sex.
- 4. The physician needs to be familiar with only one diet on which to begin all adult patients. Three diets are necessary for children because of the different needs of the various age groups. The figures for all of them can be carried in one's pocket on a prescription blank, or one can always begin with the fluid diet.
- 5. The method of giving insulin varies with the condition to be treated.

- (a) In coma. One unit of insulin per kilogram of body weight as the first dose, followed by twenty units every half hour until the acidosis is under control. (b) In fever. Insulin is given every two or three hours by the "color formula." This is a flexible and foolproof method of giving insulin during fever.
- The ambulatory patient receives insulin at meal time and possibly a small dose at night. Any adult can begin with 5-5-5, and many, after they are stabilized, can get along on a dose before breakfast and before supper only. In preparing a patient for operation a special method of giving insulin is necessary, which has been described.
- 6. The coma patient needs fluid first, then insulin, and last of all glucose, which is to be started after the patient's own blood sugar has been reduced to about 200 m.g. The one exception to withholding glucose is when the diagnosis is in doubt. In this event give glucose with the first infusion.
- 7. Diabetes is no longer a contraindication to operation. In acute surgical conditions at least two hours should be devoted to the preparation of the patient. All operative cases should receive saline, glucose, and insulin preceding the operation.

 960 PARK AVENUE

The Tenth Conference of the International Union against Tuberculosis will meet in Lisbon, Portugal, September 7-10, 1936, under the chairmanship of Prof. Lopo de Carvalho, President-elect of the Union. The Biological subjects "Radiological aspects of the pulmonary hilum and their interpretation" will be presented by Prof. Lopo de Carvalho. Among the ten countries to take part in the formal discussion, the United States will be represented by Dr. Henry C. Sweeny, Medical Director of Research of the Chicago Municipal Tuberculosis Sanitarium. The report on the Clinical subject, "Primary tuberculosis infection in the adolescent and the adult," will be given by Dr. Olaf Scheel of Norway, and Dr. Robert E. Plunkett, Director of the Division of Tuberculosis, New York State Department of Health, will represent the United States in the discussion. The opening report on the Social subject, "The Open Case of Tuberculosis in rela-

tion to family and domestic associates," will be presented jointly by Dr. Charles J. Hatfield, Director of Henry Phipps Institute, Philadelphia, Pa., and Dr. D. A. Powell, representing Great Britain. The Organization Committee of the Conference has secured reductions in hotel prices and railroad fares. It has also prepared an attractive program of receptions and excursions to enable members of the conference to visit the chief anti-tuberculosis institutions of Portugal and, in addition, to see some of the most picturesque scenery of the country. Members of the Union are invited to take part in the conference without payment of a fee. Other persons may participate as "Members of the Conference," and application should be made through the National Tuberculosis Association, 50 West Fiftieth Street, New York. Plans for a special party to the Conference may also be secured by writing to the Association.

SIMPLE MASTECTOMY WITH X-RAY IN TREATMENT OF CANCER OF BREAST

EDWIN J GRACE, MD, FACS, Brooklyn
Associate Surgeon St Mary's Hospital

WILLIAM MOITPIER, JR, BS, MD, Brooklyn
Pathologist St. Mary's Hospital

The publication in 1894 of Halsted's paper1 on the results of his method of operating on cases of cancer of the breast profoundly influenced surgical procedure in the treatment of these cases His method involved a greater removal of tissue than had hitherto been proposed as a routine measure, although extensive operations had been employed in ad vanced cases by older surgeons, especially Moore, Velpeau, and Paget Halsted advocated the removal of the supraclavicular glands because at times the metastasis passes direct to the glands of the neck without affecting the axillary group although ordinarily they become involved at a later stage than the axillary glands The removal of the pectoralis major was insisted upon since the researches of Heidenhain into the spread of cancer cells in carcinoma of the breast showed that small infected portions of the mammary gland might easily be left behind embedded in the superficial layers of this muscle In addition, of course, he practiced the complete clearance of the breast and the axillary contents

It appears to be very generally ad mitted that with Halsted's technic, operative procedures have reached their limit and that present methods can not be extended any further with benefit to the putient. The great advances in surgical technic have not, however, been attended with results that are over encouraging since the rate of mortality from cancer of the breast has been either stationary or increasing

Since 1914 there has been a steadily growing tendency to employ x-ray therapy in conjunction with surgery in the treatment of breast cancer, and as a result a small, but definite, increase in life expectancy postoperatively becomes apparent It will undoubtedly be conceded that even with the most radical types of surgery many microscopic foci of cancer will be left behind and that the possibility of

their removal at the present time is dependent upon the use of such physical agents as x-ray and radium Since sur gery is handicapped by its mability to remove many unseen foci of disease, it seems reasonable to conclude that any more favorable results obtained when a ray therapy is combined with surgery should be attributed to the use of x ray That radical surgery is superior to in complete surgery in this type of case has been definitely settled and admits of no further argument, but with the advent of such a powerful therapeutic agent as the x-ray the possibility arises that less ex tensive surgery when followed by ade quate a ray treatment might give results as good, or perhaps even better, than those obtained with radical removal

With this thought in mind, it seemed worth while to investigate a group of available cases in which some type of in complete surgery was practiced, which had received sufficient a ray treatment following the operation. In all, forty cases were collected during the past fourteen years Simple mastectomy was the usual surgical procedure employed and in over half the cases the breast was re moved with the cautery. The axillary and supraclavicular glands were removed only when definitely enlarged and palpable, while the pectoralis muscle was always left intact. In a few cases the superficial pectoralis fascia was also removed, but no attempt was made to systematically clear the axilla or otherwise follow the technic prescribed for radical mastectomy All diagnoses were confirmed by microscopic sections and the tumors were graded as to their degree of malignancy

Although the series is small it appears to be representative. The patients ranged in age from thirty years to eighty three years, and the discovery of the mass in the breast antedated the operation, according to the patients' statements, by one week to six years, the average being

three and one-half months. All the usual types of malignant growths of the breast were encountered, adenocarcinoma being the most frequent with a lesser number of scirrhus and duct carcinomas. The degree of malignancy exhibited by the tumors according to the scheme of Broders is comparable to the results obtained by others using this classification.

In our series of cases there were 5.8 per cent Grade I cancers; 11.7 per cent Grade II; 38.2 per cent Grade III, and 44.6 per cent Grade IV. Greenough² in a report of 90 cases found 6.6 per cent Grade I; 21.1 per cent Grade II; 47.7 per cent Grade III, and 23.3 per cent Grade IV. In a larger series of 104 cases from the Brooklyn Hospital, Grace³ reported 8.6 per cent Grade I; 15.3 per cent Grade II; 33.6 per cent Grade III, and 42.3 per cent Grade IV.

Every case in the present group received deep x-ray therapy during the entire period of their postoperative life, and while it is debatable whether a few of the cases (two, and possibly three) had received sufficient dosage the remainder all received an amount of treatment that was considered proper by competent radiologists.

The fate which may be found to have befallen any particular case is dependent upon a vast multiplicity of factors of varying importance and to consider all of them is beyond the scope and possibility of this contribution. The literature provides a number of different methods both of grouping and calculating end results of operation for carcinoma of the breast. For our present purposes it may suffice to take into account only two of the factors concerned, namely (a) the nature of the operation performed and subsequent treatment, and (b) the period of time after operation at which the investigation is made. All types of operation fall into two groups, the complete and the incomplete. The incomplete operation includes all cases in which the extent of the operation is less than that advocated by Halsted, Handley, Rotter, and other surgeons who have devised radical methods for the removal of affected tissues. In this group are to be placed those cases in which only the breast was removed, possibly some axillary glan is and a varying amount of skin and fasci.

Agreement has not yet been reached as to the length of time which should elapse after operation before a patient may be regarded as "cured." By far the larger number of authors have taken three years as the interval after operation upon which to base their results. Some authors, and more particularly those reporting results in more recent years, have extended the period to five years. It is, therefore, possible now to present statistics showing the end results of incomplete and radical operations for both three and five year periods.

The group of cases which we are reporting are classed as incomplete and the results which were obtained may be compared with those in which the radical operations were employed, always keeping in mind that subsequent x-ray therapy was stressed in our series.

There were 52.9 per cent three year cures in the present series. Greenough et al⁴ in 1907 reported 28.7 per cent three year cures in 260 cases; and fourteen years later reported 41.2 per cent in sixty-nine cases. Halsted in 1907 had 38.3 per cent in 204 cases and Judd⁷ in 1914 reported 48.2 per cent in 324 cases. In 1921 Mills⁸ investigated 125 cases with a three year cure of 49.2 per cent. Statistics covering a very large series of patients have shown that on the average radical removal of the breast results in 43.2 per cent cures after three years. It would seem that the approximately ten per cent better results which our cases showed at the end of three years in spite of incomplete surgery is to be attributed to the adequate administration of x-ray therapy. This contention is borne out by the reports of Perthes^o and those of Lehmann.10 In fully rayed cases following radical amputation of the breast Perthes obtained 51.3 per cent three year cures and Lehmann in similarly handled cases had 47.5 per cent while Anschutz and Hellmann¹¹ could show sixty per cent. Although it is generally recognized that surgery and x-ray are of inestimable value in this condition it would be extremely unwise to leave out of consideration the important part that the stage of the disease plays in determining the final outcome. At a time when the disease is still local and no secondary growths have occurred, the percentage of survivors at

the end of three years is from sixty five per cent to eighty per cent. If secondary growths have appeared the percentage talls to thirty per cent or less, while less than nine per cent survive as long as three years when the disease is advanced. It is not easy to determine whether a growth has ceased to be local nor is it casy to divide the life of a cancer into stages. The variety of cancer and its grade of malignancy of course greatly influences prognosis, but early removal no matter what the grade should always be a prime consideration.

All the authors quoted above have reported their findings at the end of a five year period in addition to those obtained after a three year interval, so that it again becomes possible to compare the end results of simple mastectomy combined with years and those of radical surgery

At the end of five years we had 441 per cent survivors. Greenough et al m 1907 in the same 260 cases on which a three year report was made found 229 per cent five year survivals and in the 1921 series these authors had 305 per cent of the patients still alive There were 289 per cent five year cures in Halsted's 1907 series of 204 cases while Judd in his 324 cases had 44.4 per cent and of Mill's 125 cases 368 per cent survived The review of a large series of cases brings out the fact that about 339 per cent of all patients subjected to radical mastectomy survive for five years Again we may attribute to x ray therapy the somewhat better showing in our series That remarkable results may be achieved when a ray therapy is sufficient both in dosage and duration of treatment is demonstrated by Anschutz and Hellmann who report 55 5 per cent five year cures

For ease of comparison the above quoted figures are placed in tabular form

(Table I)

Comment

A study of these figures would seem to indicate that x ray therapy everts a small but nevertheless quite definitely beneficial influence on the postoperative duration of life in breast carcinoma

When we come to a consideration of such events in the course of the disease as local recurrence and metastases, we realize the distinct bearing that the type of operation employed has on these features Analysis of a large series of eases indicates that when \ ray is omitted from the treatment there are relatively more deaths from metastases under radi cal methods than there are from incomplete methods of removal, but with radical surgery the total number of deaths and the number of recurrences is reduced Some interesting evidence bearing on this phase of the subject is provided by Meissl,12 who worked up v Liselsberg's figures in Vienna When only the growth was enucleated and the axillary glands removed if enlarged there were 628 per cent recurrences and 17 1 per cent metastases If the breast, enlarged axillary glands, and pectoral fascia were removed there were fifty per cent recurrences and 208 per cent metastases, while complete radical amputation resulted in twenty-five per cent recurrences and 366 per cent metastases In our series of cases, 274 per cent showed some evidence of local recurrence during the period in which they were receiving x ray treatment Because we were unable to determine the exact mode of death in a number of cases, no attempt has been made to calculate the frequency of metastases In all instances in which the cause of death was not definitely known, it was assumed to be a cancer death

In evaluating the significance of all the available data many factors come into

play some of which appear to assume an importance perhaps greater than the particular method of surgery used. No matter what the type of operation may be, better results are always attained in the early stages of the disease while it is still local in the breast than after it has begun to metastasize and no amount of surgery —be it ever so radical—nor subsequent x-ray therapy can completely compensate for loss of time. That the character of the neoplasm and its grade of malignancy play their part can not be denied. Basing our judgment merely on the study of this series of cases we are inclined to believe that with adequate x-ray therapy and simple mastectomy which entails none of the loss of function and few of the disabilities and disadvantages, especially metastases, associated with radical removal, it is possible to produce end results which are as satisfactory as those of any of the other procedures in common practice at the present time.

Conclusion

Forty cases of carcinoma of the breast subjected to incomplete removal (simple mastectomy) combined with x-ray treatment are presented. The end results of this method appear to be comparable to those attained by modern radical methods (radical mastectomy).

AN OFFENSIVE OFFENSIVE

The chiropractors have launched a twofold offensive against the educational barriers erected by the state to safeguard the public against quackery in healing. One of the bills proposed by Assemblyman Hill exempts chiropractic from the definition of medicine laid down in the Medical Practice Act. The other provides for legislative recognition of chiropractic by the creation of a state licensing system. Adoption of either measure, says the New York Medical Week, would destroy existing protection of the public health and open the field of healing to the incursions of quacks of all types.

There is nothing in the theory or results of "spinal alignment" to warrant tampering with the model medical practice laws of this state. Osteopathy, which is closer than any other sect to chiropractic, repudiates it flatly. No one in or out of the cult has been able to define its scientific pretensions precisely enough to permit the formulation of a curriculum which would impart the doctrine of chiropractic while assuring the public of the benefits of modern scientific knowledge.

If chiropractic, with its fallacious theory and irrational methods, were sanctioned by the state, it would be an invitation to every other irregular cult to bring pressure to bear for legislative recognition. There can be no compromise with quackery, and the state must firmly and unequivocally quash any attempts to surrender healing to the ignorant and unfit.

A MEDICAL FAIRY TALE

In an interesting article on the care of the famous Dionne Quintuplets, Dr. Dafoe describes, in the Canadian Medical Association Journal, the various methods of feeding that proved successful in these difficult cases. After a few days on milk, water and corn syrup, with a few drops of rum, the babies were given mother's milk sent from Toronto, for nearly four months. They were then changed to evaporated milk, to which acidophilus bacilli were added, until they were one year old, on

May 28, 1935. When nearly two months of age, they were given orange juice, and they received cod liver oil from July 9, 1934. After October they had a cooked cereal, and beginning in January, 1935 the customary vegetables, fruits, and egg yolk were added. In looking backward over the first year of these babies' lives, says Dr. Dafoe, "I feel that their history portrays a modern fairy tale with a medical flavor."

ANALGESIA IN LABOR

HAROLD A. PECK, M.D., F.A.C.S., Albany From the Obstetrical Department, Memorial Hospital, Albany

During the past ten years, several methods of producing analgesia during labor have been proposed. The writer wishes to record his experience with the method described by Gwathmey et al¹ in 1923 and the results obtained in a consecutive series of 400 personally conducted cases.

The technic which has been adhered to, with very little variation, is as follows:

As soon as the patient is in labor, she is given a cleansing enema of one quart of water to which no soap is added because of the possibility of irritating the rectum and sigmoid. The routine preparation by shaving and scrubbing with green soap and water is carried out and a sterile pad applied to the vulva. Next, the operator's hands are scrubbed, a sterile glove put on and a vaginal examination made to determine the degree of dilatation. From this one may estimate the probable length of labor and determine when to start the analgesia. However, it has been the writer's practice to use the drugs as soon as the patient complains of pain rather than to wait for some arbitrary degree of dilatation. If we adhere to the method of waiting to give the drugs when the patient has a dilatation of three fingers with pains every three-four minutes, the beneficial effects of the drugs will be lost in most cases which deserve them. The writer agrees heartily with McCormick2 who says:

Substitute the degree of the patient's discomfort for the degree of cervical dilatation in determining the time when the sedatives and the rectal instillation are to be given.

Before the patient is given the drugs, she is told just what is to be done and what is expected. The writer feels that this mental preparation is very important. The patient's cooperation is an absolute essential, whatever method is used. If the patient is apprehensive of each needle prick or rectal instillation, she will not get the full benefit from the drugs.

When the patient complains that the pain is more than she cares to endure, she is given an intramuscular injection of morphine grains 1/6 dissolved in two c.c. of fifty per cent magnesium sulphate solution

which can be procured in sterile ampoules. This injection is given in the upper, inner quadrant of either buttock, using a 1½ inch needle. The drugs are injected deep into the muscle, withdrawing the needle slowly as the fluid is used up so that the whole bulk will not be deposited in one spot. The injections are never given in the arm, thigh, or leg. The patient is told to get into the most comfortable position and let herself relax as much as possible. The shades are pulled down and quiet is enjoined upon the nursing staff. All handling of the patient is done as gently as possible. If one of the family insists upon staying in the room, there is to be no conversation.

If, as happens many times, this injection is sedative, nothing further is given until the patient again complains. If there is no sedation within twenty minutes, she is given another intramuscular injection of two c.c. of fifty per cent magnesium sulphate without morphine, followed by the rectal instillation. This consists of quinine (alkaloid) twenty grains, alcohol forty-five minims, ether 2½ ounces, and olive oil q.s.a.d. four ounces, known as Rectal ether 1. The instillation may be given in one of two ways, viz: Catheter and funnel or Cowan's technic. The latter is the one which has been used exclusively by the writer and consists of the use of an all-glass syringe to which is attached a small rectal tube. The patient lies on her left side with the knees drawn up, the anal area is well greased with any surgical lubricant. The syringe is filled with the rectal-ether solution, the plunger is put in the syringe and all air excluded from the tube. The tube is then well greased and inserted into the rectum for four-five inches, remembering that the direction of the rectum after it leaves the anus is upward, forward, and to the left. If this latter information is kept in mind, the physician or nurse will experience little difficulty in inserting the rectal tube high enough so that when the drugs are deposited in the rectum, there will be little likelihood that the patient will expel them. If the drugs are deposited just within the sphincter, the chance of retention is poor. If the fetal head is low in the pelvic canal, one may experience a little difficulty in inserting the tube but a little patience and manipulation will overcome this obstacle.

Occasionally, after introduction of the tube, one finds that the contents of the syringe cannot be expelled without consider-

The assistance of Dr. Wesley Van Deusen in the preparation of the statistics and of Dr. Clarence Graham in the preparation of the charts and helpful counsel is hereby gratefully acknowledged.

able pressure, but excessive pressure should never be used. If the tip of the tube bends and closes the lumen, the tube should be withdrawn slightly until it straightens out. After the rectal instillation is made by ininjecting part of the rectal ether between pains in two or three portions, the tube is withdrawn while a vulva pad is held against the anus.

During the first few moments after instillation, the patient may complain of a desire to defecate. When this sensation occurs, she is told to open her mouth, pant like a dog, and draw in with her sphincter. The sensation will pass off in a few moments in the majority of cases. Usually within ten to fifteen minutes or less, the patient is drowsy and some patients actually pass into a light sleep from which they can always be aroused. The stage of anesthesia is never reached. Often the odor of ether appears on the patient's breath, even during the instillation, showing how quickly ether is absorbed from the rectal mucosa and dispersed through the blood stream.

With patients weighing up to about 150 pounds, the writer has found that this initial dose of rectal drugs will usually be sufficient for satisfactory analgesia for a period of one to three hours. For heavier women, one may have to add more other and oil. For this purpose, a mixture is used known as Regal ether 2, which consists of ether 2½ ounces and olive oil 1½ ounces; sometimes half of this quantity is given and sometimes all of it, depending on the effect.

Whenever the rectal instillation is repeated, it is always with Rectal ether 2, unless otherwise specified. The reason for this is that in many cases labor has been induced with Watson's method which makes use of thirty grains of quinine in divided doses by mouth. When the patient gets her first rectal instillation, she receives twenty grains more of the quinine which means that, many times, she has received fifty grains within twelve hours or so. To give more quinine in succeeding doses of rectal ether would, perhaps, be dangerous to the fetus. There have been a few reports in the literature of fetal deaths chargeable to the use of quinine. So far, in the writer's experience, there has been but one case that he feels could have been charged to this effect.

Rectal ether given as described rarely produces a "stage of excitement." The writer remembers but one patient who required actual restraint; she could not speak English and did not understand what was being done. In the majority of cases, the woman curls up in the position in which she received the rectal drugs, remains so

or rolls from one side to the other, grunting or giving some notice that she is aware of the contractions. Occasionally, patients cry out with pain but even when this occurs, the after-memory is poor or blotted out entirely. Many patients have no recollection of the trip to the delivery room where a few whiffs of ether suffice to complete delivery.

As to the repetition of the drugs, the patient's comfort is the criterion. Usually, one injection of morphine sulphate grains one-sixth dissolved in two c.c. of magnesium sulphate fifty per cent intramuscularly followed by the rectal instillation of Rectal ether 1, and the intramuscular injection of two c.c. of magnesium sulphate without morphine will suffice to carry the patient from one to several hours. A later instillation of Rectal ether 2 will usually suffice to carry the patient quite comfortably to the stage of complete dilatation. From then on, she will be put on the delivery table and given whiffs of ether. Occasionally, one will need no further anesthetic for a comfortable delivery. If the labor is unduly prolonged, the morphine may be repeated if about three hours have elapsed since the last dose and the end of labor seems to be more than an hour away. The writer has used as many as four injections of morphine and four instillations of rectal ether with impunity in a labor lasting about 120 hours.

As experience has been gained with the passage of time, the writer believes that with this method we have as nearly a safe method, as well as a certain one of relieving the pain of labor, as is possible; one that can be used by any practitioner in the home or the hospital; one that has hardly a contraindication except the uncommon one of rectal disease; one that is inexpensive, easy to handle, can be given by the nurse as well as the physician, and one that can be given at any stage of labor with impunity.

The patient's response to this type of help during labor has been most gratifying. The multipara who has been delivered in past years when little was done to mitigate the pain of the first and second stage of labor is the one who appreciates it most. The primipara of today expects some such method to be used.

As for complications, they have been few and those not serious. There were three gluteal abscesses at the site of the injection of the magnesium sulphate. These healed promptly after incision and drainage. There was one ether burn of the buttock due to the expulsion of the rectal drugs, undetected by the nurse; this was only first degree and healed promptly after use of emollient applications. There were three cases of diarrhea apparently caused by the ether which were relieved in a few days by the use of starch enemas and bismuth preparations. There has not been one case of ether pneumonia in spite of the fact that patients came to delivery with colds, both nasal and bronchial. Not once has it been necessary to wash out the rectal drugs because of a bad reaction. It has been used as indicated in every type of case with cardiac, renal, and toxic complications and maternal and fetal dystocias. Not one case of contraction ring dystocia has occurred in the writer's practice since this method was adopted even though all types of manipulation have been done as was necessary. Previous to this, the complication was not infrequent. If rectal analgesia will prevent the occurrence of this dreaded complication in the average man's hands, it has filled an important niche in the practice of obstetrics. Postpartum hemorrhage has not occurred in this series. It has been the writer's practice, for several years, to use Infundin (B. W. Co.) 1/2 c.c. hypo during the second stage when indicated or if none is used then, it is given immediately after the birth of the baby. Consequently, the placental stage is short and blood loss is minimized. Credé expression of the placenta is practiced if there is not spontaneous separation within ten minutes. Immediately after placental delivery, a hypo of 1/2 c.c. of Ernutin (B. W. Co) is given. The combination of these two drugs is usually enough to hold the uterus in good tone and prevent undue postpartum bleeding. They may be re-peated as indicated. In toxic cases with high blood-pressure, Pitocin (P.D.Co) is substituted for the Infundin,

There have been very few cases of fetal asphyxia which could be charged directly to the drugs. If fetal asphyxia occurred, it was apparent that the drugs had been given too near the end of labor. The fetal deaths in this series could be accounted for in nearly every case by some existing disease or malformation which was fatal in itself. Maternal morbidity was very

low and in no instance chargeable to the method except the cases of abscess and diarrhea noted above. There were no maternal deaths.

The incidence of low forceps operations and episiotomies is high, especially in the primiparous group. It is the belief of the writer that these operations, while seemingly radical, are in reality conservative. With a patient under the influence of drugs which rob her of her voluntary powers to a certain extent, labor might be unduly prolonged even though the uterus was efficient. When the presenting part reaches the perineum, a carefully applied low forceps followed by gentle traction simulating the efforts made by the patient to deliver the head will do no harm. Frequently, all that is necessary is to help the occiput to engage under the symphysis. The forceps may be removed and the head delivered by manual expression. If there is good elasticity of the perineum, delivery may be accomplished with little or no laceration, If the vaginal opening is small, not sufficient to allow the doubled fist to come through without danger of rupture, then episiotomy is indicated. The perineal incision is repaired as soon as labor is over. Whether a lateral or a central incision will be made depends upon the extent of the perineum. If it is seen that the anal sphincter will be jeopardized, the writer prefers the lateral incision, otherwise a median one is made. By the use of this method of analgesia plus the use of the outlet forceps, episiotomy where indicated, and taking away all attempts at straining during labor, patients do not suffer postpartum exhaustion nor do they complain of the sensations caused by a weakened pelvic floor when they get out of bed. General body tone is preserved which means a speedier and healthier convalescence.

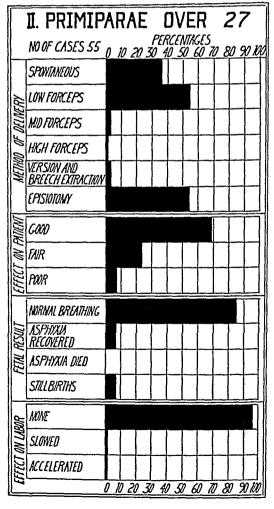

The results in this series of cases are expressed in charts I-III. For convenience and simplicity, the cases have been divided into three groups with arbitrary boundary lines according to age and parity: primiparae under twenty-seven years of age; primiparae over twenty-seven years of age; and multiparae of all ages.

From a study of the charts, certain facts may be deduced. It will be seen from a comparison of the methods of delivery that spontaneous deliveries are slightly more common in primiparae under twenty-seven years of age than in those over that age, and in multiparae reaches the highest percentage. This is to be expected, considered from the angle of muscle tone and elasticity of tissues. In multiparae, there is usually the added advantage that cervical dilation is quicker and that the ligamentous and vaginal tissues have already been stretched. The incidence of low forceps operations is slightly greater in elderly primiparae than in the younger and least of all in the multiparae for the same reasons as given above. The other operations, mid-forceps, high forceps, and version with breech extraction occupy an insignificant place. Episiotomies are less frequent in the young primiparae than in the older ones and least frequent in the multiparae for the same reasons before mentioned.

The effect on the patient has been indicated in three arbitrary classes:

- 1. Good. A result is considered good when the patient gets sedation from the injection of morphine and magnesium sulphate for some time and when sedation is continued by the rectal instillations until she is ready for the delivery table. Sleep may not result but the patient is comfortable and has little recollection of events from the time of the first injection until the end of delivery.
- 2. Fair. A result is considered fair when the patient receives some sedation but not enough to keep her from recognizing pain and is made somewhat more comfortable. These patients may complain as the second stage is reached and require ether inhalation to get them comfortably to the delivery table. Partial loss of memory for pain is present.
- 3. Poor. The result is considered poor when the patient gets little or no sedation.

	I. PRIMIP					:			_		- 1

V 1180P	NONE										
TECTOR	SLOWED										
		0 1	0 2	0 :	XO :	10 3	50 6	D I	n a	80 9	010

This may be accounted for in several different ways, and many times is not the fault of the method. The drugs may be given too late in a precipitate delivery. Failure of cooperation of the patient may vitiate the results.

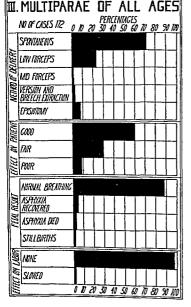

The average results have been good in about sixty-five per cent of the cases for all groups, fair in about twenty-five per cent, and poor in about ten per cent. While these results are not as good as some which have been reported, still the writer feels that they are much better than the average of obstetrical analgesias.

A study of the fetal results shows that about ninety per cent of the babies born under this method are not asphyxiated; that most of the asphyxiated babies recover, and that when death occurs, there is almost always some cause for the death other than the drugs.

There was little or no effect on labor in about ninety-six per cent of the cases.

Summary

1. The method of rectal analegesia for

obstetrical use as given by Gwathmey et al is given in detail.

2. The degree of the patient's discomfort rather than the degree of dilation is preferred as an index of the analgesia necessary.

3. The advantages of the method are: safety, availability for home or hospital use, practical lack of contraindications, economy, and ease of application.

4. The comparative rarity of maternal

and fetel complications is stressed.

5. Low forceps and episiotomies of election were done in a considerable percentage of cases as a conservative measure.

6. The results in 400 cases are indicated in chart form in classifications according to age and parity of the patients, methods of delivery, effect on patients, fetal results, and effect on labor.

7. In primiparae under twenty-seven years of age the methods of delivery were:

Spontaneous 45.3 per cent; low forceps 47 per cent; mid-forceps 4 per cent; high forceps .6 per cent; breech spont. 2.9 per cent; version and breech extraction .6 per cent; episiotomy 50 per cent.

The effect on the patient was: good 69 per cent; fair 20.8 per cent; poor 10 per

cent.

The fetal result was: normal breathing 90 per cent; asphyxia recovered 3.5 per cent; asphyxia died 1.7 per cent; stillbirths 4.8 per cent.

The effect on labor: none 96 per cent:

slowed 4 per cent.

8. In primiparae over twenty-seven years of age the methods of delivery were:

Spontaneous 36.3 per cent; low forceps 54.5 per cent; mid-forceps 3.6 per cent; high forceps 1.8 per cent; version and breech extraction 3.6 per cent; episiotomy 54.5 per cent.

The effect on the patient was: good 69 per cent; fair 23.6 per cent; poor 7.4 per

cent.

The fetal result was: normal breathing 85.4 per cent; asphyxia recovered 7.2 per cent; asphyxia died 0 per cent; stillbirths 7.2 per cent.

The effect on labor: none 96.3 per cent; slowed 1.9 per cent; accelerated 1.9 per cent.

In multiparae of all ages the methods of delivery were:

Spontaneous 71.5 per cent; low forceps 23.8 per cent; mid-forceps 1.7 per cent; version and breech extraction 2.9 per cent; episitomy 8.1 per cent.

The effect on the patient was: good 60.4 per cent; fair 30.2 per cent; poor 9.3 per cent.

The fetal result was: normal breathing 88.3 per cent; asphyxia recovered 5.2 per cent: asphyxia died 3.4 per cent.

Stillbirths 2.3 per cent.

The effect on labor was: none 97.6 per cent: slowed 2.3 per cent.

- 10. There were no fetal deaths attributable to the method.
- 11. The causes of fetal deaths were as follows:
- A. Babies born in asphyxia, death ensuing within twenty-four hours:

1. Cerebral hemorrhage, maternal dystocia.

2. Premature labor, atelectasis.

- 3. Placenta previa, premature labor, atelectasis.
- 4. Placenta previa, premature labor, atelectasis.

5. Premature labor, atelectasis.

6. Cerebral hemorrhage, breech extraction.

7. Premature twins, atelectasis.

- 8. Atelectasis.
- 9. Maternal toxemia.

B. Later deaths:

1. Twins, two days, hemorrhagic disease.

C. Stillbirths:

1. Fetal dystocia, impacted shoulders, elevennound baby.

Macerated fetus, maternal toxemia.

3. Maternal dystocia, flat pelvis.

4. Infra and supratentorial hemorrhage. Qui-

5. Maternal dystocia, flat pelvis.

- Twin, smaller of the twins.
- 7. Placental apoplexy, macerated stillbirth. 8. Placenta previa, intrauterine asphyxia.
- 9. Spina bifida, double hare lip and cleft palate.
- 10. Placenta previa, six months fetus.
- 11. Strangulated cord, intrauterine asphyxia.
 12. Maternal dystocia, flat pelvis.
 13. Encephalocele.

14. Prolapsed cord, dystocia-dystrophia syndrome.

15. Anencephalus.

16. Intrauterine asphyxia, cord around neck three times.

ILLUMINATED SUCTION

GERVAIS WARD McAuliffe, M.D., New York City Department of Surgery, New York Hospital

The need of localized illumination of the throat, in addition to other means of illumination, has often been found necessary in performing tonsillectomies. The suction instrument has always formed an integral part of the armamentarium of every throat operative procedure.

We depend upon it to locate bleeding points in the postoperative fossae for the placement of ties as well as keeping the airway clear of blood. A small bulb was attached to the end of the suction instrument to make light travel with the suction. The two in close companionship could, we thought, reveal much more, and in sharper detail. In our experience with this hybrid of an old and tried adjunct of every throat operation, this proved to be the case.

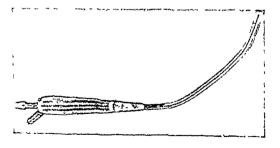

In the accompanying illustrations the light bulb is seen at the end of the shank of

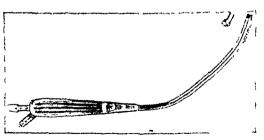

the suction instrument. The suction tip must be removed to detach the bulb if replacement is necessary, or for sterilizing purposes. The bulb is sterilized in alcohol and the rest of the instrument boiled in the usual manner.

At the base of the handle is the contact post for the reception of the electrical current. The flow of current is regulated by a rheostat in the same fashion used for electrical head lights or electrical otoscopes.

We have since found many uses for illuminated suction on the pavilion of the Otolaryngology service at the New York Hospital in postoperative recoveries and its application will possibly become more diversified than relegation to one specific procedure-tonsillectomies for which it was originally intended.

COMPLICATIONS OF GASTRIC AND DUODENAL ULCERS

D. PHILIP MACGUIRE, A.B., M.D., F.A.C.S., New York City

Assistant Clinical Professor of Surgery, New York Post-Graduate Medical School and Hospital, Columbia University

Unfortunately, the advent of spring invariably ushers in the recrudescences of gastric and duodenal ulcers with their

serious complications.

It seems appropriate for the entire medical profession to pause and give tribute to the great work accomplished by the internist for the alleviation and cure of gastric and duodenal ulcers. The author and his contemporaries of the older school in New York City highly regard Drs. Janeway and Delafield and their associates for their remarkable ability in making an accurrate clinical diagnosis of this affection with the benefit of no mechanical and very little laboratory aid.

Although the diets of von Leube,1 Ziemssen, and Boas were favorably introduced abroad, the dietary régime of H. Lenhartz2 was perhaps the actual beginning of a scientific dietary treatment. In this country, the famous Sippy method was published and advocated in 1909 by Dr. Bertram W. Sippy⁸ of Chicago, Dr. Max Einhorn, of our staff in 1910 introduced a method for treating ulcer cases by administering the food through a duodenal tube, the lip of which rested in the terminal portion of the duodenum, Dr. Charles Bolton^{5, 6} of London presented his dietary treatment in 1913, followed by that of Dr. Smithies which the latter has used since 1917.

The author admits especial indebtedness to Dr. B. B. Crohni and his associates of Mount Sinai Hospital, New York City, for the many publications, including his excellent book of 1927, that exemplify this treatment and will stand as lasting

memorials to his ability.

These internists persisted in their dietary therapeusis and outlined them so that their successors might benefit by their experience since they had faith in their methods.

Occasionally, these men have been insulted and humiliated by inexperienced surgeons who severely criticized their therapeutic measures when certain patients, under medical treatment, would

hemorrhage or perforate, or, discharged as cured, would be sent in to the surgeon as an emergency case due to a rapid recrudescence and complication.

Nevertheless, the internists, using their dietary treatment for gastric and duodenal ulcers, have undoubtedly established their superiority; while the surgeons continually disagree as to the choice of operative procedures as is evidenced in the operative résumé on collected statistics read by Heuer³ before the 1934 meeting of the Medical Society of the State of New York, and published in its organ (this

have proven inadequate in far too great a percentage of operative cases.

Able and conscientious internists candidly admit that a certain number of gastric and duodenal ulcers, especially the latter, are not amenable to any form of

JOURNAL) January 1, 1935. Because of a

lack of standardization, surgical efforts

dietary or medical treatment.

In 1914, Greenough® presented the remote results of medical therapeusis. He observed cases for over a period of sixteen years with the following results: thirtynine per cent were well, forty-two per cent relieved, twelve per cent unrelieved, and seven per cent resulted fatally. Dr. B. B. Crolin,10 giving a survey of one hundred ulcer cases in his textbook, Affections of the Stomach, stated that upon discharge from the hospital the immediate results were: eighty-six per cent apparently cured and only fourteen per cent remaining unimproved. For the first six months, the patients were relatively immune from recurrences. However, within the first year twenty-seven of these supposedly healed cases (31.4 per cent) already evidenced recurring symptoms. Each year brought fresh recurrences which ultimately resulted in a relapse of fifty per cent of the apparently cured cases. The shorter the period of observation the better were the results.

Without fear of serious contradiction, one may state that forty per cent of gastric and duodenal ulcers are cured by a medical régime, and forty per cent are not, but are relieved, being able to continue their work by utilizing ambulatory treatment with occasional rest in bed. Actually, eighty per cent of these cases are excellently cared for by the internist. This is a record to be proud of considering the fact that these patients often practice indiscretions in both their pre-

We may safely state that about twenty per cent of these patients consult the surgeon. These include cases having complications such as: perforating, hemorrhaging, stenosis with vomiting, and almost constant pain symptoms.

scribed diets and habits.

In the author's opinion most conservative surgeons consider simple closure as the operative measure of choice in dealing with perforation which is the most common complication of ulcer. He believes any attempt to perform extensive surgery such as gastrectomy, or even gastroenterostomy, in an infected field breaks all surgical rules.

The other serious complication of ulcer is hemorrhage. The occurrence of this condition varies from approximately twenty-five per cent to thirty per cent in duodenal, and twenty per cent in gastric ulcers. Hemorrhages may also take place from splenic conditions such as: Vaquez's disease, polycythemia, von Jaksch's disease, Gaucher's disease, and, most important of all, Banti's disease (splenic anemia) when the hemorrhage is so profuse and alarming. Rolleston believed that the enormously distended vasa brevia ruptured into the stomach as a result of torsion of the splenic vein. This was due to the great bulk of the organ which resulted in massive hemorrhages. There is a possibility of encountering hemorrhage in acute and chronic leukemias. Hemorrhage may also occur in Meckel's diverticulum with aberrant gastric tissue in its wall, ulcerations of the small intestines, and, of most importance, in serious pathological changes in the appendix.

In cases of hemorrhage under medical treatment, the mortality varies from two and one half per cent, as reported by Hurst, in five per cent presented by von Bergman, to twenty-five per cent, each, given by Finsterer 12. 13 and Chiesman of London. In the author's classification of hemorrhages of the first and second

grades, the red blood cell count is above 2,000,000, the hemoglobin count above forty per cent, and the systolic pressure above 80 m.m., but less than 80 m.m. in the third and fourth grades.

It is essential to know that the bleeding may be extrinsic to the gastric and duodenal region and may occur in the following liver conditions, viz.: portal cirrhosis, spirochetosis icterohemorrhagea, obstructive hepatic jaundice, malignant tumors of the liver, hypertrophic miliary cirrhosis, hydatid disease, acute necrosis, carcinoma of the common duct, hemochromatosis primary, carcinoma of the gallbladder, calculi of the external biliary system, and cholecystitis. Special emphasis should be given to the congenital obliteration of the bile ducts and latent cirrhosis of Rolleston because of the possibility of the same infection, causing the ulcer, being the source of the cirrhotic change in the liver.

According to Gray's Anatomy, the gastroduodenal artery is a short but large branch of the hepatic which descends near the pylorus behind the first portion of the duodenum. At the lower border of the duodenum, it is divided into two branches, the gastro-epiploica-dextra and the pancreatico duodenalis superior. This is in close relationship with the common duct, anterior to the portal vein.

In the first, second, and third grades of ulcers of a single bleeding, the medical treatment of hemorrhage consists of the administration of a hypodermic of morphine (gr. 1/6), and atropine (gr. one one-hundredth) which should be repeated in order that the patient may enjoy rest and quiet. Small quantities of ice water, about 200 to 300 c.c., each, of chilled ferric chloride (1-1,000) and also silver nitrate solutions (1-1,000), glucose solutions up to fifty per cent, and adrenalin solutions, may be introduced through a Levine or similar tube. If the stomach is distended with blood, a suction should be applied with a syringe or an evacuator to permit the gastric walls to contract.

Dr. Frank Smithies,¹⁴ of Chicago, advised the following medical treatment for bleeding ulcers. Repeated doses of morphine are to be administered which should be given intravenously in shock patients. He prefers the Thomas Bogg method of clotting and estimating of blood-clotting

time. In cases of vomiting, bleeding, and gastric distension, he advocates a thorough lavage with normal saline solution at 110° F., as suggested by the late Dr. Rodman. After a preliminary emptying by lavage, nothing should be given per mouth. For more than twenty years, Dr. Smithies has employed as a nutrient enema the following: eight ounces of normal salt solution, thirty c.c. of syrup of glucose, and thirty c.c. of fifty per cent alcohol, administered by the Murphy drip at body temperature, which is given four times within twenty-four hours. He also advises the administration of fluids intravenously and by clysis to keep up the fluid reserve. In cases where bleeding continues up to thirty-six hours, he advocates operative procedure. Both Hurst11 and Smithies14 prescribe the immobility of the patient by keeping him quiet in bed, reassuring him, and administering sufficient morphine and atropine (one 1/100 gr.) to keep him drowsy. Some internists have advised the use of foods and liquids by mouth, but both Hurst and Smithies disagree with this treatment.

Dr. Lester Unger, the transfusionist of our hospital, who advocates massive transfusions in these cases, thoroughly convinced the writer of the advisability of this method that he has consistently applied it in all such cases, in which he routinely administered 1,000 c.c. of whole blood by transfusion with marked success. If necessary this amount should be repeated three times in cases of massive hemorrhages. In the desperate cases Dr. Unger believes that after severe bleeding a chemical change takes place at the site of the hemorrhage, causing imperfect clotting to occur which has an unfavorable effect on checking the bleeding. Consequently in these desperate cases arrangements should be made for three donors instead of the usual one. If the hemorrhage continues after the administration of the usual medical treatment together with the series of massive whole blood transfusions advocated by Dr. Unger, it is generally conceded that all conservative measures have been exhausted and operative procedures must be considered.

Hurst11 states:

I believe that the only indication for

operation, in the acute stage, is the persistence or recurrence of severe hemorrhage whilst the patient is still fasting, especially in individuals past middle life with a long history pointing to the presence of a chronic ulcer and with arteries so degenerated that they are unlikely to contract sufficiently for satisfactory plugging by thrombosis.

In operative cases of hemorrhage, particularly the third and fourth grades, the procedure usually consists of two stages. In the first stage, under local anesthesia supplanted by cyclopropane, ethylene, or gas-oxygen, surgical intervention should be confined to the source of the bleeding. In the hemorrhagic ulcers of the duodenum, the three vessels that we should bear in mind are the right branches of the coronary or gastric, and the pyloric branches of the hepatic artery in the bleeding gastric ulcers and the gastroduodenalis, a branch of the hepatic.

A complete excision should be made through the healthy tissues, even to a transgastric approach, in the ulcers; if necessary, ligating the "bleeders" with mattress sutures controlling the gastric or pyloric branches. It may be necessary to cut through the gastrohepatic omentum in order to mobilize the gastric area. After mobilization of the gastric area, an incision is made one cm. distal to the pyloric ring. It is brought transversely across the duodenum, holding the superior and inferior angles taut by stay sutures according to the von Haberer technic. The incision should be sufficiently extensive so that the ulcer may be excised by a cautery of low heat. The base of the ulcer should be scarified according to the von Haberer technic and the bleeding kept under control. Then, the resected edges of the ulcer should be sutured together. The exclusion operations of von Eiselberg through the pyloric ring, or Devine of Melbourne, above the incisura, require too much time in patients whose lives virtually hang on a thread. In the before-mentioned operative procedures, the time factor involves the necessity for furnishing a jejunal anastomosis. Again, unfortunately, it leaves the acid producing pyloric antrum intact.

In the writer's opinion there is no question but that the operating surgeon has been unable to find the offending lesion in many cases and has encountered a general

oozing condition which might have been due to extrinsic causes and not ulcers. In such cases the gastric or duodenal area mucous surfaces resemble the appearance of a wet blotter. Faulty diagnosis was often due to an imperfect work-up.

In the third and fourth grouping that the author has made, the condition to be dealt with is far more serious than the ulcer. This is a streptococcus invasion of the blood vessels, with all its attendant pathology, which reduces them to almost a gelatinous state obliging the surgeon to explore quite a distance to find an artery sufficiently healthy to clamp-off.

Out of every seven cases of massive hemorrhages three are fatal according to Aitken,¹⁵ and ten to eleven per cent of the

moderately severe ones.

In those cases, not reacting favorably to medical treatment and massive whole blood transfusions, operative intervention is indicated. If the bleeding continues in a persistent hemorrhage from a posterior duodenal ulcer before a posterior duodenal approach has been made, it is advisable for the operating surgeon to pass his left index finger into the foramen of Winslow and attempt to control the hemorrhage by applying pressure so that he may orient himself. The author has found that by inserting his left index finger through this foramen and extending it under the gastrohepatic omentum above the first portion of the duodenum, and making an incision in the omentum so that a rubber catheter may be passed through by elevating the ends of the catheter caught by a Kelly clamp, the bleeding in this area may be controlled in most cases except in those exceptional ones in which a collateral anastomosis exists with the gastro-epiploica-dextra artery. There is little danger of injuring the common duct since the writer has found it to be a very resistant structure. In experiments on the cadaver his efforts to tear it after suturing in a rubber drainage tube were of no avail. The next step after the hemorrhage has been controlled is to make the posterior duodenal exposure and ligate the cause of the bleeding.

Some authorities have cautioned against transfusions in amounts greater than 250 to 300 c.c. They believed this increases the systolic pressure to such an extent, even up to normal or above, that it

would encourage further bleeding, since tarry stools are sometimes seen even after a blood transfusion of 500 c.c. This is only a temporary condition and the blood added in large amounts is very beneficial to the patient. There has often been some question in the author's mind as to whether blood transfusions in small amounts are really beneficial in serious cases, since the patient is usually disturbed by the preparations for the procedure as is evidenced by the perspiration and the look of anxiety that appears on the face. Small amounts of transfused blood hardly compensate this extremely nervous state. Dr. Unger disproved the before-mentioned theory and further claims that the systolic pressure declines following repeated transfusions of whole blood, never coming up to normal, and is usually 10° to 20° below it.

The following operative procedures were taken from the collected statistics read before the 1934 meeting of the Medical Society of the State of New York. These included four procedures for the treatment of gastric ulcers, and three for the treatment of duodenal ulcers: Gastric ulcers: (1) Excision and pyloroplasty; (2) Gastroenterostomy; (3) Excision and gastroenterostomy; (4) Gastric resection. Duodenal ulcers: (1) Local excision of ulcer and some form of pyloroplasty; (2) Gastroenterostomy; (3) Pylorectomy or partial gastric resection.

The above procedures can be replaced by two operations; viz.: gastrectomy (partial or subtotal) and gastroenterostomy. The author deems it advisable to reserve all cases having an absence of high acidity, open patulous pylorus, and a six-hour retention, especially in patients around middle life or older, for gastroenterostomy. This applies to all cases in which the patient is too old or in such poor condition that he could not withstand a gastrectomy.

It is essential to differentiate between a partial and a sub-total gastrectomy when this treatment is to be considered. For partial gastrectomy, the procedure advocated and practiced by von Haberer in nearly 2,000 cases, has become very popular at the present time. There should be no deviation from this technic since he

has perfected it to high efficiency.

The Hoffmeister-Finsterer type of operation is advised to deal with ulcers higher up in the lesser, or, in the greater curvature or body of the stomach. We are all well-aware that the higher the resection is made, the greater the increase

in the mortality in these cases Certain surgeons adopting the Hoffmeister-Finsterer technic have severely criticized the von Haberer operation which they believe to be ultra-conserva-In their opinion the oxyolytic cells are merely masses in the fundus and body of the stomach, and the pyloric antrum has little to do with the secretion of acid Their objections may be merely theoretical since you Haberer's technic and his modification of Billroth's No 1 operative treatment have been unreservedly accepted on the Continent Von Eiselberg of Vienna, whose operative experience covers over 4,000 gastric cases, favors this operative procedure because of the low percentage of surgical mortality

The local excision surgical procedure has never warranted serious consideration or support, in smuch as it leaves a deformity proportionate to the amount of tissue removed, does nothing to counteract the production of ulcers, and, of more serious import, may be used in known and

intrinsic malignancies

Plastic surgical procedures are of more theoretical rather than actual benefit, as is well-evidenced by the decline in use of

the Horsley plastic teclinic

A serious factor in hematemesis arising from ulcers is the chloride depletion Although, the loss of blood may not be entirely accountable for this condition, nevertheless patients having ulcers who were placed on the Sippy diet for an extended period of time with an intensive alkaline treatment invariably developed an alkalosis which was demonstrated by Hardt and Rivers, ¹⁶ followed by many similar cases in the later literature

Dealing with patients who are already mortally ill, it is not surprising that a mild or even severe alkalosis develops from a combination of alkalosis, due to the Sippy régime, a chloride formation of two gm instead of five gm according to Wildman, and a hemorrhage with intense vomiting. When the acid gastric secretion occurs in normal function, chlorine ions are withdrawn from the blood bearing an

excess base which, combining with CO₂, increases the bicarbonate reserve of the blood. The base chloride balance in the blood is re established by the absorption of chlorides and water from the gastric juice in the ileum and colon. Alkalosis may result from any abnormality which prevents the absorption of the chlorides in the small intestine.

In the ulcer cases, particularly in the presence of an obstruction, there is a loss of gastric juice, which contains hydrochloric acid, due to the vomiting. This depletes the chlorine-ion content of the blood

The normal blood chloride level and blood volume may be maintained for a while by the withdrawal of tissue chloride and fluid which is actually responsible for dehydration When this supply of tissue chloride has been exhausted, a hypochlorema develops which liberates the originally combined chloride base so that it unites with the CO2 which increases the bicarbonate content. Then the urine becomes alkaline because of the markedly diminished chloride excretion and the presence of an excess of base ions. The occurrence of alkalosis in ulcers is evidenced by a low chloride level, a high CO, combining power of the plasma, a marked increase in the nonprotein and urea nitrogen, and an alkaline reaction of the urine

The imperativeness for the recognition of this complication is evident. The benefit to the patient derived from the transfusions will be augmented when this affection is cured by the intravenous injection of five per cent glucose and saline solutions.

In these ulcer cases complicated by obstruction and vomiting, the author firmly believes that many of the fatalities were mainly due to alkalosis and not the hemorrhage

A re emphasis has been recently made by Dr Wright* who states

Preclinical and even severe scurvy is fre quently present but unrecognized in adults Vitamin C is omitted from the diet for various reasons, some of which include poverty, individual dislike for the foods containing vitamin C, faddist diets, and last but of considerable importance, diets im-

^{*} Personal communication to the author by Dr Irving S Wright of New York City

posed by the medical profession in the therapy of gastric and duodenal ulcers, and certain other conditions.

Using a standard capillary fragility test [previously described by Dr. Wright17] it has been made possible to demonstrate that the capillary fragility is definitely increased in a moderate percentage of patients who have been on ulcer or colitis diets deficient in vitamin C. At first, this is present without gross evidence of scurvy but is later accompanied by frank hemorrhage from the gums, intestines, and subcutaneously. Thus such diets have been shown to definitely increase the tendency to hemorrhage.

This syndrome can be quickly cured by the use of crystalline vitamin C (cevitamic acid) either orally or intravenously. The oral dosage should be from 60 to 100 mg., given daily in divided doses. The amount given intravenously is 100 mg. dissolved in 5 c.c. of normal sterile saline solution or distilled water. In a series of acute ulcer and colitis cases, this substance has been well tolerated when taken by mouth. In several instances severe intestinal hemorrhage ascribed to colitis has been entirely cleared up by simply adding this substance to the diet. Therefore it is suggested that cevitamic acid should be included in all diets deficient in vitamin C, particularly, in those conditions frequently associated with oozing or frank hemorrhage. It is candidly admitted that the use of this substance will not affect hemorrhages which are dependent on the erosion of large blood vessels. However it may have a very definite influence on bleeding associated with the changes in the smaller blood vessels.

Conclusions

The writer has the most profound respect for the surgeons who use small blood transfusions rather than the massive ones, preferred by him and recommended by Unger.

No surgeon would consider operating on cases of acute ulcer complicated with massive hemorrhages, which are often primary, when the patient is in actual shock since most of the patients die on

the operating table as a result of the low systolic pressure, hemoglobin, and blood

Cases have been seen in which it is impossible to arrest the hemorrhages by the administration of repeated blood transfusions and the application of glucose and saline solutions. In order to build up these cases to the proper condition for exploratory operation the writer recommends repeated intravenous injections of liver extract from ampules (5 c.c.), the active and anti-anemic principles of which are equivalent to one hundred grams of fresh liver. He also recommends the intravenous injection of glucose solution up to fifty per cent. The liver extract raises the hemoglobin and red blood cell count and both solutions are invaluable for the elimination of the hemorrhage. Further experiments with these injections will be reported.

Upon opening the abdomen in cases of severe bleeding the contents have the appearance of the black hole of Calcutta. If there are no spurters, experienced surgeons emphasize the advisability of not opening the stomach or duodenum for exploration or cauterization but to be content with merely performing a gastroenterostomy. If necessary a secondary resection may be performed later.

In cases of perforating ulcer repaired by simple suture, 35 to 40 per cent return to the surgeon complaining from any one of the following complications: another perforation, perforating ulcer, stenosis due to an ulcer, or a hemorrhaging ulcer condition.

After the bleeding ulcer cases have been properly built up every consultant should advise operative treatment.

If they refuse to follow the instructions of their consultant, entire responsibility for the possible recurrence of hemorshould be rhages placed on shoulders. 28 EAST 72 ST.

ROENTGEN RAY AND RADIUM THERAPY IN DISEASES OF THE GENITOURINARY TRACT .

GEORGE GILBERT SMITH, M.D., Boston, Mass.

The urologist who attempts a general discussion of radiation therapy must watch his step. It requires very little browsing in the fields of radiological literature to convince the reader who is untrained in roentgen ray technic that he is dealing with a highly complex subject, a subject moreover which is very much in a state of flux. Even though the urologist may be unfamiliar with the details of radiation technic, he should be sufficiently conversant with the results which may be secured by the use of roentgen rays and radium to know when to use these modalities in his own patients. The application of roentgen ray therapy he must leave to the radiologist; when radium is employed, he should have sufficient knowledge of the principles attendant upon its action to be able to use it in a rational and effective manner.

It is as an urologist and not as one who is skilled in the application of radiation therapy that the author is presenting this summary of his experiences with deep

roentgen therapy and radium.

Before proceeding with specific examples of radiation therapy, the author would like to present some general considerations. It is universally admitted, some believe, that there are but very few deepseated malignant growths which can be permanently cured by any one of the methods of roentgen ray therapy now in use. That many malignant growths can be materially affected by present day methods is undoubtedly true, but complete destruction of all cancer cells in a deeply situated tumor would require an amount of radiation which would be destructive of normal tissue in nearby organs. The resistance of various types of cancer cells differs greatly; some are killed by one erythema dose, while others require from eight to ten erythema doses to produce this effect. Among the factors determining radioresistance are, according to Ewing, the adult character of the stroma, the adult character of the epithelial cells, and the substantial blood supply, as exemplified in adenomas and papillomas, the nature of the tumor bed, the presence of exudative inflammation, and acquired resistance. This last factor is present in tumor cells which have been subjected to inadequate dosage. Cancer cells are supposedly most susceptible to radiation during the stage of cell division; because of this factor, Pfahler, following the plan suggested by Kingery, brings the dosage within the tumor to one hundred per cent of an erythema dose within a few days or a week, and maintains the dosage at or near this point during the succeeding period of ten or fourteen days by frequently repeated treatments. Pfahler believes that total radiation should be applied in as short a time as is consistent with the health of the patient.

As to the type of radiation which should be employed, Failla,2 in a summary of extensive experimental work done at the Memorial Hospital in New York City, compares the results obtained from 200 K.V. and 700 K.V. roentgen rays and from gamma radiation and concludes that better clinical results may be expected from the use of very high voltage roentgen rays on two grounds: (1) because of the greater depth doses obtainable, and (2) because of the very probable greater differential action of the shorter wave length, whether direct or indirect, on the tissues of the human body. Very few hospitals have machines of this voltage at present, but reports by Mudd3 in California, where a machine of one million volts has been in use for the past three years, suggest that the use of greater voltage than we now ordinarily employ will give results which are not attainable by the lower voltages. An opposite point of view is held by some excellent radiologists who contend that with a machine of 200 K.V. as much effect can be produced on the deeper tissues as is consistent with their functional integrity.

Three degrees of favorable reaction from deep roentgen therapy are theoretically possible: (1) Complete death of all tumor cells; (2) Diminution of the activity of the growth through setting up fibrosis and cutting off the blood supply; (3) Relief of pain. The application of these results to clinical purposes will be considered later.

The employment of radium in urology has after a long period of experimentation boiled down to its use in interstitial radiation—that is, the implantation of seeds of radon or of needles containing either radon or the element itself directly into the tumor—with the idea of killing all tumor cells at the first application. This method is particularly suitable for the treatment of relatively small, localized cancers. In its development we have derived great help from the excellent work of Doctor Edith Quimby4.5 of the Memorial Hospital, whose carefully worked out tables show the actual amount of radiation in terms of the erythema dose delivered by various forms, strengths, and positions of seeds and needles. From Quimby we learn that twenty erythema doses have a necrotizing effect; by consulting her tables and following the prescribed dosage, we can deliver within an accessible tumor an amount of radiation which can be gauged with approximate accuracy. According to Francis Carter Wood,6 squamous cell epithelioma, which is relatively radioresistant, should be given from five to ten erythema doses.

The effect of the gamma rays applied at a distance from the tumor corresponds closely with the effect of filtered roentgen rays (Wood), as has been proved upon the eggs of the fruit fly, but as Wood points out, it is much less costly to radiate large areas with roentgen rays.

He says:

The chief advantage of radium under present conditions lies in our ability to insert the radiating material into a tumor and thus give enormous doses locally, doses which could not be applied with roentgen rays which have to pass through patients' skin.

Knowing that positive cures of deepseated malignant growths by means of radiation are rare, we should, as Wood advises, select only the inoperable growths for radiation therapy. Whenever possible, the nature of the tumor should be determined by biopsy before treatment is begun. With these general considerations in mind, let us take up the application of radiation therapy in urology.

Radiation of kidney tumors, especially those of the embryonal type found in children, has recently received considerable attention. Waters,7 Hyman,8 Randall, Dean and Pack, and Pohle and Ritchie¹⁰ have reported cases within the last three years treated in this way. There seems to be no question that radiation will reduce the size of these tumors, thereby enabling the surgeon to remove some tumors which might otherwise have been inoperable. Nephrectomy should be done within six weeks after radiation, as regrowth of the tumor is likely to occur. The ultimate results however have been little better than those obtained in cases that were treated by surgery alone. In the six cases reported by Pohle and Ritchie, for example, five died of metastases. In the one that is still alive, three years and eight months after being first treated, two attempts at nephrectomy were unsuccessful. Waters, in sixteen cases, found that 93.4 per cent of the cortical renal tumors were radiosen-The epithelial carcinomas of the renal pelvis and the malignant papillary cystadenomas were radioresistant.

There would seem to be little justification for attempting radiation of renal tumors unless the tumor is so large that its operability is doubtful. Certainly the development of metastases has not been decreased by radiation. If extension of the growth along the renal pedicle or to adjacent structures has occurred, it will not be removed by radiation. The sole result of deep therapy appears to be the shrinkage of the tumor itself, due perhaps in part to necrosis of the more sensitive cells. Cancer cells apparently undamaged by radiation have been found in the tumors after their removal.

The value of postoperative irradiation is also questionable; it implies a faith in the efficacy of deep therapy which is not borne out by the facts. If the surgeon has been unable to remove the entire tumor, he is justified in requesting thorough irradiation of the operative area in the hope of setting up a fibrosis in and about the malignant focus, but he should not delude himself with the expectation that scattered cancer cells will be destroyed. If radia-

tion had no harmful effects, its employment after operation might well be made routine, but unfortunately this is not the case. The subjection of a patient recently operated upon to a stiff course of deep therapy may make him miserable for one or two of the few months of life which remain to him.

The patients with frankly inoperable renal tumors are usually in such poor condition when first seen that adequate irradiation is out of the question. If metastases other than solitary ones can be demonstrated, the value of radiation is doubtful. One series of treatments may be tried, in case the tumor should prove

to be highly radiosensitive

In regard to the treatment of bladder cancer, urologists hold widely divergent ideas. It is generally conceded that external radiation is of little value As Dean and Quimby¹¹ point out, with erythema doses applied through four portals, the total dosage secured in the bladder area is but 1.2 of an erythema dose, whereas the resistant type of epithelial tumor encountered in the bladder requires from five to ten crythema doses for its destruction. The majority of urological surgeons would agree, I believe, that where resection of that portion of the bladder which bears the tumor can be done without interference with the ureters, it is the method of choice This is not the opinion of the group at the Memorial Hospital in New York City, who have consistently hered to the plan of treating all bladder tumors by interstitial radiation Their results give strong support to the correctness of their position. With a mortality of only 37 per cent in one hundred and six consecutive operations, they have obtained apparent destruction of the growth for a period of three years between 43 and 55 per cent of patients with papillary bladder, cancers, and between 278 and 318 per cent of patients with infiltrating bladder cancers These results are at least as good as those reported by surgeons employing other methods, and show a lower operative mortality

Dean and Quimby¹¹ insist upon the desirability of employing sufficient interstitial radiation to give between twenty and thirty threshold erythema doses not only within the tumor, but

within a zone extending one centimeter beyond the demonstrable horder of the growth To secure this result, they do not hesitate to use as many as fifty seeds, yielding thirteen thousand millicurie hours. According to Quimby, twenty crythenri doses has a necrotizing effect, it would seem as if such large doses would necessarily produce an extensive slough which would require months or

even years to heal In the author's experience, the formation of extensive radium slough in the bladder, especially about the bladder neck, has been productive of long standing discomfort and strangury. In a series of bladder tumors consisting of forty-one papillary and fifty-seven infiltrating growths, thirty-two papillary growths were treated by surgery or electrocoagulation with seventy eight per cent free from growth (not all hid gone for three years however) and nine by interstitual radiation with eighty-nine per cent free from growth, of the fiftyseven infiltrating growths, thirty were treated by interstitial radiation twenty-three per cent apparently con trolled, four by electrocogulation with none controlled, thirteen by resection with forty-six per cent controlled, ten by total cystectomy with thirty per cent controlled

The author finds that he has been tending more and more toward the implantation of seeds through the cysto scope in the smaller papillary tumors and in large tumors when the patient's general condition contraindicated operation The results in a number of cases have been surprisingly good. The author is still hesitant about using this method in multiple tumors or in large tumors situated on the trigone or close to the ureteral orifices The addition of an extensive radium slough to a bladder already septic in a patient reduced urmary infection, has proved to be a lethal measure in a good many instances In such cases it may prove feasible to destroy most of the tumor by electrocoagulation through the open bladder, to institute suprapubic drainage, and if the patient's general condition improved, reopen the bladder and implant radium into the base of the tumor

In my opinion, radium has very definite value in the management of bladder tumor; the surgeon who operates upon these cases should decide before operation upon the best method of attack, and should have at hand enough radium to meet the needs of the situation in case he is unable to resect the growth satisfactorily. The implantation of radium seeds along the line of suture following resection of the bladder wall is not desirable, as the radiation is likely to interfere with the healing of the bladder incision.

Cancer of the prostate is another bone of contention among urologists, some of whom are convinced of the value of interstitial radiation, while others disregard this method altogether. In estimating the effects of any type of treatment in this disease, we must bear in mind the fact that in the great majority of cases, its progress is surprisingly slow. Patients have been known to live for ten years after the diagnosis has been made without any treatment whatever. These cases are of course exceptional, but it is not unusual for patients to show very little appreciable change within a period of two or three years. At the Tumor clinic at the Massachusetts General and Huntington hospitals we have a number of these cases under roentgen treatment. An occasional case will show decrease in the size of the gland, but in general I would say that we had seen little effect upon the prostate itself following radiation. Metastases develop while the patient is under active treatment, but there can be no doubt as to the value of deep roentgen therapy in keeping the patient comfortable so far as the pain from metastases is concerned. Leddy and Gianturco, in a paper on this subject from the Mayo Clinic, state that the relief of pain depends on the direct destructive action of the roentgen rays on cancer cells which press on to irritate the pelvic nerves. We doubt whether this is true, as relief is often experienced within twenty-four hours. In forty cases so treated, they secured complete relief of pain in three, marked but incomplete relief in twenty-one, no relief in sixteen. Relief of pain can often be secured by what we term a "palliative" dose (about 800 r.) which is definitely less than the dose that would be given in the attempt to control the disease (2400 r.).

The author has employed interstitial radiation in somewhat over forty cases of

prostatic cancer. In about twenty per cent its use was followed by a diminution in the size of the prostate, and an apparent set-back to the activity of the growth. The patients to whom 4000-5000 millicurie hours of radiation were given suffered extreme pain; a number of them died within a few months and in every autopsied case areas of active cancer cells could be found. The cases that did best were those who received a smaller dose -around two thousand millicurie hours. One patient was given this amount of radiation through the open perineum and, after suffering severely for six months, appeared to be greatly improved. His prostate became small and soft. He died of a coronary occlusion about two years after operation. Unfortunately no autopsy was obtained.

Generally speaking, the author's experience with the use of radium in cancer of the prostate has not been sufficiently encouraging to induce him to use it except in the occasional case. In early cases he believes total prostatectomy to be the best treatment; in more advanced cases, relief of obstruction by transure-thral resection and control of pain by deep roentgen therapy.

Simple orchidectomy in tumor of the testicle has been shown to bring about a cure in but five per cent of cases. The radical operation of Chevassu-Hinman is successful in seventeen per cent. In contradistinction to these results Dean¹⁸ reports the following: of sixteen patients who were classified as operable when first seen, eighty-six per cent have no signs of the disease; of ninety-seven patients classified as inoperable when first seen because of the presence of inrecurrences, metastases, operable both, twenty-nine per cent have no sign of the disease. In this series Dean has set no time limit by which to estimate the value of his treatment, so it is probable that the final results would not appear so favorable, but even so, he and his coworkers have definitely established the value of irradiation in the treatment of testicular tumors. The author is unable to see the logic in radiating the testicle before removing it, as they propose, for orchidectomy can be performed without risk of spreading cancer cells if the spermatic cord is exposed and clamped before the testis is removed.

The knowledge gained by the behavior of the tumor when radiated preoperatively seems to me to be offset by the information secured from pathological examination. By the latter method we can recognize unusual types of tumor, such as the testicular manifestations of multiple myeloma. The diagnosis of a testicular tumor may be wrong; it is undesirable to submit to extensive radiation a patient whose condition does not call for this treatment.

Dresser, Mintz, and the author have recently collected from several hospitals in Boston and from the Cancer Hospital at Pondville a series of seventy-five testicular tumors. Many of these patients were sent to the hospital for radiation only after metastases had developed following orchidectomy. The series contains therefore a larger percentage with poor prognosis than one would find in an unselected series of cases. In spite of that, fourteen cases or eighteen per cent were alive and apparently well three or more years after orchidectomy. Six of these were embryonal carcinomas, three were mixed tumors, two teratoid tumors, one a teratoma, one a leiomyoma, and one a carcinoma Two had been given an adequate amount of radiation, two a fair amount, six an amount which seemed insufficient, and four no radiation at all. Twenty-nine other cases had been given what appeared to be sufficient or fair amount of radiation, but of these at least twenty-one are dead. There is a great difference in the response of these tumors to radiation; some abdominal masses will show no decrease in size while others will almost melt away. Often they develop again as rapidly as they disappeared We have had a few instances where metastatic deposits in the abdomen and supraclavicular region have disappeared after radiation and have not developed again during several years of observation As a rule, when multiple metastases have developed the prognosis is ultimately fatal. The time to radiate is immediately after the primary tumor is removed. A course of radiation amounting to at least 1600 r. to each of four portals should be given over both upper and lower abdomen and through corresponding portals over the back.

It is desirable that a standard method of radiation should be developed; when this is done, it will be possible to estimate more accurately the results which we may expect from deep therapy.

Conclusion

It is the author's opinion that roentgen ray therapy is of definite value in changing the status of some renal tumors from that of inoperability to operability; that in cases of solitary metastases not amenable to surgery, radiation should be given a thorough trial

Radiation is of value as a palliative measure and for relief of pain in cancer of the prostate, while in tumor of the testicle it is of so much value that the failure to employ it after orchidectomy constitutes a serious error of omission. It is worth little in tumor of the bladder, whereas in this disease interstitial radiation is the best method to employ in at least fifty per cent of all cases. Interstitial radiation in cancer of the prostate has in my hands been disappointing, although in the occasional case it has proored to be effective in retarding the progress of the disease.

Unless some new method of applying radioactive substances is discovered, it would seem that our knowledge of radium technic has about reached the saturation point. As regards roentgen ray therapy, it is not at all unlikely that future developments will so far transcend those of the present that the scope of its usefulness will extend far beyond the limits with which we are familiar today.

FEVER THERAPY IN SOME GENERALIZED DERMATOSES

LOUIS TULIPAN, M.D., and WILLIAM DIRECTOR, M.D., New York City

From the Dept. of Dermatology, New York University College of Medicine and the Dermatological Service of the Third (New York University) Medical Division, Bellevue Hospital

The treatment of skin diseases with foreign proteins or other nonspecific means is not new. An extensive literature exists on the subject and it is not our intention to make a thorough review of this. Various means have been employed to produce the desired effects. Chief among them are bacterial vaccines, turpentine, milk, peptone, autohemotherapy and autoserotherapy. Autohemotherapy and autoserotherapy were introduced by Luithlen¹ in 1913, bacterial vaccines by Engman and McGarry,² milk by Schmidt and Saxle³ in 1916, and turpentine by Klingmuller⁴ in 1918.

Excellent reviews have been written in English by Wright⁵ and by Low.⁶ Wright concluded that nonspecific therapy was of definite value in certain skin diseases; that autohemotherapy was of value in psoriasis in conjunction with local therapy and was also of help in chronic urticaria; that milk preparations were of immediate value in furunculosis and carbunculosis and could effectively relieve itching of idiopathic pruritus, and pruritus accompanying a dermatosis; that milk injections were disappointing in eczema, acne, and psoriasis; that vaccine therapy was of some value in psoriasis; and that turpentine was of value in infections caused by trichophyton and certain bacteria.

Low thought that the form of protein used was unimportant and that any type might be used. He listed the diseases treated and the results obtained by himself and others. Urticaria, psoriasis, chronic eczema, contact and light dermatitis were treated with varying results; neurodermatitis was stubborn and did not react well; ulcus molle was treated by all methods with good results. A limited number of cases of the following diseases were treated with nonspecific therapy: erythema multiforme, purpura, scurvy, prurigo, zoster, herpes simplex, parapsoriasis, impetigo, erysipeloid, acne, actinomycosis, tinea versicolor, pityriasis rosea, alopecia areata, leprosy, aplithous stomatitis, Darier's disease, warts, and mycosis fungoides. Low also reported seven cases of exfoliative dermatitis, in six of which he obtained no results; the seventh was a case of exfoliative dermatitis on a psoriatic base in which the dermatitis disappeared but the psoriasis was left unaffected. He also cited a case treated by Engman and Mc-Garry which resulted in a cure.

In our series the stock New York City Board of Health Bacillus typhosus vaccine was used. This contains one billion bacilli per c.c. In each case 0.1 c.c. of the vaccine was given intravenously as the first dose and was increased gradually until a maximum of .4 to 1.3 c.c. was reached. The interval of injection varied from two to seven days. The onset of the reaction began with a chill or sensation of chilliness about twenty to thirty minutes after the injection and lasted TABLE I.—RESULTS FROM TREATMENT WITH

A summary of the twelve cases treated gave the following results: Complete resolution three, improvement six, no improvement three.

from twenty to sixty minutes. The duration of the fever was five to six hours and ranged from a slight elevation above normal to 104 degrees F The highest temperature was observed after the first or second treatment and was usually lower following subsequent injections even with increased dosige. The symp toms accompanying the fever consisted of mild headache, drowsmess, loss of appetite for about twenty four hours and mild thirst Several unusual reactions occurred In one case the patient failed to have the usual chill a half hour after the injection but instead felt slightly chilly and suffered from generalized joint pains, nausea and vomiting for twentyfour hours and swelling of the legs, lips, and mouth In another case the patient had precordial and lumbar pains as well as a fever of 1026 degrees F three days after the injection. The effect on the skin lesions was noted usually after the first or second injection. If there was no iniprovement by this time, none was seen after subsequent injections

Summary

Twelve cases of generalized dermatoses were treated intravenously with typhoid vaccine, three showing complete resolution, six improvement, and three no improvement

From this small series one can state that in a resistant generalized derinatosis intravenous foreign protein therapy (typhoid vaccine) may prove of great value. It is not possible to predict which cases will be benefited.

AN ASPIRATING SYRINGE WITH SIDE-COCK ADAPTER

For Aspiration of the Knee Joint

MICHAEL S BURMAN, M.D., New Yorl City
From the Hospital for Joint Diseases, the Service of Dr. Leo Majer

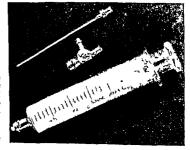

In aspirating a knee joint it is annoying to detach the syringe from the needle empty it and replace it, especially when the joint contains more than twenty cubic centimeters of fluid. The author has never seen an infection follow this routine but it does not give a clean cut technic in aspiration.

The author wishes to present a syringe (Tig 1) for ispiration of the knee joint which allows the emptying of the filled syringe through a side cock in an adapter fitted to the syringe. The idea is surely not new but this syringe has been so satisfactory in the fifty or more cases in which it was used that the author does not hesitate to recommend it. It is especially useful in those joints which contain one hundred or more cubic centimeters of fluid.

When the side cock is placed parallel to the barrel of the syringe fluid is admitted into the syringe from the joint when the cock is at right angle to the barrel and overhes the exit tibe in the adapter, the fluid contained within the syringe is expelled In gonorcheal arthritis with effusion it is desirable to inject air into the joint This can be done with the same syringe

after the withdrawal of the effusion Air is drawn into the syringe when the side-cock is priallel to the exit tube in the adapter it is injected into the joint when the cock is on a line with the barrel of the syringe

This syringe is a simple and handy adaptation of the ordinary aspirating syringe. It makes aspiration of the knee joint an easier and simpler procedure both for surgeon and patient 114 East 54 St.

ELUSIVE ULCER OF THE BLADDER With Special Reference to Its Treatment With Phenol

NATHAN P. SEARS, Ph.B., M.D., Syracuse Professor of Clinical Gynecology, Syracuse University College of Medicine

Elusive ulcer of the bladder is a chronic submucous inflammation occurring in the dome or vertex of the bladder. This lesion was first described by Hunner in 1914. Its elusive character and the fact that in many instances no abnormal elements are found in the urine, has often caused the patient, so afflicted, to be classified as a neurasthenic. When cystocele, fibroids, or other pelvic lesions exist, these are often subjected to operation with the assurance that their elimination will relieve the symptoms.

The etiology of the ulcer lacks specificity but focal infection seems to play an important part. Apical tooth abscesses are often of importance, and tonsils and sinuses may be harboring the infection which causes a persistence of the bladder lesion. Besides focal infection, submucous cystitis may be the result of chronic urinary infection. The author has seen two typical elusive ulcers associated with tuberculosis of the kidney. Hunner¹ reported a similar experience, and the fact that the bladder lesion is not tuberculous was proved by histologic examination in Hunner's cases. Chronic renal infection of other types may also be followed by definite areas of submucous infection located in the vertex of the bladder after the rest of the bladder has resumed a normal appearance.

The symptoms of Hunner ulcer are very suggestive if not pathonomic. If the condition is kept in mind the diagnoses may often be made by history alone. Chronicity of symptoms is at present a constant factor, but if earlier diagnosis are made this will ultimately be less conspicuous. In the early cases which the author has seen, frequent urination is the most outstanding complaint, the next being suprapubic pain when the bladder is distended. As the condition progresses, spasm, burning on urination, and pain following urination appear. In advanced cases with scarred and contracted bladders the frequency and pain will be so marked as to confine the patient to her room. Bleeding may be noted and was given as a presenting symptom in one of the author's cases. However its existence is often only discovered by questioning the patient and is found to occur after the bladder has been somewhat over distended. It is due to cracking of the diseased mucosa.

The physical signs are few but distinct. The urine in uncomplicated cases may contain no abnormal elements and the culture be negative. The author recently saw a patient whose urine contained no cells and yet frequency was so marked as to allow practically no sleep.

Palpation of the bladder by vaginal examination will often locate a tender area which the patient will identify as the source of her pain. Cystoscopic examination does not always reveal the ulcer. With the electrically lighted type of cystoscope and fluid medium the lesion may, by brilliant illumination be revealed as a linear superficial ulcer with a surrounding granular zone, the whole area being usually one to two cm. in diameter. Surrounding this is seen a pale elevated zone several centimeters in diameter which represents an area of edema. Those who have become proficient with the Kelly cystoscope and the knee-chest position will, when examining and treating women, find this an invaluable aid. Through this instrument one looks almost directly at the most frequent site of the ulcer and the distention with air often causes slight bleeding which will disclose the lesion.

If the area of submucous cystitis is at first not seen its existence may be suspected by a more or less characteristic appearance of the bladder wall. In such cases the mucosa is pale-white and traversed by markedly engorged and tortuous vessels. The mucosa also has a hard appearance and in one case on first examination several small areas of hemorrhage occurred. Frequently, as one inspects the bladder wall for ulcer, an area of pale redness will be seen. Touch-

ing this with an applicator of cotton, will often cause the patient to exclaim with pain, and it will be noted that even the lightest touch has caused the thin diseased mucosa to bleed; this is the ulcer.

At times more than one area is located. In one of my cases, after a long search, a lesion in the right half of the dome of the bladder was discovered. This was treated with marked, but not complete relief. On looking for more trouble another area at the junction of the retropubic region and the vertex was found. The treatment of this was followed by prompt and complete relief.

In looking for Hunner ulcers it is important to remember that they appear more frequently in the vertex or well up in the dome of the bladder. In Keene's twenty cases he did not find one at the trigone. In one of my cases, an ulcer on the lateral wall a short distance from the left border of the trigone was found.

The diagnosis of this distressing condition becomes the duty of each urologist and gynecologist. From the number of these patients subjected to operation, it is evident that certain facts should be emphasized. First: It is definitely found from experience that when a patient complains of any of the symptoms usually due to urinary disease, such as, frequency of urination, or pain before, during or after the act, in practically every case the lesion responsible for these symptoms will be found within the urinary tract. This is an axiom, the exceptions to which only prove the rule. Too many women have been operated upon for slight cystocele or a moderate sized myoma of the uterus because these conditions are assumed to be the cause of frequency of urination or pressure upon the bladder. Second: It should also be noted that several distinct lesions of the urinary tract, such as ureteral stricture, trigonitis. chronic urethritis, and elusive ulcer usually do not produce abnormal elements in the urine. If these facts are observed and the existence of elusive ulcer kept in mind we can hope for the diagnosis of this condition before the patient has suffered so long and perhaps been subjected to several unnecessary operations.

The treatment of this condition has not been satisfactory. Hunner, Kretchmer,

Frontz, Keene, and others for some time resected the ulcer bearing wall of the bladder with rather unsatisfactory results. Recurrences were fairly frequent and in some instances a second operation was performed. Kretchmer and Furniss were among the first to report favorable results with the use of high frequency fulguration. This procedure is still used and will give long periods of relief. It, however, usually requires an anesthetic and promises no permanency of cure. Bumpus has had success with hydraulic distention under general anesthesia.

When ureteral stricture is present, many of the cases are relieved by dilatation of the stricture, with or without the application of silver nitrate to the ulcer. Regardless of local treatment, infection either focal or in any other portion of the urinary tract must be eliminated. One must also keep in mind the fact that urethrotrigonitis is a frequent accompaniment of elusive ulcer and will be confusing in the treatment as well as in the diagnosis.

Another important feature in the treatment of Hunner ulcer should be kept in mind. A chronic bladder lesion is one of the most annoying conditions a patient may have. The irritation and constant desire to urinate often prevents the patient from leading any degree of normal life, and the sleeplessness and lack of rest, particularly, affect nervous and mental stability. For this reason the patient should receive a careful general study. When a patient has been harassed in this manner for years and has completely lost all confidence in recovery, it is well to put her in hospital for a period of from one to three weeks. Here, sufficient sedative should be given to insure rest and sleep. The intake of fluid should be adjusted to diminish the night output of urine. The usual order to force water often causes considerable unnecessary distress. Some medication such as santal oil or tincture of hyoscyamus are helpful. Local treatment may now be tolerated and a wise nurse can each day irrigate and gradually distend the bladder with hot boric-acid solution, which may be followed by the instillation of some soothing antiseptic, such as one ounce of gomenol or one to thirty argentide. After eight to ten days of this treatment, the

general cystitis, often accompanying the chronic ulcer, will be improved and local treatment may be directed at the lesion.

Since local treatment of this condition has been, up to date, rather uncertain and unsatisfactory, the author recently2 described a simple and painless method which can be easily carried out in the office. It consists in the application of concentrated phenol applied to the ulcer through the Kelly cystoscope. A local anesthetic is instilled into the bladder and applied to the urethra for ten to fifteen minutes. The bladder is then emptied by catheter, the patient placed in correct knee-chest posture, the vaginal orifice opened to allow air to enter the vagina, and a Kelly cystoscope introduced into the bladder. By means of a head mirror and reflected light, the lesion is located and studied, and, after aspirating all urine from the bladder vertex, is thoroughly swabbed with pure phenol, followed in a few seconds by an alcohol swab. After the ulcer is thoroughly painted, the patient remains in the kneechest posture, with the cystoscope in place, for a few seconds. As the cystoscope is withdrawn, if the trigone and urethra are inflamed they are painted with ten and five per cent silver nitrate respectively. The air is then allowed to escape and the patient to go about as usual. There is often some increased discomfort for a few days about which the patient should be warned. The lesion is then inspected in about two weeks and may or may not require more treatment. The application of phenol should be limited to the ulcer and not applied to too large an area. Long, severe reaction may follow too free use of this solution.

Twelve cases have now been treated by this method. These can be divided into three distinct groups. In group I, there are seven patients who have had a primary ulcer for from eight months to twenty years, the average duration being eight years. Of these, three had had at least one pelvic operation, with no relief of bladder symptoms, but one of these three had developed carcinoma of the uterine body for which the operation was performed. Five had had no renal infection and one had some unknown bacterium cultured from the left kidney, but no pus was found. Catheterized specimens of

urine in five of these cases contained a rare or no pus cell, red cells were a frequent finding. After treatment, pus is generally found in the urine.

Five of this group are quite well after one to four applications of phenol and have remained so without further treatment for from four months to two years.

The sixth case is one who had had symptoms for twelve years. She had sought relief in many different cities and large clinics. In the summer of 1934, she consulted Dr. Hunner who found an ulcer. Because the patient lived near Syracuse, she was referred to me for treatment on January 26, 1935. She was having a great deal of distress. The urine contained pus and the bladder was generally red and contracted. In the right side of the dome of the bladder a red, bleeding, granular area two cm. in diameter was found. In the center of this was a greyish necrotic elevated area about ½ cm. in diameter. Phenol was applied with an interval of four weeks with very little success. The patient was then put at rest for two weeks under sedatives and gradual bladder distention with hot boric solution. Her symptoms are less than ever before, the bladder is generally normal in appearance except a granular area at the site of the ulcer. She will return soon for further treatment after again having sources of focal infection investigated. The author shall inspect the bladder and apply phenol if necessary. As yet this patient has not had a successful result.

The seventh case is a woman aged thirtysix who was seen on April 23, 1934. She had had frequent attacks of bladder irritation for ten years. Local application to the urethra and trigone had given temporary relief from the burning on urination but the frequency, pelvic pain, and a bearing down feeling continued. She was sent to the hospital for vaginal repair and uterine suspension. Cystoscopic examination made on the above date disclosed an elusive ulcer on the sacral aspect of the bladder cavity. This was carefully painted with phenol fol-lowed by alcohol. The patient was seen on May 7 two weeks after this treatment and only a faint pink area was seen at the site of the ulcer and there was no pelvic pain of any kind. It is of course too soon to predict a cure.

In group II are three cases in which typical areas of interstitial or submucous cystitis were complicated by or followed chronic renal infection.

One had an area typical of elusive ulcer in the dome of the bladder following nephrectomy for tuberculous kidney. There was no evidence of tuberculosis about the trigone or urcteral orifices. All usual treatment failed and pure phenol application was decided upon. Relief was prompt and has continued for three years. Since no tissue sections were made of this lesion one might suspect that it was tuberculous in nature but pig innoculations were negative. The location of the lesion was typical of ulcer and Hunner has proven by microscopic study of removed tissue that nontuberculous submucous cystiis (Elusive ulcer) may accompany tuberculosis of the kidney.

The second case of this group is somewhat similar. She still has a tuberculous right kidney but had a typical clusive ulcer, which when treated with phenol has left the patient with a perfectly normal bladder and completely symptom-free for one year. She is so comfortable that she has not been able to make up her mind to have her diseased kidney removed. This patient had had a diagnosis of ulcer in another city several years before and had had a long period of relief from fulguration.

The third case of this group presents several points of interest. She was thirty nine years old and had had an infection of the left kidney since an attack of scarlet fever at the age of eleven. For ten years the patient had come to me at infrequent intervals for treatment which consisted of dilating the left ureter and irrigating the kidney. The bladder was usually found to be extremely inflamed. She could not decide upon nephrectomy when this was finally advised. In 1931 she developed a generalized arthritis. After careful study, left nephrectomy was done. The result was astonishing: her arthritis promptly improved but there was still frequency and suprapubic pain, A small area of submucous cystitis was located, phenol applied and the condition greatly improved. It seems reasonable to assume that this ulcer was the result of a long continued urinary infection.

In a third group are two patients who present features not so evident as in the other groups.

The first is a woman aged twenty-nine who was seen January 2, 1935. The appendix and a cyst of the right ovary were removed in 1928. In the lower abdomen she had, for two years, noted a bearing down pain which radiates to the region where her appendix was removed. There had been no burning or pain on urinating but frequency was noted. This had begun about ten years ago. Pelvic examination disclosed normal organs except that no right

ovary was felt. The bladder however was tender. When the bladder distended, the patient exclaimed that this produced a feeling like her old pain. No ulcer was seen but a slightly reddened area was found at the apex of the dome of the bladder. This was not seriously considered. The patient returned March 2, 1935, and this area was again noted but this time seemed more definite. It was gently touched with an applicator. Immediately the patient stated it was the location of her pain. Phenol was applied and when last seen, April 8, the pain had completely disappeared. This patient presents an ulcer and yet had had no definite symptoms pointing to the urinary tract.

The second case in this group, a young woman thirty years old, seen April 27, 1935, had had for three years a most annoying frequency. Nocturia was so marked as to allow very little sleep. There was no burning or pain at any time and the urine was clear microscopically. On examination there was some stricture of the urethra and the bladder showed a pale hard looking mucosa with branching tortuous vessels. No ulcer was seen. A diagnosis was made of chronic urethritis and urethral stricture. The dilatation of the urethra gave considerable relief. On May 1 a definite ulcer was found and swabbed with phenol. On May 11 the patient stated that she was almost completely relieved. It is evident that it is too soon to say whether or not she is well; the author simply adds her record to his reports to show the symptoms presented by an early case.

Summary

Twelve cases of elusive ulcer treated with concentrated phenol are presented. Eight of these have remained symptom-free and have no evidence of ulcer in their bladders for from four months to two years after treatment. Three, although quite well at present, are too recent to classify as cures. One with a very extensive lesion, although rapidly improving, is still not without definite bladder distress.

Conclusions

1. Chronic submucous cystitis (elusive ulcer of Hunner) is a commonly over-looked lesion of the bladder.

 The chief symptoms presented are, besides burning and pain during urination, marked frequency of urination and suprapubic pain when the bladder is distended.

- 3. The urine from a case of uncomplicated ulcer may contain no abnormal elements.
- 4. For the above reasons, many women with this condition are classified as neurotic, or are subjected to unnecessary operations.
- 5. Treatment is, in general, unsatisfactory. Focal and complicating urinary infections should be eliminated. Rest and sedatives may be necessary in cases where the symptoms have been severe for a long time.
- 6. Local treatment is directed at the destruction of the ulcer and has consisted of resection or fulguration.
- 7. In women, the application of concentrated phenol thru the Kelly cystoscope, is simple and, so far, has proved an efficient treatment.

CASE REPORT

COMPLETE HORNIFICATION OF THE MUCOSA OF THE RENAL PELVIS ASSOCIATED WITH AN UNUSUALLY LARGE CALCULUS

M. M. MELICOW, M.D., New York City

From the Squier Urological Clinic, Columbia University Medical School

The role of chronic irritation as a cancerigenic factor is well-known. Why it is associated in one instance with the development of a neoplasm, and in another with hyperplasia or metaplasia only, is not known. Neither can we affirm at present whether there is in the life history of a new growth a transition through stages of hyperplasia, metaplasia, and finally neoplasia. Thus it is important to record the circumstances attendant upon changes in the character of a tissue. For this reason the author is reporting the following case: It is an instance of metaplasia of the renal pelvic mucosa into skin with hornification. An unusually large pelvic calculus, which formed following an injury to the kidney, acted as the chronic irritant.

W.S., age twenty-eight, was admitted to the Squier Urological Clinic on December 12, 1934, complaining of repeated attacks of dull pain in the left costovertebral angle and hematuria. Seven years ago he was kicked during a football game and had had gross hematuria. This recurred after any strenuous exertion. For two weeks prior to admission the pain radiated to the testis and there was present slight burning on urination. He had lost twenty-five pounds in the last year.

The general examination was negative, except for a mass in the left upper quadrant of the abdomen which was the size of a grapefruit and moved with respiration.

The urine was acid, specific gravity 1.018, albumen three plus; there was no dextrose. Microscopic examination showed occasional red blood cells. Roentgenograms of the abdomen revealed the right kidney, normal in size, shape, and position. The outline of the left was not seen. However, in the region of this kidney a large, dense elliptical shadow, measuring 12.5 x 7.5 cms., was noted. The upper border of the shadow was opposite the transverse process of the second lumbar vertebra and the lower, .5 cm. above the crest of the ilium. Within this shadow a similarly shaped shadow of slightly increased density suggested the appearance of The psoas large laminated calculus. shadows were normal. The liver shadow was smooth and that of the spleen enlarged. The transverse arches of the fourth and fifth sacral segments were incompletely fused. Roentgenograms of the heart, aorta, and diaphragm were negative.

The patient was cystoscoped and the pyelograms showed the calyces, pelvis of the right kidney, and the major portion of the right ureter well-outlined and appearing normal. Again no outline of the left kidney was seen; in its place there appeared the large shadow already described. The left ureter was normal for a distance of 2.5 cm., but as it reached the shadow of the calculus it narrowed and then appeared dilated and tortuous.

The urine from the right kidney was cloudy, acid, and contained occasional red and white blood cells, and that from the left was similar, but contained many white blood cells.

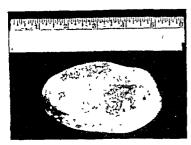

Fig. 1. Large oval pelvic calculus removed from sac-like kidney.

The patient was operated on December 17 by Dr. Squier. The kidney was freed and delivered through a left lumbar incision. It was enlarged and soft and contained a calculus within the pelvis. The stone was large, smooth, and oval A complete nephrectomy was done with the usual drainage. patient was discharged on January 6, 1935 with the postoperative wound healed.

Pathologic report: Gross-The calculus (Fig. 1) was very large, measuring 12 x 7 x 5.5 cms., and weighed 235 grams. One surface was jagged due to prominence, caused by deposits of elongated translucent The other surface was relatively smooth. The kidney was sac-like with a wall thickness of about .4 cm.

Microscopic-Section through the kidney showed multiple hemorrhages, areas of lymphatic infiltration, and a marked relative

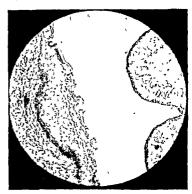

Fig. 2. Microscopic section of pelvic mucosa showing metaplasia (squamous cell formation and keratinization).

increase in stroma. There was considerable cloudy swelling of the few remaining tubules, and hemorrhage and fibrosis of some of the glomeruli. The striking feature was the presence of a metaplastic epithelium in the lining layers of the pelvis and adjoining ureter. There was a change to the squamous type of cell with hornification. The tissue resembled skin. (Fig. 2.)

Diagnosis: Nephrolithiasis with atrophy and fibrosis of kidney, squamous cell metaplasia, and keratinization of pelvic and ureteral mucosae.

NEISSERIAN MEDICAL SOCIETY MEETING

The American Niesserian Medical Society will hold its second annual meeting on May 18, in the Hotel Statler, Boston. All interested are cordially invited. The program will include:

10 00 AM. The "Flow of the Seed" in Antiquity, M. L. Brodney, M.D., Boston

'The Technique of Isolating the Gonococcus and of Determining the Thermal Death Time,"

and of Determining the Include Death Time, C. M. Carpenter, M.D., Rochester. "The Application of the Thermal Death Time Principle to the Treatment of Gonococcal In-fection by Fever Therapy," S. L. Warren, M.D., Rochester.

The papers of Drs Carpenter and Warren will be illustrated by moving pictures in colors Business meeting.

2 00 P.M. Presidential Address.

The Twelfth Scientific Session of the American Heart Association will be held on Tuesday, May 12, from 9:30 to 5:30 P.M.

Hans Zinsser, M.D. (guest speaker): "To What Extent Can a Bacteriologist Contribute to the Control of Venereal Diseases?"

Reports of the following committees: Male Clinical, P. S. Pelouze, M.D., Chairman; Female Clinical, C. C. Norris, M.D., Chairman; Laboratory and Research, C. M. Carpenter, M.D., Chairman; Public Health, Thomas Parran, Jr., M.D., Chairman, Sociological, W. F. Schott, M.D. Chairman, Sociological, W. F. Schott, M.D. Chairman Snow, M.D. Chairman.

Discussion and action on the following questions: (a) Methods of obtaining funds for encouragement of research on the gonococcus and gonococcal infections; (b) Publication of transactions; (c) Work programs for the ensu-

7:30 P.M. Dinner (The Niesserian Medical Society of Massachusetts will be host).

at Hotel Phillips, Kansas City, Missouri. The program will be devoted to Cardiac insufficiency.

PEPTIC ULCER IN CHILDHOOD With Case Report

FRANK J. WILLIAMS, M.D., Albany

Peptic ulcer is a highly prevalent disorder in adult life. Its etiology is not definitely known and its clinical manifestations are often so obscure as to escape early recognition. Most persons who have an ulcer suffer a long time before they finally obtain relief through a correct diagnosis and proper treatment. Stated briefly, the clinical picture consists of recurrent pain in the epigastrium. The pain is of a boring and burning character and is present only when the stomach is empty. The prompt relief obtained by taking food is a striking and characteristic feature of this condition. Another important symptom is nocturnal pain which awakens the patient every night or early morning and is relieved only by taking fook, milk or alkalies.

According to all available clinical records, peptic ulcer is of rare occurrence in young children. In a recent review of this subject Kennedy¹ states that an ulcer in a young child fails to induce those signs and symptoms which in the adult lead to probable diagnosis of ulcer. He believes the familiar clinical picture is usually absent under the age of nine or ten years, but after that age they show the characteristic symptoms. The following case is of interest because the typical syndrome of ulcer is seen in a young child.

This patient was a boy of five years who had always been in average good health and whose past history was negative except for minor disorders. He was seen in January 1932 with the complaint of recurrent pain in the abdomen. The onset of the disturbance dated back several weeks and although the diet had been carefully restricted there had been no improvement. At certain periods of the day he showed definite evidence of considerable distress in the abdomen, indicated by crying and holding his hand over the epigastrium. The pain awakened him at night, usually in the early hours of the morning. The physical examination was negative and it was impossible objectively to discover the reason for his apparent distress. There had been no elevation of temperature at any time. There was no abdominal rigidity, no tenderness to pressure, and no distention. There had been no vomiting and no bowel disturbance. Occult blood was not found in the stools. The absence of physical signs and the character of the pain suggested the possibility of ulcer. This diagnosis was verified by x-ray examination which revealed a niche in the cap of the duodenum. The child was placed on a modified Sippy diet consisting of milk and bland foods given at frequent intervals, with the addition of alkalies. Improvement was noted almost at once after ulcer therapy was employed, and complete healing was accomplished after its continuance for several weeks.

Morse² analysed from his records 14,-000 cases of chronic or recurrent pain in children among which he found five cases of ulcer. Palmer³ collected reports of forty-five cases in children which were found at operation, in only ten of which was a correct diagnosis made. The literature contains reports of ulcers occurring in infancy and early childhood, many of which are recorded as postmortem discoveries. Henderson4 asks why ulcers in childhood are so frequently reported by pathologists and so rarely reported by pediatrists. In view of its frequency in adults the questions arises whether it occurs more often in children than it is diagnosed. Jankelson⁵ states that ulcers in children are overlooked for four reasons:

- 1. They are not suspected in childhood
- 2. In younger children a history cannot be obtained

3. Uncomplicated cases do not give a his-

tory typical of ulcer

4. X-ray examinations of the digestive tract are not made with same frequency as in adults.

It is claimed by enterologists that a substantial percentage of persons with this condition give histories of gastro-intestinal upsets dating back to child-hood Moynihan agreed that many adult cases admit, on query, having had symptoms dating back to the age of ten years or earlier. Digestive disorders are numerous and varied in children. The pediatrist should regard the chronic ones, especially

Read at the Annual Meeting of the Medical Society of the State of New York, Albany, May 14, 1935 those associated with hyperacidity, as possible ulcer or as antecedents of this condition in later life. Marked progress has been made along the lines of scientific feeding, especially as to vitamin content and mineral balance which serve to protect the child against nutritional deficiencies. It is also important that he be safe-guarded against possible damage to the gastrointestinal mucosa

Summary

A case of duodenal ulcer in a young child is described to call attention to the possible presence of this disorder in childhood

Ulcer should be considered in cases of recurrent epigastric pain and its possible occurrence at any age must be realized

Its diagnosis with the aid of the x-ray is easy if suspected The x-ray is a more reliable aid than gastric analysis and is easier for the patient

The absence of vomiting, of occult blood in the stools, and of physical signs in the abdomen do not exclude the diagnosis of ulcer.

Rapid healing will result in childhood as in adult life if the diseased area is protected from the digestive juices which can be accomplished by such treatment

as the Suppy diet and alkalies

Chronic and recurrent symptoms referable to the digestive tract should be looked upon as possible forerunners of peptic ulcer in adult life Efforts should be made by the pediatrist to correct all digestive weaknesses which might be the predisposing factors of this common ailment, and thus reduce its incidence

Discussion

DR ARTHUR W BENSON, Troy -Dr Williams has made a distinct contribution in reading a paper upon "Peptic Ulcer in Childhood" Considering its importance, the subject has received scant recognition in the past We will all, I am sure, think of that condition more often in future, especially when encountering gastrointestinal disturbances and whenever a diagnosis is obscure Every pediatrician is eternally on the lookout for pus in the urine in girls, and for outs media in all children Likewise should we not be eternally vigilant to detect a possible gastric or duodenal ulcer?

It is encouraging to know that an x-ray can be so helpful I fear that I have not secure ! an x-ray picture frequently enough in handling very young children. In the two cases I've seen in babies, in both instances the diagnosis was made postmortem. In both cases the possibility of gastric ulcer was not suspected by myself or my colleagues in the hospital I feel that it has been very profitable for me to go over the literature I strongly suspect from the comments of several observers, that the condition is not nearly as uncommon as we have always thought

BETWEEN MENTAL HEALTH AND MENTAL DISEASE

B. LIBER, M.D., DR. P.H., New York City

Editorial Note: Under this title will appear short summaries of "transition cases" from the service of this author in the New York Polyclinic Medical School and Hospital. The descriptions are not comblete clinical studies, but will accountate cituations from the boint of view of a size of the studies. service of this author in the New York Polyconic Precious School and Property of view of are not complete clinical studies, but will accentuate situations from the point of view of individual studies with as crop ath in the grown day practice of anadicine complete contact states, our com accentance statements from the point of a complete contact states, our contact in the every day practice of medicine individual mental hygiene such as crop up in the every day practice of medicine

A man of forty had frequent attacks of indigestion, with epigastric pain and vom-This began ten years before, after the death of a member of his family. Investigation showed that he had been afraid that he too might die and that the only prevention he could think of was food.

He was far from intelligent and, within a short time, the need for food became an obsession for him. It was not an appetite that he tried to satisfy; it was a habit that changed into a craving, a gluttony that made him voracious to the same degree as the drunkard who is attracted to drink claims to be thirsty. He was indeed suffering from

No sooner had he finished his meal than food drunkenness. he asked for more food or bought it if he was away from home. He ate almost constantly the whole day and sometimes during the night, that is whenever his irritated digestive tube awoke him.

He gained no weight. He was very emaciated and weak and had great difficulty in performing his insignificant task. Prognosis was bad and unless help was coming soon his very life was in danger.

His case had been repeatedly studied by competent physicians, who found no organic trouble which could explain his condition.

He needed severe discipline, rigid education, which, as soon as it became possible, in an institution, helped him not only to be restored to normal weight and to a regularity in eating, but to a conviction that his health and life did not depend on ceaseless intake of food.

It was necessary to lecture him about digestion, about the digestive juices, and so on, all in the most elementary way.

But the final touch and the most causal treatment was the removal of his apprehension, his fear of death.

Heroism

A woman of thirty-eight, living with her husband in New York, had left her only son, now twenty, in Italy, six years ago.

She had had four major surgical operations, one of them a Cesarean and the latest a pelvic one which brought on the meno-

pause, three years ago.

Her complaint was, beside the climacteric symptoms, a fear of disease, a restlessness and depression, which could not be explained through anything in her environment that might have made her unhappy. Husband's behavior was "perfect" and she loved him and he loved her.

She longed for her boy, but circumstances

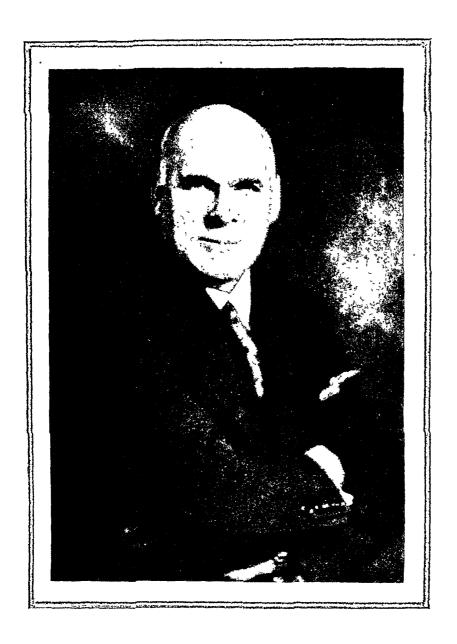

did not allow her to join him.

She often started weeping when seeing young men of her son's age.

No matter how her state of mind and her mood might have been understood, it was evident that she was heading toward some serious maladjustment or mental catastrophe.

What she needed mainly was encouragement-and that helped-also a correction of her point of view. For instance, the operations which she had undergone were either a subconscious excuse or a real reason for a feeling of great inferiority. She was no good; she was below other women of her age, and so on. The examiner called her a heroine; she was wonderful. Only an exceptional resistance made it possible to stand those operations and to withstand their effects and recuperate from them. She deserved a medal—quite as much as a soldier wounded in battle, etc.

Once upon a time a physician, an engineer and a politician were in earnest discussion concerning the antiquity of their professions. "Medicine is the oldest of all," said the physician. "It is recorded in holy writ that God removed a rib from Adam and created Eve. That surely was the first surgical operation." "But earlier than that," said the engineer, "God created order out of chaos—an engineering problem." "Well," said the politician, "my profession antedates both of yours. May I ask you who created chaos?"-From an address by Dr. Nathan B. Van Etten.

EDITORIALS

The New President—Dr. Floyd S. Winslow

We live in a significant period of medical practice. The structure of the social order medicine serves influences the character which the delivery of medical service takes. In the changing period through which we are passing, it would seem that we are particularly fortunate in the selection of him who will hold the reins of leadership among us. For he is no novice.

Dr. Floyd S. Winslow, a native of our state, has reached his high office after years of service to science, to medicine, and to the organized profession. It is not our purpose to write a biography. Suffice to call attention to a period of service extending nearly thirty years, during which his counsel and wisdom helped toward solution many perplexing problems. Monroe County may well be proud of its distinguished son, who has been president of its County Society, its Academy of Medicine, and president of its Pathological Society. We have known him as a delegate to the State organization for years, and as Vice-Speaker of our legislative body. His interest in civic affairs denotes the extent of his sphere of influence: his horizon is wide.

Under his leadership we expect his broad range of interests to give us a large viewpoint and his intimate acquaintance with our affairs and our machinery of government to furnish a state administration which shall be progressive, forceful, and liberal.

Dr. Frederic Ewald Sondern

It is with feelings of sincere regret that we note the finish of the fine administration of Dr. Frederic E. Sondern, Wisely our laws provide for his continuous service as past-president in the Council and Executive Committee for another year. The administration which has just culminated in the brilliant annual meeting in New York City was one during which the State Society passed through periods of hard sailing. The inauguration of the new Workmen's Compensation Law and the adoption of its fee schedule, the transference of the malpractice defense insurance-to cite but two outstanding issues -would easily, under any other less masterful handling, have led to disunion, disruption, and controversy. During his whole term the evident courtesy, patience, and philosophy of the leadership reacted to bring controversy to compromise without sacrifice of fundamental principles. Wise, cheerful, and just in his decisions. he had the happy faculty of being able to bring around him men glad to serve him and help in the common cause.

In looking at our retiring president and viewing his very evident executive accomplishments of administration, we are apt to overlook the fact that amidst all his obligations and duties to organized medicine in this State, he has never lost sight of his prime interest in his professional intellectual life. His professional life has been lived during the evolution of clinical pathology, and he still is an outstanding figure in this field of medicine. Nor has his interest lagged during the years devoted to organized medicine. The National Association of Pathologists, the qualifying boards of which have recently been revised and standardized to meet in equality with other professional qualifying boards, owes much to Dr. Sondern.

We congratulate Dr. Sondern upon the completion of a term of office during which added distinction was won for organized medicine, but we hope that we may have him among us for a long time so that we may profit from his maturity and his wisdom.

The New Surgeon General of the U.S. Public Health Service

Dr. Thomas Parran, Jr., whom we had come to know better the longer he was Health Commissioner of the State, has succeeded Dr. Hugh S. Cummings as Surgeon General of the United States Public Health Service.

In New York he has left behind him a fine record and a career in which he can take just pride. We wish for him continued success in his new field, and we pledge him loyal support in all worthy endeavors for the public welfare, in which we, too, are vitally interested.

We feel that a better understanding has been evolving between the State health authorities and the organized profession lately. We desire nothing better than that Dr. Parran shall continue the development of this better mutual comprehension "through liberalizing present medical practice and coordinating it with public health and medical services." We certainly find accord with the ideas expressed by Dr. Parran in his address on Health Security before the recent annual meeting of the New York Tuberculosis and Health Association. "* * * And

finally, how (shall we) control the everyday circumstances that are the basic factors in health—housing, food, work and working conditions, a living wage? For surely it seems an unscientific use of our effort and an unbusinesslike failure to order our affairs, when we struggle to control and to cure disease that could be prevented at the source."

Another sentence, which had all the earmarks of a slogan, attracted our attention: "The problem of the patientless doctors and the doctorless patients." With the former we have the same sympathy that any failure in human endeavor arouses. The doctorless patient, however, is our constant concern. It is our hope that study and wise planning will eventually find a solution for this problem. The solution should not be had, however, by setting up a bureaucracy which might eventually change the whole pattern of our parliamentary system of government.

The New State Commissioner of Health

Governor Lehman has appointed Edward S. Godfrey, Jr., State Commissioner of Health. Dr. Godfrey is a career-man in the department, who has had at least thirteen years of experience in private practice. From this we shall expect an understanding and a sympathy with active medical practitioners. He must know the problems which the practicing physician faces and in him the profession should find an official who will meet the problems of medical practice not from the usual bureaucratic attitude, but from the professional viewpoint, which once he, too, held. Dr. Godfrey has contributed freely to scientific journals; his work on measles being an outstanding contribution.

We are on the threshold of new phases in medicine. Preventive medicine is rapidly developing. The organized profession is awake to the inherent dangers to the body-politic of bureaucracy, and desires to see it curtailed. It stands today embattled for its rights to continue the developments of private practice, with the implications which this holds for rewards for industry, talent, and application, as well as for the incentive to lead the intellectually adventurous to take up this career of service and devotion. The profession desires to resist the encroachment of the State upon private medical practice. It is whole-heartedly in favor of any measure of public welfare that is for the good of the people, but it desires to see paternalism reduced to its minimum requirements in delivering medical care. The profession is habituated to enduring financial sacrifices for the public welfare, and has no quarrel with a situation which is deplorable in itself without taking account of its medical implications.

If Dr. Godfrey, in planning his new administration as State Commissioner of Health, will recognize these factors, he will win for himself the entire support of organized medicine in New York. Too often the profession has found in a public health official an office-holder who is more concerned in working out schemes to aggrandize his office, than for those which leads to helpful mutual cooperation with the profession.

We wish the new Commissioner of Health every success and tender him our cooperation.

Misuse of Scientific Articles for Propaganda

It is a deplorable incident when scientific articles are quoted erroneously or deliberately misquoted to further the propaganda of groups which are antagonistic to the medical profession. It is still more deplorable when editorial comment in a medical journal upon some worthy, completed scientific problem, or upon work in progress is published incompletely or parts separated from textual contacts to the end that some laudable project may be given added publicity.

We refer to a recent issue of the Health Bureau of Rochester, New York, where, in order to emphasize the importance of syphilis control and to call attention to the excellent work performed by this organization, resort was had to picking out certain texts in one of the editorials of our Journal,2 which, when loosely connected, served to distort the real context of the editorial.

The editorial in question dealt with a discussion of the theories of treatment for syphilis held by the schools of Neisser and Chesney. Ninety-two words were omitted by the Health Bureau and these were represented by three dots in the Health Bureau publication. Had these omitted words been printed in their pamphlet, the true intent of our editorial would have been evident. To have printed these, alas, would have made the last two paragraphs of no value for the Bureau's purposes in propaganda.

Habitually we are inclined to assist health bureaus in their endeavors. We can hardly be blamed, however, for reacting to news propaganda which first changes our remarks and then terms the editorial which they reconstructed "an extremely dangerous one." Obviously, we too, would decry what the Rochester Health Bureau made of it. We strongly recommend a reperusal of our editorial.

Prognosis of Deafness in Youth

When one has to cope with degenerative changes in a sense organ, the futility of therapy in the largest proportion of instances is a most discouraging factor. While constant search is being made for remedial measures, the importance of early detection and prophylaxis must not be overlooked. Particularly is this true in the loss of hearing perception.

Many surveys have been made to determine the number of deafened persons in our midst. In the main, these have been statistical analyses more or less embellished with details as to causes, incidence, and age of onset. Fowler has taken a

^{2.} New York State Journal of Medicine, 36:193, Feb. 1, 1936.

^{1.} Syphilis Control: Health Bureau, Rochester, N. Y., p. 2, Feb. 1936,

^{1.} Fowler: New York State Journal of Medicine,

distinctly novel point of view in his discussion of moderate deafness in youth. This group, ranging from five to eighteen years of age, is most subject to the suppurative diseases of the temporal bone. Rarely does this group present clinical evidences of otosclerosis or nerve deafness.

He calls attention to the importance of slight or moderate deafness which can be determined by the physician and of which the patient rarely complains. It is only the pain and distress of the inflammatory lesion which makes the patient seek medical care. Once these have passed, the negligible loss in hearing is often apt to be ignored. It is then that the importance of treatment for hearing loss is to be considered. The avoidance of recurrence of infection in the tympanic cavity, the studied consideration of whether adenoidectomy is indicated, the determination of what constitutional factors may play a role in furthering the progression of the lesion—all are problems which the physician must face. Fowler states that, "prognosis on the average is favorable with youth and early treatment." The aurist sees the late cases only, so that it is the family physician upon whom rests the burden of early detection of impaired hearing.

CURRENT COMMENT

APROPOS OF THE UNREST in Europe at the present time we quote from the Medical Record of April 15, 1936. "One of our greatest dangers at present is that technical science has supplied us with means for annihilating the human race. Such a catastrophe can be avoided only by securing the active cooperation of science and art, and mental hygiene can show the way in which we can secure this cooperation so essential to progress in the art of living. * * * Probably the greatest contribution made by mental hygiene during the past quarter of a century has been in bringing about public realization that our most valuable possessions are our distinctive human characteristics, and that this must become an essential part of our outlook if we are to hope for an end of international strife." The foregoing comes from the address of Dr. Stewart Paton at the recent annual meeting of the National Committee for Mental Hygiene.

"BARNUM IS STILL RIGHT" claims the Observer in the Supplement to The Bulletin of the Bronx County Medical Society. "It is a peculiar thing that intellectual people with many degrees to their credit frequently are so credulous when it comes to seeking treatment for their physical ills. For some reason they do not seem to have gathered from their extensive reading even a fundamental knowledge of what is necessary to protect one's health. When someone comes along with a ready smile and a glib tongue to tell them how a miracle can be worked and thereby benefit their health, they seem to lose all power of reason and accept promises of the impossible. * * * Legislation is possible but public ignorance cannot be overcome by laws where health is concerned. We are forced to come to the conclusion that the battle against disease can be won only if we have, in addition to a welltrained medical profession, an informed public. * * *"

"'Complete Medical care for only ten cents a day,' promised by health insurance proponents, has that chicken-in-every-pot appeal which a gullible public loves. Longheaded physicians can prick the bubble when patients blow it by reminding them that ten cents a day means \$36.50 a year per individual, \$153.50 a year per family—payable in advance!"—From Medical Economics of April, 1936.

Anent the housing question: "It is also discouraging to note that the building which is being done is still for the most prosperous ten per cent of the population. We are making the same old mistake again: overbuilding for the upper-income group and wholly neglecting the vast majority of Americans who neither want nor need philanthropy in the form of government-built 'slum-clearance' projects, but who cannot afford the only kind of new houses that are being built.

The small-house problem, which must be solved before we make a real dent on unemployment, is still unsolved, and will be until Washington awakens to it and unifies the government's scattered efforts." Raymond Moley in *Today*, under date of April 18, 1936.

DISCUSSING "The Present Trend in Medical Economics" in the April Supplement to the Bulletin of the Bronx County Medical Society, Dr. James C. Sargent states that: "No one, not even the loose-talking reformers, would dare to extol the present level of

medical care in the socialized countries of the world. * * * There is no earthly reason for any change whatever in the timehonored and proved present system of private medical care except it be limited to that relatively small group of patients who occasionally suffer serious sickness, the proper care of which requires services beyond private means. The whole movement toward state medicine unblushingly brushes this pertinent fact aside."

"THE HOSPITAL AND THE PHYSICIAN," an editorial in the April Westchester Medical Bulletin states that: "There are those who go among us crying 'Peace, peace!' They would have us believe that the differences between the doctors and the hospitals are imaginary, the issues ephemeral. In so doing, these would-be palliators are rendering a signal disservice to all concerned, and they will succeed only in postponing and augmenting the difficulties of the inevitable adjustments which will be made before the hospitals and the doctors together can face their mutual destiny in confidence and security.

If the issues between these two groups cannot be denied or evaded, neither should they be exaggerated. They should be defined; and the approach to their solution should be upon the firm basis of logical principles, and genuine respect for the inalienable prerogatives of each group. * * *

The fate of the ill-starred Moran-Esquirol Bill' in the present State Legislature vividly illustrated one fact which is of almost sinister significance for the profession; namely, that in contrast to the apathy and inertia of the profession, the hospital managements and lay trustees are alarmingly aware of what is going on, nor did they hesitate, at the first instance of opposition, to try to play the charity patients themselves against the doctors who have served them so faithfully and so well in the wards and dispensaries! It would be difficult to point to any campaign against any specific legislative proposal in this state in recent years which would equal the campaign waged by the hospital managements against the 'Moran-Esquirol Bill' in respect to the bitterness, the hysteria, the unfair tactics and the incredible misrepresentations used.

And this is all the more disturbing when one considers that the proposal was built upon an incontrovertible thesis, i.e., that hospital corporations as such should not be permitted to practice medicine by collecting fees for the professional services of their professional staffs."

"Textbooks eulogize men of war but pay scant attention to the men of peace. The development of medicine is scarcely mentioned among the forces which have elevated the race from a condition of savagery to a higher plane of civilization. The French attempt at building the Panama Canal resulted in failure; the American, in success. Under the French the death rate among the workers was appalling; the American death rate was almost negligible in comparison. This difference between failure and success is attributed to the cradication of malaria and other tropical diseases by American medical science." A "Timely Brevity" in the Supplement to the Bulletin of the Bronx County Medical Society.

The Westchester Medical Bulletin quotes the following comment on corporate medicine from the book "Economic Problems of Medicine" by A. C. Christie, M.D. "** the should be understood clearly that the function of a hospital is to furnish hospitalization and certain facilities for the practice of medicine, the latter being wholly a function of physicians. When a hospital or a university receives money for the services of its hospital staff and assigns such money to its corporate income it has departed from its proper function and has entered the field of medical practice. This constitutes the corporate practice of medicine which is always unethical and in a number of jurisdictions has been held to be unlawful. * * *

It is very important at the present time that the entire medical profession maintain a united front to resist encroachments upon the practice of medicine by many different types of organizations and institutions. Medical colleges, hospitals and the medical profession are allies in the battle against disease and they can maintain their alliance only if each adheres to its own special field and function?"

The visit of Lord Horder, physician to King Edward VIII, to the United States, is sponsored by the League for Less Noise. He is founder and president of the English

League for Less Noise. He will speak at a dinner at the Hotel Astor, May 5. He also will speak at Harvard University and at the convention of the American Medical Society.

Correspondence

[The Journal reserves the right to print correspondence to its staff in whole or in part unless marked "private." All communications must carry the writer's full name and address, which will be omitted on publication if desired. Anonymous letters will be disregarded.]

146 Barrett St., Schenectady, N. Y.

To the Editor:

On Page 503 et seq., Volume 36—Number 7, New York State Journal of Medicine, there is an article, "Traumatic Subdeltoid Bursitis," by Joseph Echtman.

Dr. Echtman describes traumatic subdeltoid bursitis and recommends physiotherapy as treatment therefor. Before such a widespread shotgun prescription is given for this protean disease, may I be permitted to outline some of the causes of traumatic subdeltoid bursitis and recite the contraindications for physiotherapy?

Traumatic subdeltoid bursitis is inflammation of the subdeltoid bursa. An adjoining bursa, the subacromial, may be involved, or these may be confluent. An inflammation, often sterile, is excited by chronic traumatism. This traumatism may come from beneath the bursa by chronic strain on the

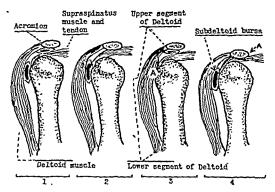

Fig. 1. Normal shoulder showing subacromial and subdeltoid bursae as separate structures. Note separation of deltoid muscle and greater tuberosity by subdeltoid bursa. Note also separation of acromion and supraspinatus tendon by subacromial bursa.

Fig. 2. Shows obliteration of subacromial bursa and adherence of supraspinatus tendon to This completely eliminates the action of the supraspinatus which means that the patient can not actively abduct the arm from

zero to thirty degrees.

Fig. 3. Shows obliteration of subacromial bursa and adherence of the deltoid muscle to the greater tuberosity. This is either painful or eliminates the ability to abduct the arm from an angle of thirty degrees to an angle of ninety degrees.

Fig. 4. Shows impingement of the acromial process on the humeral head by reason of round shoulders. This mechanically blocks motion of the shoulder and is painful by reason of ensuing

bursitis.

supraspinatus tendon. (This is seen often in tailors and leather workers.) It may come from above by reason of faulty posture which impinges the acromion upon the humeral head. Manifestly in these two conditions, physiotherapy, at the most, can do no more than temporarily relieve symptoms.

In the chronic stage, adhesion of the bursa to the supraspinatus tendon will cause pain. Adhesion of the bursa to the inferior surface of the deltoid muscle will cause weakness and some pain, since by this method the deltoid acquires a new insertion and only a small percentage of the muscle power of the deltoid is advantageously util-

By reason of long immobilization due to pain or artificial splinting, thickening will occur in the joint capsule. This is manifested late in the x-ray by a humeral head pulled high into the glenoid fossa.

In the above conditions it is only reasonable to feel that physiotherapy will be of small importance. The painless manipulations described by Dr. Echtman will prolong

disability far beyond need.

Before accepting physiotherapy as a cureall for traumatic subdeltoid bursitis, let me again recommend clean-cut diagnosis of the condition based on its etiology. Manifestly the case due to faulty posture can not be cured by heat and massage. It can only be cured by correction of the posture. The case due to supraspinatus injury will be benefited only when the supraspinatus tendon is repaired. The case kept painful by periarticular adhesions will be helped only when those adhesions are stretched out or broken. The case kept alive by adhesions of the deltoid to the humeral head will never be benefited until those adhesions are obliterated.

The case with painless calcification should not be subjected to undue treatment. This calcium soap may remain in place throughout life without symptoms. Certainly there is no indication for prolonged treatment when the x-ray finding is the only sign of persistent disease.

I hope that this letter will stimulate interest in the exact etiologic diagnosis of subdeltoid bursitis. Properly, there is no such thing as subdeltoid bursitis, any more than there is a disorder called sciatica; both are simply symptoms; neither is a Sincerely yours, EDWARD K. CRAVENER, M. D. disease.

April 7, 1936

Presidential Address

DOCTORS AND CIVICS

FREDERIC E. SONDERN, M.D., New York City President of the Medical Society of the State of New York

At the present juncture there is an unusual focus of the average mind on civics, in an endeavor to reconcile the evident incompatibility between democracy as we know it, and the new autocracies of which there appear to be an endless variety. It would seem the duty of all clear thinking people to make an unusual effort to preserve a guarantee for the continued enjoyment of personal liberty. In recent time we are threatened with types of control, certainly autocratic, and in some ways actually despotic, under the guise of economic need. Sensitized so to speak, by alarming trends or such as seem alarming, current literature dealing with the subject becomes increasingly popular and interesting.

One reads in a recent issue of the Atlantic: "Our politicians who pride themselves on their loyalty to the people, are often careless of human values. They usually think and act only in the interest of a particular, articulate coterie that applies political pressure for some special legislation. The Congressional Record for instance, reads more like the minutes of a body of representatives of special interests, than a parliament functioning for the whole people of the United States. There are Congressmen that represent potatoes and Senators that represent silver; there are Congressmen that speak for the American Federation of Labor and Senators that speak for the American Legion. In the attitude of our representatives lies perhaps the greatest peril besetting the American people today. We can survive without potatoes, but what are we to be without character?"

Turning from this drab conception of those we have elected to draft our laws and mould the policies of our nation, the following is found in a recent report of our own Committee on Legislation. "Only about one quarter, or exactly 27.8 per cent of 550 practicing physicians living in one important election district in New

York, registered to vote in a recent election." It is this evidence of dereliction in civic duty on the one hand, and the recorded unfortunate results of elections on the other, that prompted this brief presentation of my topic.

History shows the participation of the physician in government from the earliest time. Plinius, the elder, born A.D. 23, was physician to the Emperor and an unusually able Minister of Finance both by his ability to collect taxes and in frugal administration. Subsequent show an increasing number of prominent physicians in the sense that they attended the ruling Kings and potentates, who rendered outstanding service in diplomacy and other civic duties, notably in Greece and Spain. One Solomon Isak Isreli, an Arab born A.D. 854, widely known as a statesman and diplomat, was among the most prominent medical authors, not only of his day but of the middle ages. Some seven volumes of his, translated into Latin. exist to this day. His favorite topics were fever and dietetics. Early Russian political history, filled as it is with scandal, intrigue, and cruelty, quotes numerous physicians who participated in it, in addition to filling important professional po-

Scandinavian history records Struensee, a German, born in 1737, evidently a most able doctor, whose brilliant political career in Denmark reads like a romance. He gradually came to occupy a most exalted position in that Kingdom, and while intrigue led to his most cruel execution in 1772, his outstanding achievements in educational and legal reforms are recognized to this day. Olof Rudbeck of Sweden was not only an eminent research worker, having demonstrated the lymphatic system in 1653, and becoming professor of medicine at Upsala at the age of thirty, but was also the most able diplomat in Sweden of his time.

The Central European Countries like-

wise offer many striking examples of physicians who were at the same time outstanding parlimentarians and diplomats. The democratic uprising in 1848 was largely conducted by such men as Johann Jakoby in Prussia and Fischhof in Austria. A past-president of this Society, Abraham Jacobi also figured in this uprising against the government of that

The records of the political activities of physicians in France are also filled with distinguished names. The great revolution of nearly a century and a half ago, the outcome of intense sorrows of a people fomented for centuries, was expressed in blind fanaticism, bitter revenge, shocking cruelty. Unfortunately numerous physicians were among the unscrupulous, maddened demagogues, guilty of every known atrocity. The worst of all probably was the physician Marat, a revolutionist for gain rather than in principle, a mob leader in words rather than in action, who was murdered in his bathtub by Charlotte Corday in July 1793.

Guillotin, who incidentally did not invent the machine which bears his name, Trelat, Littré, Bert, and Combes were all physicians and members of the republican party who have been prominent in the government of France in those days and since. Combes it will be recalled was the primary advocate of the separation of church and state.

England in the course of the years has also had physicians in the diplomatic service as well as in other government activities. Sir Rutherford Alcock for example, a prominent medical author of his day, was an ambassador abroad, and a close student of far eastern art.

In more modern time, three names particularly come to mind. Virchow, Clemenceau and Sun Yat Sen, doctors and statesmen all.

Virchow, that mighty doctor, physicist, and anthropologist, the foremost of the 19th century, that pillar of modern pathology based on pioneer and radical research, exercised a potent influence on both the science and art of medicine, greater probably than anyone else before or since. Virchow's political activity was the direct result of his recognition of the existing and progressive decay in government efficiency, due to a growing bureau-

cracy of doubtful honesty. His fearless assertions in the political arena were characterized by the same unerring precision noted in his medical research. He achieved much in government reform in the interest of public health, and was probably the leading protagonist in opposition to Bismarck of that day. This leading Prussian statesman challenged Virchow to a duel on account of a supposed insult in the Chamber of Deputies, but in the final analysis our intrepid scientist was apparently "too proud to fight."

Clemenceau, was certainly the most

genial and celebrated statesman among the physicians of France in modern time. While he was in general practice in Paris during his early years, he soon deserted medicine in the interest of politics, and became a member of the Chamber of Deputies at the age of 35. He was a radical republican throughout and his long and successful civic career was characterized by convincing oratory, keen political sense, and absolute honesty. The rehabilitation of Dreyfuss was one of his difficult achievements in the interest of justice. His more recent political activity, especially during the world war, is so well-known as to need no comment. As an evidence of his genial nature, his remark when Woodrow Wilson presented his celebrated fourteen points, that "Moses only required 10," was characteristic of him.

Sun Yat Sen, the Chinese physician, was the leader in the overthrow of the monarchy and in the creation of the Chinese Republic.

Our own country also shows a long list of physicians in political life. Browning of Brooklyn has published the names of one signer of the Declaration of Independence, fifty-eight who were governors of states, twelve lieutenant governors, and 278 members of Congress, during the years of 1789 to 1910 inclusive. In more recent time we all know Lyman Wilbur, Hubert Work, and Royal S. Copeland in government service.

This rather long record of physicians who have served their fellow citizens by embracing political careers, is far too brief to cite their many achievements based not only on their ability as statesmen, but on their specific knowledge as physicians, and on the respect accorded

them in the appreciation of that knowledge

All of this should be a stimulus to the members of our profession, not necessarily to engage in a political career, but to undertake proper activity not only in the election of the most desirable candidates for office, but also in the more ardious duty of selection of these candidates in the first place.

Socialism or at least socialistic trends have become increasingly apparent both abroad and at home, no matter under what guise presented. Are we prepared to discard individualism in favor of collectivism? While the early history of the world relates the establishment of fundamental customs which may be considered evidence of collectivism, still the Renaissance of the 14th century noted the rebirth of individualism. It took another 500 years to completely break down those old fundamental customs by higher education, progress in science, and

competition in industry, which was followed by the most brilliant period of progress in every art and every science. Thus, true progress seems due to individual effort rather than to collective effort.

Our country had its origin from those seeking individual freedom, its constitution is based on that principle, its success resulted from the achievement of individuals, and its glory will go down in history as created by individuals and not by collective effort. While the medical profession consists essentially of those primarily interested in a science, the application of which forms the basis of the healing art and the prevention of disease, let it also realize to the full, the fundamentals which underlie liberty and happiness, and let its members devote the time and thought needed to suitably and efficiently aid in shaping political destiny to this end

20 West 55 St

The Physicians' Home, Inc.

In the autumn of 1918 the late Dr Wolff Freudenthal related to a group of physicrums who were members of a medico social society called The Medical Union the economic distibility of an elderly physician at that time an inmate in the poorhouse It was the feeling of the members assembled that an organization should be formed to create and maintain a home for aged and infirm physicians, their wives or widows or to assist in

any other way found feasible

This altruistic idea was put into practical form by the organization of a Committee with Dr Freudenthal as Chairman Application was made for incorporation under the title of The Physicians' Home, and a certifi cite of incorporation was granted to the organization on June 4, 1919 The incorporators were Drs Daniel Cook Warren Coleman, Max Einhorn, Wolff Freudenthal, Silas F. Hallock, Graeme Hammond, Fran cis Huber, Robert T Morris, Alexander Trautmen Henry Mann Silver, George Steel Ralph Waldo, Albert G Weed, John E Welch Mr Stuart G Nelson and Justice Bartow S Weeks A constitution and byliws were subsequently formulated and adopted, and the original officers were Dr Robert T Morris President, Dr Ralph Waldo Vice-President Dr Silas F Hallock, Secretary, and Dr Albert G Weed, Treasurer

In the fall of 1919 an appeal was made to the members of the medical profession soliciting members and donations for this worthy purpose The response was very gratifying and funds began to be accumulated.

The first guest of the Physicians' Home was sent to a Home for the Aged at Amityville New York, and this Home was utilized throughout the succeeding years until 1923 In 1922 the late Dr Stephen B Mountain, of Olean New York, offered to the Physicians' Home a house and farm at Canadea New York It was stipulated in the transfer that the Physicians' Home should make certrin installations and to carry out certain provisions for the maintenance of the prop erty Dr Mountain was elected Director. and acted in the capacity of Resident Man ager for the Physicians' Home In 1923 all of the guests of the Physicians' Home were transferred to the Home at Caneada This location did not prove satisfactory. The distrance from New York City at the eastern end and Niagara Falls at the western end. proved a hardship for many of the guests, together with the fact that the Home was two and a half miles from the nearest rail road station. The high cost of maintenance, together with the demise of Dr Mountain made it incumbent upon the Directors to return the property to the Estate of the late

Dr. Mountain. The guests, who had varied in number from three to eleven during this period, were lodged at the Jackson Hotel at Dansville, at Amityville, and a few at Dr. Barnes Sanitarium in Connecticut. Through the years the number of guests has varied from four to seven, and there has at all times been a waiting list. Inadequacy of income has rendered it impossible to take care of all the elderly physicians who have applied to the Home.

During the formative years many individuals have aided and made donations to the Home. Since incorporation the Officers have been: Drs. Robert R. Morris and Warren Coleman, President; Drs. Ralph Waldo, William H. Dieffenbach, Warren Coleman, and Silas Hallock, Vice-Presidents; Drs. Hallock, Albert G. Weed, Edward G. Cunningham, and Arthur L. Sherman, Secretaries; Drs. Weed, Cunningham, and Sherman, Treasurers.

On April 15, 1936 changes were made in the Constitution and By-Laws and in the certificate of incorporation, with the purpose of creating a more systematized organization. The Board of Directors of the Physicians' Home, Inc., was increased to thirtythree, as follows:

```
three, as iollows:

DR. FRED H. ALBEE, NEW YORK
MR. MAX BINSWANGER, NEW YORK
DR. ARTHUR W. BOOTH, ELMIRA
DR. WARREN COLEMAN, NEW YORK
DR. THOMAS H. CUNNINGHAM, NEW YORK
DR. ADOLPH G. DE SANCTIS, NEW YORK
DR. MAX EINHORN, NEW YORK
DR. JOSEPH JORDAN ELLER, NEW YORK
DR. THOMAS P. FARMER, SYRACUSE
DR. CHARLES H. GOODRICH, BROOKLYN,
NEW YORK
DR. CHARLES M. GRATZ, NEW YORK
DR. SILAS F. HALLOCK, NEW YORK
DR. B. WALLACE HAMILTON, NEW YORK
```

```
DR. JOHN HENDERSON, NEW YORK
DR. CHAS. GORDON HEYD, NEW YORK
DR. A. BERN HIRSCH, NEW YORK
DR. PETER IRVING, NEW YORK
DR. DAVID J. KALISKI, NEW YORK
DR. GEORGE W. KOSMAK, NEW YORK
DR. SAMUEL W. LAMBERT, NEW YORK
DR. ROBERT T. MORRIS, STAMFORD, CONN.
DR. EDWARD C. PODVIN, NEW YORK
DR. WILLIAM H. ROSS, BRENTWOOD, N. Y.
DR. GEORGE DOW SCOTT, NEW YORK
DR. ARTHUR L. SHERMAN, NEW YORK
DR. ARTHUR L. SHERMAN, NEW YORK
DR. ANDREW SLOAN, UTICA, NEW YORK
DR. FEDERIC E. SONDERN, NEW YORK
DR. TERRY'M. TOWNSEND, NEW YORK
DR. TERRY'M. TOWNSEND, NEW YORK
DR. HARRY TRICK, BUFFALO
MR. J. MILLER WALKER, NEW YORK
DR. FLOYD S. WINSLOW, ROCHESTER, N. Y.
DR. LOUIS A. VAN KLEECK, MANHASSET,
NEW YORK
```

A Board of Trustees was elected as follows:

	W. LAMBERT	
	COLEMAN	
DR. DAVID J.	KALISKI NSWANGER	for Three Years
MR, MAX BI	NSWANGER	for Four Years
MR. J. MILLE	R WALKER	for Five Years

The Officers of the Physicians' Home, Inc., are:

```
President ......DR. CHAS. GORDON HEYD
1st Vice President. DR. WARREN COLEMAN
2nd Vice President. DR. SILAS F. HALLOCK
Treasurer .....DR. B. WALLACE HAMILTON
Secretary .....DR. JOSEPH J. ELLER
```

The Physicians' Home, Inc., is a worthy medical public service, and should enlist the sympathetic cooperation of all members of the medical profession, as well as the profession's non-medical friends.

We appeal to you to further the object of this organization—"To create and maintain a Home for aged and infirm physicians, their wives or widows, or to assist in any other way found feasible."

CHAS. GORDON HEYD, M.D., President

MEDICAL "MACHINE SHOPS"

The faculties that do not teach practical medicine are perhaps in some degree responsible for the wave of machine shops which young physicians are setting up all over the country, said Dr. Nathan B. Van Etten, in a recent address. Failing inspirational influence, the social objective of some young physicians seems to place material gain above service to the sick. They continue their education under the seductive eloquence of salesmen for machinery and drug houses and go deeply into debt, mortgaging their futures for several years of instalments, which must be retrieved from credulous patients, who are put through the whole show of unnecessary x-ray, fluoroscopic, electrocardiographic, lamp and mechanical tests with which the physician himself is only faintly acquainted. It is an amazing experience to walk into the office of a recent graduate and realize, by quick computation,

that some one is backing an investment of from three to five thousand dollars or more in mechanical equipment. It is reasonable to fear that these young physicians are in danger of slipping into the mire of quackery, are sacrificing ideals to expediency, and are also creating an impression in the minds of patients that physicians who do not possess these elaborate instruments are consequently incompetent to make diagnoses or to advise up-to-date therapy.

Is this unsocial conduct merely a phase of practice that will destroy itself by lowering popular respect for these instruments through their indiscriminate and unskilled use? Will it need the disapproval of medical organizations? Will it need public education? It seems obvious that machines and gadgets must be subordinated to intelligence and a revival of common sense.

Medical News

Bronx County

A SERIES OF FOUR weekly radio health broadcasts were given in April by the Bronx County Medical Society and Bronx Tuberculosis and Health Committee, as follows: "Symptoms of Tuberculosis," by Dr. Emanuel Schwarz, April 6; "The Control of Tuberculosis," Dr. M. Aronshon on April 13; "Broken Bones," Dr. Thomas O'Kane, April 20, and "Neglected Abdominal Pains," Dr. Lawrence J. McTague, April 27.

Broome County

Dr. H. Jackson King addressed the April meeting of the Broome County Medical Society, on "Acute Appendicitis."

Chemung County

THE POSTGRADUATE SERIES OF lectures of the Chemung County Medical Society, includes the following programs: April 1, "Staphylococci Diseases," by Dr. O. W. H. Mitchell, of Syracuse; April 8, "Practical Everyday Obstetrics," by Dr. James K. Quigley, of Rochester; April 15, "Pneumonia," by Dr. Russell L. Cecil, of New York City and Dr. Bleyer, of St. Joseph's Hospital; April 22, "The Newer Endocrinology and Gynecology," by Dr. Thomas P. Farmer, of Syracuse; May 6, "Thyroid Diseases," by Dr. Martin P. Tinker, of Ithaca; May 13, "Hypertension," by Dr. Clayton W. Greene, of Buffalo.

Dutchess County

THE STANDING or medicine as a profession and the value of associations of allied professions were discussed at a dinner meeting of the Dutchess County Medical Society at the Nelson House in Poughkeepsie on March 21, by Dr. James Rooney, of Albany, former president of the New York State Medical Society, and Dr. Joseph Lawrence, executive secretary of the state society. Approximately seventy-five attended.

Dr. James E. Sadler was appointed chairman of a committee to investigate the proposed hospital group insurance plan by the Dutchess County Medical Society at its April meeting. Dr. Sadlier will select the other members of the committee.

Dr. John P. Ross, president of the society was in charge of the meeting. The scientific program included a symposium on gall bladder and liver, Addresses included: Anatomy and Function, Dr. H. M. Hedgecock; Surgical Aspect, Dr. A. R. Moffit; Medical Aspect, Dr. Scott Lord Smith; and X-ray Viewpoint, Dr. C. O. Davison.

Erie County

IN RECOGNITION of the esteem in which he is held by the medical profession and of his major accomplishments in the science of obstetrical surgery, Dr. Irving W. Potter, of Buffalo, on April 2 received a gold medal from the Buffalo Academy of Medicine.

The award was presented at the annual dinner of that organization and the Medical Society of the County of Erie in Hotel Statler ballroom. Dr. Allen A. Jones, another veteran Buffalo physician, made the presentation in behalf of the academy.

Approximately 400 members of the medical profession of Buffalo and vicinity paid a rising tribute to Dr. Potter. The award has not been given by the academy for

many years.
Dr. Herbert J. Donnelly, president of the academy, and Dr. Milton G. Potter, president of the Medical society and son of the man of honor, made brief remarks.

Born in Buffalo sixty-seven years ago, Dr. Irving White Potter was graduated from the University of Buffalo, School of Medicine in 1891. For forty-five years he has been practicing in Buffalo and for three decades has specialized in obstetrics.

Twenty years ago he was elected a Fellow of the American College of Surgeons. He is a past president of both the Buffalo Academy of Medicine and the Medical Society of the County of Erie. He is also a member of the American Association of Obstetricians, Gynecologists and Abdominal Surgeons and the American Medical Ass'n.

Dr. Potter is attendant at the Buffalo City hospital, Millard Fillmore, Deaconess

and Lafayette General hospitals.

He is not only the father of a physician, but the son, grandson and great-grandson of physicians. His father, Dr. Milton G. Potter, was dean and professor of anatomy of the University of Buffalo Medical school. His grandfather and great-grandfather practiced medicine in Wyoming county.

Kings County

A DINNER-DANCE in celebration of the Twentieth Anniversary of the Medical Society of Bay Ridge was given at the Graud Ballroom of the Hotel Bossert recently.

FITTY-FIVE MEMBERS of the Brooklyn-Long Island Chapter of the American College of Surgeons visited the University of Toronto and allied hospitals in April for an all-day clinical program. This trip was one of a series of chapter visits to various large medical centers two or three times a year during the past five years. DR. MORRIS HINENBURG, assistant director of Montefiore Hospital in the Bronx will assume his duties as executive director of the Jewish Hospital in Brooklyn on May 1, according to an announcement by Joseph J. Baker, president of the hospital.

Monroe County

APPOINTMENT OF Dr. George W. Corner, professor of anatomy in the School of Medicine and Dentistry of the University of Rochester, to be Thomas Vicary lecturer for 1936 of the Royal College of Surgeons of England, is announced at the University. The lecture will be given in the historic hall of the college in Lincoln's Inn Fields, London, in December. Doctor Corner also will give a series of three lectures by special invitation of the University of London, and another at Guy's Hospital Medical School.

His lecture at the Royal College of Surgeons will deal with surgery in the Middle Ages. In his lectures at the University of London and Guy's Hospital, he will discuss various aspects of the research which he and his associates have been carrying on for several years on the functions of the reproductive organs, leading to discovery and isolation of the ovarian hormone, progestin.

ROCHESTER NEWSPAPERS recently noted the seventy-sixth birthday of Dr. Charles F. Otis, of Honeoye Falls, who told the reporters that the way to keep young is to keep working. Dr. Otis's father and grandfather also practiced medicine in Honeoye Falls, and his son Charles is a doctor in Rochester.

Nassau County

By a strange coincidence, as noted in the local newspapers, Nassau County lost on the same day two of its oldest physicians, who were at the same time its oldest heads of financial institutions. The deaths of Dr. Frank T. DeLano, president of the Bank of Rockville Centre Trust Co., and Dr. Samuel Johnson Bradbury, of Lynbrook, president of the Peoples National Bank and Trust Co., occurred on March 28. Dr. DeLano was in his eightieth year and Dr. Bradbury in his eighty-third.

Dr. DeLano was a past president and secretary of the Essex County Medical Society, past president of the Queens and Nassau County Medical Society. After the separation of the Queens County Medical Society he joined the Nassau Medical Society, the Medical Society of the State of New York, and became a fellow of the American Medical Association. With the organization of the Associated Physicians

of Long Island, about 1893, he became a charter member, and in 1910 was elected president.

New York County

FOR THE PAST FIVE years the Joint Committee of the Organized Medical and Dental Professions of the City of New York has been encouraging medical-dental cooperation in the treatment of the sick. The Joint Committee has conducted combined medical-dental meetings and arranged programs which attracted large audiences of physicians and dentists. These meetings have become a regular institution in Greater New York. This committee has arranged medical-dental programs for the New York State Medical and New York State Dental Associations.

While considerable progress has been made in reaching the practicing physicians and dentists, the Joint Committee realized that in order to make medical-dental cooperation more general in the future it was necessary that medical and dental schools should be encouraged to teach their students the importance of such cooperation in car-

ing for patients.

To carry out this objective, the committee sent a questionnaire, two years ago, to all grade A medical and dental schools in the United States and Canada to ascertain to what degree the schools emphasized the correlation between medical and dental sub-The report of this research was submitted at the 1934 Combined Medical-Dental Meeting and aroused considerable interest among the educators present who discussed the report. It was suggested, that knowing the deficiencies of this teaching in the professional schools, it would be of value to have the Joint Committee go a step further—to submit specific recommendations for the improvement of medical and dental curricula in regard to this important but neglected phase of instruction.

Following the adoption of a resolution at the 1934 meeting a subcommittee was appointed to study the curricula of all Medical and Dental Schools and to report back to this body its opinions and recommendations.

That subcommittee decided that since the curricula of the schools are already over-crowded with courses, and many departments are clamoring for more teaching hours it would be best, for the present, not to suggest any radical departure from present methods, but to attempt to suggest changes which would not materially alter the curricula of the schools, but would use already available hours in the various teaching branches to emphasize the relation between the teeth and general health.

To go into detail as to hours and subjects to be taught would only engender resistance on the part of the schools, so the committee is presenting the following outlines which it hopes will call attention of the educators to the subjects in which medical-dental relationship arises.

RECOMMENDATIONS FOR MEDICAL SCHOOLS

1 The committee is of the opinion that if attempts are made to force too much upon medical schools in this connection they will say that they have no room for a course in this subject and will not consider the matter at all

2 The committee does not believe that it is practicable or necessary to give a complete, comprehensive course in this subject.

3 Re-calling attention of the appropriate are found to

ourse in this subject

3 lb; calling attention of the various teaching departments to the importance of the teeth in relation to the general health and disease, much can be accomplished toward furthering the cause. The committee terfore mades the following suggestions for the medical curriculum

(a) In Austomy and Histology An hour's special attention to teeth and jaws (b) In Physiology The importance of the teeth in digestion, massiciation. Occlusion to the teeth and the control of the design of the teeth, alternative the control of the design of the teeth, alternative the control of the teeth and the control of the control

discress
(d) In Bacteriology The teeth and their surfounding tissues as soil for bacterial growth and for dissemination of infections
(e) In Hygiene Importance of care, preserve ton and replacement of teeth to prevent discress (f) In Physical Diagnosis (1) Recognition of conditions in the mouth captile of acting as foci of the diagnosic procedures to the diagnosic procedures (2) Recognition of conditions prejudical to health—carries uniqued teeth, mal occlusion faulty deniures, etc.

to health—caries unerupted teeth, matoccuisson faulty dentures, etc.

(g) In medicine and allied specialities. The relation of dental conditions to general diseases.

(h) In surgery and allied specialities. In addition to dental captures are surgery the importance of dental captures of the surgery dental captures and the necessity for dental captures and distinct to other surgical procedures should be stressed.

4 In the senior year, one to three lectures correlating all the facts presented in the different courses should be given preferably by a dentist of wide

experience 5 tvery medical student should have a full mouth dental x ray taken

ORSTETRICS

Obstetric patients should make regular visits to the dentist during the entire course of gestation

1 Prophylactic Dental Care
(a) Hyperic care of the oral cavity
(b) Diet for expectant mother
Influence of diet on teeth of (1) Mother,
(2) Offstructurality
Influence of victimus
(c) The Carlot Carlo

- Influence of Vustercol—Cod Liver Oil
 (c) Focal Infection—Isotor in (1) Toxemia of
 Fregnancy, (2) Sepsis (postpartern)

 2. Active
 Fregnancy, (3) Sepsis (postpartern)
 Discounting the Conditions which may include
 (a) Extractions, fillings, root canal treatment, apical abscess, removal of bengin no plasm, gingival hypertrophies, pyorrhoza
 (b) Anesthesia—(1) Local or Block, (2) Gen
- 3 Medical Dental Conference about Case, Progress
- Notes (a) Medical dental conferences should be held
 - (a) Medical dental conferences should be held when the dentist is in doubt about his patient's general health of the conference of the conference of the dental discoust and notes furnished by the dentist on the treatment he rendered to the natient (c) The physician should note whether or not there is improvement in general health
 - of patient

RECOMMENDATIONS FOR DEVIAL SCHOOLS

Recommendations for Devial Schools

I Supplement Courses in General Pathology by more practical clinical observation. Courses in General Pathology should be supplemented by more clinical observation of the conditions causing the morbid tissue conditions covered in the lectures and laboratory in struction. The correlation should be extended to clinical observation of the course of infections studied so that fectures and laboratory examinations may be teen in definitely with clinical symptoms should provide actival Hostital operative experience. The courses in Maxillo I acial Surgery do not give enough hospital contact and experience. The men do not actually work, themselves, under hospital conditions. There

in Maxillo I acial Surgery do not give enough hospital contact and experience. The men do not actually work, themselves, under hospital conditions. There fore, provision should be made for dental students to actually do operations in the hospital for everal days. Fven if the operation is a simple extraction, the students should prepare in the same manner as if a major piece of Oral Surgery was to be done. Only by actual participation can the proper feeling and judgestanding be given to these men.

ui derstanding be given to these men

3 Courses and assignments in Oral Diagnosis to be
extended to actual medical and dental cooperation extended to actual medical and dental cooperation. Particular arters should be laid on the relationship of dental infection to discuse elsewhere in the body. Physicians and dentitist should cooperate in making the diagnosis. The case should be worked up by both professional groups in the presence of the students and a complete program for health rehabilitation determined upon so that the dentist will know what effect may be expected to result by his prevention of, or elimination of infection in his particular area, and what effect will be had upon the dental efforts by the elimination of infection, and alteration of systemic elimination of infection, and alteration of systemic

elimination of infection, and alteration of systemic disturbance by the physician

4. Wore actual practice train of should be provided in those Universities having the Medical School Hos pital available, efforts should be made to provide each student with actual residence within the hospital under competent supervisors, even though the time may be only one week. I rist, more actual knowledge of hospital procedures practice care of the change of the pital procedures practice care of the change of the condition o mencement

5 Medical and Dental Students Health Examination Fvery dental student should have in his third of fourth year a thorough physical examination follows: iourin year a thorough physical examination following the above ideas and a written report submitted by the student, analyzing his own cordition and making specific recommendations for treatment, should be provided

provided Actual experience in clinic and classroom will soon produce further advancement of teaching to better impress the student dentist that his every service is a health service, that the physician's aid should be sought frequently, and that aid and cooperation should be given freely to the physicians at all times

Note - The Joint Committee desires your opinion and suggestions on these recommendations and will appreciate your early reply. Please address your reply to M. O MAGID, M D, Sccretary, 1018 East 163 Street, New York, N Y.

THE OPENING CEREMONIES of the Italian Medical Center at 135 East Fifty-fifth Street were held on April 11. The center was founded and is under the direction of Dr A L Soresi It has a capacity of more than one hundred beds.

The center includes operating rooms, an x-ray department, clinical and laboratory sections and most modern hospital facilities.

DR ARTHUR B DUEL, vice-president and chairman of the board of the Manhattan Eye, Ear, and Throat Hospital, died on April 11 at his country home near Pawling. He was known as co-originator of a method

for curing facial paralysis. With the late Sir Charles Ballance of London he succeeded in direct repair of injured nerves through grafts taken from other nerves.

Niagara County

WILLIAM MARTIN, of New York City, assistant general counsel to the New York State Medical Society, addressed the joint dinner meeting of the Niagara Falls Lawyers' club and the Niagara Falls Academy of Medicine, at the Niagara Falls Country club on April 17 on the subject "The Legal Relationship of Patient and Physician." Dr. R. W. Holt is president of the Academy and Raymond A. Knowles, president of the Lawyers' club.

DR. RICHARD H. SHERWOOD, president of the Niagara County Medical Society, gave a radio talk on April 10 at radio station WGR, Buffalo, on "Early Diagnosis of Tuberculosis."

Onondaga County

THE ONONDAGA MEDICAL Society, at its meeting on April 7, at the University Club in Syracuse, heard two interesting papers on "Landry's Paralysis"—Report of five cases, by Dr. Frederick N. Marty and Dr. Wardner D. Ayer, and "Acute Poliomyelitis in Syracuse in the last Twenty Years," by Dr. A. Clement Silverman.

Ontario County

THE QUARTERLY dinner-meeting of the Ontario County Medical Society was held at the Clifton Springs Sanitarium on April 14. The scientific session was conducted by the sanitarium staff in the nature of a clinical-pathological conference on tumors of the large bowel, with presentation of case reports.

Otsego County

Dr. George William Augustin, of Oneonta, who died on March 28 at the age of fifty-nine, had been health officer of the city for twenty-seven years. He organized medical inspection in the schools two years before it became obligatory by law.

During the World war, he served overseas with the rank of major. He was in major engagements at St. Mihiel and the Meuse-Argonne, serving in those sectors from September 1 until the Armistice. He was awarded a citation for bravery under fire and was presented with the order of the Purple Heart.

Richmond County

Dr. John L. Rice, New York City health commissioner, was a guest at the annual

dinner of the Richmond County Medical Society, April 15, at the Richmond County Country Club on Flagg place, Dongan Hills.

St. Lawrence County

TWENTY-THREE MEMBERS of the Ogdensburg Medical Society attended the April dinner meeting at the Crescent Hotel. Drs. T. S. Barnette and R. J. Reynolds of Potsdam and Dr. L. T. McNulty of Norwood conducted a discussion on pneumonia. Dr. H. E. Vaughan, president of the society, presided.

Tompkins County

THE MARCH MEETING of the Tompkins County Medical Society was held at the Tompkins County Memorial Hospital on March 24. The Society was addressed by Dr. Geo. D. Vogt and Dr. H. I. Johnston

of Binghamton.

Dr. Vogt talked upon the Gradient Plan and his lecture was illustrated with various graphs and statistics. Dr. Johnston talked upon medical economic conditions about Binghamton, discussing particularly the Spaulding Plan and the arrangement with the Medical Profession that the Endicott-Johnson Shoe Co. have. Then followed considerable discussion, particularly regarding the Gradient Plan. The concensus of opinion appeared to be that there were a number of points in the Plan which would make it unsuitable for use in Ithaca and vicinity.

After the speakers of the evening had departed, the Society held a short business session. The chief point of interest was a discussion of the Ehrlich bill which is in assembly, namely an act to amend the Public Welfare Law in relation to manner of providing cost of medical care in the home. This was discussed freely and the Society unanimously endorsed this act.

Warren County

APPROXIMATELY EIGHTY gathered in the auditorium of the Crandall library on March 27 to hear Dr. Robert Loeb address the Glens Falls Academy of Medicine on "The Role of Sodium in Adrenal Disease."

Dr. Loeb, of the Presbyterian Hospital in New York and associate professor of medicine at the College of Physicians and Surgeons, told of research work in disease in the adrenal gland.

Dr. A. N. Foxe of Glens Falls is the author of "Crime and Sexual Development," a new book published by The Monograph Editions press.

Medicolegal

LORENZ J. BROSNAN, ESQ.
Counsel, Medical Society of the State of New York

Malpractice-Ether Burn of Eye

A case very recently passed upon by the Courts of one of the New England States furnishes a good example of the type of situations that arise from time to time in surgical practice, where, although a doctor uses care and skill, an unfortunate result is contained by the residents.

is sustained by the patient.*

The action was one brought against an anesthetist who had participated in an operation performed upon a woman for a thyroid cyst. In the pleadings the plaintiff charged that the defendant physician had been so negligent in administering ether to her in the course of the operation that her eyes were badly burned with a claimed impairment of vision.

The persons present at the operation were the four persons who made up all of the witnesses who testified upon the trial of the action. They were, the patient herself, the operating surgeon, Dr. D., the hospital nurse who assisted at the operation, and the defendant who administered the anesthetic.

The plaintiff in her testimony told of the preliminaries to the operation and then described how afterwards she realized that her eyes were afflicted in such a manner that she could not open them, and how when she left the hospital she could see very little. She told of discussing the condition with the surgeon and learning that ether had gotten into her eyes. She gave a story of pain and suffering and told how she had undergone treatment for her eves for weeks.

treatment for her eyes for weeks.

The records of the hospital were used to show that the second day after the operation the patient had "conjunctivitis from ether in the right eye." Other entries in the records showed that about two weeks later she received treatment for conjunctivitis, and that a diagnosis of the condition was at one time made that her condition was "de-

nuded corneal epithelium."

The surgeon who had been the plaintiff's family doctor testified that prior to the operation she did not suffer from the condition.

The principal witness in the case was the defendant who was first called as a witness by the plaintiff. He detailed his qualifications which showed that he had had considerable experience in anesthesia.

The only testimony upon the trial as to the actual administration of the ether was

* Klucken v. Levi, 200 N. E. 565.

supplied by the defendant. He had started the procedure by the use of a Gwathney machine in order to "bring the patient to the state of anesthesia known as induction, and then to be carried into the stage known as moderately deep anesthesia." He then changed to a cone, stating that it was easier to use than the mask, and that with the cone he could maintain a quiet even level of sleep. The cone was, he said, made of cardboard in cylindrical shape, open at both ends, filled in the upper third with gauze and covered with a heavy towel. He explained that the towel protected the face from the cardboard and absorbed ether which might run from the gauze. The ether was poured by hand into the cone from a metal container held by the nurse. The patient's eyes were protected by towels which were lifted on occasion to determine the reaction of the pupils, as an aid to determine the amount of ether to be administered. The doctor described how he had held the patient's chin with one hand and the cone with the other, and that he would lift the cone and invert it, and direct the nurse to pour amounts of ether in liquid form into the cone, and after holding the cone in his hand until full evaporation had taken place he would replace the cone.

The doctor testified that if fumes or liquids got into the patient's eyes, as he handled the cone, it must have come from outside the cone. He stated that it would take a large amount of ether to saturate the bandages over the patient's face, and that if the apparatus were properly handled no fumes or liquid would get into the eyes. He denied that if fumes or liquid got in the eyes it would indicate that the apparatus was improperly handled. The anesthetist further testified that he had properly handled the apparatus and he did not see how fumes or liquid got into the patient's eyes. The doctor asserted that he had taken extraordinary precautions that all should be done properly in the particular case.

Upon questioning by plaintiff's counsel the following answers were elicited from the

defendant:

Q. If any ether got into her eyes it came from outside the cone or leaked from the bottom of the cone into her eyes?

A. If it got into her eyes it would have to come from an outside source, yes.

Q. And if that were done by the ordinary

anesthetist you would say that that was improper, wouldn't you, if it got into her eyes in that way?

A. To my mind, I wouldn't say it was im-

proper.

Q. But you wouldn't expect the ordinary anesthetist to permit it to get into the eyes of the patient under those circumstances, would you?

A. I wouldn't, no.

He also made the following statement in the course of his testimony:

There was no way in which one could absolutely prevent ether vaporization from reaching the eyes of the patient and with the use of the towels there would be no escape of liquid ether.

The nurse, when called as a witness, described her training and presented ample proof that she was an experienced operating room assistant. She corroborated the doctor's description of the details of the methods used by him in handling the anesthesia, and also stated that he had not departed from the usual technic.

With the testimony substantially as outlined, the Court submitted the case to the jury and a verdict was rendered against the doctor. An appeal was taken by the defendant upon the contention that upon the record he was entitled to have had a directed verdict in his favor. The Appellate Court reversed the holding of the Trial Court, and ruled that the case should never have been submitted to the jury for their determination.

In so ruling the Court said in part:

There is no evidence that the defendant did not possess the standard of skill which the law required him to possess and there is no testimony in the record, lay, or expert, that there was any "departure by the defendant from the usual technic in handling the gas oxygen anesthesia." The fact, warranted by the evidence, that the plaintiff suffered injurious effects to her eyes by the administration of ether by the defendant, would not alone warrant the further inference of fault on the part of the defendant in administering the ether. In the absence of expert affirmative evidence of fault in the administration of ether to the plaintiff the basic question is whether the defendant in administering the ether did use the care and skill which the law required.

There is no evidence to show that the mask or cone was defective or inadequate or that the defendant should have insisted upon additional apparatus or equipment. There is no direct evidence to show a causal relation between the acts connected with the administration of the ether and the injury to the plaintiff's eyes, or that those acts were attributable to the defendant's negligent conduct. There is nothing in the record to exclude the reasonable inference that the nurse in pouring the liquid ether spilled ether upon the outside of the cone which found its way to her eyes to their harm. If such were the fact the defendant was not chargeable because the nurse was furnished by the hospital and there

is no evidence that the defendant directed or failed to direct her other than to say that the liquid ether she poured into the cone was enough. There is nothing to warrant a finding that the ether in vapor form got into the plaintiff's eyes through the administering of ether.

Plastic Operation Upon Nose

A young woman was referred to a physician, specializing in plastic surgery, for treatment with respect to a condition affect-

ing her nose.

She had been treated at the X-ray Department of a hospital for a skin cancer of the nose and upon examination the doctor found a large atrophied scar extending over the left side of her nose with a granulating surface near the corner of the eye. He explained to her that a two-stage operation would be necessary to attempt to repair the condition.

He had the patient placed under a general anesthesia and using a diathermy knife cut away all of the affected skin from the left side of her nose. It was intended that a second stage operation should be performed later on by taking a flap from her forehead and grafting it to her nose. The patient remained at the hospital for a week and received the usual ward care. After she was discharged from the hospital she called at the office of the plastic surgeon and requested that the doctor continue his treatment of her as a paying patient. It was explained to her that he could not undertake to treat her in that manner but that she would have to make arrangements with the hospital to continue as a ward patient for the second operation.

The patient became disgruntled and went to another doctor who performed the second stage of the operation and obtained a very satisfactory result. The final result was excellent from a cosmetic standpoint.

The patient instituted an action against the plastic surgeon charging that he had undertaken to perform a single operation upon her and that he improperly performed the same so that it was necessary for her to go to another doctor to have the opera-

tion completed.

The case came on for trial before a Judge and Jury and the plaintiff attempted to charge the defendant both with negligence and abandonment. However, she was unable to present a convincing case and at the conclusion of all the testimony the Judge conferred with the attorneys and suggested that the plaintiff discontinue the action, which was done. The Judge indicated that if the case were submitted to the Jury and the Jury should by any chance find a verdict in favor of the plaintiff he would, under the evidence, be obliged to set the verdict aside.

Across the Desk

The Young Doctor's Temptations

LITTLE DEVILS FILL THE AIR all around us, according to the theology and demondogy of Africa, Asia, and isles of the tropic seas, and who are we to say that the variegated heathen may not be right about it? They may know more about devils than we do. We know, anyway, that temptations assail us on every hand, and if they don't come from little imps whispering in our ears, then where in the mischief do they come from?

To every man come his own peculiar temptations, suited to his nature, and the ones that beset the path of the doctor are different from those that try the souls of other professions and vocations. A good medical man of the Southland, Dr. Wingate M. Johnson of Winston-Salem, North Carolina, is out with a little book titled "The True Physician" (MacMillan), in which he gives a lot of helpful advice to young doctors just setting out on a medical career. Older practitioners may find a reminiscent interest in glancing over the list of temptations which the youngsters are told to avoid, and in remembering how they met them and fought them off.

At the very start, then, the young interne finds his life in the hospital so enjoyable, so full of fine friendships and helpful association with older men that he is tempted to stay on from year to year. The longer his experience, the more valuable he becomes to the hospital and the more he shrinks from the cold plunge into private practice. In fact, "many such men essay timidly to venture into practice for a little while, as a youngster might put a toe into cold water, then recoil violently into the sheltering arms of the first institution that will receive them." Unless the young medico expects to specialize at once in surgery or a special branch of medicine, Dr. Johnson advises that "from one to two years is long enough to linger in the delightful atmosphere of the hospital."

"Deadbeats, Dope-Fiends, and Abortion-Seekers"

Well, the young doctor takes the plunge, opens his office, and awaits the patients.

will they be like? "The first patients," says Dr. Johnson, "are apt to include a tremendous majority of deadbeats, dope-fiends, and abortion-seekers." Here is a situation to try the young man's wisdom and tact. To make enemies of them is undesirable, perhaps, but to grant all their demands would mean disaster. The thing to do is to remember that even such undesirable people "are human beings with feelings and also some influence," and treat them with all the courtesy and consideration possible. At the same time it is best to tell the dope-fiends and abortion-seekers at the very outset "that your professional soul is not for sale." For "with the sort of free-masonry that exists among drugaddicts, to supply one will mean an influx of others; whereas to dismiss the first two or three will mean freedom from molestation by others."

The young woman, married or single, who has missed her period and wants help, will have a wealth of reasons and arguments and perhaps the offer of a fat fee too. Of course it may be that her reasons are valid. "It is true that it is sometimes necessary, for the sake of the mother's health, to interfere with pregnancy. Then it should be done as an open and aboveboard operation, or by radiation, after a consultation with at least one other physician in good standing. Any doctor who will do a criminal abortion for gain is putting himself on an exact par with a prostitute who sells her body for money; he has lost his professional virtue. Sooner or later he will be found out, and then woe is that man -an outcast from his professional brethren henceforth forevermore."

"Law and Medicine See the Worst of Each Other"

The next discovery of the young physician may be that he has certain legal duties. Contagious diseases must be reported, even over the strong pleas and protests of mothers and boarding-house keepers. The temptation is to lend a lenient ear to them, but the doctor must remember that the very mother or landlady who is pleading will lose her

respect for him if he fails in his duty; the facts will come out sooner or later anyway, and the doctor who is on the right side of the law will have no regrets.

More and more the doctors are being called into court, either to testify as experts or to defend damage suits. The depression seems to bring out the wort traits in the greedy, who think they see a chance to sue or threaten their doctors and wring money from them by every legal trick known to shyster lawyers. "Of all the professions," remarks Dr. Johnson, "law and medicine see the worst side of each other." Years after some petty accident case the doctor may be summoned to testify about it and be questioned as closely as if it had happened vesterday. "Here the value of accurate records is apparent, for after the lapse of months or years, it is not safe to trust even the best memory. Your records show the patient's condition at the time of injury, and not as the lawyer and he together much later imagine it must have been."

Two temptations beset the medical man here. One is to embroider the facts in a way to put the best appearance on them. This is dangerous, and may give the hostile lawyer his opportunity to involve the witness in contradictions and lead him into confusion. The other temptation is to lose your temper, which is equally disastrous. A calm sticking to facts, as shown on the record card, avoids them both.

Another bit of advice here is useful. When asked to kiss the Bible, "it should not make you a whit less truthful if you place your hand on it and kiss the back of your thumb instead of the actual book; and will certainly expose you to several million fewer germs."

Certain physicians are sometimes overtempted by big fees to testify for one side in a suit where other doctors have taken equally large fees to testify for the other. The resulting scene in court is most regrettable and brings no credit to the profession. "It is a sad commentary," remarks Dr. Johnson, "that such a spectacle is allowed." "The bigger the reputation of the 'expert,' the higher the fee he can charge; but I wonder often what they can buy one-half so precious as the stuff they sell."

More Whispers of the Imps

The little whispering imps have more temptations to suggest, too, which the young doctor must watch for. He may become a prominent and respected citizen of his town or city, which is excellent, but, if so, he is likely to be asked to run for some political office, which may be a whisper of Satan. People are apt to feel that the doctor on the stump, making political speeches, is not overburdened with practice, and when he goes to the legislature he may come home to find much of his practice gone.

A doctor, too, likes to have people hang on his words of wisdom, but it can be carried too far. The doctor who is perpetually airing his views on public affairs, literature, music, the drama, gardening, golf, bridge, and Wall Street finally creates the impression that he knows more about these things than about medicine.

The doctor's wife, as we all know, may make or mar his success, and a volume might be written on this subject. Dr. Johnson, however, makes but one point: avoid the temptation to talk over the patients' ailments with her. "More than one doctor has lost practice by getting a reputation for discussing his patients with his wife." The right kind of wife will accept this silence loyally. In passing, adds our adviser, "no doctor should marry a woman who is incurably jealous."

A smile will wreathe many a doctor's face as we come to the temptation of the "foolishly sentimental female admirers." are generally only an intolerable nuisance. Yet "the very nature of the doctor's work makes him a natural prey of the softhanded, soft-hearted, soft-headed type of woman who may exist for one thrill after another." The young medical man is seriously warned "never to allow this type of woman to become too familiar," for "as a doctor friend of mine said recently, the public like nothing better than to make a xylophone out of a doctor's reputation, and the most innocent may suffer from the malice of gossip."

Then there is the temptation to let one's soul sink into cynicism at the gross and sordid side of human nature displayed to the doctor; there is the temptation to "please the family" of the patient by lax measures when radical treatment is best; there is the temptation to be overpersuaded by the pharmaceutical "contact man" and the smoothtongued high-pressure stock-salesman.

The Most Insidious Temptation of All

Most insidious and damaging of all is the temptation to overwork and overstrain body and mind, which after all are not made of iron and are hard to bring back after a breakdown. One afternoon a week off is strongly urged, with complete release from medical duty or thought. Brief trips out of town or family picnics are suggested. A wide range of reading is recommended, and from his own experience Dr. Johnson advises a half-hour of non-medical reading every night on going to bed. As he puts it,

"When you come in at night with your brain seething with the problems of the day, and perhaps stimulated by a final wrestle with some disease, the best way I know to shift your mental gears is to sit down or undress and lie down with a friendly book or magazine. Within a few minutes the tension eases, the thoughts become peaceful, and it is easy to switch off the light and go to sleep. Incidentally, a glass of milk and a few crackers at bedtime also help to invite sleep." And, we may infer, all the little demons, baffled, fly up the chimney.

How Smart Are We?

PERHAPS WE ARE HAPPIER not to know some things. We had a rather disagreeable surprise, anyway, a few years ago, when our psychological friends had the bright thought to try an intelligence test on some 1,700,000 men in the army draft as a fair sample of the population. The sad revelation was that, taking us all by and large, we are not much above a 13-year level in brain power. The discovery was at once seized upon by newspaper and magazine publishers and movie magnates to aim at the child-mind thus revealed, and we see the deplorable results in the wood-pulp magazines and tabloid papers splashed all over the newsstands and in the wild and trashy cinema plays and posters.

Another and better effort, however, has been to set the psychologists to making further intelligence tests, recording, classifying, tabulating, refining, in an effort to find facts that will be useful in education, industry and general welfare, and help fit people for their right work and put the square pegs in the square holes. One difficulty has been to find groups of folks willing to take such examinations. Most people are too busy or do not wish to have their mental powers tested. So the psychologists have had to fall back on tests of policemen, firemen, college students, prisoners, inmates of almshouses, etc., all exceptional classes, either above or below the average line. The unemployed submit to intelligence tests if paid for it, but may perhaps not be average in mental caliber.

People Found Who Like Quizzes

A group of Philadelphia investigators, however, have found a supply of human material which is neither above or below

the line, which has plenty of leisure, and which enjoys the quizzes as a welcome pastime. Where are these amiable folks? In the hospitals. Illness happens to all alike, high and low, and as they lie there awaiting the slow processes of recovery, they are glad to show that they can spot as quickly as anyone the absurdity, for example, in the sentence: "You are thin and I am thin, but he is thinner than both of us put together," or "The three men laughed, then stopped suddenly as the eyes of each met those of the others across the table."

Patients in the surgical or orthopedic wards of three Philadelphia hospitals were taken for the tests, and were selected only if the record was free of neurological or mental disorders, and if the physical condition was satisfactory for good work. The investigators were Anne Roe. Ph.D., and Katharine E. McBride, Ph.D., working under the direction of Theodore Weisenburg, M. D., who died before the appearance of the report, entitled "Adult Intelligence," which is published by the Commonwealth Fund in New York.

Their findings are too voluminous and detailed to be even summarized here. In general, their tests, like many others, rate the average adult as about on a level with the school child of 14, but it should be said that the authors and many others object to this sort of classification. An interesting discovery is that the peak of mental development occurs before the twenties and holds fairly steady through the fifties. Another is that formal schooling may not be so important as supposed. An unschooled man of high intelligence will pick up a wealth of knowledge for himself, while a man of low intelligence will get little out

of school and forget that little in a short time. This proves the wisdom of studying the child's mental capacity and fitting his training to it.

The chief point of interest here is the discovery that the psychological members of the profession have in the hospitals a wealth of subjects who would welcome their long questionnaires, enjoy the picture-puzzles and pencil games, and in time give a large enough basis of reports to permit making legitimate conclusions of value on just how smart we are, and why, and what to do about it.

Books

Books for review should be sent directly to the Book Review Department at 1313 Bedford Avenue, Brooklyn, N. Y. Acknowledgment of receipt will be made in these columns and deemed sufficient notification. Selection for review will be based on merit and the interest to our readers.

RECEIVED

How to Have Good Health Through Biologic Living. By John H. Kellogg, M. D. Octavo of 498 pages, illustrated. Battle Creek, The Modern Medicine Publishing Co. 1932.

Cloth, \$3.75.

Pediatric Treatment. A Manual of the Treatment of the Diseases of Infants and Children designed as a reference work especially for the General Practitioner and Physicians entering the field of Pediatrics. By Philip S. Potter, M.D. Octavo of 578 pages. New York, The Macmillan Company. 1935. Cloth, \$5.00.

Radium Treatment of Skin Diseases, New Growths, Diseases of the Eyes, and Tonsils. By Francis H. Williams, M. D. Duodecimo of 118 pages, illustrated. Boston, The Stratford Company. 1935. Cloth, \$2.00.

The Successful Examiner. By Dr. Albert Seaton. Duodecimo of 90 pages. Indianapolis, The Rough Notes Publishing Company, Inc. 1935. Cloth, \$1.00.

Recent Advances in Cardiology. By Terence East, M. A. & Curtis Bain, M. C. Third edition. Octavo of 350 pages, illustrated. Philadelphia, P. Blakiston's Son & Co. 1936. Cloth, \$5.00.

The Hair and Scalp. A Clinical Study with a chapter on Hirsuties. By Agnes Savill, M. D. Octavo of 288 pages, illustrated. Baltimore, William Wood & Company. 1935.

\$5.00.

Post Mortems and Morbid Anatomy. By Theodore Shennan, M. D. Third edition. Octavo of 716 pages, illustrated. William Wood & Company. 19 Baltimore, 1935. \$9.00.

The Foot. By Norman C. Lake, M. D. Octavo of 330 pages, illustrated. Baltimore, William Wood & Company. 1935. Cloth, \$4.50.

Manson's Tropical Diseases. A Manual of the Diseases of Warm Climates. Edited by Philip H. Manson-Bahr, M. D. Tenth edition, revised. Octavo of 1003 pages, illustrated. Baltimore, William Wood & Company. 1936. Cloth, \$11.00.

The Next Hundred Years. The Unfinished Business of Science. By C. C. Furnas, Octavo of 434 pages. Baltimore, The Williams & Wilkins Company. 1936. Cloth, \$3.00.

A Yankee Saint. John Humphrey Noyes and the Oneida Community. By Robert A. Parker. Octavo of 322 pages, illustrated. New York, G. P. Putnam's Sons. 1935. Cloth, \$3.75.

The Early Diagnosis of the Acute Abdomen. By Zachary Cope, M. D. Seventh edition. Octavo of 254 pages, illustrated. New York. Outside University Pages, 1925. Cloth

York, Oxford University Press. 1935. Cloth,

The Diagnosis and Treatment of Pulmonary Tuberculosis. A Handbook for Practitioners, A Text-Book for Students, Nurses and Social Workers. By John B. Hawes, 2d, M. D. & Moses J. Stone, M. D. Octavo of 215 pages, illustrated. Philadelphia, Lea & Febiger. 1936. Cloth, \$2.75.

Glandular Physiology and Therapy. Symposium Prepared Under the Auspices of the Council on Pharmacy and Chemistry of the American Medical Association. Octavo of 528 pages. Chicago, American Medical Association.

1935. Cloth, \$2.50.

The Art of Ministering to the Sick. By Richard C. Cabot, M. D. & Russell L. Dicks, B. D. Octavo of 384 pages. New York, The Macmillan Company. 1936. Cloth, \$3.00.

A Textbook of Roentgenology.

Roentgen Ray in Diagnosis and Treatment. By Bede J. Michael Harrison, M. B. Octavo of 826 pages, illustrated. Baltimore, William Wood & Company. 1936. Cloth, \$10.00.

Delafield & Prudden's Text-Book of Path-

ology. Revised by Francis C. Wood, M. D. Sixteenth edition. Octavo of 1406 pages, illustrated. Baltimore, William Wood & Company.

1936. Cloth, \$10.00.

A Manual of the Common Contagious Diseases. By Philip M. Stimson, M. D. Second edition. Duodecimo of 437 pages, illustrated. Philadelphia, Lea & Febiger. 1936. Cloth,

Recent Adances in Medicine. Clinical Laboratory Therapeutic. By G. E. Beaumont & E. C. Dodds, M. D. Eighth edition. Octavo of 450 pages, illustrated. Philadelphia, P. Blakiston's Son & Co., Inc. 1936. Cloth, \$5.00.

You Must Eat Meat. Fancies, Foibles and Facts about Meat. By Max E. Jutte, M. D. Duodecimo of 164 pages. New York, G. P. Putnam's Sons. 1936. Cloth. \$2.00.

nam's Sons. 1936. Cloth, \$2.00.

REVIEWS

Diseases of the Liver, Gall Bladder, Ducts and Pancreas. Their Diagnosis and Treatment. By Samuel Weiss, M.D. Quarto of 1099 pages, illustrated New York, Paul Hocher, Inc 1935 Cloth, \$10 00

This large volume of one thousand one hundred pages is undoubtedly the most complete and up-to date work covering the subject The arrangement of the material is such as to make it easy to look up exactly what is desired in the shortest period of time While, in general, obsolete methods of diagnosis and treatment have been left out, a paragraph on historical data in connection with each disease is of great interest and value The illustrations have been chosen with great care, diets and prescriptions are conservative and the descriptions of special tests and treatments are instructive. The ninety pages of references cover nearly every important article ever written on the diseases in question, and the index is complete and comprehensive Altogether the work is one which should be of great value to the general practitioner, surgeon and gastroenterologist A. F R ANDRESEN

The American Illustrated Medical Dictionary. By W A Newman Dorland, M D Seventeenth edition Octavo of 1573 pages ohn, W B Saunders Philadelphia, W 1935 Cloth, \$7 50 illustrated Company

We congratulate the author on the thoroughness of the work yet the simple manner in which the newer terminology is explained and definitions given

This is not only a dictionary but a veritable encyclopedia and as the author states he has taken a "middle course between the large, unwieldy lexicon and the abridged students' dictionary, avoiding the disad-vantages of each" The illustrations are excellent and are employed to the best advantage

This work has more than earned a place on your book shelf and will indeed serve as a junior encyclopedia for all branches of medicine SAMUEL ZWERLING

Objective and Experimental Psychiatry By D Ewen Cameron, MB Octavo of 271 pages New York The Macmillan Com-pany, 1935 Cloth, \$3 00 Octavo of

Every physician of any experience realizes how inadequate are most of our methods of eliciting and evaluating facts and symptoms Most of us will welcome any effort at progress along this line

This book is an effort to summirize progress in psychiatry toward observational and experimental methods in "fact finding" Attention is called to the personal equation and other variables influencing interpreta tion The author discusses various observations and laboratory tests in relation to the different forms of mental disease, some of which seem to be opening the way for more fruitful research, not only along psychological lines but in the direction of more purely physical and chemical reactions

Among the subjects he discusses are intelligence, the introvert and extrovert, word association, conditioned reflexes, heredity. statistics, blood sugar tests, ephedrine and adrenalin reactions, respiratory centre in schizophrenia with consideration of the effects of carbon dioxide and bulbo capnine. research in epilepsy, basal metabolism, blood pressure, sedimentation rate-and hemato encephalic barrier, Ph reactions to personality, constitution, pathology, and statistical methods

It is encouraging to see that so much is being done toward correlating the various psycho-biological observations but there is much still to be done The presentation of all these data must represent a great deal of work on the part of the author

A E SOPER

United Atlas of Blood Diseases By A Piney, M D and Stanley Wyard, M D Third edition Diodecimo of 110 pages, illustrated Philadelphia, P Blakiston's Son C 1935 Cloth, \$400

The third edition of this little Atlas of Hematology may be recommended as one of the most authentic and authoritative summaries in the English language. The glossary, the diagramatic sketches of the different blood cells and natural colored photographs are beyond compare

The clinician and the general practitioner will find it a necessary accessory to his armamentarium MAURICE MORRISON

The Doctor and the Public. A study of the Sociology, Economics, Ethics, and Philosophy of Medicine, Based on Medical His tory By James P Warbasse M D Octavo of 572 pages, illustrated New York, Paul B Hoeber, Inc. 1935 Cloth, \$500

It is indeed a large contract, to review a book of this type, containing 572 pages of profound learning and an index, and written by a well known author of acknowledged literary attrimment. His thesis, boiled down to a few words is the inevitable relation of medicine and the doctor to the needs of mankind and the right of the human society, as a whole, to demand the services of the doctor in a form, best calculated to meet its needs for the protection of health and the treatment of disease. Some readers will say that this book is entirely socialistic in its trend, but the careful reader will soon recognize the fact that it contains many postulates, scarcely debatable, which clearly define the mescripible changes, now at hand and coming in the near future involving

the attitude of the doctor towards his individual patient and the community at large. The background for the doctor's argument lies in a delightful, short history of the progress and growth of medicine from prehistoric times to the present. It is a history, not so much of individuals as of the facts, discoveries and struggles which have made medicine what it is today and largely determined the attitude and relationship of the people towards the healing art. The later chapters discuss the cultural side of medicine, the economic questions, interesting to both doctor and layman and definite demands, already being made by the public, for something different from the doctor than what he is now giving. The book reveals much learning, a vast amount of research work and a wide knowledge of social economics. For us all the author has produced a work, both fascinating and illuminating and one not to be neglected by those of us who are actively interested in the solution of a difficult problem, vitally important to the medical profession. The ancient aphorism, "Oh that mine enemy would write a book," does not apply to "The Doctor and the Public."

J. M. VAN COTT

The Oxford Medicine. By Various Authors. Edited by Henry A. Christian, M.D. Originally published in six octavo volumes by the Oxford University Press, New York. Revisions and new articles added from 1923 to 1935.

The original plan of the publishers of the Oxford Loose-Leaf Medicine to supplement, revise and replace various articles from time to time as views changed, has been carried out over a period of years from 1923 through 1935. Each volume has been thoroughly treated in the ways mentioned, modernizing this great system. It is intended to note here some of the changes in the six volumes but these are so numerous that many or most cannot even be mentioned.

In volume 1, L. J. Henderson's article on "The Regulation of Acid-Base Equilibrium" has been revised by J. P. Peters, Frank Billing's "Focal Infection" by E. E. Irons and W. T. Bovie's "Radiation and Its Effects" by George W. Holmes. There are many other revisions and the new articles are those by H. K. Ward on the "Virus Origin of Disease," D. C. Laird on "Work and Fatigue," L. G. Rowntree on "Normal Water Balance and Its Regulation," and G. D. Barnett "Edema of other than Cardiac or Renal Origin."

Edemas discussed in this last one are Inflammatory, Obstructive, Nutritional. Endocrine, Allergic, Trophic, Angioneuro-

tic, Chronic Hereditary and War Edema.
In volume 2, I. C. Walker's articles on "Bronchial Asthma" and on "Hay Fever," are revised by the same writer and some other revisions are S. A. Levine's on "Clinical Electrocardiography," H. A. Christian's on "Purpura" and G. R. Minot's on "Diseases of the Blood." Among the new ones are those of Alexander Lambert on "Angina Pectoris and Coronary Occlusion," W. P. Murphy on "Agranulocytosis" and G. M. Mackenzie on "Paroxysmal Hemoglobin-

One of the most interesting articles in volume 2 is that on "Syncope and Related Syndromes" by Soma Weiss, in which vasovagal, carotid sinus, oculo-vagal, pleural shock and a considerable number of other types of syncope are discussed. It is well to remember this for reference.

In volume 3 some of the new articles are "The Roentgen Ray Examination of the Digestive Tract" by Walter C. Alvarez, "Nephritis in Childhood" by Blackfan and McKhann and "Diseases of the Kidney, other than Nephritis" by William C. Qinby. The other important articles have been revised, including the well known one by Plummer and Wilson on the "Diagnosis and Treatment of the Diseases of the Thyroid Gland."

In volume 4 J. C. Aub has a new article on "Lead Poisoning" and some other new ones are "Industrial and Domestic Gas Hazards" by L. J. Moorman, "Anomalies of Lipid Metabolism" by R. S. Rowland. and "Spontaneous Hyperinsulinism" by Clifford L. Derick. Among the revisions are that of Alice Hamilton's "Industrial Toxicology," Howard's and Mills' "Obesity" and the article by E. T. Woods on "Belliagra" and the article by E. J. Woods on "Pellagra" revised by F. R. Taylor.

In volume 5 O. H. P. Petter has a new discussion of "Trichiniasis," F. R. Taylor one on "Arachnidism," Charles F. Craig one on "Blackwater Fever" and C. Armstrong on "Psittacosis." There are other new articles and some important revisions.

in Diagnosis." W. A. Turner's article on "Epilepsy" has been revised by Cobb and Lennox and A. S. Barnes, "The Myo-Lennox and A. S. Barnes, pathies" by R. N. Ironside.

There are numerous revisions and new articles not mentioned here which with those noted, bring to this valuable reference book, new value and maintain its high reputation in the field of medicine.

HEPATIC AFFECTIONS

THE experience of many generations has proven that the waters of Vichy are excellent cholagogues. That is especially true of Vichy Celestins. It helps not only to promote the flow of bile but also to increase its fluidity. Under the alkalinizing influence of the water, the metabolic activity of the liver lobules is stimulated and toxic material is more effectively destroyed or eliminated from the bloodstream. For these reasons Vichy Celestins has been found of distinct service in the majority of hepatic affections.

Vichy Celestins is the property of the French Republic, under whose supervision the water is bottled. The medical profession and all consumers are protected by a guarantee of the French Government as to the water's authenticity and purity.

Dermetics departs completely from cosmetic theory and practice—involves no massage, no strong astringents, no "skin foods", no packs, no mechanics. DERMETICS recognizes that cell structure of the body is nourished and renewed by the blood stream.

DERMETICS voids dangers of forcing foreign matter into the pores; uses the "blushing" principle,

aiding skin's self-cleansing, self-renewal; gives skin an INVISIBLE COMPLEXION DRESS, an extremely thin film permitting skin to function normally while protecting against sun, wind and soil. Dermetics moisture proof Powder and Color Complements will not streak or cake. Write Dept. J-5 for free booklet "Dermetics Replacing Cosmetics".

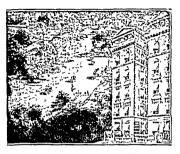

Doctors' wives and nurses are invited to have a free demonstration, Suite 230, Rockefeller Center. 630 Fifth Avenue.

CHARLES B. TOWNS HOSPITAL

FOR THE EXCLUSIVE TREATMENT OF

ALCOHOLISM and DRUG ADDICTION

This hospital has specialized solely in addictions for over thirty years. Our experience has shown us that best results could not be obtained when associated with any other type of case. Its method of treatment has been fully described in the journal of the American Medical Association and other scientific literature. The treatment is a hospital procedure and provides a definite means of eliminating the craving and the toxic products of alcohol and drugs. Emphasizmg the after care and with appreciation of the seriousness of the alcoholic problem we devote the convalescent period to minimizing the possibility of relapse. In the classification of the City of New York hospitals this institution has been granted a special license by the Commissioner of Hospitals for the exclusive treatment of alcoholic and drug addiction.

and Camps

Chosen for character and beneficial environments

No better word can be said for the summer camp for boys and girls than the fact that more than a million children all over our broad land will spend their summer in camp this year. That tells what parents think. A writer in Hygeia says that the benefits of camp life for the child have been generally recognized, and camps are now available to children in families of almost any economic level. Besides the pri-

vate camps there are the Boy Scout and Girl Scout camps, the "Y" camps, the Fresh Air camps for poor children, and others. The outdoor life, the regulated program of play and rest, the instruction in games and the opportunity to live close to nature should be of great benefit to the child who has been confined in stuffy steam heated houses during the winter months.

Travel and Resorts

Germany-'Round About the Olympics

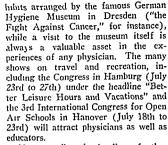

Aesculapius is pointing his snake stick at Germany this year with more than the usual emphasis. The Reich, always of great interest as the classic land of spas and health resorts where the physician can see and study personally what he is prescribing for his patients, offers some very special attractions this summer, in direct or indirect connection with the Olympic Those who have been fortunate enough to secure passes for the games, will witness the greatest spectacle of its kind that has ever been arranged in history. More than 5.000 athletes, representing at least 50 nations, will compete. There will be a greater variety of events than ever, as the International Committee has added several new types of sport to the list of contests. There will be a wealth of art, music, theatre and other offerings which have been included in the

Olympic program in a highly interesting effort to make the XI Olympiad a world festival of

culture as well as of sport.

Quite logically, medical science has its prominent place in this score. The International Sports Physicians' Congress takes place in Berlin from July 27th to 31st, immediately preceding the games. The meeting of the world's specialists for voice hygiene is held after the games, August 20th to 22nd.

and the 3rd International Oto-Rhino-Laryngological Congress from August 17th to 22nd. There are, in other cities as well as Berlin, traveling ex-

Almost endless is the line of other special attractions arranged for this summer. The entire country is included in the idea of "The World's Festive Year in Germany," and from the grandiose Bavarian Alps to the beautiful beaches of the North Sea and Baltic, from Lake Constance and the Black Forest to the picturesque amber coast of East Prussia, there is not a city without an important theatre, music and art program; not a town or village without colorful history plays or folk

festivals, from the famous "Master Drink," in Rothenburg to the amusing "Jahrmarkt" in the village, to which the country folk flock

in their quaint native dress.

There is Bayreuth of course, where the "who is who" in music appreciation meets before and after the Olympics-all programs are arranged so as not to interfere with the great games-and there is the great Wagner-Mozart-Strauss series in Munich, and the Reich

festival plays in Heidelberg. known as "The Bayreuth of the Drama." Munich has its special arts expositions, as have

A visit to the Reich this year promises fascinating interest for the medical profession, professionally and follerwise. (Left) The world's foremost heart research institute is the William G. Kerckhoff Institute in Bad Nauheim. (Center) Badenweler in the Southern Black Forest is one of Germany's famed health resorts (Kight) Beauty features German resorts—landscaped park and monumental architecture of Bad Nauheim.

· Olympic Year is the World's Festive Year in Germany. The XIth Olympic Games are centered in a grand programme of exciting attractions: The Bayreuth Wagner Festival Plays, the Munich Opera Festivals, International Olympic Art Exhibitions, brilliant theatricals, interesting expositions and conventions. German genius for organization has timed these events so that you can enjoy them during a glorious vacation in Germany. In addition: Scenic grandeur and natural beauty ... famous health resorts ... romantic castles . . . picturesque folk festivals ... medieval towns ... cosmopolitan cities...the Rhine. Modern travel comfort and the traditional hospitality of the land of Wanderlust and Gemütlichkeit. Railroad fares reduced 60% and Registered Travel Marks at low rates. Write for booklet 50.

GERMAN RAILROADS

665 Fifth Avenue at 53rd Street, New York

many other cities, while international and other important sport events outside of the Olympic Games cover everything from ping-pong and "Schuetzenfest" to the great Kiel regatta and the famous automobile races on the world's largest course, the Nuerburg Ring.

Germany is making it easy to enjoy her unsurpassed scenery, quaint old and great modern cities and the splendid entertainment program. The German Railroad Company is granting foreign visitors a fare reduction of 60 per cent, if they will stay in the country seven full days. For expenses in Germany, "Travel Marks" are available far below the regular Reichsmark quotations. Prices of hotels and all other accommodations have been exceedingly moderate for years, and the Government has seen to it that the influx of visitors during Olympia Year is not taking advantage by boosting prices. Transportation has been developed to the highest possible perfection in all branches. The world's fastest and most luxurious trains and most magnificent automobile roads, the famous Reichsautobahnen, the densest net of airlines and an excellent motorcoach system operated by the Government make travel in Germany as delightful as it is inexpensive. Detailed information and advice on itineraries for Germany are easily available through the German Railroads Information Office at 665 Fifth Avenue, New York City. That office also furnishes interesting illustrated travel hand books covering the various districts of the country and different subjects, such as "Travel" and "Germany-The Land of Healing Spas."

Cod Liver Oil Known Back in 17th Century

Cod liver oil is a somewhat ancient product. As far back as the middle of the 17th century it was known in England as "trayne oyle" and was used probably, in various manufacturing processes. Its medicinal qualities were discovered later. Two of the oldest and best known fishing grounds are the coastal waters of Norway and Newfoundland and considerable quantities of the oil in the early days were landed at west of England ports by boats from Newfoundland. Records would go to show that fish liver oils were exported from Norway to England during the 15th and 16th centuries. Other fishing areas are the coast of Scotland, Iceland, Japan, Siberia and the east and west coasts of North America.

In the early days the oil was obtained by allowing the livers to rot which broke down the cellular sacs, thus permitting the oil which they contained to escape. Today, however,.

steam is used to extract the oil, according to the Industrial Department of the Canadian National Railways. The great value of the oil medicinally is its vitamin content and to secure this, it is necessary to extract the oil shortly after the fish is caught. To accomplish this, some of the fishing vessels are equipped with apparatus to extract the oil.

In Newfoundland, at plants along the coast, the medicinal oil is prepared from the livers of cod caught inshore. Within the past three or four years halibut liver oil has come to the fore due to its high vitamin content. The halibut, like the cod, is a cold water fish, the principal fishing grounds being off the coast of Norway, the west coast of Greenland, the Hebrides, the waters of Alaska, the Pacific and Atlantic coasts of Canada and coastal waters of Japan.

Three Major Festivals in Austria

Official announcement has been made here of the programs of the three major Austrian festivals scheduled for this season. Advance reservations of seats for the three musical festivals and the performances of the "Christus" Thiersee exceed all reservations of previous years and the programs themselves are of unparalleled brilliance.

The Vienna Festival which will open on June 7th will be considerably heightened in splendour by the fact that this year Vienna and Lower Austria will celebrate the 800th Anniversary of Margraf Leopold, the Saint. The ceremonies of the occasion are expected to exceed anything Central Europe has seen since the Jubilee of the Emperor Franz Josef took place in Vienna in 1908.

Bruno Walter, Weingartner and Krips will conduct the Vienna Philharmonic during the festival. Productions of the Vienna State Opera will be carried out by Lothar Walterstein. The repertory includes the opera "Dame in Traum" by Salmhofer which had its successful premiere in Vienna this winter. The "Ring" will be given as will many other international favorites.

The Bruckner Festival at Linz on the Danube will open on July 18th with a serenade in the Landhaus while Keldorfer conducts the Vienna Symphony. July 19th offers Bruckner's Mass in E Minor in the Abbey of St. Florian, where the master worked and a concert in the Marble Hall of the Abbey. On the evening of July 20th Bruno Walter will conduct the Festival Concert. Schubert's Symphony in B Sharp and a Bruckner Symphony will be given. Mozart and Bruckner

ASSOCIATED BRITISH RAILWAYS, Inc.
551 Fifth Avenue, New York
or your own tourist agent

Associated British Railways Inc. will be given by the Vienna Philharmonic with Walter conducting on the 21st.

At the Salzburg Festival this season, from July 25th to August 31st Arturo Toscanini will conduct Falstaff, Fidelio and the Meistersinger. Salzburg is now the only place where Toscanini regularly conducts opera. Meistersinger is an innovation on the Salzburg program. Walter will conduct The Corregidor, Don Giovanni, Tristan and Isolde and Orpheus and Eurydice. Weingartner will conduct the Vienna State Opera and the Philharmonic in Cosi fan Tutte and Figaro. Productions will be by Graf, Wallerstein, Erhardt and Salvini. Fidelio will be given on July 25, August 5, 16 and 31; Figaro on July 27 and August 29; Don Giovanni on July 28, August 13 and 24; Cosi fan Tuttle on July 29 and August 25; Falstaff on July 31, August 10, 20 and 26; Orpheus and Eurydice on the 1st and 17th of August; The Meistersinger on the 8, 14, 18 and 22nd of August; The Corregidor on the 11th and 21st of August; Tristan and Isolde on the 27th of August.

The great Reinhardt performances will be given as usual. The two Toscanini concerts will be on August 12th and 28th; the Weingartner concert on August 23rd and the Walter concert on August 19th.

The medieval "Christus" of Thiersee, the only great medieval passion play to be given in Europe this season will take place at Thiersee near Kufstein on Sundays from May to September.

There Go The Ships

At this time considerable interest is being aroused in ships and shipping by the new super-mammoth liner "Queen Mary," which will soon make her appearance on this side of the Atlantic on her maiden voyage. There is something about a super ship which seems always to awaken an intense interest in things of the sea. It was so in the golden era of the sailing ship.

One of the greatest of these early ships was the "Marco Polo" launched from shipyards in Saint John, New Brunswick, in 1850, and considered the fastest ship afloat in her early days, being a forerunner of the famous clipper ship era. She was a three decker of 1600 tons, 184.1 feet in length, and designed for the East India trade. Her dimensions were such that it was decided to await the spring tide before launching. Unable to check her rapid movement when she was sliding down the ways, the Marco Polo ran aground in the mud on the opposite side of the creek and then

CHARM IS ETERNAL Where the Blue Danube Flows

And all the ages of men from the Nibelungen times to ours have found its appeal irresistible. Sail down the stream that Strauss loved, from Passau to Vienna, city of arts and emperors. Stop over at Linz for the Bruckner Festival. Traverse in a day the flowery Wachau, most romantic river region on earth, with its castles and fortresses, its towering abbeys, its heady wines and airy songs. Melk grandest abbey in Europe, Aggstein of the robber barons. Dürnstein, that knew Richard the Lion-hearted. As the sun sinks over the Vienna woods you will sight the gleaming spire of St. Stephan's and know that the subtle, inimitable life of Vienna awaits you.

One of world's most distinguished medical faculties at the University of Vienna.

AUSTRIA is Europe's most inexpensive country. It's overnight from all ports. Splendid accommodations, liberal reductions.

FESTIVALS: Vienna, June 7-21. Bruckner at Linz, July 18-21. Salzburg, July 25-August 31. Passion Plays at Thiersee, Sundays, May to September.

AUSTRIAN STATE TOURIST DEPT. 630 Fifth Ave., New York, Circle 6-3667

heeled over. Two weeks later she was hauled off slightly hogged but not otherwise damaged. Her maiden voyage was from Saint John to Liverpool, on May 31, 1851, with a cargo made up of timber and scrap iron. Records indicate she made the trip in fifteen days and then returned to Mobile, Ohio, for a cargo of cotton, arriving back in Liverpool after a passage of thirty-five days. From there she went into the Australian trade carrying immigrants from England and made the voyage out from Liverpool in seventy-six days, like time being made around The Horn on her return which earned for her on her arrival in Liverpool the title of the fastest ship in the world. After roaming the seven seas, the Marco Polo came back to Canada to lay her bones on her native soil. being wrecked on the beach at Cavendish, Prince Edward Island, in August 1883 when carrying a load of timber from Quebec. Some relics of the Marco Polo are preserved in the New Brunswick museum in her native city.

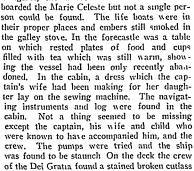

Many other fine ships followed the Marco Polo from Saint John shipyards, the White Star line contracting for four from these yards of six to be built in the province, to carry mails from England to Australia. They were the Ben Nevis, White Star, Mermaid and Shalimar. The White Star was claimed to be the largest merchant ship afloat at that time, being 284 feet in length on deck.

Nova Scotia also contributed some fine ships in the days of sail. One of the strangest mysteries of the sea concerns a Nova Scotia built vessel, the Marie Celeste. Built at Spencer's Island and launched in 1860, she eventually became the property of a United States firm. It was in the year 1871 that she sailed on her fateful voyage, the mystery surrounding which has never been satisfactorily cleared up throughout the years that have intervened and which has been the theme of many stories. On November 1 in that year the Marie Celeste sailed from Boston with a cargo containing a large consignment of alcohol and was manned by a crew of mixed nationalities made up of sailors from the United States, Sweden, Germany, Great Britain and Canada. Of the latter there were only two, one from Nova Scotia and the other a native of Saint John, New Brunswick.

And now comes the strange part of her story. Just the other day there passed away at Rexton, in New Brunswick, a retired sea captain who was in his 87th year and who, at the time, was a member of the crew of the British barque Dei Gratia. While the Dei Gratia was sailing on the high seas in a light breeze, the mate sighted a brigantine with the Stars and Stripes at her peak and all sails set. There was an uncanny appearance about

AAATII

the ship, however, which was heading up and falling off to the wind without, apparently, anyone at the helm, so the master of the Dei Gratia decided to investigate her. Coming up alongside, the crew made her out as the Marie Celeste but not a soul appeared in sight Mooring the Dei Gratia alongside, the whole crew

Music spells Hawait

with silver trimming and red tassels, lying on top of a hatch. The sword was long and tapering such as those once used by French and English duellists but what part it played in the apparent tragedy has never been found out. The master of the Dei Gratia detailed half of his crew to sail the Marie Celeste into Gilbraltar

and when the Dei Gratia reached New York each member of the crew received \$700 as salvage money. The sword remained in the possession of the retired sea captain of Rexton and his family now retains it as an herrloom.

Prince Edward Island also contributed her quota of sailing ships as did likewise Quebec, Eastern Canada having made a name for itself for the many fine slips that came from those shipyards During the War old-time shipwrights again picked up their tools to construct sailing ships to augment the fleets which carried munitions across the ocean.

Today, where once the frames of sailing ships rose from the stocks in Saint John, a huge drydock, one of the largest in the world,

and steel shipbuilding plant is located, and likewise in Halifax, Nova Scotia, is a large drydock and plant for building steel ships. Another large drydock and shipbuilding plant is located at Quebec.

Wooden shipbuilding is still carried on in Eastern Canada, particularly in Nova Scotia.

Along the southwestern shore of the province where the line of the Canadian National Railways threads in and out of the various picturesque fishing towns and villages, following along the coast for its entire length, and particularly at Lunenburg and Shelburne, one can see fishing schooners being constructed, while Shelburne has also contributed some fine yachts. The present-day shipwrights have not lost the art of their forebears who turned out some remarkably fine and fast ships, the performance of the famous "Bluenose," international fishing schooner champion, which is a product of Lunenburg yards, and the yachts constructed by Shelburne builders testifies.

The Loveliest "Fleet" of Islands

If Mark Twain was not the first tourist to visit Hawaii, he was the first to invent a memorable slogan for the Islands. He called them "the loveliest fleet of islands ever anchored in any ocean." What he said years ago is being appreciated in increasing numbers by tourists today.

Less than 2400 miles from California, the Islands can be reached in less than five days' sailing and as a part of the United States, they offer adventure without the bother of customs inspections, foreign money, foreign postage or foreign languages.

Oahu the island on which Honolulu is located, is the center from which sight-seeing tours radiate. The whole island abounds in glorious vistas of sea and mountain. The two outstanding motor trips are those around Koko Head and over the famous Pali. The beach settlements, Schofield Barracks, largest U. S. army post and Pearl Harbor naval base, the Mormon Temple at Laic, the coral gardens at Haleiwa and Kaneohe, the railroad trip around Kaena Point, and Cooper Ranch Inn, hibiscus headquarters, always attract attention.

In and about Honolulu are the Oriental shopping district, Waikiki Beach, University of Hawaii, Diamond Head drive, the pineapple canneries, Punchbowl crater, the Tantalus drive, Manoa and Nuuanu residential districts, Waialae and Oahu Country Clubs, the Bishop Museum and Oriental temples.

Hawaii largest island, that gives its name

PISTANY SPA INFORMATION

587 Fifth Avenue

New York, N. Y.

to the entire group, is dominated by two towering mountains, Mauna Loa and Mauna Kea, both of which rear their summits 14,000 feet above the sea.

Kilauca volcano, in Hawaii National Park. is on the slope of Mauna Loa, while Hualalai, a dormant volcano, rears its cloud-capped head over the island's western section. On the lower slopes of the two great mountains are fertile grazing and agricultural areas.

Leaving Hilo, the motor road leads through Hawaii National Park, across the grotesque volcanic district of Kau, where ancient and recent lava flows have been thrust across the countryside in jumbled confusion, and into luxuriant Kona, romantic birthplace of Hawaii history and legend. In Kona the ancient relics of a bygone civilization are seen by visits to the crumbling heiaus or temples which dot the scenic lava coast. Burial caves, dreamy bays where remnants of the old Hawaiian life remains, coffee plantations, coastal villages, all nestle in the magic serenity of Kona, and center around the delightful Kona Inna modern and thoroughly up-to-date stopping place.

On the island of Maui is the crater of Haleakala 10,000-foot dormant volcano, which can be comfortably viewed from the motor road at the rim. The natural color effects, that tint the walls and cones of the stupendous crater, are sights indescribable, and the view from the summit over the island is one of the most impressive in the Pacific. On clear days practically all islands of Hawaii can be seen from the top of this great mountain.

Haleakala does not dwarf Maui's other scenic beauties. There is a winding motor trip to Keanae Valley, which skirts a jagged coastline through forests of bamboo and other tropical foliage. There is historic Iao Valley, a short distance from the town of Wailuku, where a volcanic freak known as "The Needle" pierces the clouds.

By the schedules of the Matson Line ships, it is possible to make the round trip from California within two weeks, giving two days in Honolulu or longer visits may be arranged outbound on one vessel and returning on another of similar luxuriousness.

Heavy Increase in Motor Tours to Europe

Captain Thor Eckert, vice-president and general manager of the Arnold Bernstein, and Red Star Lines, declared to-day that advance passenger bookings and inquiries from prospective travellers in practically every state in

Public Health and Medicine in Europe!

ANNOUNCING

A Professionalized Tour Specially Arranged for Members of Organized Medicine

Physicians from other states will be admitted, but the tour is open only to physicians and immediate members of their family. The itinerary includes London, Copenhagen, Stockholm, Helsingfors, Leningrad, Moscow, Kharkov, Kiev, Vienna, Prague and Paris. Arrangements have been concluded in cooperation with the British Medical Association, the Czecho-Slovak Ministry of Health, the Medical Center of Vienna, the Soviet Commissariat of Health and with Scandinavian Medical authorities, and the party will have an unusually extensive opportunity to study the most illustrative hospitals, spas and medical institutions en route. There will also be personal interviews and discussions with foreign medical leaders. The party will sail from New York on July 11th, and will return before September 1st.

 For literature and complete information on this tour, please address Department NY-5. A complete program of special EDUTRAVEL projects in other fields, will also be sent on request.

JOHN L. HORGAN - MANAGING DIRECTOR

the Union indicate tourist passenger travel to Europe this summer would be heavier than in many years. "And, it is surprising to see how many individual and family groups are planning to tour England and the continent this summer in their own automobiles," he added.

The Red Star Line and Arnold Bernstein steamers operating in the Southampton-Antwerp service from New York are equipped with sea garages, each of which will house several hundred automobiles in well-sheltered tween deck compartments, the cars being loaded and landed in but a few minutes' time by electric elevators aboard the steamers. Seldom is a car even scratched with this modern method of handling, Captain Eckert said.

"Not only are we receiving record passenger bookings to Europe, but according to our European representatives, travel westbound during the usually dull period this summer will be exceptionally heavy with hundreds of European families planning trips to America this year. Many of these, too, will bring with them their motor cars. Our eastbound bookings of passenger automobiles to date is fully 200 per cent higher than at the same period last year, and is increasing daily.

"Many travellers will go abroad in our steamers with their cars to tour Central Europe and England; others have arranged tours to the North Cape, returning to Antwerp by a different route to make the ocean voyage home. We already have automobile parties booked from 42 states, as well as from Alaska and Mexico. Many college groups are expected to add to the grand total of motor travellers to Europe this summer to view the Olympic Games, as this is the most direct and economical method for these young people to tour the Continent to the greatest possible sightseeing advantage."

Captain Eckert declared that the Red Star and Arnold Bernstein Line steamers which carry tourist class passengers exclusively would operate the Red Star steamers, Westernland and Pennland, and the newly renovated Arnold Bernstein ships, Konigstein and Gerolstein, throughout the late spring and summer season on a weekly schedule, sailing from New York every Saturday. Tourist class travel, he said, had become most popular on these vessels, for with no other class of passengers carried, the tourist traveller enjoys the complete freedom of the entire ship, lives in modern outside rooms with hot and cold running water, enjoys every possible comfort and amusement indoors and out, and in addition each ship has a large modern dining room as well as swimming pools—most popular in the summer travel season.

Early Summer Cruises to Bermuda

For the many who know that there is really no particular season for a trip to delightful Bernuda—that the "Isles of Pleasure" are as pleasant in May and June, as in December and January—the following scheduled cruises will become a part of their excursion calendar.

The duration of these tours will run from five to sixteen days, thereby filling the requirements of practically everyone. The time is arranged so one may spend from a day to over a week at one of the typically beautiful hotels of Bermuda. Cost per person (two in room at hotel) covers minimum round trip steamship fare and hotel accommodation, American Plan, at the Belmont Manor and the Inverurie. From a minimum of \$68 for the five day trip, the inclusive rates run a varied scale up to the minimum of \$151 for the 16 day cruise.

From New York, Furness Line steamers sail on the five day cruises, May 6 and May 9. For six day cruises May 2 and 16, and every Saturday thereafter until June 15. For an eight day cruise on May 6, nine day cruise May 2, twelve day cruise May 2, sixteen day cruise May 6.

Cruises of ten, eleven, twelve, fifteen and sixteen days' duration, embark from Boston and Montreal on Canadian National steamers, May 9, 14, 23, 27, and June 6.

When Called to New York

for consultation or convention

You'll find the comfort, charm and privacy of a well-managed home awaiting you at THE BARCLAY, combined with

- CONVENIENT LOCATION—a step from Grand Central Station, on bus and subway routes leading to hospitals and medical centers; a short distance from Broadway theatres and the better men's shops.
- ECONOMICAL LIVING—parlor suites with serving pantry and electric refrigeration, \$10, \$12 and \$15 . . . Single rooms, \$5, \$6 and \$7 . . . Double rooms, from \$8.

September if you are fortunate or shrewd enough to be present, you will witness one of the world's truly spectacular open-air theatrical performances.

For "Frs. 3.30" to "Frs. 12.—," depending of course on whether you prefer "I Place" or "IV Place" for scats, you can see "William Tell" as true to life as it is possible to make it in reenactment.

On the stage, nature and art are so closely blended as to form one harmonious whole. There is no paltry paper scenery, but real trees, rock, turf, soil, and air. Real buildings, architecturally correct, and corresponding with those of ancient-historical Central Switzerland

The large stage affords ample space for the 350 actors in the folk-scenes, as well as for the well-fed cattle returning from alpine pasture grounds, and for the huntsman on horse-back. Scenes such as you will see, if you are there, are not possible on an ordinary stage—or in even the largest American showplace.

The rural scenes represent the real life of mountain herdsmen in centuries gone by. The fine costumes were all designed by the late Rudolph Münger, well known Swiss master of heraldry and were made with absolute historic accuracy by Kaiser Ltd, at Basle.

The auditory is covered, and all the 2,000 scats are numbered.

Interlaken has accommodations for 4,500 guests in more than sixty hotels and boarding houses. Because of its unique position in the heart of the Jungfrau region, this resort serves excellently as headquarters for sightseeing in the Bernese Oberland

If your itinerary includes Europe this year, here is an outstanding feature in an equally interesting country, that you should not miss.

down to Atlantic City where the best hotels have tried to give us all the trimmings of a ship without the "floating."

High up above the street where the eye sees only the ocean, they have created the finest illusion of being aboard an ocean-going liner, that one can find in the broad expanse of the Atlantic coast. Rails, portholes, and crows' nests are but a beginning of the created atmosphere. Steamer chairs are but mere accessories. Companionways seem so real, you almost instinctively look for your stateroom.

There are promenade decks, beautiful lounges, and even a sports deck usually sporting several shuffle-board games.

There's everything but a berth for the landlubber sailor-and with just a wee bit o' imagination even that is provided, for the elevator "gangplank" doesn't leave you too far away from your comfortable hotel room on the nth floor (pardon-we should have said "deck").

Travel Brevities

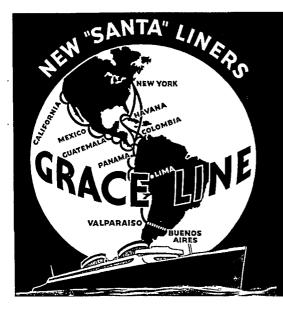

GUESTS of the Belmont Manor and Golf Club in Bermuda recently, included Dr. Chas. T. Hazzard of New York, Dr. S. H. Hazard of Rhode Island, and Dr. Carl E. Parry of Washington.

A NATIVE East Indian medical journal reaching this office carried a full-page advertisement of a charm that "secures employment to the unemployed," gives "success in lawsuits," "realization of your fondest dreams of love and marriage," victory over enemies," "sure relief in chronic diseases," and "bodyguard against dangers, accidents, witchcraft, etc." The price varies with the number of the above items covered by the charm, ranging from \$10 to \$50.

AMONG THE "RESTERS" at the Hotel Bermudiana in Bermuda, we notice the following: Dr. Robert Maynard of Vermont, Dr. Ernest Charron of Montreal, Dr. J. E. Chickering of New Jersey, Dr. J. Stratton Carpenter of Pennsylvania, Dr. J. J. Driscoll of Connecticut, and the following New York physicians-Dr. Thomas J. Baker, Dr. R. H. Honsberger, Dr. A. S. Blumgarten, Dr. A. H. Hausen, Dr. S. S. Carlino, and Dr. F. R. Webber.

IT WAS CAPTAIN SHREVE, in the early days on the Mississippi, who gave us the word "stateroom." He was the first to put wooden partitions between sleeping quarters on river

Great Western

America's World Famous Champagne

MERITS THE CONFIDENCE OF THE PROFESSION

Some of the reasons for its continued acceptance are:

- Quality and Purity.
 Great Western Champagnes are made by the true French method of slow fermentation in the bottle, taking years of time.
- 2. Only American Champagne to win medals in Paris, Brussels and Vienna.
- 3. Because it is made in America you don't pay for import duty, ocean freight, etc.

Good stores everywhere are ready to serve you. Write for our booklet, "The Art of Serving Wines and Champagnes" and leaflet "A Superior Vermouth." Address Dept. NYM-5, Pleasant Valley Wine Co., Rheims, N. Y.

Successfully

HAY FLVER, it is estimated, affects at least two per cent of the white population of this country. This means that five of each 250 patients seen by the General Practitioner in the course of a year suffer from attacks of Hay Fever in the early summer or fall. Four out of five of these distressingly afflicted victims can be given decided relief by means of a standardized series of injections.

Such 1 series of injections is available when Pol-LEN ANTIGEN Lederle is employed

Treatment sets comprise fifteen graduated doses which simplify the administration of appropriate amounts of the specific Pollen Antigen

MAINTAIN MINERAL ALKALI BALANCE

WITH

Kalak

Hypertonic-Alkaline-Carbonated-Not Laxative

The years of experience with physicians who have used Kalak show that the use of a formula containing calcium, magnesium, sodium and potassium salts represents a correctly balanced solution. This is Kalak which, as such, aids in maintaining a balanced base reserve.

How Alkaline Is Kalak?

One liter of Kalak requires more than 700 cc. N/10 HCl for neutralization of bases present as bicarbonates. Kalak is capable of neutralizing approximately three-quarters its volume of decinormal hydrochloric acid.

BARR ULTRA-SHORT WAVE RADIOTHERMY UNIT

SURGERY:

The Barr SW5 Ultra-Short Wave Unit also has available Monopolar currents for tissue cutting, coagulation and dessication. ACCEPTED BY the Council of

Physical Therapy

of the
AMERICAN
MEDICAL
ASSOCIATION

POWER. Ample power is available for heating deep seated tissues. Actual experiments conducted on eight subjects showed that the temperature rise, using cuff electrodes, of the deep-lying tissues of the thigh was higher than that obtained with conventional diathermy.

SIMPLICITY: Treatments easily administered one knob regulates the output of the machine.

MECHANICAL AND ELECTRICAL: Highest quality components used thruout. Constructed by Artisans having many years experience in making this highly specialized type of equipment. This guarantees the physician years of dependable and outstanding performance.

APPEARANCE: Constructed in a solid mahogany veneer floor cabinet. Oversized meter is used to assure easy reading. A worthy addition to a dignified office.

13,198 cases of syphilis

IN A RECENT REPORT* dealing with the results of treatment in 13,198 patients with early syphilis, the value of persistent and continuous treatment is stressed. A minimum of from 12 to 18 months of continuously applied treatment with alternate courses of an arsphenamine and a heavy metal was found to produce by far the most favorable results.

Iodobismitol with Saligenin is a propylene glycol solution containing 6 per cent sodium iodobismuthite, 12 per cent sodium iodide and 4 per cent saligenin. It presents bismuth in anionic (electro-negative) form. Iodobismitol with Saligenin has been shown by clinical trials and experiments to be rapidly and completely absorbed and slowly excreted, thus providing a relatively prolonged bismuth effect. Its content of 4 per cent saligenin—a local anesthetic agent—is an additional advantage. Repeated injections are well tolerated in both early and late syphilis.

Neoarsphenamine Squibb is readily and rapidly soluble and possesses uniformly high spirocheticidal power and low toxicity. Arsphenamine and Sulpharsphenamine are also available under the Squibb label.

Congratulations, Doctors, on the outstanding success of your Convention . . .

. . . and many thanks for the interest you showed in ADHESOL

The Medical Society can well be proud of this year's convention. It was, indeed, a credit to the Profession of New York State. . . . We want to express our appreciation for the courtesy extended the Adhesol exhibit and the widespread interest in Adhesol as "the modern technique for adhesive tape and plaster removal: neat, efficient, without pain or pulling" . . . May we suggest that if you were unable to see Adhesol demonstrated at the Convention, you send a dollar for large, professional-size bottle.

Food-for thought!

Fish for brains and carrots for beauty!

In childish faith, through the power of suggestion, we learned to eat many things undoubtedly good for us. Maturation erased much of our childhood credulity, but happily left some, for had we become so calloused as to be immune from evocation of new ideas through association or intimation, then we certainly would suffer from an over-dose of development.

The illusions of "fish furnishing potential intellective material" and "carrots creating dermal perfection" may have been shattered, yet we do not condemn them as entirely without value. Opinions on their specific worth may differ—even the most learned will disagree on many things—so ultimately the final court of judgment must be the reader, the user, the consumer.

Before these, the advertiser must also stand trial, for obviously there can be no laboratories—no proving grounds—fitted by experience or equipment to approve or disapprove all advertisements privileged to appear in your STATE JOURNAL. The responsibility is too great for one individual to shoulder, and the opinion of a comparatively few, too narrow a margin to be an indisputable criterion.

For this reason your comments and information are of incalculable value. Such aid is earnestly solicited, and we are grateful for both good and bad reports on a product or service, based actually on personal experience and observation.

Dilaudid

BILHUBERCORP

Dilaudid is a quickly acting and effective cough sedative even in small doses. For the average prescription add 1/2 grain Dilaudid to 4 ounces of suitable vehicle and give in teaspoonful doses, (about 1/64 gr. Dilaudid). The dose may be increased or decreased according to the severity of the cough and age of the patient ...

*DILAUDID (dihydromorphinone hydrochloride) Council Accepted Hypodermic and oral tablets, rectal suppositories, and as a soluble powder

> • Dilaudid comes within the scope of the Federal Narcotic Regulations. No prescription containing Dilaudid, regardless of quantity, is refillable.

HOW CAMP MAKES "INDIVIDUAL" INEXPENSIVE SUPPORTS

In this matter of supports the profession is interested not alone in garments which are scientifically designed to alleviate or improve the specific conditions for which they are prescribed. Physicians are interested in such garments only if they fit accurately the individual patients for whom they are intended. For, without accurate individual fit, the scientific principles of design have no application whatever.

S. H. Camp & Company have devoted their best efforts in their twenty-seven years in the support field to provide individual garments at a reasonable price. To accomplish this an extensive study of the three basic types of build with their proportionate irregularities has been conducted. Every skill in design has been called forth to type garments and at the same time to accommodate the differences in waist, hip and thigh measurements and in the proportionate irregularities in height of thin, intermediate and stocky types. This extensive study and skill in design has resulted in the manufacture of supports which are in effect individual.

An example of skill in design is the famous and exclusive Camp Patented Adjustment Feature, a block and tackle system of lacers with self-locking buckles, which provides the means for tight-

ing buckles, which provides the means for tightloosening a garment at will. The lacers

GLYCINE of GELATINE in MUSCULAR DYSTROPHY

• Since 1932 observers have been reporting improvement in patients with muscular dystrophies who have been fed glycine daily over a period of weeks. Among the types of cases that have definitely been benefited are those of myasthenia gravis, pseudohypertrophic muscular dystrophy, and progressive muscular dystrophy. (1)

Benefits have ranged from arrest of the disease and the cessation of symptoms to improved muscle function and a return toward normal striations. For instance, one report by Boothby on 46 cases of myasthenia gravis states that all but two responded favorably. (2)

Knox Gelatine is 25% glycine. Its use as an adjuvant in glycine therapy is made widely available because it is so inexpensive. The recommended dosage of glycine is 10 to 15 grams daily. This amount is contained in 40 to 60 grams of Knox Gelatine which can be used in relatively concentrated form as high as 31% in desserts and 10% and more in soups.

Muscular atrophy in progressive dystrophy. Note infiltration of fat and both swollen and shrunken muscle fibres: striation obliterated.

 A truly remarkable product, Knox Gelatine. Made as carefully as an ampule solution. Bacteriologically safe. Contains no sugar or flavoring. pH is nearly neutral. Exceeds in quality minimum U.S.P. standards.

See that your patients get a U.S P. gelatine or better. None surpasses Knox Gelatine in purity. Send for booklet of recipes showing how gelatine may be used to make interesting glycine-rich dishes.

VIOSTEROL

Easily administered. Palatable. Uniform in potency. Accurate in dosage. Rapid in action.

SAFEGUARDED 4 WAYS

In Viosterol, the medical profession has a thoroughly dependable source of Vitamin D for aid in bone and tooth building, and for the treatment of rickets. Extraordinary precautions have been taken at every step to warrant confidence in Foundation-licensed Viosterol:

1 After the discovery of the Steenbock Irradiation Process, five years were spent in experimental and clinical work to insure that when made available to the profession, Viosterol preparations should be both safe and efficacious.

2 In the seven years since Viosterol preparations were put on the market, continuous experimental and clinical research have been carried on by independent clinicians, by the Foundation and by the pharmaceutical licensees, to perfect the product and accumulate a complete fund of experience bearing upon its applications.

3 Continuously—biological assays both by the Foundation and its licensees are carried on to insure a product of a high degree of uniformity.

4 In this work several experiments have been devoted to studying toxicity. Research and experience show that a great latitude in dosage exists without hazard.

It is a custom of sound engineering to insist upon a high safety factor in every bridge, every machine, every structural member they use. Similarly, it has been a policy in the development of Viosterol preparations to provide necessary safeguards of standard quality, laboratory research, clinical evidence and experience. Viosterol is identified with the names of these five eminent American pharmaceutical companies:

ABBOTT MEAD JOHNSON PARKE, DAVIS SQUIBB WINTHROP

Exclusive Licensees of

WISCONSIN ALUMNI RESEARCH FOUNDATION*

M A D I S O N

*A corporation not for private profit... founded in 1925... to accept and administer, voluntarily assigned patents and patentable scientific discoveries developed at the University of Wisconsin. By continuous biological assays, the public and professional confidence in accurately standardized Vitamin D is maintained. All net avails above operating costs are dedicated to scientific research.

102 Advertisers have taken space in this issue of your Journal. Give them your business when possible.

In the Raw

Some people eat to live, but (should we say fortunately for physicians?) too many just live to eat.

The doctor seldom has to worry about the former. The latter, however, give him much to be concerned over, for in addition to abusing the digestive tract by overeating, they invariably stuff themselves with the wrong kinds of foods or with those which are poorly prepared, preserved, or cooked.

While a lot of our foods are unfit for human consumption unless they are cooked, the world is blessed with nature's products which not only may be eaten raw, but which are more nourishing and sometimes more digestible in that state.

The only problem that raw food presents is the necessity to be sure of their freshness, purity, and cleanliness. Long exposure to air after they have been harvested or prepared, naturally increases the hazards of contamination. Therefore, those which are sealed against contact with air soon after ripening provide greater safety and undoubtedly richer nutrition.

A study of manufacturing, canning, etc, will be of great value to the physician and the dictitian. Much can be learned from advertisements and from literature which manufacturers and canners will be only too pleased to send to the doctor.

It was 1924... and there was no tomato juice

TAKE a tomato juice that I can recommend with confidence," said a physician to the three Kemp brothers in the summer of 1924.

In those days the juice

In those days the juice of tomatoes was used only in infant feeding—and

was NOT available commercially. But Kemp brothers were working on the idea. And in 1928—after four years of research and experimenting—they introduced their product—the now famous Kemp's Sun-Rayed Tomato Juice. Made by an exclusive process (U. S. Pat. No. 1746657), it is the *original* vitamincertified, non-separating, undiluted tomato juice. Packed in enamel-lined cans to prevent "tin-taste." . . . Available at all food stores. Send for free copy of Steenbock Report J-36 on Feeding Tests. The Sun-Rayed Co. (Div. Kemp Bros. Packing Co.), Frankfort, Ind.

Making the First Formula Agree with the Baby

Newborns require breast milk. Deprived of human milk, their nutritional requirements are met by simple mixtures of cow's milk, sugar and water. The milk may be fresh, evaporated, dried, sweet or sour; the sugar simple or mixed.

Whole milk formulas are suitable for most newborns with good digestive capacities. The amount of whole milk given should approximate 3/3 of the total required calories. And the remainder (one-third) should be in added Karo. Water is added to the mixture for the fluid intake to be about 21/2 ounces per pound of baby weight per day.

Evaporated milk formulas are indicated for newborns with limited digestive capacities, They may be used to advantage in considerably higher concentrations than whole milk for premature, feeble and debilitated infants.

The added Karo is again one-third of the total required calories.

Dried milk formulas are suitable for allergic infants who will take only small volumes at a feeding and babies of allergic parents. Formulas approximately equivalent to whole milk may be made up with water and Karo added in the same ratio as in whole milk mixtures.

Acid milk formulas are of particular value for babies with low digestive capacities requiring large food requirements. Acid milk requires no dilution with water.

FORMULAS FOR THE NEWBORN

3 Ounces; 6 Feedings

Whole	Mil	k					. 10 ounces
Boiled	Mil	k					. 10 ounces
Karo	•			٠			2 tablespoons
Evapor	rate	ı N	1il	k		-	. 6 ounces
Boiled	Wa	ter					. 12 ounces
Karo							2 tablespoons
Powde	red	M	ilk	_	-		5 tablespoons
Boiled	Wa	ter					. 20 ounces
Karo							2 tablespoons

The amount of Karo required may be added directly to the total volume of acid milk prescribed. Karo is an excellent milk modifier of dextrins, maltose and dextrose (with a small percentage of sucrose added for flavor) for both the baby and the budget.

Corn Products Consulting Service for Physicians is available for further clinical information regarding Karo. Please Address: Corn Products Sales Company, Dept. NM-5, 17 Battery Pl., New York City.

ELI LILLY AND COMPANY

FOUNDED 1876

Makers of Medicinal Products

AMYTAL

(Iso-amyl Ethyl Barbituric Acid, Lilly)

Supplies the relaxation and sleep which are essential to rapid convalescence of medical and surgical patients. Upon awakening the head is clear; there is no after depression; energy and self-confidence are restored.

'Amytal' (Iso-amyl Ethyl Barbituric Acid, Lilly) is supplied in 1/8-grain, 1/4-grain, 3/4-grain, and 1 1/2-grain tablets in bottles of 40 and 500.

THE STUTTER-TYPE PERSONALITY AND STUTTERING

JAMES SONNETT GREENE, M.D., New York City Medical Director, National Hospital for Speech Disorders

The stutter-type personality is a chronic hesitator coming from neuropathic stock, demonstrating neuropathic tendencies.

A person may not show that specific sort of hesitation we call stuttering,* but still belong to the large group of people which comprises the Stutter-Type.** His personality, like that of all other individuals, depends upon the constitutional make-up of his nervous system. According to Dr. Pavlov, nervous systems can be classified as strong, moderately strong, and weak, in terms of excitation and interruption of psychomotor function. These interruptions are the result of uncontrolled reaction to irrelevant stimuli. The highly excitable organism lacks the ability to exclude irrelevant stimuli while responding to the stimulus proper.

The stutter-type, on account of his nervous make-up, forms part of the group of strongly excitable individuals, those who show a marked combination of the ltarmful effects of excessive excitation and interruption. Their mental and physical activity is disturbed and inhibited because of uncontrolled reactions. An individual belonging to this group may be said to stutter in more ways than in speech.

In our work at the National Hospital for Speech Disorders we have treated people who stuttered playing musical instruments, for example, becoming stuck on a note on the piano, as a stutterer to a word, those who stuttered on the violin giving a spasmodic repetition of notes; those who make the typewriter or linotype machine stutter, and others who demonstrate their hesitations in such acts as dancing, golfing, driving an automobile, etc. I am sure everyone has observed stuttering automobiles, the driver imparting his own spasms to the machine.

The stutter-type hesitates chronically. Although intellectually and physically on a par with the rest of mankind. emotionally he is victimized by an instability which makes a rationally ordered life impossible. Instead of proceeding on his business efficiently, like a well-oiled mechanism, with an adequate margin of strength for emergencies, he is constantly being thrown out of gear by a series of emotional shocks. Although many functions of the human mechanism may show the result of this deficiency of emotional integration thru hesitancy, caused by a partial or total blockage of activity, it is only when speech becomes involved that we really notice the trouble and designate it as stuttering.

A stuttering individual is usually un-

* Stuttering and stammering are often used interchangeably, but according to derivation, stuttering stands for labored, difficult, hesitant speech with resultant defective conversation Stammering refers to defects of articulation and should never be confused with stuttering. Stammering depends on performance, stuttering depends on emotional disturbances. Technically, stuttering is known as "Dysphemia" or wrong speech, while stammering is known as "Dyslalia."

** The term "Stutter-Type" was first used by the author in a paper read before the New York Neurological Society at the New York Academy of Medicine, Dec. 4, 1934. "Treatment of the Stutter-Type Personality in a Medical-Social Clinic."

Read in part before the Open Forum of the Annual Meeting of the Medical Society of the State of New York, New York City, April 29, 1936

able to say words or phrases without hesitating and becoming emotionally aroused. His speech is characterized by tonic and clonic spasms of the vocal tract.

Whatever form or style the stutterer's hesitation may take does not alter the fact that he is a stutterer. He may have a tendency to repeat letters, syllables, or words, he may puff and blow, he may contract his jaws and not be able to start speaking, he may try to talk on his inspiration or introduce various forms of bodily movement with his speech, etc.; but no matter what muscles are involved -face, lips, throat, chest, abdomen, diaphragm, etc.—the fact remains that it is difficult for him to carry on a conversation, not because of defective enunciation, but because of hesitations, conditioned on certain states of mind in the form of emotions, feelings, or attitudes.

Many theories have been advanced to explain the difficulties which beset these stutter-type individuals of neuropathic stock who demonstrate neurotic tendencies. The conception we advance stresses the role played by primitive emotional reactions, especially fear and allied emotional states, setting off the tendency to many hesitating acts. This is particularly so in such a symptom as stuttering. It is the neurotic mechanism converting the psychic conflict into a physical symptom.

Since emotion is fundamental to our problem, a brief outline of its development and function may be necessary.

Life, for our savage ancestors of prehistoric ages, was not as it is for us, a routine of planned work, orderly pleasure, and many emotionally neutral social contacts. It was a life of apprehension, in which anything unexpected was liable to be a crisis necessitating decisive action. The savage's range of physical activity was wider than ours. He needed a special source of energy for emergencies, because his emergencies could only be solved by sudden physical action, and emotion came to his aid as a quickly induced state of preparedness. In emotion, breathing and heart-beat are accelerated, increased secretion of adrenalin steps up the activity of the entire muscular system, the whole organism is brought into a condition eminently suited for fighting or running away, in short for self-preservation.

Allied to these positive physiological manifestations are certain economies of the body in the emotional state. Some activities are temporarily inhibited because they would use up energy unnecessarily; for instance, the blood-supply of the digestive organs is diminished, saliva stops flowing; and for us the most important fact is, that mental activity of the higher more integrative kind, is inhibited.

Physiological psychologists, such as Cannon¹ and Crile,² had tried for a long time to find physiological states changes in the body which they could correlate with the many "emotions" which the psychologists thought they had been able to find in the mind, but without success. There is only one "emotional state," which we have already described. The trouble with "lists of fundamental emotions" published by various psychologists, lies in confusion between an energy and the forms it may take; for example, what is the use of considering the electric light, radio, x-ray, and all the other electrical contrivances as different sorts of energy when they are only transformations of the same fundamental electrical energy into more familiar forms.

We must learn to separate an energy from its manifestations; we must learn to separate emotion from the various mental states which constitute its manifestations. We have an almost infinite variety of mental states, almost as many as we have memories. Some of them are particularly strong at a given moment, because there is more energy flowing thru them, more "emotion." They may be anything from the memory of a recently deceased relative, reminding us of the limits of our existence, to a beautiful picture or work of music, reminding us of the unattainability of the perfection they suggest, while yet they demonstrate the height we humans have reached. Always however, there will be demonstrable in any emotional state, besides other things, either a trend toward a feeling of superiority or toward one of inferiority, which is the remnant of the two ways in which the preparedness state, the "emotion" of the savage, found outlet. He either stood and fought, or ran for his life. His emotion. either took on the specific guise of rage, satisfactory ability—pleasure, or it became fear, unsatisfactory ability—pain. In our own day also, if a man in a state of emotion recognizes himself as able to cope with a situation, as superior, we get the picture of reinforced superiority or "rage." If however, he feels inadequate to handle the matter, we get the picture of reinforced inferiority, or "fear.' To put it epigrammatically:—

EMOTION + SUPERIORITY = "RAGE" EMOTION + INFERIORITY = "FEAR"

Either rage-activity or fear-activity got the savage out of his predicament. Both led to direct physical action. In our present day society however, neither one could lead to anything but trouble. Our world offers no outlet for extreme emotion, except by means of useless, morbid, or fatal behavior. For example, in the case of the stutterer, his useless emotional upset is decidedly detrimental to his well-beingthe automobile driver (as shown by Dr. Henderson*) when started mentally or jolted goes out of control, and while trying to steady himself presses on the accelerator pedal thereby increasing the speed of his car, often with fatal resultsthe novice aviator "freezing" to the controls of his plane, holding on to them for dear life although it means destruction. In both cases it is the operator who "goes out of control, not the machine." These are examples of the deleterious effects of extreme emotion. In fact, we might say that today extreme emotion assumes the form of a vestigial appendage, like the thymus in the adult or the veriform appendix to the cecum.

There is a normal range of emotion between mere neutrality and a state we might describe as "pleasant excitement," within which we should try to remain. It

* Prof. Yandel Henderson of Yale University in a paper read before the National Academy of Sciences, Nov. 18, 1935 entitled "How cars go out of control: Analysis of the Driver's corresponds in a way to the state of excitation of our muscles called "tonicity.' without which our bodies would be limp and unable to stand erect. People who live within this range react to their environment in a lively healthy way, while people who stay under it are lifeless, dull, uninteresting, lacking in personality. course a crisis in either of these types calls out extreme emotion, but whereas the normal person is constantly active and accustomed to finding ways and means of overcoming the difficulty and putting his emotional energy to work, the "low-E" person not alone has less energy to start with, but also lacks practice in meeting his difficulties, and therefore his emotion has a tendency to overshoot the mark, becoming a violent and uncontrollable wrought-up condition. This is the picture of the stutter-type personality, in whom the emotional crisis is a chronic affair.

Speech is our most recently developed and most complex finely balanced muscular activity, unperformable during periods of intense emotion. The ability to speak, as we all know, is the result of training. The neuromuscular activity or coordination which produces speech is of a very complicated nature. Many nerve areas and muscle groups, both large and small, must work in perfect harmony. Quick reaction time and coordination are developed by long practice in the use of the speech organs. Constant repetition of the process of speech has developed the nerve paths and muscle responses to the stage where the action appears like a reflex, like the winking of an eye. Now, when an individual is in a storm of conflicting emotions, lines of communication are broken and the misdirected nerve messages become delayed or diverted. Most of us at some time or other have experienced the distinctly unpleasant condition of speechlessness due to emotional turmoil. If we realize that the stutterer is in just such a state many times a day, our fundamental problem becomes clear.

Emotion is the body's response to the recognition that a crisis is impending. The stutterer is a chronic sufferer from emotional shocks due to recurrent speech crises.

The question arises whether ordinary situations should be critical situations in his case. The answer is that his activity

out of control: Analysis of the Driver's Reflexes."

"The automobile driver when startled mentally or jolted goes out of control submerging his conditioned reflex built up by driving a car and demonstrating his instinctive self-righting reflex which was excited thru the sudden disturbance of equilibrium. Besides the impulse to steady himself he simultaneously performs another instinctive act as part of the same nervous muscular complex. He forcibly extends his legs causing his feet to press hard on the accelerator pedal thereby increasing the speed of his car with fatal results."

depends on an aroused state. A surge of emotion goads him out of feelings of depression and inadequacy which may in fact, have only a slight basis, but seem very real to him none the less. He starts acting and talking, but is forced to stop almost immediately. True, this surge of energy almost unconsciously produced, helps him to attain the "fighting pitch," lifts him out of his introverted quiescent condition. But the activity people expect of him requires only a minimum of physical effort in spite of the fact that it includes the most complex set of exactly coordinated neuromuscular adjustments ever demanded of anyone. So, although he lacks a well-trained neuromuscular organization, he constantly tries to produce the split-second response that he sees in the normal speaker. If he cannot produce speech spontaneously he often flies into a panic which further demoralizes his speech faculties. In his aroused state, adjustments are out of the question. for emotional stimulation cannot be reversed or adequately used once it has gone beyond a certain point, depending on the degree of the development of the individual's expressive functions. therefore unloads his surplus emotion in various ways, as thru peculiar bodily movements, spasms of the musculatures involved in speech, tenseness thruout the body and a general feeling of unbearable anxiety culminating in fear. Exhaustion follows and with it a depression, which again makes overstimulation necessary, and thus a vicious circle is instituted.

That a general predisposition toward emotional instability can be traced in the family of the stutter-type has long been an acknowledged fact. Of over a thousand patients who have been treated in the National Hospital for Speech Disorders during the last year (1935) forty per cent had stutterers in their immediate family, and over one-half gave a definite history of nervous instability in the family. A child of such a family does not necessarily inherit stuttering as such, but belongs to the stutter-type and inherits peculiar neuropathic tendencies, a general instability of the nervous system which predisposes him to stuttering.

A more specialized inquiry into the genesis of the general instability, which makes the stutterer susceptible to the vicious circle of emotional excitement and

depression, reveals the significant part played by this parental neuroticism. We all know the type of parent, especially the mother, who quite often is "on edge," who breaks out and scolds her children, who shows a tendency to nag, to be tense, yet who may for all that, be intelligent and seemingly healthy. Theoretically we all realize the burden which is placed on the child of such a parent. Handicapped on the one hand by an hereditary legacy from a nervous and unstable parent, and on the other by an environment colored by this same unstable parent, it necessarily follows that the already troublesome difficulty is reinforced and accentuated. The child is thus not in a curative environment, not even in a neutral one, but in one definitely detrimental along the lines of its own deficiencies.

However, tho it is true that the parents of the stutter-type generally exhibit "nervousness," hyperemotionality, or peculiar behavior of some kind, when we try to seek some specific determinant of stuttering itself in the parental background, we find that the family pattern of the stutterer might just as well be that of a juvenile delinquent, a neurasthenic or psychotic. It therefore devolves on those who try to trace the genesis of stuttering out of a general background of instability, to also show to some extent why this background did not lead to any of the troubles mentioned.

It seems evident that the nature of the disorder passed on from parents to children, which leads to such difficulties as stuttering, is only to a very slight degree some specific organ weakness or inferiority. The chief factor in evidence is the disturbance of some stabilizing mechanism of the organism which, while functioning properly, keeps the individual "hewing to the line" of normal behavior. This mechanism is akin to the growth-regulating function of the pituitary body,* which

^{*}As Dr. C. I. Stockard of Cornell recently pointed out in a paper read before the National Academy of Sciences on Nov. 18, 1935 at the University of Virginia, that when the growth-regulating pituitary gland is not functioning properly, members and parts of an organism will not be correctly proportioned to one another. In his experiments he found that one part of an animal might follow one pattern, while the rest followed another, so that there is a discrepancy in physical proportion, just as in the stutter-type there is a discrepancy in emotional balance.

probably has its seat in the thalamic region of the brain and is liable to perturbations due to emotional shocks of the extreme kind, and to hereditary weakness, which may be the result of the upset of the chemical and mechanical equilibrium of the body and be of glandular origin.* Possibly this stabilizing mechanism has become atrophied in modern men due to disuse. In other words, we assume that in the stutter-type there is present some somatic deviation from the normal, but so slight that no one has been able to isolate and define it, even tho it necessitates some functional compensation.

Although we are still far from understanding the actual anatomical mechanics of emotional balance, there is evidence of its being largely contingent upon the balanced opposition of the parasympathetic and sympathetic divisions of the autonomic nervous system. The former superintends the "peace-time" organization of the individual, the latter his "war-time" organization. The stutter-type person shows dominance of the parasympathetic system on the whole. He is peaceful, uncombative, avoids competition. Possibly he is the result of long continued dormancy of self-defense emotion in himself, resulting from long continued dormancy of fighting and competing emotions in his ancestors. This factor has in all probability led to a certain degree of atrophy of that part of the nervous system controlling the body's fighting organization. But in order to meet the demands of environment the individual must organize himself on two different planes or suffer defeat everytime an emergency arises. Most people blunder when thrown into strange situations that require quick action, but the stutter-type especially so, because of his high emotional tone. His marked nervous excitability and his emotional stress, as a system of tensions and chemical changes in the blood plasma, interferes with his ease and harmony. Any stimulus is liable to set up a break in rhythmic manifestations so that his inner and outer rhythms fail to harmonize; and no matter what he attempts to do, speech included, it is poorly executed. The rhythm of the stutterer's body governed by the opposing forces of the autonomic system is destroyed as soon as he ventures beyond a low peace-time level of activity. The normal person when overactive tends in the direction of sympathetic dominance. The stutterer's overactivity tends in the direction of still further parasympathetic dominance, or uncontrolled spasmodic dominance.

The respiratory tract is innervated by the parasympathetic division. Its neuromuscular balance, next to the cardiovascular system, is more readily upset by emotion than perhaps any other organ system. The stutterer has never had enough practice in counteracting sympathetic influence during stress, thus he is usually rocketed to temporary manifestations of hypersympathetic dominance: quently, the stutterer, although a parasympathetic type having a pale mucous membrane, readily demonstrates during the stress of examination, a change to sympathetic dominance with its attendant mixed or red mucous membrane. There is a continued conflict going on within him between the parasympathetic characteristics he possesses and the sympathetic characteristics.

In all probability this is due to the fact that he is a cross between a sympathetic type of father and a parasympathetic type of mother, or vice versa, thus creating a combination of the two with each system striving for dominance. His natural status should be for a maximum level of parasympathetic control thus repressing the turbulent manifestations of the sympathetic.*

Granting the disturbance of this controlling mechanism in the stutterer, the question naturally arises as to how such an individual can be relatively normal outside of his stuttering. Why does he not show the same emergency reaction in all

^{*}Dr. Roy R. Grinker of the University of Chicago in his recent book Neurology points out, that the emotional pattern or quality of sensation is a thalamic function, and part of the personality may be a quality derived from the thalamus.

^{*}This fact was demonstrated when Dr. Jarvis' of Vermont, who for years has made extensive research studies on characteristics of the autonomic nervous system, recently visited our Clinic, and was kind enough to examine 30 adult stutterers (ages 18 to 30 years). He found half of the group were pale mucous membrane individuals, while in the other half, under the stress of examination, the direction had shifted to the mixed and red type of mucous membrane.

kinds of situations? The answer seems to be that the person so afflicted resorts to specialization in order to achieve relative stability in every-day life. He picks on one certain sphere of physiology in which to display his helplessness. Thus his stuttering becomes an expression of an inferiority which is really much more general, which in fact, would normally involve speech only to a very slight extent. Also, he makes it possible for himself to lead a fairly normal life socially in a smaller sphere. A kind of biological conscience comes into play, a will to unity and normalcy imbedded deep within the organism which may be driven to retreat by the exigencies of bodily or mental inferiorities, but which tries to consolidate the normal remainder of the organism into a smaller but normally functioning unit. The process by means of which the stutter-type, abnormally set back by the impact of social life in early childhood, tries to limit his social environment by means of his stuttering, is of course, no more "conscious" than is the growing of a claw by a lobster, but the underlying will to unity of the organism is the guiding factor in both cases.

Recent investigations tend to show that whenever some defect (whether consciously recognized or not) confronts an individual, two distinct means of meeting the situation present themselves, the one to be followed depending on inherent constitutional factors. Either the entire personality must be diminished to meet the level of the weakest aspect, or else the weakness must be bottled up, as it were, in a "symptom," while the rest of the personality goes on as before, tho often stumbling over the symptom. Our stutter-type generally belongs to the so-called "asthenic type" whose physique has been reduced in a multitude of particulars to provide, one might say, a normal environment for some constitutional defect. Emotionally he exhibits a tendency to introverted states of mind. We cannot say however, that the stutter-type belongs wholly to the asthenic (introverted) group, for his behavior in many ways approximates that of the pyknic (extraverted) group. It is only one factor of his personality, that which finds its expression in speech, which is introverted. He belongs then, to a special group.

Many children during their first exciting years of oral expression are often prone to overstimulation under excessive adult pressure, so much so, that they actually work themselves into a disorganized mental and physical state. They literally wear themselves out by their incessant talk, so that they often lose control of the mechanism of the vocal tract, with resulting hesitations. The preschool stutter-type child with his neuropathic diathesis has more difficulty in learning speech than other children and in suppressing unnecessary infantile nonspeech movements. This type shows a distinctly lower grade of psychomotor efficiency, with its accompanying functional disturbances, as the result of poor psychosomatic interrelationship. His conditioned speech reflex, being unstable, is not a fixed response and thus severe shock subjects him to the influence of inhibition.

Many a mother wonders why one of her children outgrew these manifestations and spoke normally, while in another the trouble persisted. Since children vary markedly in the vulnerability of the speech apparatus, evidently the latter was a stutter-type child, his mechanical disability and poor habit formation did not allow his speech to develop normally; it did not become a fixed conditioned reflex. Aside from this, no doubt there was inherently greater difficulty in surmounting environmental stresses—mental unrest with its anxiety, worry, and fear.

Periods of unusual environmental stress occur several times in the life of the individual. The first occurs in child-hood, generally around the time the child goes to school, and consists of the impact of social life with the comparisons of one's self with others of one's own sex and age which it involves. The second period, in adolescence, is due to the impact of the whole complex of sexual facts on the as yet unprepared young person.

The genesis of the stutter-type most often occurs during the first period of stress, either on account of the underlying neuropathic diathesis or of both hereditary and environmental factors combined. Excessive difficulty in meeting the demands of the second, mainly sexual, period of stress engenders neurosis. Later on, during maturity, a third period of conflict occurs in which the main factors

are internal, a conflict between the egotistic will to power of the individual and his perception of the crushing ruthlessness of eternal natural laws as expressed

by the aging of the person.

Each of these three periods is characterized by a change of emphasis. The child begins by taking his school-fellows, representing society to him, too seriously. Later, he lays undue weight on sexual matters, becomes more or less obsessed by them; there occurs a narrowing down from society to one person, the loved one.

Finally, importance is shifted from people altogether, and one's relation to universal laws of some kind becomes an important factor in life. In case of total failure in this adjustment, psychotic conditions are the result. However we are mainly concerned here with the sort of personality which is the result of failure to surmount the first hurdle in this development. That personality is the stutter-type because stuttering is the typesymptom of his condition of chronic hesitancy. It is his primary reaction to social conditions and must not be confused with the usually following secondary manifestations of the neurosis. This develops much later and is a disturbance in the field of personal relations.

There has been in the past a good deal of vague comment on the "neuroticism" of the stutterer. It has of course always been possible to perceive in him a basis of emotional pecularities, but the why of the actual conversational difficulty escaped detection amid a welter of general remarks. If stuttering were merely the symptom of a neurosis, why is it that when alone the stutterer is able to talk? Why can he talk under certain conditions and not under others? We have all been under the domination of psychoanalytic theories of neurosis with their aura of conviction that mental troubles are the result of obscure "deep-seated" conflicts of some sort, meaning by deep, sexual. The extreme exponents of the Oedipus complex, the psychoanalytic school, made the fundamental mistake of attempting to explain purely social conflicts sexualistically or else ignored them altogether. The failure of the psychoanalytic treatment of stutterers proves that the type of adjustment it affords to a single person who serves as an intermediary or bridge to others, is not adequate for the stutterer. The neurotic must develop contact with the individual person; the stutter-type on the other hand must develop contact with the group. We are dealing with a condition which is social in origin and needs treatment of a social nature, such as is afforded in our own medical-social clinic.

Realistically considered, the first actual difficulties a child encounters are those met with when he goes to school for the first time. We call this the social impact. The sort of primary sexual conflict the orthodox psychoanalysts postulate as appearing in the mind of the infant cannot occur at that age because the child is still actually a part of his parents, accepting everything coming from them without criticism or thought, and is himself accepted more or less completely by his parents, hesitating talk and all. Only when the child goes to school does he meet with nonacceptance, criticism, competition; and the competition is keenest in a field where to the unobserving eye it is hardly even discernable. I mean the field of speech, a field in which if he belongs to the stutter-type he is already inclined to be oversensitive. Besides that, the child has not yet developed an excusing apparatus for himself which will furnish his ego with compensations for his failures. He either can do a thing as well as others, or he cannot; and if he fails he not alone receives no mercy at the hands of young fellow-barbarians but is more cruel to himself than the adult would be.

If then, the "social-impact" proves insurmountable and the child cannot cope with his social environment, he must and will develop a symptom, if he has not already done so, which is also an expression of his failure and a means of escaping the conditions leading up to it. This symptom is stuttering. It shields him from people. He has embodied his feeling of social inferiority in a process which will cut him off from the possibility of social success, it is true, but also from the possibility of real utter failure. A state of tentative equilibrium is thus attained. We may surmise that, other factors remaining the same, the loss of his stuttering would make life even more serious for him.

Let us now see how some well-known facts fit in with the view of stuttering

DIAGNOSTIC SIGNIFICANCE OF PAIN

Frederick J. Kalteyer, M.D., Philadelphia, Penn.

Clinical Professor of Medicine, Jefferson Medical College; Attending Physician to the Philadelphia General Hospital

By common consent, pain is assigned to the front rank of diagnostic symptoms. Because of its import and frequent occurrence in a large proportion of ailments, it constitutes the chief criterion in the solution of many clinical problems, especially when evaluated with concomitant phenomena. In certain disorders it is the only guide to their recognition. The quality and intensity of pain are determined by individual peculiarities and the nature of the pathological lesion. Since pain depends on consciousness, its degree varies with the alertness of the sufferer. It is impaired or even wholly abolished in somnolent, stuporous, or comatose states from toxemia, and in constitutional disorders characterized by pronounced weakness, as shock; it may be intensified by mental and emotional excitement from fear, fright, and anxiety. Some individuals possess an excessive susceptibility to pain, while others seem to be quite immune. The neurotic and sanguine constitutions are more readily affected than the phlegmatic. Prolonged suffering and recurrence of painful sensations augment this symptom, while hardship and exposure, especially in uneducated persons, dull this sensation. There are differences in pain susceptibility due to racial peculiarities; Anglo-Saxons and Orientals, as a class, are apathetic when contrasted with Latins and Hebrews.

Pain varies greatly from trifling discomfort or sub-pain, to intense agony so great as to cause death. It is an aid in detecting both minor and major disturbances, and frequently is the first sign of injury or disease, occurring long before structural changes in the tissues can be recognized by physical signs. By its characteristics, the nature and onset of a pathological process may be suggested, as displayed by the excruciating general abdominal pain of a perforated gastric ulcer. Its location gives information of

the site and the spread of a morbid process. Its character and behavior may indicate the type of structures or tissues involved by the disease, as the dull paroxysmal and poorly localized abdominal pain of intestinal colic, or the sharp accurately placed pain of pleurisy or peritonitis. Its relation to certain functions may point to the organ affected, as the association of pain with gastric digestion, or its relief by taking food, or its appearance on defecation, urination, deep breathing, or exertion. Movements of the body generally intensify, while rest eases most pains, although in abdominal colic, the patient may roll about the bed and press upon his abdomen to get relief, while in angina pectoris, the symptom may develop suddenly during sleep. The influence of atmospheric conditions as a change in weather to humidity or rain, may precipitate a neuralgic attack, or fair weather may bring relief.

The effects of pain are as significant in diagnosis as the symptom itself. The pain producing stimulus may directly or indirectly disturb other functions. Pain is a warning signal of bodily injury or disease, often termed a defensive or protective mechanism. Through its secondary influence, it is frequently attended by such harmful effects as nervous or emotional dyspepsia, vomiting, general weakness, shock, heightened blood pressure, glycosuria, hyperglycemia, and sweating. Physiologists have advanced satisfactory explanations for most of these perturbations which should receive careful consideration by the physician, when appraising the results of a pathological disturbance. This short discourse will be devoted to a consideration of pain itself and not to its attendant phenomena.

Although the clinical interpretations of pain are of great service in the diagnosis of a large group of disorders, we must

admit our disappointment in the failure of this symptom to localize accurately and

are internal, a conflict between the egotistic will to power of the individual and his perception of the crushing ruthlessness of eternal natural laws as expressed by the aging of the person.

Each of these three periods is characterized by a change of emphasis. The child begins by taking his school-fellows, representing society to him, too seriously. Later, he lays undue weight on sexual matters, becomes more or less obsessed by them; there occurs a narrowing down from society to one person, the loved one.

Finally, importance is shifted from people altogether, and one's relation to universal laws of some kind becomes an important factor in life. In case of total failure in this adjustment, psychotic conditions are the result. However we are mainly concerned here with the sort of personality which is the result of failure to surmount the first hurdle in this development. That personality is the stutter-type because stuttering is the typesymptom of his condition of chronic hesitancy. It is his primary reaction to social conditions and must not be confused with the usually following secondary manifestations of the neurosis. This develops much later and is a disturbance in the field of personal relations.

There has been in the past a good deal of vague comment on the "neuroticism" of the stutterer. It has of course always been possible to perceive in him a basis of emotional pecularities, but the why of the actual conversational difficulty escaped detection amid a welter of general remarks. If stuttering were merely the symptom of a neurosis, why is it that when alone the stutterer is able to talk? Why can he talk under certain conditions and not under others? We have all been under the domination of psychoanalytic theories of neurosis with their aura of conviction that mental troubles are the result of obscure "deep-seated" conflicts of some sort, meaning by deep, sexual. The extreme exponents of the Oedipus complex, the psychoanalytic school, made the fundamental mistake of attempting to explain purely social conflicts sexualistically or else ignored them altogether. The failure of the psychoanalytic treatment of stutterers proves that the type of adjustment it affords to a single person who serves as an intermediary or bridge to others, is not adequate for the stutterer. The neurotic must develop contact with the individual person; the stutter-type on the other hand must develop contact with the group. We are dealing with a condition which is social in origin and needs treatment of a social nature, such as is afforded in our own medical-social clinic.

Realistically considered, the first actual difficulties a child encounters are those met with when he goes to school for the first time. We call this the social impact. The sort of primary sexual conflict the orthodox psychoanalysts postulate as appearing in the mind of the infant cannot occur at that age because the child is still actually a part of his parents, accepting everything coming from them without criticism or thought, and is himself accepted more or less completely by his parents, hesitating talk and all. Only when the child goes to school does he meet with nonacceptance, criticism, competition; and the competition is keenest in a field where to the unobserving eye it is hardly even discernable. I mean the field of speech, a field in which if he belongs to the stutter-type he is already inclined to be oversensitive. Besides that, the child has not yet developed an excusing apparatus for himself which will furnish his ego with compensations for his failures. He either can do a thing as well as others, or he cannot: and if he fails he not alone receives no mercy at the hands of young fellow-barbarians but is more cruel to himself than the adult would be.

If then, the "social-impact" proves insurmountable and the child cannot cope with his social environment, he must and will develop a symptom, if he has not already done so, which is also an expression of his failure and a means of escaping the conditions leading up to it. This symptom is stuttering. It shields him from people. He has embodied his feeling of social inferiority in a process which will cut him off from the possibility of social success, it is true, but also from the possibility of real utter failure. A state of tentative equilibrium is thus attained. We may surmise that, other factors remaining the same, the loss of his stuttering would make life even more serious for him. Let us now see how some

facts fit in with the view

expressed above. The very early incidence of this trouble, occurring as it does most generally at the time the child first goes to school, bears us out. When it is not actually school life itself which brings on the first signs of stuttering, it is an analogous situation involving competition with other children. If stuttering were just a neurotic condition with its background of regression to an infantile neurotic state, more cases would give the onset as occurring during their high school or college periods. It would also be more prevalent. For our vast army of real neurotics generally runs the gamut of neurotic symptomatology during course of a few years, and it is difficult to see how stuttering, as a most obvious condition, could escape being a frequent temporary symptom. The fact is, the stutterer's neurotic anxiety taking the form of a fear neurosis, is a creation instituted by his need for the protection of his personality in numerous speech situations. This defense reaction soon becomes the prototype of all his social reactions, which in turn penetrates and sets the pattern for his entire behavior. In his case the ground work for his symptom stuttering was laid thru his heredity, his prenatal growth and development, and his preschool years, his neuroticism being the natural sequence.

The uneven sex-distribution of stuttering, lends support to our view. About eight times as many boys as girls stutter. There are obvious reasons for that. Foremost is the fact that early environmental stress is never as hard on girls as on boys. The element of social competition enters into the life of even the youngest boys much more decisively than into that of girls. For the little girls play with each other in groups, the same as they did when they played with their mothers or sisters at home, while the boy is injected immediately into an incomparably more strenuous atmosphere of group games in which the prowess of much older boys sets the standard. In other words, the social impact is stronger in the male sex and stuttering therefore must be more common. Also an additional hardship for the male is the fact that mothers usually center their affection on him, injudiciously shielding him and thereby weakening him, with the result that he is unable to cope with the regulation environmental onslaughts. This protection is not beneficial but detrimental.

Besides all this, another factor to be considered is that the fixed personality components show decided differences. Dr. Allen* of the Mayo Clinic tabulated over 300,000 cases and found that females are stronger and healthier than males. They showed in many ways greater physiological and neurological stability. Their susceptibility to many conditions was decidedly less pronounced than that of the male. And as he puts it "The male is inferior to the female, and speaking comparatively, the price of maleness is weakness." This in a way is a definite reflection on their ability to maintain normal control of all organs including speech organs. In fact the female speech apparatus is stronger as well as more perfected in action, thus making for development of a single neuromuscular pat-Since the ability to speak is the result of training and girls are more loquacious, practicing speech all the time, it follows that with their finer mechanism, higher rhythmic sense, and better coordination, they are less liable to lose their balance under new environmental conditions.

We have seen that the two basic factors which the stutterer tries to carry out are: first, chronic crystallization of his anxiety reaction in one symptom—stuttering; second, the contraction of his fear of social activities to a size he can handle. These activities depend one upon the other.

The necessary "de-concentration" of his symptom demands a process similar to that which we observed in the asthenic "schyzoid" type of personality, namely a toning down of the level of activity of the stutterer to attain the level of metabolism in which he is able to maintain himself in a state of normalcy. The speech symptom is thus robbed of its place in the center of the personality.

He must further adjust his energy output to his surroundings. His environment

^{*&}quot;Which is the Weaker Sex?" by Edgar V. Allen, Hygeia, Jan. 1936. "There can hardly be any other explanation than that the male is handicapped by a lessened degree of vitality that is directly or indirectly the result of a peculiar complex of hereditary factors."

must be completely changed so that his sphere of activity is gradually enlarged. He must be *taught* to handle any number of new situations which are likely to arise

in ordinary life.

The stutterer must not be made to think that direct or specific acts, instrumental or otherwise, is his special salvation, for in the last analysis it all evolves into one and the same thing-distraction. Treatment using any form of distraction cannot be lasting despite the fact that it has been employed so extensively. Whether the patient is told to press his nails, swing his arm, pace up and down, rub a button, toy with a watch chain, keys, or pencil, speak according to tracings, learn to write all over again in order to change his handedness, or to institute the phenomenon of stutterers crawling on all fours in order to produce non-stuttering speech, or stutterers talking to waltz time to cure their stuttering, etc., no matter how scientific the explanation may be for doing the special trick it is all one and the same thing-specific distraction.

The reason that many suggestive measures have been employed so extensively is on account of their aid in controlling the individual's emotions so that his innate rhythm and harmony is not disturbed. His fear takes second place and his arrhythmia and lack of coordination become decreased. The help derived makes it possible for him during that time only, to give a more or less perfect technical performance. Any form of distraction when considered in the light of a specific in the cure of stuttering is usually detrimental to the successful outcome of a case.

The reorganization of the type therefore, cannot be brought about through temporary measures of distraction. It is a complex health problem of a medical-social nature, for only through the composite therapy of a Medical-Social Clinic can adjustment be brought about. The treatment must consider the individual's whole personality which is in keeping with the fact that the united complex life means the correlation of both the psychic and somatic.

Our Medical-Social Clinic, founded in 1916, is a powerful motivating force for the integration of the stutter-type. It brings order and peace out of chaos and anxiety, the hope and wish of every stutterer. In our specially created environment he learns to acquire emotional stability so that he is capable of taking a non-hesitating stand, facing situations squarely and fearlessly. He not only gets tranquillized, but remains tranquillized. All this is brought about through a composite therapy of a medical, psychological, psychiatric, re-educational, and social nature.

The chronic hesitator learns to act rhythmically in an organized and confident manner in all situations, because, through personality changes, the task of his adjustment to life has been accomplished. The stutter-type can now be classed as a definite pathological entity, and from my own observations and study of the subject we can say that the problem of stuttering has finally found a practical solution.

GERMANY'S NEW MEDICAL LAW

By a new law in Germany, no more "non-Aryan" physicians will be admitted to practice medicine while the proportion of physicians of other than German extraction to the total number of physicians in the German reich exceeds the proportion of non-German inhabitants to the total population of the reich. A non-Aryan wife makes the husband also non-Aryan in this rating. The

proportion of non-Aryan physicians still exceeds the legal maximum, so that the bars are up until the proportion goes below that point.

By another clause in the law physicians are forbidden to use (on announcements, name plates and prescriptions, for example) any designation that refers to the activities of some predecessor.

DIAGNOSTIC SIGNIFICANCE OF PAIN

FREDERICK J. KALTEYER, M.D., Philadelphia, Penn.

Clinical Professor of Medicine, Jefferson Medical College; Attending Physician to the Philadelphia General Hospital

By common consent, pain is assigned to the front rank of diagnostic symptoms. Because of its import and frequent occurrence in a large proportion of ailments, it constitutes the chief criterion in the solution of many clinical problems, especially when evaluated with concomitant phenomena. In certain disorders it is the only guide to their recognition. The quality and intensity of pain are determined by individual peculiarities and the nature of the pathological lesion. Since pain depends on consciousness, its degree varies with the alertness of the sufferer. It is impaired or even wholly abolished in somnolent, stuporous, or comatose states from toxemia, and in constitutional disorders characterized by pronounced weakness, as shock; it may be intensified by mental and emotional excitement from fear, fright, and anxiety. Some individuals possess an excessive susceptibility to pain, while others seem to be quite immune. The neurotic and sanguine constitutions are more readily affected than the phlegmatic. Prolonged suffering and recurrence of painful sensations augment this symptom, while hardship and exposure, especially in uneducated persons, dull this sensation. There are differences in pain susceptibility due to racial peculiarities; Anglo-Saxons and Orientals, as a class, are apathetic when contrasted with Latins and Hebrews.

Pain varies greatly from trifling discomfort or sub-pain, to intense agony so great as to cause death. It is an aid in detecting both minor and major disturbances, and frequently is the first sign of injury or disease, occurring long before structural changes in the tissues can be recognized by physical signs. By its characteristics, the nature and onset of a pathological process may be suggested, as displayed by the excruciating general abdominal pain of a perforated gastric ulcer. Its location gives information of

the site and the spread of a morbid process. Its character and behavior may indicate the type of structures or tissues involved by the disease, as the dull paroxysmal and poorly localized abdominal pain of intestinal colic, or the sharp accurately placed pain of pleurisy or peritonitis. Its relation to certain functions may point to the organ affected, as the association of pain with gastric digestion, or its relief by taking food, or its appearance on defecation, urination, deep breathing, or exertion. Movements of the body generally intensify, while rest eases most pains, although in abdominal colic, the patient may roll about the bed and press upon his abdomen to get relief, while in angina pectoris, the symptom may develop suddenly during sleep. The influence of atmospheric conditions as a change in weather to humidity or rain, may precipitate a neuralgic attack, or fair weather may bring relief.

The effects of pain are as significant in diagnosis as the symptom itself. The pain producing stimulus may directly or indirectly disturb other functions. Pain is a warning signal of bodily injury or disease, often termed a defensive or protective mechanism. Through its secondary influence, it is frequently attended by such harmful effects as nervous or emotional dyspepsia, vomiting, general weakness, shock, heightened blood pressure, glycosuria, hyperglycemia, and sweating. Physiologists have advanced satisfactory explanations for most of these perturbations which should receive careful consideration by the physician, when appraising the results of a pathological disturbance. This short discourse will be devoted to a consideration of pain itself and not to

its attendant phenomena.

Although the clinical interpretations of pain are of great service in the diagnosis of a large group of disorders, we must admit our disappointment in the failure of this symptom to localize accurately and

determine definitely the extent of certain lesions particularly in deeply seated organs. Our inability to designate the site of some morbid processes by the position of the pain, can in many instances he ascribed, in part at least, to a lack of physiological and anatomical knowledge which is so essential to a full understand-

ing of the symptom. It is supposed that our sensations are aroused in the brain and projected either to the exterior of the body, or to some peripheral organ. We are not however conscious that the sensation occurs in the brain. Long experience has taught us that the peripheral reference of pain is an attempt to locate the site of the stimulus. The nerve impulses concerned in the production of pain are mediated by a special set of nerve fibers which terminate in the ventral part of the lateral nucleus of the optic thalamus. It is assumed that when the impulses reach the thalamic level, pain comes into consciousness as a crude. unrefined, and unlocalized sensation. The pain tract from the thalamus ends in the somesthetic area, in the post-central gyrus of the cerebrum. Peripheral projection and the discrimination of certain qualities of the sensation are believed to be due to cortical activity. Head and many other neurologists have recorded cases in which the fibers leading from the optic thalamus to the cerebral cortex were severed as a result of disease, and in these individuals there was an inability to localize and discriminate the quality of painful sensations.

In general it may be stated that the afferent nerves in the body wall or somatic structures are highly sensitive, while those in the internal structures or viscera are of low sensibility. The application of mechanical, chemical, thermal, and electrical stimulation to the internal viscera including the central nervous system does not as a rule give rise to sensation.

The abdominal pain arising from appendicitis and the shoulder-top variety occasioned by lesions in the neighborhood of the diaphragm will be discussed at some length since they illustrate distinct types.

In an address delivered before the Inter-State Postgraduate Medical Association of North America, I directed attention to the fact that: The surgeon has repeatedly demonstrated the insensitive state of the greater part of the intestinal tract. The stomach or gut may be cut without discomfort. The liver is also apparently insensitive. There is an absence of tactile sense in the mucous membrane of the gastrointestinal tract. A thermic response of these structures is also of a low order. Only extremes of temperature are recognized in the lower colon, rectum, esophagus, and stomach. In health, we are seldom conscious of the movements of the stomach and intestines.

Active peristalsis or reverse peristalsis may arouse a distinct sensation, although the position of the stomach or intestines, or the nature of their movements cannot be recognized. Alvarez² emphasizes the value of this symptom when he says:

It seems reasonable to suppose that the brain of a sensitive man or child should detect, or in some way become conscious of, abnormalities in peristalsis long before they are severe enough to become visible on the roentgenray screen. Furthermore, these disturbances are often so transient that it would be hard to demonstrate them objectively.

In sharp contrast to this low state of sensibility of the internal viscera is the highly developed sensory status of the parieties, especially in the skin where heat, cold, touch, and pain give a prompt response with more or less exact localization. The parietal peritoneum and pleura are also very sensitive to pain, but not to cold or heat. The visceral peritoneum and pleura are quite insensitive.

Although the internal organs do not respond to the various forms of stimuli, which bring about definite sensations when applied to the skin, severe pain often arises in diseases of these viscera, This pain is generally attributed to tension of nerve endings in the walls of these structures. For example, in disorders of the stomach and intestines, such pressure may be due to contraction of the muscular tissue in the walls of these viscera in response to dilatation. It is well-known that hollow organs may be distended with little or no discomfort. It is also known that there are wide variations in the contractility and irritability of the muscle tissue in the walls of these viscera, and when these properties are unduly increased, stimulation induces violent contraction attended by severe pain. Diverse forms of pain can be explained by differences in the degree and duration of this phenomenon — over-distention stomach and intestine may occasion only a feeling of fullness, which appears to arise from moderate muscle tension. Intestinal colic is characterized by intermittent paroxysms of severe pain brought about by violent recurring contractions of the bowel. Biliary colic is featured by agonizing seizures of rather prolonged duration from more or less sustained tension. The pain occasioned by traction on a mesentery is sharp and caused by the tension applied to highly sensitive somatic nerves situated in the base of these structures. This pain is of somatic origin and not visceral.

A case which illustrates clearly some of these sensory peculiarities of the abdominal viscera came under my observation several years ago. In order to determine histologically the diagnosis of a gastric neoplasm in a woman, forty-five years of age, two pieces of tissue were excised with punch forceps from the wall of the stomach. This procedure was accomplished by passing forceps into the stomach through an esophagoscope. Although no anesthetic was employed, the pronounced trauma incident to removal of the neoplastic tissue and mucosa with punch forceps did not cause discomfort. An exploratory abdominal operation was later performed on this patient, using novocain infiltration anesthesia in the abdominal wall. Handling the stomach and intestine did not excite pain so long as traction was not exerted on the mesenteries of these organs.

Acute appendicitis presents certain forms of pain which have received intensive investigation. An inquiry into their causes and production sheds much light on this rather obscure problem. Deaver³ recognized three cardinal symptoms of acute appendicitis, namely, pain, tenderness, and rigidity of the abdominal wall. He pointed out that:

The pain is at first colicky, and is referred to the umbilical region; later, it becomes localized at the site of the appendix. Tenderness on pressure is always present, and is sometimes best elicited by rectal or vaginal examination. The point of greatest tenderness is usually over the site of the

appendix. The rigidity of the abdominal wall is usually right-sided. It follows the localization of the pain, and is most marked over the inflamed area. Vomiting is common at the onset of the attack. It desists in favorable cases. Its continuance is an unfavorable symptom.

The initial pain is generally severe, diffuse, and vaguely localized across the abdomen in the region of the umbilicus or the lower epigastrium. Distinguishing features are its colicky nature and absence of definite localization. The position of the pain in the umbilical or epigastric region is remote from the seat of disorder in the right iliac fossa, and therefore is misreferred. This phenomenon is how-ever designated "referred pain." It is believed by many authorities that hyperalgesia of the skin of the abdomen frequently indicates a disturbance in an abdominal organ. The nerve supply of both—the skin and the internal viscus may have its origin in the same spinal segment. It is well-known that the visceral afferent nerves possess a low order of sensibility. Head explains referred pain as follows:

When a painful stimulus is applied to a part of low sensibility, in close central connection with a part of much greater sensibility, the pain produced is felt in the part of higher sensibility rather than in the part of lower sensibility, to which the stimulus was actually applied.

One interpretation of the mechanism of referred pain suggests that the nerve impulses (developed in the nerve terminals of the diseased organ, the part of low sensibility) are mediated by visceral afferents to the dorsal spinal root ganglion, where, in consequence of a synapse, they are routed to the somatic pain path. On reaching the brain, these impulses arouse a sensation of pain which is projected to the nerve-endings in the skin the part of higher sensibility. When the pain-producing stimulus arises in organs whose nerve supply is derived from both sides of the spinal cord, the reference of the sensation is bilateral.

Morley⁵ denies the existence of cutaneous pain reference in disease of abdominal viscera supplied by afferent autonomic nerves, and holds that the pain is a deep-seated sensation. He gives the following explanation:

I am firmly convinced that true visceral pain exists, and that, as Hurst has pointed out, it is usually the result of abnormal tension on the splanchnic afferent nerve endings in the muscular walls of the hollow viscera. It is in no sense referred to the superficial structures of the abdominal wall, and is a deep-seated central pain, not accurately localized. When pure visceral pain occurs, as in early intestinal obstruction, or in the early hours of an attack of acute obstructive appendicitis, it is entirely unassociated with any tenderness, superficial or deep, or with any reflex muscular rigidity of the abdominal wall. I believe that the phenomena of deep and superficial tenderness and muscular rigidity of the abdominal wall, so commonly observed in association with inflammatory disorders in the abdomen, are in no way concerned with the afferent autonomic system, but are entirely referred from the highly sensitive cerebro-spinal nerves of the parietal peritoneum.

Whether Morley's views will be confirmed by future investigations is a matter of speculation. In angina pectoris (a syndrome arising in various disorders of the heart or perhaps the aorta), pain is frequently felt in the left or right arm, or both arms, and not infrequently, in the neck, with exquisite cutaneous tenderness over the precordial area, which may persist for many hours after an attack. The heart is not affected by the ordinary stimuli which bring about sensations when applied to the skin and in this respect it is not unlike the stomach and intestine.

During an operation for drainage of a pericardial effusion which necessitated resection of a part of the anterior chest wall under local anesthesia, I had an opportunity of observing the lack of sensation in the ventricular muscle of the heart and epicardium by gently squeezing the cardiac muscle and pericardium between my finger and thumb, with the result that no pain was felt. Pain radiation into the chest wall and arms -somatic structures-in cardiac disorders presenting the angina syndrome, conforms to the requirements set forth by Head in his definition for referred pain. We have then in angina pectoris an illustration of a syndrome which concerns a viscus situated deeply in the thorax, and characterized by pain projected into the arms and chest wall, especially into the skin. This is a typical example of referred pain. Since the general arrangement of the sensory nerves of the abdomen—with nerves of high sensibility supplying the parieties, and nerves of low sensibility innervating the viscera—is similar to that of the thorax, it seems probable that the pain mechanism in diseases of the thorax and abdomen is based upon the same general principle.

The pain of colic from gastrointestinal disturbances is felt across the belly in a manner suggesting a segmental arrangement; the site of the pain may be far removed from the source of the dis-

turbance.

1. If colonic disturbance is the cause of the sensation, it is over the lower abdomen. 2. If the stomach is the offender, it is over the epigastric zone.

3. If the small intestine excites the trouble, it is over the middle area.

I know of no way of showing definitely whether abdominal pain due to visceral disease is felt deeply or superficially; its segmental position across the abdomen suggests that the somatic nervous system is concerned in its distribution. Dercum believed that referred pain was largely a thalamic function. Undoubtedly there is a great need for further research and not speculation, to clarify our views on referred pain. Alvarez² writes that "the most paralyzing thing in scientific work is a facile explanation which puts a stop to further curiosity without really advancing our knowledge of the subject."

Initial appendicular pain is often widely distributed over the abdomen, and portrays diversities of severity, duration, recurrence, and subsidence. Its severity is generally proportional to stimulation activity. Heads offers the following explanation for these variations: "Its intensity can be roughly graded according to the force expended in stimulation." Colicky pain is ascribed to powerful peristaltic contractions of the appendix, which may arise from occlusion of its lumen by a foreign body, as a concretion, or by swelling of the mucous membrane. When the obstruction in the appendix is overcome through expulsion of the concretion into the cecum, the vigorous peristalsis ceases with disappearance of the pain. In cases of so-called appendicular colic, with little

traction forms (ences i phenon stomac a feeling of f. arise from mod testinal colic is c tent paroxysms 6 about by violent rethe bowel. Biliary agonizing seizures u duration from more tension. skin. This is a typical example of referred pain. Since the general arrangement of the sensory nerves of the abdomen—with nerves of high sensibility supplying the parieties, and nerves of low sensibility innervating the viscera—is similar to that of the thorax, it seems probable that the pain mechanism in diseases of the thorax and abdomen is based upon the same general principle.

The pain of colic from gastrointestinal disturbances is felt across the belly in a manner suggesting a segmental arrangement; the site of the pain may be far removed from the source of the dis-

turbance.

1. If colonic disturbance is the cause of the sensation, it is over the lower abdomen. 2. If the stomach is the offender, it is over the epigastric zone.

3. If the small intestine excites the

trouble, it is over the middle area.

I know of no way of showing definitely whether abdominal pain due to visceral disease is felt deeply or superficially; its segmental position across the abdomen suggests that the somatic nervous system is concerned in its distribution. Dereum believed that referred pain was largely a thalamic function. Undoubtedly there is a great need for further research and not speculation, to clarify our views on referred pain. Alvarez² writes that "the most paralyzing thing in scientific work is a facile explanation which puts a stop to further curiosity without really advancing our knowledge of the subject."

Initial appendicular pain is often widely distributed over the abdomen, and portrays diversities of severity, duration, recurrence, and subsidence. Its severity is generally proportional to stimulation activity. Heads offers the following explanation for these variations: "Its intensity can be roughly graded according to the force expended in stimulation." Colicky pain is ascribed to powerful peristaltic contractions of the appendix, which may arise from occlusion of its lumen by a foreign body, as a concretion, or by swelling of the mucous membrane. When the obstruction in the appendix is overcomethrough expulsion of the concretion : the cecum, the vigorous peristalsis with disappearance of the pain. of so-called appendicular colic,

or no inflammation of the organ, central pain may be the only symptom. When a concretion in the appendix is not dislodged, pain usually continues until the unstriped muscles in its walls become fatigued, then amelioration in the pain occurs. Inflammatory distention with stoppage of the lumen of the appendix often excites great tension in the viscus, which explains the more or less continuous central pain. Sudden subsidence of pain due to release of pressure in the organ may be the signal of perforation.

The chief characteristics of the visceral or central pain of acute appendicitis are therefore: 1. Bilateral pain reference; 2. vague pain localization across the abdomen; 3. segmental pain distribution in the umbilical and lower epigastric regions.

The second pain of acute appendicitis is definitely localized and sets in a few hours to twenty-four or thirty-six hours after the onset of the central pain. The localized soreness and the central pain may overlap or the initial griping may mask the localized sensation. The pain is usually felt over the right lower quadrant. It is continuous, sharp, and intensified by movements of the body from change of posture, coughing, vomiting, and deep breathing. It is generally associated with tenderness and localized rigidity of the abdominal muscles. The tenderness approximately corresponds to the inflamed organ in the abdomen or pelvis.

Since the appendix occupies various positions, the site of the tenderness varies, as over McBurney's point, or just below the liver edge, over the right upper quadrant, in the flank, and over the pelvis. Several opinions have been offered to explain the localized pain. The fact that the tenderness occupies a circumscribed area, is right-sided, is aggravated on movement of the body, and is associated with rigidity of the muscles in the abdominal or pelvic wall, near the site of the lesion, suggests stimulation of highly sensitive somatic nerves. Mackenzie⁷ was unable to explain this symptom, and wrote:

I cannot satisfactorily account for the predominant symptoms from the appendix being so distinctly one-sided, seeing that it is developmentally a portion of the digestive tube.

Cope⁸ points out that {

This tenderness appears to be located actually in the appendix itself, for the site of the pain on pressure varies somewhat according to the position of the appendix, is obtainable when that viscus is not adherent to any surrounding part, and is frequently elicited when the overlying wall is neither tender nor rigid. In the case of an appendix situated in the pelvis a rectal examination will frequently elicit pain on pressing on the inflamed organ.

Morley⁰ attributes the localized pain to irritation of the nerve endings of the parietal peritoneum. He states that:

Where recurrent attacks of obstructive appendicitis gave rise to the epigastric splanchnic pain alone, the parietal peritoneum was shielded from the appendix by a fairly thick omentum; and as the degree of inflammation was too mild to penetrate through the thick walls of the appendix and the omentum, the parietal peritoneum was not affected. This explains the complete absence of localizing pain or rigidity, and the difficulty in diagnosis. An appendix wrapped round by omentum and coils of small intestine as a result of some former attack, will in fat persons often give rise to no characteristic right sided pain or rigidity until it has perforated. This absence of rigidity is particularly liable to occur if the cecum and appendix are lying low in the true pelvis. But a degree of inflammation so slight as to cause but a little congestion of the outer serous coat of the appendix and a trifling fibrinous deposit will, provided it lies within reach of the parietal peritoneum, cause the most accurately localized tenderness and rigidity.

The excruciating pain of perforated peptic ulcer impresses one with the highly sensitive nature of the parietal peritoneum. Cope's⁸ description of the onset of this condition is as follows:

The initial symptoms are those due to the pain and shock consequent on the flooding of the peritoneal cavity with the gastric contents. The sudden great stimulation of the innumerable nerve-terminations by the irritating fluid escaping from the ruptured viscus causes reflex depression of the vital functions. This may be so severe that the patient may feel faint, or fall down in a syncopal attack. . . . The pain is sudden in onset. The patient may be feeling well one moment, the next he is writhing in agony and crying out for some one to relieve him,

In appendicitis, rigidity of the anterior abdominal wall is generally absent when the organ lies on the pelvic floor, or when it is shielded by omentum from the anterior parietal peritoneum. The abdominal rigidity is localized at or near the site of the lesion, is generally unilateral in distribution, and the muscle contraction is constant. It is a reflex which concerns only somatic afferent, and somatic efferent nerves.

The contention that the localized pain and muscle rigidity of appendicitis are due to parietal peritoneal irritation is supported by the following symptoms:

Unilateral pain reference.
 Localized rigidity.

(3) The tenderness corresponds to the irritated peritoneum which is near the site of the inflamed appendix. In an acute pelvic appendix, the peritoneum of the pelvic floor is tender and muscle stiffness involves the iliopsoas and not the muscles in the anterior abdominal wall. In retrocecal appendicitis soreness and rigidity are in the flank.

(4) Pain is more or less continuous and accentuated by movements of the parietes.

Another striking illustration of the diagnostic value of pain is the shoulder-top variety. Ross'o in 1887 directed attention to this sign and wrote as follows:

There is, however, an associated pain often present in pleurisy for which it is somewhat difficult to find an explanation. We allude to pain, often severe and urgent, over the outer third of the clavicle, and reaching to the shoulder-tip - the territory of the anterior branch of the fourth nerve. Sometimes the pain feels as if a nail were being driven into the joint, and in these cases it may be inferred that the sensory nerves of the joint (a branch of the suprascapular nerves derived from fourth and of the circumflex nerve derived from the fifth cervical root) are in a state of irritation. Now the fourth and fifth cervical pairs of nerves have no splanchnic connections, and consequently this pain cannot be the associated somatic pain of splanchnic irritation. In observing a case of pleurisy a few days ago, and casting about for an explanation, one of the students suggested that, considering the connections of the phrenic, the pain might be caused by irritation of that nerve. It then occurred to me that Peter had described a phrenic neuralgia, and on referring to his description. I found that he regards pain over the shoulder-tip as a constant symptom. It is only right to add that the phrenic nerve is regarded by some physiologists as a purely motor nerve; but, considering how exquisitely sensitive the diaphragm becomes in pleurisy and in peritonitis, it can hardly be destitute of sensory nerves. In favor of the view that the shoulder-tip pain is caused by irritation of the phrenic, is the fact that essentially the same pain is met with in pericarditis, peritonitis, abscess of the liver, and during the passage of gall stones; while we shall immediately see, that it is probably met with in a more or less disguised form during attacks of angina pectoris.

John Morley¹¹ in a valuable contribution on "The Clinical Significance of Shoulder-Tip Pain," refers to its anatomical and physiological basis, its occurrence in gallstone disease, perforated gastric and duodenal ulcer, perforated peritonitis from other causes, ruptured tubal pregnancy, rupture of the spleen, pneumonia, and diaphragmatic pleurisy. He demonstrated in a case of empyema in which a rib was resected under local anesthesia that when a finger was introduced through the anesthetic chest wall and gentle pressure applied on the upper surface of the central area of the diaphragm, characteristic shoulder pain appeared on the corresponding side. When the extreme periphery of the upper surface of the diaphragm was irritated, pain was felt along the lower chest wall.

The phrenic is derived mainly from the fourth cervical nerve, a small branch from the third and one from the fifth cervical nerves, a branch from the sympathetic, and rarely one from the vagus. The central zone of the diaphragm is supplied by the afferent fibers of the phrenic, the outer zone or rim of the diaphragm is innervated by afferent fibers of the lower six thoracic nerves. Afferent fibers of the third and fourth cervical nerves supply the greater portion of the skin of the shoulder-top. When the central zone of the diaphragm is irritated, pain is felt over the shoulder-top, and when the peripheral zone is stimulated, it occurs over the lower chest wall or the upper abdomen. Shoulder-top pain is definitely a referred sensation, easily explained on Head's hypothesis.

In a recent contribution on shoulder-

top pain,12 I directed attention to the following:

The location, extent, intensity, and duration of this symptom varies considerably. It may cover a wide area over the top of the shoulder or may be localized to a small zone at its tip. Bilateral pain is not uncommon, and indicates involvement of both right and left diaphragm. The pain varies much in severity. In some cases it is so mild as to excite only slight discomfort; in others, it is intense and boring in character. It may be constant, intermittent, or occur only on deep breathing.

The association of abdominal with shoulder pain is common. Abdominal pain may be so pronounced as to annul shoulder-top pain. A case illustrating the presence of violent pain in the lower chest, although the central portion of the diaphragm was subjected to irritation, came under my observation several years ago. It was that of a physician who received a gunshot wound of the peripheral zone of the diaphragm and the spleen. At operation, much free and clotted blood was found in the upper abdomen, which caused marked irritation of the central area of the diaphragm. He suffered from very sharp pain at the base of the chest on the left side, especially on breathing, induced by the lesion in the peripheral region of the diaphragm. The severe pain prevented the phrenic nerve pain from coming into consciousness.

Morley's¹¹ interesting observation supports this finding. He says:

Occasionally we meet with a case of perforation in which the abdominal pain is so severe that the patient's sensorium is unable to appreciate another stimulus. The greater pain inhibits the lesser, and the shoulder-tip pain is denied when we put the question. Induce spinal anesthesia however, and as the anesthesia mounts to the sixth dorsal segment and the abdominal pain vanishes. the patient will ejaculate, "Ah! now I fee' that pain in my shoulder you asked me about."

In acute cholecystitis and biliary colic, shoulder-top and abdominal pain may be associated. Phrenic nerve pain in gallbladder disease is rare, and not easily explained. It is not unlikely that in some individuals fibers of the phrenic reach the wall of the cystic duct and neck of the gall-bladder. Such a disposition of these fibers would elucidate the symptom in gall-bladder disorders. Phrenic pain is almost constant in perforative peritonitis due to the irritation of the under surface of the diaphragm. When free and clotted blood comes in contact with the diaphragmatic peritoneum, it sets up shoulder discomfort. It is an early symptom of diaphragmatic pleurisy.

An interesting case of pleurisy in a girl of seventeen which came under my observation, presented this symptom. Her illness began suddenly with fever, cough, and pain over the right shoulder-top. On the second day of her illness, sharp pain set in at the base of the right chest, and on the following day both the shouldertop and basal chest pain disappeared. After the pains ceased, the physical examination revealed a right-sided pleural effusion. The symptoms indicated that the infection spread from the pleura overlying the central zone of the diaphragm, to the pleura covering the peripheral area of the structure. The separation of the pleural surfaces by the effusion, removed the irritation which caused the shouldertop and lower chest pain.

A painstaking and systematic clinical study of pain, especially when correlated with associated symptoms, and appraised on a physiological and anatomical basis, is a most useful and often an indispensable guide to diagnosis.

NAILS AND THEIR DISEASES

MORTIMER J CANTOR, M D, Brooklyn

From the Department of Dermatology and Syphilology, Good Samartian Dispensary, New York City and the Department of Dermatology, Beth Moses Hospital, Brooklyn

Introduction

In going over some of the important literature on the general subject of nails and their diseases, I find many of the leading texts on dermatology, puthology, physiology, and surgery, make little or unsatisfactory mention of either the physiology or pathology of the nuils

Dr J Heller's original monograph on nail diseases is the finest and most comprehensive work on the subject, and from it I have found deep inspiration and a

wealth of material

The importance of nail symptoms may be considered from two points of view one being that they are manifestations of some internal pathology, the other that they indicate some local or general disease of the body covering. Littrely too little attention is, and has been, given to discussions on the changes in the nails or to the significance of such changes.

There is much work yet to be done to systematize the conglomerate collection of data on nail disorders or diseases so as to offer a better understanding of the underlying physiology and pathology. This treatise must, of necessity, be very much curtailed, only the most important and common nail disturbances will be discussed and many of the terms employed in connection with the description of nail diseases will be defined.

Histology and Anatomy of the Nail

The peculiarity in the biology of the nail is that the germ cell develops up to its finish, so that during the life of the nul, which is estimated to be from 120 to 160 days in the adult, there is a complete life cycle—from the epithelial or ectodermil cells of the matrix to the lifeless, exfoliative homogeneous mass of

Acknowledgment and thanks for their help and guidance in the subject is extended to Dr B Lapowski and Dr A Walzer of the De partment of Dermatology and Syphiology of the Good Simaritan Dispensary the nail body. The growth of the nail is continuous during the life of the individual, being more active in childhood and in the summer season. In the child, the nail is renewed in eighty to ninety days, the nails of the toes requiring about three times the period mentioned for renewal. If left uncut, the nail will not grow indefinitely, but will become thin and a natural free distal border will form.

The nail consists of modified cornified epithelium. The nail begins to develop at about the end of the third month of fetal life as a semilunar groove near the end of the dorsum of the finger or toe As the semilunar depression invaginates deeper and further back, the upper portion of this invagination forms the upper nail folds which overhang the nail body, The nail root and the nail body develop from the lower reflection of this invagination, in which there have formed granular prickle cells, and it is from these cells that the nail develops The nail is therefore formed from specially modified prickle cells and is not actually an outgrowth of the enthelium

The matrix or root of the nail consists of the posterior portion of the invagination and the changed epithelium, and extends to the anterior convex margin of the lunula (seen as the white crescentic portion of the nail body) The matrix. as can readily be seen, is a very important structure Microscopically, it is composed from the bottom up of the following a papillary layer with the basal layer of cylindrical epithelial cells, immediately above this are several rows of prickle cells, and then above these, several rows of flat, closely packed, granular cells having shriveled nuclei and containing fine granules which give the white opaque appearance to the lunula The most posterior cells of the matrix form the surface of the nail, the cells more to the front forming the median portion, the cells

Read at the Annual Meeting of The Medical Society of the State of New York, Albany, May 14, 1935 most anterior (or those of the lunula) forming the lower surface of the nail." This is important in the explanation of various nail disturbances and may account for:

1. Injury to or disturbances of the cells of the lunula, resulting in leukonychia.

2. Injury to the median cells, resulting in variations in the thickness of the nail.

3. Injury to the posterior cells, resulting in ridges, furrows or depressions.

The nail body is the result of specialized granular prickle cells which have become flattened and have undergone cornification. They are arranged in superimposed lamellae which can only be distinguished near the nail matrix since further forward they become knitted together to form an almost homogeneous plate. The under surface of the body is traversed by fine longitudinal ridges which fit into corresponding depressions in the nail bed.

The nail bed extends from the matrix almost as far as the free edge of the nail and on it the nail plate rests, being attached to the nail bed. Microscopically, the nail bed consists of a prickle cell layer over a papillary layer. (Fig. 1 and 2).

The circulation to the nail is through a plexus in the matrix formed by dorsally directed branches of the terminal arterial anastomosis of the distal phalanges. In the hand, the median nerve supplies the thumb, index, the middle and lateral half of the ring finger, while branches of the ulnar nerve supply the little finger and the inner half of the ring finger. This is

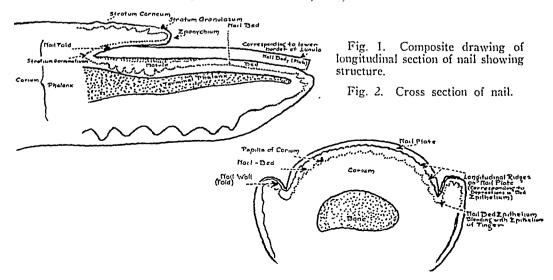

of importance in the trophic changes of the nail. There are several types of "tactile corpuscles" in the corium of the nail bed and matrix which give to the digits, senses of pressure, heat, cold, and pain.⁴

General Considerations

The nails are extremely sensitive to slight nutritional variations. Their manner of reaction to the same trauma may be very different and is due, in a great part, to the extent and duration of the effect of the disease or irritation on the matrix. Thus, the same cause may give either atrophy, hypertrophy, color changes, friability or other dystrophic changes, or any combination of these.

In the several accompanying illustrative cases, the finger nails have been utilized in preference to the toenails, although the toenails are affected in a similar way by the same disturbances. trauma of the toenails in walking and other detrimental factors, such as lack of exercise, excessive heat and moisture render them so changed in appearance that, even in a normal case, the finer descriptive values are lost. It has been shown that tinea organisms are to be found in apparently normal appearing toenails.12 How far this holds true in finger nails is yet to be ascertained, and, at the same time, the relationship of tinea infections of the hands and forearms to tinea of the finger nails needs clarification.

Of the various classifications of nail diseases, the etiological basis is most suitable, viz.,

Some Symptoms and Terms Descriptive of Nail Disorders

Onschaurts Hypertrophy of the nails in length, brendth, and thickness, with varying color changes occurring congenitally or post-traumatic (Fig. 13)

Onvchogryphosis This is restricted to hypertrophies usually congenital, in which twisted contorted, horn twisted mals are present (usually in the toes)

Onychia Inflammation of the nail body from any cause

Unguis incarnatus Ingrowing nuls

Hangnail This is a part of a lateral nail fold detached mechanically and torn upward

Subungual hemorrhage Hemorrhage under the nail plate, occurring in trauma, scurvy, hemophila, etc

Anonychia Absence of one or more nails is rare, but may occur with other mal developments. It may be the result of de layed development, and the mals, although absent at birth may appear later. There there been reperted cases of false implantation of mals, in which the mal is attached to a part of the finger other than normal as at the first interplalangeal joint.

Onschorrherts A splitting of one or all of the nail plates, usually in longitudinal lines

Pitting This occurs as small depressions in the nul plat. These depressions have a punched out appearance, pin-point to pin head in size and varying in number, usually occur on the index and ring fingers. This condition has been noted in cardiac disease, typhoid, smallpox etc. It has been found that practically all of the above tubercular children have these depressions in the nulls? They have also been noted following trauma of maincure.

CHART I -ETIOLOGICAL CLASSIFICATION

Congenital	anonychia etc dystroplies	atroj hy hy pertrophy
Traumatic	Physical Chemical	Manieuring Laborer I riability D scoloration
Neoplastic	Benign fil ror Vial gnant-sam	na—chondroma coma
Infections	Mycotic Epideric Trichor	mophytos s—Fungus phytosis ychia
Affections of The Na is Associated With Cutaneous Diseases	See Chart II	Psoriasis of Nails
Affections of The Nails Associated With Internal Diseases	Syphilis Circulatory-Disease Rheumatism Tuberculosis Endocrine Disturb	es-club fingers etc

Longitudinal ridges
In ridges occur in longitudinal direction, varying from very fine hur lines to the thickness of a large pin When these ridges are wider, they give the mail the appearance of being fluted or reedy, and are then grouped with 'Onychorrhexis' Occasionally, they occur in liealthy mails following trauma Recently hypovituninosis has been held a factor in this disturbance *

Paronychia This is a mild inflammatory process (Streptococcus or staphylococcus) starting in the mil-fold and involving either part of or the entire mul-fold

Fig 3 Patient aged sixteen Epidermo phytosis of fingers six months ago followed four months later by affection of the nails

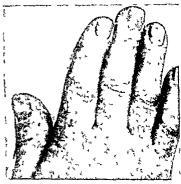

Fig 4 Patient aged thirty five Lpidermo phylosis of fingers and involving nails at the folds Duration, one year

Leukonychna (White spots, also called "Gift Spots") There are many theories of the formation, amongst them being trauma in manicule, interference in the nutrition of of the nail matrix, abnormal cornification, air in the nail substance, parakeratosis with-

out infiltration of air, and finally, deficient keratonization. There are three distinct varieties:

- 1. Punctata: extremely common, "White spots" after trauma of manicure.
 - 2 Striata usually in transverse direction and

seen more often in neuritise and following severe

illness and congenitally.10

3. Totalis: one of the rarest disorders of the nails. It may be congenital, but is usually acquired following severe sickness. It is occasionally associated with scleronychia, and is also seen in postrheumatic fever (not involving the lunula).

Beau's lines: Transverse furrows which denote impairment of nail nutrition, either systemic or local. They are first seen over the lunula and gradually progress forward with the growth of the nail.

and the Brown or the han

Types of Atrophy

1. Onychotropia: Thin, abortive, and defective nails, most often associated with alopecia, generalized or in patches, and with congenital nail and hair disorders in the family.

2. Hapalonychia: Softened and weakened nail plates which readily split, caused by

defective nail production.

3. Kollonychia: (Spoon nails). Nail plates are thinned, presenting concavities more marked transversely than from before backward. It is supposed to be almost pathognomonic of acanthosis nigricans.

Anychoschizia: Loosened nail in its bed.
 Occurs as symptomatic process in psoriasis, eczena, syphilis and other diseases in which collections of cells beneath the nail mechani-

cally raise it.

5. Onychomodesis or onychoptosis: A total and intermittent shedding of nails after any severe systemic fever. The nail may also be shed with generalized alopecia areata, syphilis, and diabetes⁶ (Chart I).

Classification

1. Congenital: Anonychia, as previously described, also mutations.¹⁵ (See chart I.)

2. Traumatism: As a result of traumatism from many sources (mechanical, chemical, x-ray, etc.), the nails may be severely injured and entirely changed in appearance, such changes depending on the part or parts of the nail so damaged. The severest changes will result from injury to the matrix.

3. Neoplastic disorders: These are confined to the various forms of subungual growths, such as fibroma or sarcoma, and also include the phalangeal tunnors io in so far as they affect the nailbed and cause subsequent elevation or

displacement of the nail-plate.

The verucea of the nail-folds should also be mentioned here. This usually occurs on one or both lateral nail-folds, is of the cauliflower type and may extend deep into the nail-fold, causing pain, discomfort, and bleeding.

4. Infections: (a) Pyogenic-parony-

chia, as described. (b) Onychomycosis.

1. epidermophytosis. 2. trichophytosis.

3. favus. (c) Moniliasis.

In normal nails, many tinea, yeast, and thrush fungi are to be found, the main types being the microsporon, trichophyton or megalosporon, pityrosporon, hemispora, oidiomycosis. Before going any further, I might say that I cannot at this time go into a full discussion of the plurality of fungi causing ringworm of the nails. ¹⁷ This is, of course, the task of the mycologist.

The relative importance of the trichophy-

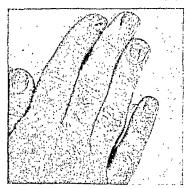

Fig. 7. Patient aged thirty. Psoriasis on body for many years. Nails of "worm-eaten" type of about one years' duration.

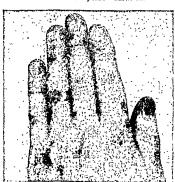

Fig. 8. Patient aged thirty-four. Psoriasis on body for ten years. Nails, type showing pitting. Duration, one year.

ton and epidermophyton as a cause of onychomycosis has changed often in recent years. It has been shown that the former is by far the predominant cause of nail diseases of the toes.¹⁸

On the other hand, it seems that in Europe the epidermophyton plays the dominant role.¹⁰ From a study and compilation of over 500 nail affections in a tropical climate, the most prevalent was onychomycosis. (1890.)²⁰

(a) Trichophyton. Ringworm of the nails may be a primary disease, but it is

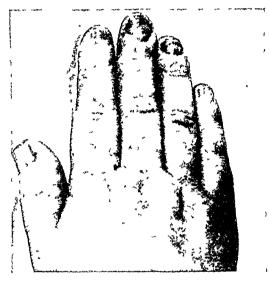

Fig. 9. Patient aged thirty-nine. Tinca trichophyton finger nails involved. Duration, seven months Hands, body, and hair normal.

Fig. 10. Patient aged thirty-two. Tinea trichophyton: finger nails, duration, six months No skin lesions ever present.

usually secondary to ringworm of distant parts of the body. The nails of the hands are more commonly affected than those of the toes, probably due to the act of scratching other affected parts. Infection usually takes place beneath the free border, attacking the epidermis of the nail-bed and nailbody, causing the formation of a dirty gray, scaly thickening which raises the nail. It gradually spreads backward towards the matrix, attacking the nail substance itself and giving rise to various nail changes as irregular, thickened, spongy, dirty-looking nail with a frayed edge. The final diagnosis, however, is made by demonstration of the organism in the exudate or scrapings, or by cultural or biological characteristics. Figs. 9, 10, 11, 12. A rare case of onychomycosis affecting all the nails of the hands and feet was caused by a trichophyton.21

(b) Epidermophyton. The diverse character of the lesions of mycosis (non-trichophyton) of the nails of almost all nail cases, suggests the idea of symbiotic relationship of these fungi with various common saprophytic molds or bacteria so often associated with them in the tinea lesions. Invasion of the nails is always secondary to the epidermophytosis on the hands or feet. It may attack from the nail-folds-only one nail or several, or all. In a typical case, after invasion of the nails, the plate becomes changed in color, consistency, and shape, the process beginning commonly along the attached borders of the nails at the lateral or post-nail folds. After infection of the nail bed and matrix, the nail becomes friable and breaks away irregularly from its attachment, and there are often subungual striae towards the lunula. As usually seen, the nail surface is irregular, showing ridges and depressions. It is spongy, granular, and of a yellowish or brownish color. The anterior portion of the nail is finally cast, leaving a stump near the lunula which is markedly deformed. Figs. 3 and 4.

- (c) Favus (very rare). Gives similar clinical picture.
- 5. Affections of the nails associated with cutaneous disease:
- (a) Psoriasis. One of the most important and common diseases of this group is psoriasis. Psoriasis of the nail alone, if it occurs at all, must be very rare. The predilection of the nail site for the lesions to form may, of course, be present in an individual inclined to psoriasis of the body. In a given case of psoriasis of the nail with no body manifestations, one may find that either the body lesions have disappeared or that the lesions will appear.

Changes in association with psoriasis occur in three distinct forms:

1. The margin of one or more nails near the free border loses its natural lines, the edge of the plate is visibly loosened from its attachments and a thin granular mass interposes between the damaged portion of the nail and its bed (psoriatre plaque) The diseased part of the nail, being friable, may break away or else cling to its attachment, the second portion. The process may slowly continue to the root of the nail. In some few cases, there is a well-defined subungual psoriasis patch which may proceed to the point of partially detaching the nail from the bed, although the nail is not often completely

shed Figs 5 and 6.

2. There appear multiple pin-head sized and smaller punctate depressions, often regularly arranged in longitudinal directions about eight to ten in the nail affected. These represent points of softening of the nail substance and, in

appearance, have been likened to the exterior surface of a thimble.²² Fig. 8

3. The nails appear "worm-eaten," pitted, friable, and discolored; some split, some fracture which may leave a crumbled-edged, wellattached stump with the distal quarter or half of the plate missing and the exposed matrix covered with an imperfectly formed, horny epidermis 22 Fig 7.

6. Affections of the nails associated with internal disease:

Syphilis of the nails, Exclusive of chancre of the nail which sometimes involves the nail-bed, or more often the nail-fold, the nail changes in syphilis that occur in the secondary and tertiary stages may be divided into two large groups 2, 13, 14

(a) Onychia sicca syphilitica In this group, there is no obvious inflammation of the adjacent skin or of the nail matrix or nail-bed. Regarding this group, almost every conceivable clinical type of nail lesion has been described, among which are pittings, thickenings, fissures, splittings, discolorations, and even Beau's Lines Much difference of opinion is expressed as to whether these dry onychia are the result of local syphilitic manifestations or due to general nutritional disturbances of other etiological factors besides syphilis

(b) Paronychia or perionychia syphilitica. In this form the nail lesions are secondary to local inflammatory disturbances and include two varieties (1) Papular or pustular lesions on the nail-bed, (2) Papular-crusted or ulcerative lesions around the nail and involving the matrix and the nail-bed Each of these varieties is said to be more common than onychia sicca. The diagnosis in these syphilitic nails is dependent upon the history of the case and its associated lesions, with or without a positive Wassermann at the time.

Conclusions

 It is impossible in this article to attempt to describe all the nail conditions

listed in the classification (Chart I) because of the time limitation of this paper.

2. An attempt is made to clarify for the general practitioner the anatomy, physiology and varied findings in nails and their diseases. A chart of classification of nail diseases and a chart, depicting graphically the predominant signs and symptoms found in nails associated with the more important dermatological entities, are added.

3 From the appearance of the diseased nail, it is difficult or impossible to come to a definite conclusion with regard to

Fig. 11. Patient aged seventy. Tinca trichophyton: finger nails, duration about twenty years. Timea of groin for many years.

Fig. 12. Patient aged twenty-five. Tinea trichophyton: finger nails, duration, three months

Fig. 13. Patient aged six and a half. Lichen spinulosis of body with pachyonychia congenita. Case reported by Andrews and Strumwasser, N. Y. STATE J. M., 29.747, 1929.

the underlying cause since similar appearances may be produced by totally different causes. In most cases, a firm diagnosis can only be attained from the presence of concommitant symptoms of cutaneous or general disease.

4. In affections of the nails associated with cutaneous disease, psoriasis and mycoses are chosen because of the limitation of this article and because of their relative importance and prominence in dermatological and medical practice. Illustrating photographs are appended, as well as a photograph of a case of pachyonychia congenita with lichen spinulosis of the body.

A: Psoriasis: The deep form of pitting arranged in a longitudinal form is suggestive; also the psoriatic plaque and subungual keratoma.

B: Mycoses: Here the diagnosis should really rest on a microscopic demonstration of the organism or by cultural or biological characteristics. The mode of invasion should tend to give a clue.

1. Epidermophytosis of fingers may involve the nails, beginning as a rule, from the nail-

2. In trichophytosis, involvement begins with the edge of the nail. There is also a history of tinea of the scalp or skin.

5. In affections of the nails associated with internal diseases, syphilis is chosen because of its interest to most physicians. Here, the other etiological factors must be ruled out before considering a nail syphilitic.

6. Other lesions of the nails should lead to careful history and search made for the cause, such as recent illness, excessive manicuring, traumatism.

MEDICAL CENTER FOR JERUSALEM

Construction of the Rothschild-Hadassah-University Hospital on Mount Scopus, overlooking Jerusalem, probably will begin late this summer, according to Dr. Jacob J. Golub, director of the Hospital for Joint Diseases and consultant to the building committee of the institution in Palestine.

It will be the first medical center in Palestine, Dr. Golub explained, and will cost about \$750,000. On a twenty-five-acre plot will be three units of buildings, each three stories high; a 260-bed hospital, a graduate medical school, with complete laboratories, and a nurses' training school and residence.

CLINICAL-PATHOLOGIC STUDY OF MENINGITIS

MAN HELFAND, M.D., New York City

Instructor in Neurology and Psychiatry, Post Graduate Medical School, Columbia University From Department of Neurology and Psychiatry Post Graduate Hospital

The writer has undertaken the study of these cases in order to add light to (1) the pathogenesis of meningitis, the dissemination of the inflammation and the concomitant intracerebral pathology, (2) the relationship of a specific bicterial infection to the nature of the pathology produced, and (3) the relationship between the clinical symptomatology and the

lesion found in necropsy

For this purpose eighteen cases have been examined, these were hospitalized and later came to necropsy Microscopic section of the body organs as well as of the brain were studied. The following stains were used in this series Nissl. Hematoxylin-Losin, Van Gieson, scarlet red, Spielmeyer, Bielschowsky and Penfield's modification of Hortega clinical history of each was carefully studied and compared with the pathological findings, and the following reports represent summarized conclusions which may help to elucidate the above problems

Embryologic and physiologic principles In the study of the reaction of any tissue we must invariably refer to its embryologic origin, for any tissue reacts in a manner which is inherent in its particular potentialities. The meninges are mostly mesodermal tissue, but doubtedly there is also some ectodermal element in it 1 Of course, the dura as well as the arachnoid and pia are structurally different from each other The dura is very vascular, and contains lacunae with many interstitual spaces in which are nests of arachnoid cells, whereas the arachnoid is avascular and its cells are mesothelial in type, and, as the name suggests, it spreads and fuses in a spiderlike fashion with the pia. The pia has two main layers, an external and internal. the latter separated from the former by longitudinal fibers which are usually parallel to each other and occur in thick bundles

An important fact is that the subarachnoid space which contains the spinal fluid may be compared to a vascular system This space extends along the adventitia of the blood vessels into the brain substance, and also along the nerves, cramal as well as peripheral2 The flow of fluid within this space has usually no definite direction, but its constituents may mixed when the fluid is propelled to and fro in a tide like motion by the change of intracranial content capacity due to inspiration and expiration Of course, this fluid is absorbed by arachnoid villi, and therefore all the constituents will sooner or later reach this station 3

Another important physiologic fact is the existing barrier between the blood and the spinal fluid. This is easily demonstrated experimentally, if one injects dye within the blood, it does not penetrate into the spinal fluid Also, if one injects bacterial toxins within the aorta, one can not produce, under ordinary circumstances, an encephalitis Neither can one isolate the bicteria from the spinal fluid But if there is a concomitant injury or defect in the meninges or bruin substance, then this barrier is reduced and the inflammatory process enters into the brain tissue with remarkable intensity 4

It must also be remembered that one is not justified in calling any reactive process showing infiltrations in the blood vessels, an encephalitis By the term encephalitis is meant that there must be present an independent inflammatory disease with local structural inflammatory signs These signs by themselves are in sufficient for the diagnosis of an encephalitis If given a softening with infiltration of the blood vessels in its vicinity, we would term this a local inflammatory reaction, but not an inflammatory disease. This conception has been definitely established as a pathologic truth 5

Pathogenesis and distribution If the foregoing is kept in mind, it becomes very much simpler to follow certain principles in the production of meningitis No blood infection can produce a meningitis or an encephalitis unless the blood barrier has been minimized at first by a vascular insult to the brain parenchyma These

insults are usually the result of bacterial emboli within the vessels, or of a toxic interference in the performance of the vascular function. If such an injury occurs, there results within that area a definite inflammatory process whose products are drained via Virchow-Robin spaces into the subarachnoid space. It is at this point that a meningitis begins from the infectious products in the spinal fluid.

An example of such a phenomenon may be illustrated by means of the following case:

V.B., male, age forty-one, was admitted to the hospital with weakness, chills, fever. cough, and a pain in the chest. He looked toxic, and somewhat confused. Examination showed a resolving pneumonia in both lungs, with a possibility of a lung abscess or empyema. In the course of the high fever the patient developed a left facial palsy, twitching of the right side of the face, mouth, and tongue. Gradually he ceased to use the left side of the body, which became more or less spastic. Swallowing became difficult, and finally the patient altogether lost the power to swallow. There was no definite Kernig at first; spinal tap at this time showed 190 cells, thirty-five of which were lymphocytes.

Autopsy showed chronic upper respiratory infection, chronic purulent bronchitis, upper right lobe lung abscess, chronic bilateral pleuritis, empyema left, metastatic infarcts and abscesses in the liver, spleen, and pancreas. There was diffused purulent meningitis most marked at the base of the brain, but present also along the convexities. Microscopic examination showed metastatic abscess in the right cerebellum, as well as an abscess in the right parietal lobe. There was also a circumscribed area of softening in the left parietal lobe involving the anterior and posterior central gyri with a large thrombus formation in the vessels of the adjacent meninges.

This case demonstrates a generalized pyemic process with metastatic abscesses into the brain parenchyma, including a vascular lesion. In spite of the existence of the septicemia for some time, a generalized meningo-encephalitis was produced only after the brain blood barrier was minimized through the vascular trauma.

On the other hand, the infectious agent may gain entry to the spinal fluid via endoneural channels or through contiguous trespassing, as in otitic abscess; or by actually penetrating a vessel wall during its course into the subarachnoid space: or through its trophistic affinity towards the fluid, in which case there would exist a meningitis primarily. The inflammatory products then course through the Virchow-Robin spaces into the layers of the cortex and produce a concomitant encephalitis; the encephalitic process is more or less limited to the upper layers of the brain because of the fact that the vessels from the pia penetrate the brain substance for only a short distance. frequently one finds a defensive glia reaction in the first layer, the "Randzone," because of the direct irritating stimulus of the inflammatory products in the fluid which it bathes.

Extra-meningeal pathology: It is very significant that an ependymitis usually accompanies every form of meningitis. This is due to the fact that the infectious agent permeates the foramina of Magendie and of Luschka into the inner ventricles, thus affecting the ventricle lining, mostly its subjacent tissue. This is characteristic of all forms of meningitis, and it can also be experimentally produced by the injection of dye into the subarachnoid space intravitally, and later on, post-humously, one finds not only a meningo-encephalitis of the superficial layer of the cortex, but also a subependymitis.6.7 It is also characteristic that in those cases in which the basal cisterns are mostly involved, the floor of the third ventricle is always affected; for the floor of the third ventricle almost reaches the meninges at this point.8

All meningitis is accompanied by a perineuritis. This is due not only to the involvement of the cranial nerves as they pass through the subarachnoid spaces but also to the continuation of the subarachnoid spaces along all nerves, spinal as well as cranial.

There is also a concomitant cerebral edema with an increase of tissue spaces. The edema may be so great as to lead to diapedetic extravasations of blood. This is easily understood from our foregoing physiologic considerations. The retention of fluid may be due to the blockage of drainage by the inflammatory products in the perivascular spaces as well as to the direct involvement of veins causing local circulatory obstruction. This excess may

lead to vacuole formation (status facunaris) or to metabolic changes within the

ganglion cells

Frequently one finds circumscribed areas of myelm sheath loss within the white substance. Usually they are perivascular, but at times one may consider these foci as due to a nutritive interference dependent on vascular dysfunction.

Relation of the infectious agent to pathologic lesion. The cases which have been studied in this scries included various infectious agents most of which have been bacteriologically proven Although there is a discernible qualitative difference in the reaction called forth by them, nevertheless the capacity of the various tissues in the meninges to react to a noxious substance is more or less limited For instance the dura brings forth proliferated fibroblasts and gitter cells. The vessels may be increased in number, cdematous, and their walls infiltrated with cells These infiltrated cells may even wander away from their anchorage into surrounding space The arachnoid is avascular, and always remains morphologically the same However, the mes othelial cells may be mingled with wandering cells of the infiltrative type which may be found discrete or in clusters The pia, on the other hand has numerous blood vessels, and these will show a reaction similar to that in the dura. In the purulent cases of this study, the pmn leukocytes predominated These at times contain ingested microbes. At times there are necrotic areas in which one finds remnants of necrotized cells. These areas may be surrounded by macrophages and numerous gitter cells. The inner layer of the pia, in these cases is very hyperemic and very vascular The infiltrations in these vessel walls are composed mostly of leukocytes, but there are also many lymphocytes and polyblasts. All these are found not only in the Virchow-Robin space, but may penetrate through the ves sel wall to and including the very intima, so that panarteritis is produced

There is no appreciable difference between the pneumococcic and the meningococcic local reactions. The leutic mening encephalitis is characterized mostly by the predominance of the lym phocytes and plasma cells, whereas the tuberculous infection has as its outstand-

ing characteristic the macrophages this infection the cells of the blood vessels strin brdly, the elastica may be split up or broken, and the adventitia is invaded by numerous cells which may become caseous because of their insufficient blood supply, thus leading to the formation of tubercles It is noteworthy that in tuberculous and luctic infections the predominating seat of the inflammatory process is at the base of the brain, lessening in intensity towards the convexities. One also notices a confirmation of the findings of Pollak,10 that in the tuberculous process the arachnoidal involvement predominates whereas in syphilis the pia is mostly in-

Clinical symptoms Attempts to correlate the clinical symptoms with the actual puthological findings obtained in postmortein studies, meet with some difficulties. For we can not associate personality putterns of behavior with a definite focus of pathology. The symptoms of meningitis have to be evaluated (1) from the total personality make-up, (2) from toxic effects, (3) from vascular dysfunctions (4) from neuritic involvements, and (5) from intracerebral pathology. Each case represents an entity in itself, although possessing some traits of a common group

1 Personality changes This is especially evident in tubercular meningitis, where the onset may be gradual with hardly any fever. The patient becomes irritable cries without provocation loses his appetite, becomes sulky and at times stuporous and prefers to be left alone. At times the patient is fretful and restless.

2 Torue effects Severe headache and vomiting should be considered as the earliest manifestations to arouse suspicions of an intracranial involvement especially of mennigitis if there is some infection present, such as middle ear disease 11 Fever is usually present, and ranged in the cases of

this study between 100-105° F

3 4, and 5 Vascular dysfunctions present symptoms depending on the nature of the lesson it produces. At times the patient shows hemiplegic signs, and at other times aphasic, these may be transitory or permanent. Trequently the content of a dehritum might give material for the diagnosis of cortical miolement. As stated before, in all cases of meningitis there is an accompanying subependymitis. This is to be considered especially in the symptoms due to increased intracranial pressure.

The localizing signs may be many and varied, depending on the concomitant neuritis or upon the intracranial seat of the lesion. In those cases which have the predominating inflammatory process in the basal cisterna, an involvement of the third, fourth, and sixth nerve is very common. The sixth is usually most frequently involved, because of its long course underneath the dura and also underneath the petrosphenoidal ligament, exposing it more to injury by an exudate. Optic neuritis is frequently seen; one of our cases had a right homonymous hemionopsia due to an involvement of the left temporal

A rigid neck and Kernig are not always present. They may be considered as diagnostic signs only if obtained. They are present in basilar meningitis, but if the process is mostly in the vertex, there may be no stiff neck and no Kernig.

Conclusions

- 1. The dissemination of meningeal inflammation follows physiologic principles.
- 2. Meningitis is always accompanied to a greater or lesser extent by intracerebral pathology.

3. There is a qualitative difference in

the reactions to the various agents.

4. Clinical symptoms should be evaluated from personality change, toxic influences, vascular dysfunction, neuritic and intracerebral involvements.

MEETING FOR STUDY OF GOITER

The annual meeting of the American Association for the Study of Goiter will be held in Chicago, June 8th, 9th, and 10th. The tentative program is as follows:

Monday, June 8, Morning

Dr. J. B. Collip, Montreal, Canada, Title to be announced.

Dr. Willard Owen Thompson, Chicago, Ill. 1. "Interrelations of Pituitary and Thyroid" or 2. "Recent Observations on the Thyroid Hor-

Dr. J. Lerman and Dr. W. T. Salter, Boston, Mass. "The Role of Natural and Artificial Thyroid Proteins."

Dr. H. J. Perkins, Boston, Mass. "The Interpretation of the Blood Iodine Level Before and After Subtotal Thyroidectomy for Hyperthyroidism."

Dr. D. Ray McCullagh, Cleveland, Ohio. "Quantitative Investigations of the Thyrotropic Hormone."

Afternoon

Dr. John De I. Pemberton, Rochester, Minn. "Hyperthyroid Reactions."

Dr. S. Hertz and Dr. J. H. Means, Boston, Mass. "Profound Weight Loss as a Precipitating Factor of Thyrotoxicosis."

Dr. Frederic A. Coller, Ann Arbor, Mich. "Liver Function in Relation to Hyperthyroid-

Dr. James H. Hutton, Chicago, Ill. "The Response of Exophthalmic Goiter or Graves'

Disease to Irradiation of the Pituitary and Adrenals."

Dr. Nathan A. Womack and Dr. Warren H. Cole, St. Louis, Mo. "The Thyroid Gland in Hypoglycemia."

TUESDAY, JUNE 9, AFTERNOON

Dr. Henry S. Plummer, Rochester, Minn. "Mortality in Exophthalmic Goiter." Dr. James A. Lehman, Philadelphia, Pa.

"Hyperthyroidism in Children."
Dr. Arthur E. Hertzler, Halstead, Kansas.
"End Results of Total Ectomies in Interstitial Goiters, Cardiotoxic States and Spontaneous Myxedema."

Dr. T. C. Davidson and Dr. David Henry Poer, Atlanta, Ga. "Goiter in Georgia: A Statistical Study in Five Hundred Consecutive Cases.

Dr. Charles H. Arnold, Lincoln, Neb. "Control of Hypo-Parathyroidism."

Prize Award Essay.

WEDNESDAY, JUNE 10, AFTERNOON

Dr. Frank H. Lahey, Boston, Mass. "Stage

Operations in Severe Hyperthyroidism."

Dr. Frederick S. Wetherell, Syracuse, N. Y. "An Investigation into the Use of Iodine as a Treatment in Toxic Goitre."

Dr. Alfred H. Noehren, Buffalo, N. Y. "The

History of the Thyroid Gland."

Dr. George E. Beilby, Albany, N. Y., Dr. John C. McClintock. "The Pyramidal Lobe of the Thyroid and Its Significance in Hyperthyroidism."

HYPOTHYROIDISM

HERMAN L. FROSCH, M.D., New York City Associate Physician, Morrisania City Hospital

In some main aspects of hypothyroidism, I am in thorough accord with Dr. Cecil Barlow, honorary physician to the Lincoln County Hospital, England, who in 1931 published a paper entitled "A Plea for the Earlier Recognition of Thyroid Deficiencies." My own treatise can be introduced by reading the first two paragraphs from this paper.

About eighteen years ago [writes Dr. Barlow] the importance of this subject was unpleasantly brought home to me, by the discovery that I was on the high road to myxedema, and that the condition had been coming on for about two years. The diagnosis was made at sight by my old friend and teacher, Dr. R. G. Helb, senior physician and pathologist to the Westminster Hospital, who met me by chance in the hospital. He was a somewhat laconic individual, so instead of commenting upon my appearance, he sent me a postcard two days later, on which was written "Try thyroid." I had not been well for two years, although working hard, and daily meeting other medical men, but none of them hinted that I was suffering from hypothyroidism, although some did remark that I did not look well.

As a result of this discovery, I have ever since been on the alert to detect evidence of a failure of a thyroid secretion in my patients, and I have been, and am immensely impressed by the large number of persons to be seen going about with obvious thyroid defect, which has probably been unrecognized and certainly not treated. I am forced to the conclusion that the average medical man is not nearly sufficiently alive to the condition.

I am in complete accord with Dr. Barlow on this question. In the past few years, since my interest in this subject has been aroused, I have seen all too many patients treated as psychoneurotics, neurasthenics, or "nervous breakdowns," when the real cause was a hypofunction of the thyroid. All too many patients are treated with diets for constipation, agomensin for amenorrhea, iron for anemia, and strychnine for weakness, when the real cause of the trouble lies in the thy-

roid. One is prone to forget that although it is possible to live without the thyroid, yet for a complete and well-functioning mechanism it is needed for the tempo at which it keeps the body.

Perhaps it would be well to investigate the thyroid first, before sending the next patient to Florida or the mountains for a complete and thorough rest. Much may be accomplished at home by a little judicious extract administration.

The following cases illustrate this contention.

Case 1. A.J., fifty-six years old, a little lady fifty-seven inches tall, weighing 116 pounds, the mother of one of my colleagues and a friend came to see me after going the rounds of many consultants; complaining of precordial pain, choking sensation on lying down and extreme weakness, so that even ordinary conversation seemed to exhaust her

Physical examination revealed a wellnourished woman, suggestive mongoloid expression around the eyes, thinning of temporal hair, almost complete loss of outer third of eyebrow hair, hardly any hair in the axillary and pubic regions. B.P. 160/80, and pulse ninety. Basal metabolic reading done the following morning gave a minus nine per cent reading.

Despite the reading I was so thoroughly convinced that this patient suffered from hypothyroidism, that I decided cautiously to try the therapeutic test. She was, therefore, put on 1/4 gr. of thyroid three times daily, a half hour before meals.

Nine days later, she said that she felt slightly stronger; blood pressure was 140/90 and pulse was ninety. I asked her to renew the thyroid. One week later patient insisted that she felt decidedly stronger, that she was able to walk several blocks without being unduly fatigued. This time her pressure was 125/75 and her pulse rate was seventy-five. The thyroid was now increased to ½ gr. three times a day. Within one week her pulse was ninety-nine; but she stated that she had not felt as well in two years. Approximately five weeks from her first visit, another B.M.R. was minus 13 per cent, and the patient felt fine.

This case illustrates a few interesting

points. To begin with, here is a case of hypothyroidism with a hypertension. This certainly is not according to old time teaching, and in addition, the blood pressure comes down to normal under thyroid administration. I can cite several such cases, one of which was a far advanced myxedema, with a blood pressure of 190/110, which fell to normal with thyroid administration.

The other point of interest is the lowered basal metabolic reading after five weeks of thyroid therapy. This I see all too frequently in my work to call it just a coincidence. I believe it can be explained, either, that the first reading was much too high because of the anxious expectancy of the patient, when confronted with an unknown and to her formidable instrument; or that the thyroid administrator had depressed the thyroid in its function and that it had gone into a more or less resting state. It is my opinion that the first explanation is probably the correct one.

Case 2. A man of thirty-seven, a "bookie" at a race track, came in with a complaint of nervous spells, depressed feelings, sometimes with exhaustion, and, sudden periods of extreme weakness; he was not sure of himself. These attacks occurred at the most inopportune moments. Because of this fear, he gave up his job and stayed at home, and was afraid to walk a few blocks away from the house. These attacks had lasted, up to the time of writing, over a period of two months. Ten years ago, he had had a similar condition which lasted for a very long time but finally subsided; he had never been well since.

His past history is essentially negative except for a gonococcus infection six years ago. With the exception that the left shoulder is higher than the right, and that there is a scoliosis of the thoracic spine, with a convexity to the left, the physical examination was essentially negative. The blood pressure varied from 130/70 to 150/80; pulse ninety. For almost two months, this patient continued to come in on the average of twice a week, and despite all forms of sedation, symptoms continued unabated.

A basal metabolism at this time was minus 17 per cent. He was, therefore, put on ½ gr. of thyroid three times a day and asked to return in ten days. On returning, stated that he felt better, and that his symptoms were on the wane. His pulse and blood pressure remaining unchanged; his thyroid was increased to two gr. a day.

On the following visit there was no question but that there was more life in his speech. He was back on his job, and at the time of this writing he claims to be completely normal, having gained seven pounds in weight, pulse seventy-eight, blood pressure 130/80. The last basal metabolic reading two months after the institution of thyroid had been minus fifteen per cent. The patient dreaded the periods when he was off thyroid, and now takes an extra amount when under unusual mental or physical stress or strain.

Here again is a patient whose first basal metabolic reading, as compared with the last one, must have been much lower than the actual findings. Furthermore, under the old-time treatment surely this patient would have been sent away for a complete and thorough rest in the country, with the return of all his symptoms as soon as he came back to town.

In this case, I have not attempted to push the thyroid to the point of bringing his basal metabolism to the normal, for his normal may be low to begin with. I gave him sufficient thyroid to bring him to the point of a feeling of well-being which, after all, is the objective desired.

Case 3. P.L., a high school girl, 15½ years old, came in with the complaint of a nervous feeling in the stomach, a shaky feeling, and underweight. Her appetite was excellent, bowels constipated, and she felt cold often. She began to menstruate a year before, and had missed only two periods since.

Her family history is extremely interesting. Her younger sister came to me because she had a large prominent gland. Her basal metabolism was minus 20 per cent. Two aunts on the paternal side have enlarged thyroids, one suffering from hyperthyroidism and the other from hypothyroidism. The mother of the patient was a rather stout person with a hypothyroid distribution of fat.

Physical examination revealed a thin underweight, highly nervous child. There was a tremor of the tongue, otherwise the status was essentially negative. Twenty-four hour urine was negative; hemoglobin ninety-five per cent; blood sugar ninety-eight mgs. per cent; cholesterol 178 mgs. per cent; weight eighty-eight pounds; blood pressure 100/50; pulse ninety. and B.M.R. minus twenty per cent.

Thyroid extract ¼ gr. twice daily was prescribed. On her return three weeks later, despite the fact that her B.M.R. was still minus twenty per cent, she said that she

felt decidedly better, and, that her nervousness had definitely disappeared. Her mother now wanted her to go to camp. To this I readily consented giving her a prescription for fity ¼ gr. thyroid extract pills. These she took on and off during her entire six

weeks in camp.

When she returned there was no question but that there was a marked improvement in the child. She had gained six pounds, was more alert, stronger, and her mother said that she was less lazy than she had been. My first reaction was to attribute this improvement to her vacation. But, then her sister was presented to me with a loss of weight and a decided change for the worse. This one had definitely lost ground under the same camp routine and regime, but without taking the thyroid.

At this time a B.M.R. in Case 3 was minus fourteen per cent, pulse seventy-five, and a gain of a half inch in height. She continued taking her thyroid and when seen a month later, her B.M.R. was minus three per cent. Her mother volunteered the information that her disposition had changed for

the better.

This case is interesting because of the family history of thyroid disturbances. Her sister suffered also from hypothyroidism; and the therapy demonstrated that, while the one was improving, the other who did not receive the extract was beginning to decline.

CASE 4. E.B., nincteen years old, a student nurse at Lebanon Hospital, case histories No. 82226 and 83097. (This case is reported with Dr. Wilhelm Weinberger's permission.) The patient was admitted the first time because of precordial pain, rapid breathing, a feeling of coldness and chilliness. She stated that she had been on duty until 7 P.M., but had been rather unconfortable during the day because of precordial pain. The pain had not been constant. At 9 P.M. the precordial pain became more severe, was accompanied by shaking, trembling, a feeling of dizziness, and a "blackness" before the eyes.

The past history obtained some time later revealed that she never had a similar attack before; she would tire very easily in that by noon she was exhausted and would marvel at how the other nurses kept going; menstruation began at thirteen, was always regular and there was no dysmenorrhea, bled six to seven days—profusely, for the first three days.

Physical examination at the time of admission revealed the following: Rapid shal-

low respiration, extremely restless, heart, lungs, and abdominal viscera apparently normal. Pulse eighty and of good quality; blood pressure 85/60,

Laboratory data: Hemoglobin 84 per cent; R.B.C. 4,200,000; W.B.C. 6,900; P. 61 per cent; L. 39 per cent. Blood sugar 72 mgs. per cent; N.P.N. 28 mgs. per cent;

calcium 9.6 mgs. per cent.

A hypodermic of morphine was given. This stopped her trembling, but she continued to complain of her precordial pain. Consciousness returned the following morning, without any recollection of the events of the several preceding hours.

Electrocardiographic studies gave negative findings. The x-ray of the skull did not reveal any evidence of increased intracranial pressure. Numerous urine analyses were negative. Blood sugars done on two consecutive days following the first one were seventy-one mgs. per cent and eighty-four mgs. per cent, respectively. B.M.R. was

minus thirty-six per cent.

Two months later she was readmitted for a more thorough and complete study. At that time the only complaint was almost constant backache, particularly over the lumbar region. Since her previous admission she had received in a haphazard fashion, on and off, thyroid extract grs. ½ and pituitary extract gr. one to three times a day.

Urine negative:

Glucose tolerance test

All the urines taken at the same time as the blood were negative for sugar.

Blood cholesterol 154 mgs. per cent; blood pressure 108/68; temperature normal; pulse varying from eighty to ninety; B.M.R. Aug. 1, minus thirty-one per cent; B.M.R. two days later minus twenty-two per cent.

She was discharged from the hospital and put on ½ gr. of thyroid extract three times a day, ½ hour before meals. She continued on this regime for almost one month, during which time her pulse and blood pressure remained almost constant, and there was a gain of 2½ pounds in weight, while the basal metabolism had dropped to minus fourteen per cent.

The thyroid extract was now increased to one grain three times a day, and another basal and glucose tolerance test was done on October 24. Glucose tolerance test this time was as follows:

Under this regime of thyroid therapy, the patient at the time of writing claimed not to tire as easily as before, since she was able to keep the same pace of work as the other nurses. She said that menstruation was less profuse than formerly and lasted only four days. She stated that she has not felt as well in approximately two years.

This case is interesting from several points of view. The first impression on physical examination is that the patient was a pituitary type of individual. It is known that disturbances in that gland do give low basal readings but not to reach the low levels of this case. Furthermore, the therapeutic test pointed towards a thyroid insufficiency. This patient did remarkably well with thyroid. She gained weight and the supervisor of nurses volunteered the information that there has been a marked improvement in her work on the wards.

The explanation for the hypoglycemic shock is theoretical but nevertheless of some interest. The thyroid is supposed to inhibit the pancreatic insulin function. With the thyroid markedly depressed, the pancreas excreted an excess of insulin which led to the attack. The glucose tolerance tests done at the beginning and at the end of the therapy show that in the former phase she utilized glucose much more rapidly than following the therapy. As to her precordial pain during her attack, I have seen several patients in mild insulin shock who had the same symptom.

Case 5. A young man, twenty-nine years old, a broker on the curb exchange, came in with this interesting story: One day during the 1929 crash he had retired to his private office for a rest. About two hours later he was found lying on the floor in front of his chair. On recovering consciousness, he could recall absolutely nothing of what had occurred. Since then, he has had many similar attacks, all of which occurred during his sleep. Some of these have been observed by members of his family, and they describe them as tonic and clonic convulsive seizures involving the entire body. There is some salivation, but never biting

of the tongue. Lately these attacks have become much more frequent, occurring as often as every two weeks. His wife and family lived in constant dread and fear of their appearance.

The patient's past history was essentially negative, except that: he had a very poor sexual libido; that he was considered lazy by all his friends; that he could sleep extremely long hours; and that he seemed always ready to fall asleep by merely sitting down in a comfortable chair.

Physical examination: Height almost six feet; weight 150 pounds; heart, lungs, and abdominal viscera apparently normal; blood pressure 100/60; pulse seventy; respiration twenty-five.

Neurological studies revealed practically absent abdominals, except for an occasional flicker of the left upper; depressed tendon reflexes. No other physical signs of focal disease of the nervous system were found.

Radiographic examination of the skull, made in the posteroanterior, anteroposterior, right lateral, and left lateral positions revealed no evident intracranial pathology.

Eye studies including perimetric examinations revealed nothing that would account for his attacks.

In doing a routine blood chemistry it was discovered that his fasting blood sugar was sixty-seven mgs. per cent. This suggested the possibility that this was a case of hyperinsulism, which depressed his blood sugar below his normal level, and led to the attacks. He was, therefore, put on a very high carbohydrate diet, frequent feedings especially before retiring at night.

The patient came in a week later with his wife, with the story that he could not and would not eat such foods, that he hated the diet, and that despite this diet he had an attack the night before, which he attributed to the food he ate before retiring.

A glucose tolerance at this time gave the following results:

10 ounces of water ½ hour later, blood sugar was....100 mgs. % 1 hour later, blood sugar was....100 mgs. % 2 hours later, blood sugar was.... 83 mgs. % 3 hours later, blood sugar was.... 76 mgs. % Basal metabolism minus 13 per cent.

To his high caloric diet was now added thyroid extract ½ gr. three times a day, a half hour before meals. On returning six days later, he reported that his appetite had improved somewhat, and his B.M.R. at this time was minus eleven per cent. Thyroid was increased to ½ gr. three times a day.

When he came to see me eighteen days later, he reported a marked increase in his

appetite and a greater interest in life. His wife remarked that "he had even attempted

to play bridge."

Physical examination revealed a more alert man. He had gained four pounds since his last visit and his B.M.R. was

now minus nine per cent.

During the following month I saw the patient several times, and each time he reported glowingly of his health: appetite was stupendous, had played eighteen holes of golf, danced, was able to stand liquor much better, and so on. Suddenly one morning, he and a friend of his appeared in the office with the story that while sleeping in his friend's room the latter had observed an attack. The patient himself had not been aware of it. This friend had seen him in

with the others.

On questioning the patient, I clicited the information that this past week had been very strenuous. Things in his office seemed to have gone awry. He had learned that his mother would have to undergo another operation. In addition he had not been as

regular with his thyroid as formerly. A

many previous attacks and stated that this

last one was extremely mild as compared

hasal metabolism done that morning was minus twelve per cent.

He was now put on one gr. of thyroid three times a day for three days, after which he was told to go back to his usual ½ gr. dose and told that whenever under any unusual mental or physical stress and strain, he must take one gr. of thyroid for a short period.

The last basal metabolism done before this writing was minus ten per cent. He had gained eighteen pounds in weight, had had no attacks, had an excellent appetite, and seemed all in all to be a different man, both his family and friends testifying to this.

The last glucose tolerance tests was as

During the entire period of thyroid administration, the patient's pulse varied between seventy and eighty and his blood pressure gradually rose from a low level of 100/60 to the last one 120/80.

This patient has been seen by several neurologists. All of them with the exception of one claim that he was suffering from idiopathic epilepsy. I am not in a position nor do I desire to dispute their diagnosis. They make it on the basis of

the description of the attacks. My contention, however, is that he is also suffering from hypothyroidism, and that it is quite possible that this may be the cause of his so-called epilepsy, and that after all it may not be idiopathic epilepsy. Even assuming that I admit the neurologists' contention that this patient is suffering from idiopathic epilepsy, I can see that the condition must be very latent, and is brought into activity only by the precipitating or trigger condition of hypothyroidism, which when removed causes the epilepsy to disappear.

L. H. Ziegler reported three cases in which he showed how latent psychotic and hereditary dispositions were brought out by hypothyroidism and disappeared

when the latter passed away.

The term myxcdema is misleading in two ways. A disease of the thyroid is called by one of its symptoms, and this symptom appears only in extreme cases. In thirty of my own cases of hypothyroidism I saw only two cases with myxcdema. Therefore—since because of long usage the term has come to stay—myxedema should be redefined, as hypothyroidism which may have, but in the great majority of cases is without the myxcdema symptom.

Hypothyroidism is, as are many other diseases, protean in its manifestations. The patient may come in with a report of anemia, constipation, weakness, tiredness, loss of appetite, nervousness, hallucinations, depressions, headaches, nerve pains, migraines, periods of collapse, precordial pains, frequent colds, or other infections. These are only a few of the chief complaints with which many of my hypothyroid cases came to my office. Every individual who comes to the doctor with any of these should have a basal metabolism done, and if that shows a borderline case. thyroid should be tried cautiously as a therapeutic test. It must never be given without the B.M.R.

Hypothyroidism to my mind is unquestionably a very common condition and one overlooked all too often. In the past ten years there have been published in the American literature more than thirty-two original papers on the subject, in which 511 cases of hypothyroidism were reported. In the last 100 basal metabo-

lisms done in my office, fifty-three were normal, seventeen were hyperthyroidisms, and thirty were hypothyroids. Only two of the last were myxedematous. In its mild form there are very few physical findings to indicate its presence. A good family history in reference to the thyroid may be of some help; a blood count giving a relative lymphocytosis may arouse your suspicion; but, above all, the final criterion is the basal metabolism and therapeutic test.

Remember in making an examination, the endocrines form a small portion of the body, but they control and regulate many important functions.

At times there is no clear-cut line of

separation between hypo- and hyperthyroidism. I have seen cases with symptoms of nervousness, sweating, tremor, increased reflexes, and tachycardia, which I thought were hyperthyroids, but the basal metabolism proved otherwise. In addition the hypothyroid individual may have a normal weight, be overweight, or underweight. It must also be realized that other conditions cause a lowered basal metabolism. These should be ruled out. If it cannot be done clinically, the therapeutic test will help.

The doctor should keep in mind always the valuable basal metabolism machine when studying a patient who baffles his clinical acumen. 1882 GRAND CONCOURSE

ALCOHOL "SHOTS" FOR PNEUMONIA?

"Shots" of alcohol are now suggested as a possible treatment for pneumonia. This unusual remedy, still in the experimental stage, is described in the Journal of the A.M.A. in a translation of an article from the Indian Medical Gasette of Calcutta.

The article says the treatment had been used in but six cases of uncomplicated lobar pneumonia, but its developers were enthusiastic in reporting its success.

The alcohol, mixed as a twenty to thirtythree per cent solution in sodium chloride (common salt), is injected into the veins like any other intravenous "shot in the arm," Dr. I. Bakhsh and Dr. A. T. Andreasen, who developed the technic, explained.

The dose varies from twenty to twentyfive cubic centimeters daily, in either one or two injections. Their results, the two doctors described thus:

"Within an hour of the injection there was sufficient decrease in the intensity of the pain in the chest to allow the patient to sleep comfortably. It had completely disappeared within forty-eight to seventy-two hours after the first injection.

"Arrest of the process of consolidation in cases treated from the start of the disease The congestive stage was remarkable. gradually regressed, so that by the time the crisis occurred the involved lobe was almost free from any signs of pneumonia.

"In two cases in which alcohol was not commenced until the fifth day of the disease and consolidation had already set in, resolution was rapid."

STUDIES IN THE ECZEMATIZING PROPERTIES OF SOAPS

JAMES W JORDAN, M.D., HAROLD L WALLER, M.D., and EARL D. OSBORNE, M.D., Buffalo

From the Department of Dermatology and Syphilology, University of Buffalo, School of Medicine, and Buffalo City Hospital, Service of Dr. Larl D. Osborne

Numerous references to soaps as a cause of dermatitis have appeared in the literature during the past few years Hazen,1 Weber, Hollander,3 Johnson,4 Stauffer⁵ and others have reported cases due to soaps. Many of the ingredients used in the manufacture of soaps have in themselves been reported as a cause of dermatitis Sodium silicate,7 oleic acid,6 stearic acid," naphtha," rosin," and olive oil have all been incriminated as a cause of eczenia Last year Osborne, Putnam, and Shunders8 reported twenty-eight cases of dermatitis in which soap ingredients appeared to be the exciting cause It was pointed out by them that in the performance of the patch test to determine whether a state of allergy to a soap solution existed, the soap dilution must be greater than that necessary to produce irritation from the alkali present. To our knowledge, no adequate studies have been made to determine how frequently sensitivity to the ingredients of soaps is encountered among individuals with normal skins and what role soaps play in the etiology of eczema

Stauffer,5 working in Bloch's clinic, is the only investigator who has reported any extensive patch testing with soap solutions He tested thirty-four patients with eight soft soans but did not mention the dilutions employed The alkalı content of these soaps varied considerably Of the thirty-four patients tested, twelve had normal skins Two of the twelve, approximately sixteen per cent, gave positive tests Twenty-two patients presented an eczematoid dermatitis, and of these, nine or forty-one per cent reacted strongly He also found that this latter group of nine patients gave positive patch tests to other known eczematizing agents Stauffer believed that the positive reactions to the soaps were not the result of their alkali content because soaps with the highest alkali content produced no more positive reactions than did those with the lowest alkali content

In carrying out this study, three groups of patients were patch tested with dilu tions of 1 100 and 1 400 of ten different sorp solutions Eight of these were commonly used toilet soaps and two, A and B. were hundry sorps. The patch tests were applied on the back of each patient and the results read at the end of twentyfour hours, and again after forty-eight hours. We attempted to accurately grade the reactions. A reaction of plus one consisted of a mild erythema. Plus one reactions were not regarded as representing allergy to soap solutions. They were so commonly encountered with dilutions of 1 100 that we believe they represent a mild irritation due to the liberation of free alkalı by hydrolytic dissociation of the soaps A reaction, graded two plus, denoted a fairly marked eigthema with slight elevation Two plus reactions unless present on repetition, are not convincing proof of hypersensitivity because of the difficulty in accurately grading any patch test. Plus three reactions denoted a marked erythema with definite elevation and occasionally slight vesiculation. Plus four signified marked erythema with definite vesiculation. We have included in the accompanying tables results obtained on all patients who gave three and four plus reactions, and who gave three or more two plus reactions

Altogether one hundred and fifteen patients were tested, requiring a total of twenty-three hundred patch tests. They were divided into the following groups

Group I This group consisted of seventy patients who had no dermatris and no his tory of any allergic manifestation Table I summarizes the definitely positive reactions which occured in this group Study of this group brings out the following points

1. Ten or 143% were considered to react positively with a minimum of three, two plus reactions.

2. Only one patient in the entire group of seventy gave a four plus reaction to one or more of the soap solutions and then only to a

dilution of 1:100 (case 9).

3. Only one patient gave a two plus reaction in a dilution of 1:400 (case 6). There were no three or four plus reactions with this dilution. It is evident then that when positive reactions do occur in individuals with normal skins that the reactions in almost every instance are mild and then only with a dilution of 1:100

4. Reactions to solutions of laundry soaps which tend to have a higher alkali content are in general no more severe, if as severe, as the reactions to toilet soaps. This bears out the observation of Stauffer that the alkali content is not the substance responsible for the strongly

positive reactions.

The definitely positive patch tests obtained on supposedly normal individuals indicates that these subjects are allergic to soap solutions. The fact that these patients reacted to soap solutions when contact was for twenty-four hours and yet were able to use soaps for ordinary purposes shows that a high grade of sensitivity is necessary to produce an eczematoid reaction on short exposure to a given substance. A positive patch test therefore, may or may not indicate that an individual will develop a dermatitis when exposed to the substance giving the positive test. The concentration of the offending substance, the duration of exposure to it, and the degree of allergy present in the patient's skin are of the greatest importance in the production of an eczematous change.

Group II. The second group consisted of thirty-eight patients who presented some form of dermatitis, nineteen of whom gave a minimum of three, two plus reactions. Table III shows the results of the tests in these nineteen cases. Analysis of this group brings out the following point:

Approximately fifty per cent of patients presenting any form of a dermatitis can be ex-

pected to react to patch tests of soap solutions This percentage compares with that obtained by Blocho in testing eczematous patients to ten common eczematizing substances. He found that thirty-five per cent of these patients reacted strongly to one or more of the ten test sub-stances. In view of the fact that fifty per cent of eczematous patients react to soap solutions, this is further evidence that a large percentage of eczematous individuals are polysensitive. This belief is shared by Bloch, 10 Klauder, 11 Williams, 12 and others. Therefore, in an eczematous patient the etiology of the dermatitis may be one of several eczematizing sub-stances. The fact that a patient with a dermatitis reacts to a certain substance does not prove that the dermatitis is due to that substance since reactions may frequently be obtained to many substances. In testing any patient with a dermatitis, further proof than a positive test is necessary to established the etiology of the dermatitis. The dermatitis must clear up when the substance is withdrawn from contact with the skin and the dermatitis must recur when reexposure occurs.

The reactions of this group of patients with a dermatitis were much stronger than in the group of patients with normal skin. Fourteen of the nineteen patients who reacted gave one or more four plus reactions to a dilution of 1:100 as compared with only one four plus reaction among the individuals with normal skins. Here as among the normal patients the reactions are no more severe from laundry soap solutions than from toilet soap solutions. As in the previous group of patients with normal skins, this group also shows but very few three and four plus reactions to soap solutions in a dilution of 1:400. Although no definite conclusions can be drawn as to the place of soap in the etiology of the dermatitis in these patients, many of them did improve when soap contacts were stopped.

Group III. The third group consisted of seven patients who had a history of other than cutaneous allergy such as hay fever, asthma, or urticaria. Four of these patients gave a minimum of three, two plus reactions

to the sorp solutions. Although this group is too small from which to draw definite conclusions, the results indicate that a considerable percentage, probably at least fifty per cent, of patients presenting any form of illergy are apt to react to eczematizing substances. If this be the case, a careful history of allergy should be elicited from each patient subjected to patch testing and the results evaluated on the basis of the above observation.

There are many substances present in soap solutions which are capable of producing a dermatitis. Table II presents an analysis of the ingredients of common toilet and brundry soaps. Sodr ash, sodium carbonate, sodium silicate, borax, and tri-sodium phosphate are negligible quantities in toilet soaps, but of importance in laundry soaps. The fact that no more reactions occur with laundry soaps than with toilet soaps suggests that these ingredients, although they may cause a dermatitis in isolated instances, are not the principal eczenitizing substances in

soaps

In Table II the free alkalı refers to the alkalı present ın an alcoholic solution of soap. The percentage is very small However, in aqueous solution hydrolytic dissociation takes place with the liberation of hydroxyl ions and the fatty acid radicles present in the particular oil or fat which was used in the manufacture of soap The degree of hydrolysis depends upon which fats or oils are em ployed Since many different fats and oils are used in the manufacture of soaps, the amount of hydrolysis that takes place in aqueous solution is different for each soap Therefore, the number of hydroxyl ions and fatty acid radicles will vary depending upon the fats and oils used in the manufacture of a given soap During recent years an increasing number of cheaper fats and oils has been used in the manufacture of soap Since previous reports have appeared of determatitis due to the commoner fatty acids such as oleic, stearic, and palmitic, it is obvious that other fatty acids which thus far have escaped our attention should be investigated for their eczematizing properties

In addition to the fats there is a long list of miscellaneous ingredients, any one of which may or may not be present in a given soap, but which are capible of

producing a derinatitis in an individual specifically hypersensitive to the particular ingredient. This list includes at least thirty perfumes and essential oils, gum, resm, animal products, medications, dyes, and metallic salts used as preservatives. It is obvious that it is impossible to determine the exact eczematizing substances in any given soap unless a complete list of the ingredients used in its manufacture is available.

Conclusions

1 Approximately fourteen per cent of individuals with normal skins reacted to dilute soap solutions A positive patch test, therefore, does not always mean that an individual will develop an eczema when exposed to a substance giving such a test

2 Approximately fifty per cent of individuals with a dermatitis reacted to dilute soap solutions. Four out of seven individuals with other forms of allergy reacted to dilute soap solutions. These results indicate that polysensitivity is common among eczematous patients and that a careful history of allergy is of great importance in the interpretation of patch tests.

3 A soap dilution of at least one to one hundred and preferably also a dilution one to four hundred should be employed in the performance of the patch test

4 Mild erythema without papules or vesicles should not be regarded as a positive finding

5 The alkalı content of soap on solu-

Discussion

DR LOUIS TUILIAN, New York City-Dr Louis Schwartz and I recently reported in the U S Public Health Bulletin on Dermatitis Amongst Silk Throwsters who who were sensitive to various types of soap We found, in our patch tests that the soap solution of 121/2 per cent strength was irritating to almost all the girls in this particular factory, when the patch tests were left on for twenty-four hours Some of the girls were also sensitive to a three per cent so'ution A sixteen per cent solution was made from edible olive oil. We found that this was less irritating than that made from sulphur olive oil foots. Our tests also showed that a dermatitis was caused principally by sensitivity to soap made from sulphur olive oil foots and ilso to a lesser degree to cresyhe acid used in anti-milden solution. Of course, the fact that a good many people do not show a dermatitis from the use of soap in their daily washing is simply due to the fact that it remains on the skin but a short

HERE IT IS IN A NUTSHELL

"We want no socialized medicine! They tell us that socialized medicine will raise the standards of medical practice as a whole I tell you that it will inevitably lower the standards of medical practice, and that standards have advanced faster in the United States than in any country having a system of socialized medicine

"They tell us that socialized medicine will strike a death blow to quackery and cult ism I tell you that Germany, after fifty years of compulsory health insurance has become the happy hunting ground for quacks and is the only nation in the world to give official recognition and endorsement to practically all forms of quackery

'They tell us that socialized medicine will eliminate economic waste. Its first result is the employment of as many salaried administrators to manage the system as there are doctors to give service

'They assert that socialized medicine will encourage preventive medicine and immunization I have shown you that immunization and preventive medicine are more successful in the United States today than in any other country in the world

"They say that workers under socialized and compulsory health insurance systems are better off than are our own workers Let our workers lose only from eight to thirteen days a year on account of illness, and the average wage carner in countries having compulsory insurance loses from fifteen to thirty days a year

'The figures published last week by the largest industrial insurance group in this country show the highest rate of health for American workers ever achieved anywhere in the world. With a medical profession such as we have now, with the standard of living such as is now available for the vast majority of the American people, with a government ready to assume responsibility for the care of the indigent sick, the determinition of the kind of medical service they vant should be left to the people of the country and to the medical profession the only group qualified by training, by experience and by law to say how medicine shall be practiced "-Dr Moriis Fishbein, at 'America's Town Meeting of the Air,' New York, March 5

٤

THE PROBLEM OF THE BROKEN HIP

JOHN J. MOORHEAD, M.D., New York City

It is a reviling reflection that the largest joint in the body is, more often than all other joints combined, the scene of nonunion with accompanying disability. To explain this tragic outcome there has been much speculation, and until recently, very little factual evidence. We hitherto ascribed the unfavorable outcome to some of the following:

1. The age incidence, because fracture of the neck of the femur was presumably an index of osseous senility. That viewpoint however is negatived because nonunion in this joint occurs also in the young and in the middle-aged; and it is a traumatic surgery axiom that articular fractures almost without exception in all other sites unite with great regularity. We of course concede that an aged patient is a poor surgical risk for any pathologic exigency; and a broken hip entails shock and a resistance that often is beyond the reserve capacity of any or-

ganism aged in years.

2. The anatomical incidence, because the neck of the femur is a zone of known poor healing capacity due to (a) the cross striae of structure; (b) poor blood supply; (c) desiccation in a closed space (the capsule) whereby blood and serum set up what virtually amounts to digestive action; (d) the interposition of the capsule or bony spiculae between the fragments, in effect causing a spontaneous arthroplasty; (e) the slow healing under the best of conditions in an area designed to support superimposed weight at an angle of 130 degrees and not in a straight line such as prevails in any other weight bearing joint. As opposed to these deterrents we occasionally have a patient presumably of poor surgical fiber who functionally recovers, thus confounding our predictions enough to reawaken interest in this problem fracture.

3. The treatment incidence, because there is no known method by which assurance of union is guaranteed. The complete immobilization in plaster of Paris is no longer regarded as the best safeguard; and the strange situation is here presented of immobilizing this joint fracture when the best teaching recommends mobilizing all other joint fractures. It is paradoxical to advise immobilization in the joints that heal worst, and yet advise mobilization in the joints

that heal best.

4. The tissue resistance incidence, because many of the patients with broken hips are arteriosclerotics, cardionephritics, diabetics, or potentially tissue bankrupts.

Now these four elements—the incidence of age, anatomy, treatment, and tissue—present a problem that is so confusing that it is a safe assertion to say that the management of this large important group is not yet standardized enough for any surgeon to assert that any given method is the best for *all* cases. There is only one other fracture in which the same confusion of ideas exists, and that is fracture of the os calcis.

However, in the very recent past certain features as to broken hips have been clarified and the author ventures to call to your attention some of these developments.

Diagnosis. It is now recognized that inability to lift the injured limb with the knee straight is the best single evidence to distinguish between a contusion-sprain and a nondisplaced fracture.

In line with this is the opinion that dislocation of the hip is an exceedingly rare occurrence, and hence that diagnosis should be made last and not first. With a fairly active opportunity to observe the injured, the author has not seen more than half a dozen hip dislocations in his experience.

X-ray diagnosis is of course the best evidence; but we must not forget that an immediate negative or doubtful x-ray may within a few days give unmistakable indications of fracture. Hence if there are any clinical evidences of fracture, it is the part of wisdom to treat for fracture until the lapse of time or subsequent x-rays indicate the actual situation.

Treatment. Early reduction means easy reduction, and this axiom is just as applicable in the hip as elsewhere. This does not mean that in an aged patient we should at once undertake heroic treatment without first giving opportunity to recover from physical and psychic shock. With this in view my plan is to apply adhesive straps to the entire length of the thigh, bend the knees, permit a semiseated position, and put on ten to fifteen pounds of traction with the limb abducted and rotated inward. This procedure will prevent muscular retraction

and assess the ability of our patient to withstand recumbency, and incidentally tide over the first days of shock, physically and mentally. It is possible to carry some patients throughout the entire period of healing by this procedure, notably that group in which reduction is promptly attained, and that other group rebellious to any fixed type of immobilization. A very thin or a very fat patient is a poor subject for plaster fixation, irrespective of age limits. The ideal surgical type of patient for a fractured hip is the old lady who weighs less than 130, the irrepressible flapper who at eighty has vim and punch and agility enough to shame her children and even her grandchildren. The author terms her the "wren type" because she is always flitting, has never been abed under a doctor's care since her last baby was born, and even then she was up and about within a fortnight. To subject a perennial of that sort to prolonged splintage will wreck the physique and the morale and invite catastrophe. They are like storage batteries, active enough to turn the machine over if used daily; but if idle, the vital fluid becomes inert and ceases to function.

There are then certain types of physique to consider before determining the appropriate kind of treatment. This means, to repeat, that there is no one best kind of treatment for every case; no set form of procedure is universally applicable.

With that in view, let us assay our prospective patients and place them in three grades based on the excellence of their physical stability, irrespective of the age

bracket.

Grade A

This patient is of good general physique; there are no gross pathological defects of the cardiovascular-nephritis, pulmonary or digestive systems, diabetes included. The morale is excellent, the weight is not excessive and the cooperative will to get well is excellent.

Grade B

This patient is of fair general physique; there are some pathological defects of the cardiovascular-nephritic, pulmonary or digestive systems, with perhaps inactive diabetes. The morale is unstable and cooperation is under forced draught.

Grade C

This patient is of poor general physique; there are definite pathological defects of the cardiovascular-nephritic, pulmonary or digestive systems, and diabetes exists. The morale is poor and cooperation is almost wholly lacking.

To be sure we meet with hazards of this same sort in all the traumata, but the point is that a fractured hip may mean a year of supervision and there is no comparable period of needed professional care for any other medical or surgical ailment. The nearest approach from a time standpoint is the prenatal and postnatal care of an obstetrical patient. Another point is that a fractured hip is an affliction of the aged usually occurring in a person poorly adapted to withstand any surgical contingency.

Hence before we decide on any line of treatment we should grade our risk, classify our patient as being in the A or good, B or fair, C or poor group. Again let it be asserted that the treatment should be based on the physical capacity of the patient more than upon the site or type of the lesion. It is customary to refer to two types of fracture of the neck of the femur; namely those in which the fracture line lies close to the head-the intracapsular, or base of the neck or central group. The other group shows the fracture line to be extracapsular, subcapital, or marginal. In this latter group, the prognosis is better because in effect these rate as high fractures of the shaft and to that end the outcome more nearly approaches that of a shaft fracture. The third group, the intertrochanteric, is not within the domain of this discussion.

Treatment

The C group are actual risks and with patients of this type the steps in management may be said to be the following:

- 1. Semiseated position made possible.
- Knee bent fifteen to thirty degrees in a hospital bed or with a pillow or bolster under both knees.
- 3. Adhesive straps applied along the lateral margins of the entire thigh, each strap about three inches wide. Moleskin adhesive is best, and to hold it in place, spirals of zinc oxide adhesive and a bandage are added. Use care near the back of the knee to prevent pressure.
- Abduct the thigh to the limits of comfort, gradually increasing this abduction as far as possible.
- 5. Attach a weight of ten to twenty pounds to the "spreader" of the adhesive.
- 6. Place an (x) mark on the center of the patella and instruct the attendants to keep this mark pointing straight upward; if necessary, prevent external rotation by placing a lift under the side of the mattress.
- 7. If possible, provide an overhead handle so that the patient can pull upon this to aid in change of position; incidentally this aids in circulation.

Comment

It will probably require twelve or more weeks before union enough is attained to allow removal of this or any form of fixation. The test of union is ability to lift the straight limb off the bed and to rotate the limb in and out, especially the former. Add to this, no pain in the hip on pounding the knee or heel. From now on, treatment varies as between crutches and a walking calipers; or a short spica of plaster of Paris from above the navel to above the knee. If this latter is used, cut out the side opposite to the fracture so that some freedom of motion is possible. Let the patient walk in the calipers or plaster, using crutches or an "invalid walker," this last being a glorified "creeper" such as is used for children.

Now this kind of management is just as safe and just as easy as the do-nothing plan of "making the patient comfortable" by using sand bags to prevent rolling out of the limb.

The B group of fair physique are treated in the same manner as the preceding, at least until shock has disappeared, and the patient is accustomed to recumbency. From then on, reduction having been obtained by the traction, we can make a choice as to the desirable definitive treatment. This may consist of a plaster of Paris casing or some form of operation. Usually we can determine the kind of management by the response of the patient and the response of the limb to the preliminary traction. Some patients do so well that we are emboldened to change their rating from the B or fair to the A or good physique grade, and if so we proceed accordingly.

There is no special need for haste in changing from the traction to another type of treatment because a period of a fortnight may elapse without harm inasmuch as the traction has been acting as a reduction and fixation agent in the interval. We must not forget that this major joint under traction can be controlled just as fracture of the spine and fracture of some long bones can be thus controlled.

The author is opposed to the immediate immobilization of any fractured hip in a plaster spica unless the physique is excellent, and there is no shock nor accompanying injuries.

The A group, or good physique group, are treated more actively, but many of these should be subjected to a period of adhesive strap traction to tide over the initial stage of shock. From this point on the choice is between nonoperative and operative management.

If we decide on the nonoperative regime, reduction is obtained and checked, and then a plaster of Paris spica is applied to the involved side from the toes to above the umbilicus. It is an added safeguard if plaster is applied to the opposite limb as far as the knee, a crossbar then being placed between the thighs. This last (using a broomstick) acts as a brace and it is also an excellent handle for turning the patient.

After the plaster is applied, an x-ray film is taken to check the pre-plaster film. Another film should be made within the next three weeks, and thereafter check-up x-rays can be made at six weeks or other intervals.

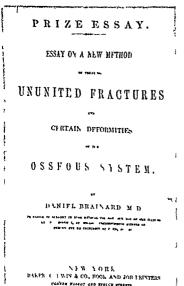

In favorable cases, callus formation may appear after six or eight weeks; but even if this encouraging prospect is evident, we must not forget that absorption of the neck may still occur even after union is apparently well-advanced. Indeed this process of decrescence (becoming less by gradual diminution) may occur any time within a year, and thus we must guard the prognosis. The author knows no way by which we can be certain that one case will unite and another will not unite; the lapse of time alone is the sole criterion. The plaster of Paris casing is usually removed after twelve or fourteen weeks and then a test is made as to the state of union by x-ray, and also by guarded motions of the patient, notably the ability to lift and rotate the limb. If now union is apparent, then a short spica is applied, the plaster reaching from below the umbilicus to above the knee. Crutches can be permitted and the patient thus becomes partly ambulatory; but no weight bearing is permitted at this stage. After four to twelve weeks, a walking calipers splint is fashioned, and thus at about six months post-trauma the patient is walking, but in this splint the heel is separated from the shoe by a space of one-half inch or more. When is unsupported weight bearing allowable? The answer is when straight leg lifting is possible; when rotation and abduction and adduction are apparent, and when pounding on the heel or knee causes no reaction in the hip

This cannot be stated in terms of the calendar, but on the contrary can only be stated in terms of ability to function as demonstrated by the mentioned signs that the author calls "tests of usage," aided of course by check-up x-ray films

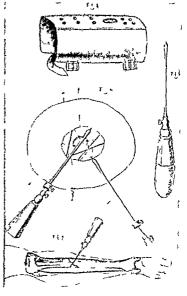

Now the difficulty with this plan of management is that the x-rays are not always an infallible guide as to the accuracy of reduction, even though the films are mide from below-up or abovedown, in addition to the standard exposures. Hence we are beginning to resort to open correction, meaning thereby actual palpation of the fracture line through a three inch vertical incision over the great trochanter This is an excellent procedure, and in appropriate cases it is a method of choice The author is convinced that many cases of nonunion of the hip arise from the basic factor causing nonumon elsewhere-namely, failure to attain apposition because of intervention of fragments, usually the capsule or bone spiculae. This incision hence gives notice as to the success or failure of our reduction, and it is made, of course, with the patient on the table ready for plaster or any other type of treatment.

However, we may not wish to apply plaster and if so there are two alternatives (1) the introduction of a nail, or (2) the introduction of several wire drills

Nails and screws have been used for over thirty years with varying success, but comparatively recently the flanged nail popularized by Smith Petersen has apparently been successful in a large group of patients. This method has the merit of not requiring any additional splintage and it shortens the in-bed period. The use of wire drills, three or more, is being tried out but as yet too few cases are on record for actual appraisal. It is claimed that wire transfixion thus used enables the patient to get out of bed in a few days and even to walk with safety shortly thereafter without splintage.

1854

To pass a nail or wires along the desired route is no easy matter and a number of expedients are advised to prevent error. Hence this procedure is not a method to be employed by the inexperienced.

Also let it be mentioned that passing drill holes across the femoral neck is recommended for the purpose of aiding union just as it is now employed in certain cases of nonunion. Incidentally, this drilling for nonunion is ascribed to Beck of Kiel (1929) but actually it was published by Daniel Brainard of Chicago in 1854 who devised an awl-like instrument then known as "Brainard's Perforator." (See accompanying illustrations.) There is nothing new in traumatic surgery!

For completeness let us not fail to mention the Maxwell-Ruth and Russel traction methods; nor must we forget ambulatory splints, nor yet the ingenious device of Anderson.

Hence we are confronted with a wide choice but the consensus of experienced opinion recommends the following: 1. For the poor physique group, adhesive strap traction.

2. For the fair physique group, plaster of Paris casing with or without preliminary incision for (a) determining accuracy of reduction; (b) drilling the fragments.

3. For the good physique group, plaster of Paris casing with the preliminary incision and drilling of the fragments; or transfixion by the Smith-Petersen nail, or wires.

There is one group that demands home care for a variety of reasons, and often the nursing facilities are meager. For that kind of problem, especially if the patient is of the "wren" type, use a kitchen chair, cutting out the seat for strategic purposes. Place the patient in this padded chair and fasten the seated patient thereto by plaster of Paris, the injured limb flexed at the knee and abducted. This is what the author calls the sitting-up-casing and the patient and the chair can be carried or rolled about, and at night the patient and the chair go to bed and remain attached to each other until union is obtained.

"IT'S NOTHING BUT A LITTLE COLD"

Despite the fact that "no reputable physician will tell you that he can cure the common cold," anybody who has one should "go to bed and call a good doctor," declared Dr. Robert Jolly, of Houston, Texas, at the American Surgeons' meeting in Buffalo. True, we have not isolated the cold germ, and there is no cure, "yet," said Dr. Jolly, "the common cold is one of the worst menaces.

"The death rate from pneumonia is the fourth largest in the United States. And most cases of pneumonia come as a direct result of the common cold.

"Much of tuberculosis grows from the cold. And virtually all of sinus trouble can be traced to that source.

"There are many children doomed to go

through life with the misery of sinus trouble because their mothers regarded the cold as unimportant and were not careful in employing preventive measures.

"But the cold is a menace.

"If you take cold, go to bed and call a

good physician.

"Try to tell this to the average person and he laughs at you. But, as a matter of fact, one gains economically by that procedure. Go to bed for two or three days instead of dragging around for a week or two with one-half your normal efficiency and you will find that you have gained in the long run.

"When you are taking cold, alkalinize your system by taking the juice of a citrus fruit or by drinking soda and water. That is the

best treatment."

A USEFUL COMPENDIUM

We are asked by the Assistant U. S. Surgeon General in charge of the Division of Venereal Diseases to call the attention of physicians to the monthly publication, Venereal Disease Information, issued by the U. S. Public Health Service. It provides a summary of the scientific developments in the diagnosis, treatment, and control of syphilis and gonorrhea. More than three hundred American and foreign journals are reviewed. Abstracts are made of

articles describing laboratory, pathologic, and clinical work. The cost is fifty cents per annum, payable in advance to the Superintendent of Documents, Government Printing Office, Washington, D. C. It represents only a small portion of the total expense of preparation, the journal being a contribution of the Public Health Service in its campaign with State and local health departments against the venereal diseases.

A SIMPLE, INEXPENSIVE APPARATUS FOR PRODUCING AN ARTIFICIAL PNEUMOTHORAX

NORMAN STRAUSS, M.D., F.A.C.P. and

GEORGE H. KOJAC, M.D., Bronx

From the First Medical Division Morrisania City Hospital

The purpose of this contribution is not to discuss the therapeutic value of pneumo-thorax in the treatment of pulmonary tuber-culosis, nor to discuss the indication or contraindications of this procedure, but only to present a simplified and very inexpensive method of producing a pneumothorax.

The machine now in use is based upon the principle of air-displacement by water. Two large bottles containing water are connected by an inverted U tube. One bottle is raised higher than the other. Water seeking its own level, will flow from the higher to the lower bottle. The water flowing into the lower bottle will displace an equivalent amount of air—this displaced air is carried into the thorax. This method is efficient but the apparatus is bulky and cumbersome (Fig. 1) and is very expensive

The new apparatus is based upon a different principle entirely. It employs an X-Acto Bi-Valve Adapter. (Fig. 2-3). This is an all-glass adapter ground to fit any Luer type syringe. The adapter has two legs each with a ground in glass valve moving in opposite directions. When the plunger of the syringe is drawn out, the suction created opens the intake valve (A) sucking in air and automatically shutting off the outlet valve (B) When the plunger of the syringe is pushed home, the pressure created reverses the operation and the air is expelled

A rubber tube is attached to the outlet leg and the needle is connected to the far end of the rubber tube

The needle (C) is inserted into the thoracic cavity in the routine fashion By simply rhythmically withdrawing and pushing home the plunger of the syringe, air is forced into the thoracic cavity.

We employ a fifty c.c. syringe—the number of cubic centimeters of air expelled into the cavity is thus easily measured by simply counting the number of syringe-fuls of air injected.

The system is connected to the manometer (D) with a three-way petcock (E) as shown in the diagram. The pressure within the thoracic cage can be determined at any time.

This new set-up costs about one-third as

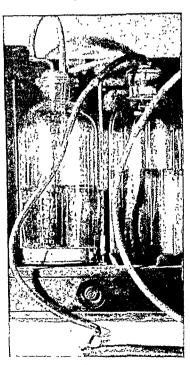

Fig. 1

Sacroiliac disease	2
Pleurisy	
Gastroenteritis	
Streptococcus knee joint	l
Sub-acute bacterial endocarditis 1	l
Alcoholism	l
Diabetes 1	l
Empyema	2
Meningitis	

For purpose of analysis the series may be divided into (A) hematological and (B) clinical effects.

A. These concern themselves with studies made of white blood counts and differentials made before and after the use of salipyrine. The routine followed was to do a white blood count and differential the day treatment was started and then to administer one tablet (71/2 grains) every four hours for eight doses. A count was made on the second day and a third count was made at the conclusion of the course of medication. In a certain number of cases in which the symptomatology was severe the dosage was doubled so that the patient received 120 grains in the course of forty-eight hours. Shilling counts were done and in no instance did it appear that any depressant action either upon the total white count or percentage of neutrophiles occurred. Drops in total counts occurred but were apparently due to drop in the febrile course of those cases presenting acute infection.

B. The clinical results most striking were in the series of cases of rheumatism and in particular those of acute articular rheumatism with red, swollen, painful joints, and elevation of temperature. The drug appeared to be efficacious in the treatment of these cases as evidenced by prompt reduction of pain, redness and swelling of the affected joints, and a drop in the temperature curve. Another group of cases were those of upper respiratory infection such as pharyngitis, laryngitis, bronchitis, and follicular tonsilitis in which the symptoms of generalized body pains, headache, malaise,

and temperature were present. There seemed to be considerable relief of all symptoms under this medication.

connection with the rheumatic group it was of interest that the cases that proved to be of gonorrheal origin were not relieved until suitable methods of specific treatment were instituted. A small group of menstruating women (2 interns) were given the drug in connection with blood studies with no untoward blood effects. Menstrual pains, however, were not lessened. It is of interest that none of our cases developed ringing in the ears or gastric disturbance such as one frequently encounters in salicylate treatment, although no soda or other alkali was used.

Conclusions

The literature studied as well as our own cases would lead one to believe that the production of neutropenia in connection with the use of drugs containing the benzene ring probably depends upon individual idiosyncrasy to this type of drug.

From the foregoing, it would appear that salipyrine may be safely employed with excellent clinical results in cases calling for salicylate therapy and that its action is exerted without deleterious effect upon the blood.

ANOTHER POINT TO REMEMBER

High school students in their consideration of the "desirability" of socialized medicine, says the Bulletin of the Eric County Medical Society, should read with some interest the following admonition by William A. O'Brien, M. D., Minneapolis, Professor of Pathology and Preventive Medicine and Public Health at the University of Minnesota:

"The confidential relationship between physician and patient that exists under our present system of medical care would be impossible under any conceivable system of state medicine or sickness insurance. Patients find it hard enough to divulge essential personal information to the doctor when they know, as they do now, that this information will be held confidential. Under any state system the physician's records would of necessity become public property. Inevitably, that patient would become more secretive and treatment would suffer,"

THE ADVANTAGES OF A SINGLE BEGINNING DIABETIC DIET FOR ADULTS

JAMES RALPH SCOTT, M.D., F.A.C.P., New York City Associate Physician, St. Luke's Hospital

The prevailing tendency in diabetic diets is toward simplification and an approach to the normal. Before the introduction of insulin thirteen years ago the diagnosis of diabetes mellitus in a child was equivalent to a death sentence on any diet. Older diabetics were condemned to a low carbohydrate-high fat regime which was not only unnatural and unpalatable but was a constant menace because of its high ketogenic composition.

With the discovery of insulin, however, an opportunity was afforded to experiment with diets of varying carbohydrate content. As a consequence not only was the diabetic child saved from extinction and the ketogenic diet of the pre-insulin era rendered unnecessary, but it was discovered that in a diabetic patient controlled with insulin the higher carbohydrate allowances actually improved the glucose tolerance so that the initial insulin dosage could sometimes be reduced even with increasing carbohydrate allowances.

It was found that in the controlled diabetic, carbohydrate acts as a normal stimulant to the pancreas, but in the uncontrolled diabetic, carbohydrate is only an additional burden to an already exhausted pancreas. This is particularly true if the fat content of the diet is maintained at a low level-as near as fifty grams as possible. As a consequence of these changes the diabetic diet now approximates that of a normal person. This of course is possible only with the aid of insulin, but less insulin per gram of carbohydrate is required with the modern diets than with the older ones. This newer conception of the normal diabetic diet is due to the courageous and original work of Geyelin, Sansum, Rabinowitch, and others.

Not only is the modern diet more normal but the process of adjusting a patient to his proper diet is much simpler than formerly. Ten years ago at St. Luke's Hospital a diabetic patient on admission was subjected to the following routine:

His theoretical caloric requirement was calculated from tables based on age, sex, height, weight, and surface area. The indicated caloric needs were then supplied by selecting one of six or eight diets, over fifty per cent of the energy of which was supplied by fat. On this diet, without insulin, the number of grams of glucose exercted in the urine in twenty-four hours was determined. Insulin was then given at the ratio of one unit of insulin to two grams of sugar excreted. Quantitative determinations of glucose and the CO₂ combining power of the blood and of the glucose in the urine were the sole guides to therapy.

Today the process of regulating a patient is much simpler, less time consuming, and more effective. Because it has been found that each patient's caloric requirements are peculiar to himself, and conform to no predetermined theoretical calculations, no attempt is made to calculate them. Gain or loss or maintenance of weight is regarded as the most reliable guide to the caloric requirements of the patient.

On admission the patient is placed on the single admission diet of C-120 grams P-65 grams F-50 grams-1190 calories. A fasting blood determination is done for glucose, urea nitrogen, cholesterol and CO2. No quantitative tests are done on the urine. The amount of insulin necessary to control the patient on this diet is determined solely by repeated examinations of the urine for sugar with Benedict's qualitative solution. Individual specimens of urine are examined daily before breakfast and from one to two hours after meals. On the basis of these tests the insulin, after starting at 5-5-5. is increased or decreased until the urine is sugar free. Blood sugar determinations may be done from time to time to check on the effect of the insulin on the blood sugar, but frequent examinations of the blood are unnecessary. The most reliable guide to the insulin requirements of the patient is the result of the four daily urine

The patient's admission weight is recorded and compared with his theoretical normal as indicated by the usual actuarial tables. The desire is to maintain the patient at or a little below his "normal". If his weight is normal or greater he is discharged as soon as his urine is sugar free, and is told to report for further observation to the clinic, where his diet may be continued or even decreased in calory value if he fails to lose weight. If he is under weight, the diet is increased at once to 200 or 300 grams of carbohydrate, not more than ninety grams of protein and as little fat as possible, usually not more than 100.

This fairly liberal fat allowance is unavoidable because of the nature of the food we eat and the requirements of palatability. All meat and fish, except haddock, contain considerable amounts of both visible and invisible fat. Therefore as the protein content of the diet is increased, the fat content must necessarily increase unless the protein consumed consists exclusively of white of egg and haddock. Also, in order to make the diet more palatable some fat must be allowed for cream and butter.

Just a few words of explanation concerning this single admission diet for adults that has been adopted at St. Luke's Hospital. The figures (C-120 P-65 F-50) are not chosen arbitrarily, but are the result of ten years' experimentation with many and varied diets. The carbohydrate content was adopted because at least 120 grams of carbohydrate was desired and because it corresponded to the carbohydrate content of our fluid diet which is used during acute infections and post-operatively. The similar carbohydrate content of the two diets facilitates the change from one to the other when necessary.

The protein content was selected because it is high enough to satisfy the protein requirements of from two-thirds to one gram per kilogram of body weight for adults, and thus maintain the patient in nitrogen equilibrium. Less protein would be inadequate for the daily metabolic needs of the patient. More protein is unnecessary while regulating the patient and is even undesirable because of its possible ketogenic effect.

The fat content is placed at fifty grams because that is the lowest figure we could arrive at and still prepare a palatable diet. At first the fat was fixed at forty grams, but because of protests from the dieticians as well as the patients, it was increased to fifty grams. This appears to satisfy patients, dieticians, and physicians, and allows an adequate supply of butter for bread and cream for coffee.

This single beginning diet for diabetic patients has proven most satisfactory for the past two years at St. Luke's Hospital. On comparing it with the admission diets of several other New York City hospitals an interesting discovery was made. It was found that four of us working independently in similar institutions had arrived after ten years of experimentation at practically identical admission diets.

There are several advantages to this single beginning diabetic diet. It reduces the duration of the patient's residence in the hospital. With the same diet for every patient, the process of determining the patient's carbohydrate tolerance gets off. to a quick start. It promotes uniformity management of diabetic throughout all services of the hospital. With but one diabetic diet to order, even the surgical intern approaches the diabetic patient with less trepidation. roughly quantitative measurement of the severity of the diabetes. For example, if it requires thirty units of insulin to regulate one patient on this diet and sixty units for another, it can reasonably be assumed that the carbohydrate tolerance of the first patient is twice that of the second. Finally, should it be found necessary, in order to reduce weight, to keep a patient on this diet for any length of time will maintain the patient in nitrogen equilibrium.

DR. LAURICELLA APPOINTED TO STATE POST

Industrial Commissioner Elmer F. Andrews announces the appointment of Dr. John Bart Lauricella of 10 Park Avenue, New York City, to be Medical Director of the State Insurance Fund. Dr. Lauricella, who won the highest per-

centage rating in a recent Civil Service examination for Medical Examiner in the State Department of Labor, was "appointed after outstanding authorities in medicine and surgery had been consulted and had endorsed his qualifications."

THE GLOVED HAND FOREARM SPLINT IN THE TREATMENT OF COLLES FRACTURE

NATHAN H. RACHLIN, M.D., Brooklyn

Restoration of function without any or with the least amount of impairment in the shortest period of time should be the objectives of treatment of any injury.

The method evolved in this description

fulfills the above specifications.

This type of fracture is usually caused by indirect force applied by a fall on the pronanted hand, with greatest force exerted on the ulnar side of the palm, directed upward, backward, and radially, the effect of which varies with the degree of force applied, age of patient, and condition of the bone structure.

The usual pathology present is an oblique fracture of the radius in the line of the force applied, i.e., upward, backward, and radially at a point of three-quarter to one and one-half inches above the styloid process. Frequently there is also a fracture of the ulnar styloid process or tearing of the ulnar lateral ligament, and occasionally tearing of the interosseous fibrocartilage or one of both radio-ulnar ligaments.

The direct result of the injury is not only the fracture of one or more hones, but also a dislocation of the hand radially because it has lost the buttress of the

radial styloid.

Restoration of function with any degree of satisfaction cannot be accomplished unless the normal relation of the wrist to the forearm is re-established, and that can be attained only by re-establishing the normal relation of the styloid processes to each other, thus reconstructing the saddle into which snugly fits the carpus.

With these points in view, we reduce the deformity, and maintain the reduction, while the immobilizing splint is

applied.

The reduction is best accomplished first by exaggerating the existing deformity and after that by reversing the causative forces thus using traction downward, forward, and towards the ulnar side, and at the same time exerting direct pressure on the distal fragment.

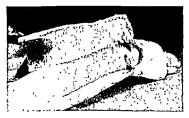

When that is completed, as evidenced by the linear alignment of the radius and the position of the styloid process, it is maintained by the continuous traction in the same line, thus offsetting the contractile forces of muscles of the forearm.

Likewise, the hand now being deviated towards the ulua, direct pull is exerted by the radial lateral ligament, thus preventing the slipping back of the fragment.

The next important step is the maintaining of that position, while the immo-

bilization splint is being applied,

While the assistant is holding firmly the forearm in that position, a properly

padded circular cast is applied, from the base of the metacarpophalangeal joints, with thumb separate to the upper end of the forcarm, with the hand slightly flexed and markedly deviated towards the ulna.

By careful and judicious treatment as described herewith, one may obtain a perfectly movable wrist joint and therefore there is no necessity for choosing any other position than one that will favor the proper union of the fracture.

By introducing, what we call the Gloved Hand Forearm Splint, we have been able to obtain perfect fixation, continuous and uninterrupted observation, both by sight and by palpitation, institute almost immediate physiotherapy, early mobilization without disturbing the relative positions of the fragments, and uninterrupted use of the phalangeal and uninterrupted use of the phalangeal and invariably, after a brief period when pain ceases, the patients use the injured hand for light and necessary duties, such as dressing, eating, and writing.

The making of the splint is simple. When the circular cast is set but not hardened, the cast is cut across dorsally rom a point corresponding to the base of the first metacarpal across to the base of the fifth metacarpal, thence a straight line on each side upward to the elbow.

By removing the cut dorsal leaf, the whole forearm and wrist are exposed dorsally yet the parts remain completely immobilized by retaining the hand within the gloved part and the forearm in the deep trough of the cast. Within a couple of days the forearm is thus exposed, and without disturbing the fragments, carefully inspected and immediate physiotherapy instituted, such as baking later as the process of repair is progressing, massage, and active and passive motion.

After about two weeks, passive motion in the wrist joint is begun by carefully and slowly lowering the anterior leaf of the cast, thus causing dorsiflexion of the hand.

As time goes on, freer use of the hand is permitted when bony union is firm as evidenced by signs and symptoms, and the splint is removed during the day.

At this rate when bony union is solid there is not only a healed bone, but also a perfectly functioning hand and forearm, with no stiffening or muscle atrophy, and the result has been obtained in the shortest possible time.

The bivalved molded, or circular bisected cast, permit too much lateral motion and therefore do not furnish adequate splinting. The metallic, cock-up, or other splints of that type are not perfectly fitted to the individual patient, permit too much wrist motion, and have what we consider the disadvantage of keeping the hand dorsiflexed with the resulting displacement of the distal fragment.

The complete circular cast, while providing perfect immobilization, does not permit any visualization or physiotherapy, or early mobilization and has the added danger, although very remote in hands trained in the application of plaster-of-Paris, of pressure due to swell-

ing or tightly applied cast.

With the use of the Gloved Hand Forearm Splint, it is possible to retain the fracture in the position of choice, to visualize continually the injured limb, to apply physiotherapy and massage, to keep up normal blood supply, to preserve our muscle tone, to prevent any stiffening of tendons, muscles, and joints by active muscle action, and active and passive joint mobilization. The course of the disability is shortened and a better result secured. It is a recognized fact that prolonged immobilization renders the subsequent motion of the adjoining joints and muscles more difficult.

In conclusion may it be added, that with proper understanding of the basic principles, and their application in the treatment of Colles fracture, one should be able to see fewer unsatisfactory results, which while reported as cures, have shorter radial styloid processes, undue prominence of the lower end of the ulna, with radial deviation of hand and wrist, and markedly diminished gripping power of the hand.

901 EASTERN PARKWAY

NOT NEEDED HERE

Successful transfusion of blood taken from the victims of fatal accidents and kept in a refrigerator for more than three weeks is described in *The Journal of the American Medical Association* by the Soviet scientist, Dr. S. S. Yudin, who first developed the procedure. Dr. Yudin, who is chief surgeon of the Sklyfasovsky Institute, the central emergency hospital of Moscow, reports in the article the results of 924 transfusions in his own clinic besides the sending of more than 100 flasks of the blood for use in other hospitals of the Soviet Union.

American hematologists interviewed by New York papers read the report with the same cautious interest with which it was published by the official journal of the American Medical Association. No similar experiment, they stated, had ever been attempted on such a scale outside the Soviet Union, and some of its results, they indicated, may prove, after analysis and verification, to have considerable scientific value. Popular repugnance to the idea of such transfusions, they suggested, and the greater availability of living donors in urban centers of the United States, were likely to prevent the new source of blood for medical purposes from being widely used here.

PHYSICAL AND PHYSIOLOGICAL GROWTH AS A FACTOR IN CHILD ADJUSTMENT

IRA S. WILE, M.D., New York City

The fundamental status of a child obviously depends upon structure and function. Any lack of structure, any acquired defect or injury, must alter the physiological potentials of the child. Thus the cretin, lacking a thyroid gland, has his total physiology altered by reason of the lack of an essential structure, the activity of which is necessary to the normal physiology and psychology of the child. A congenital myopia plays its part in influencing the sensory impressions of a youngster, but it is no less significant in determining a large variety of activities prior to correction by lenses; and even the mode of correction may alter the totality of his physical and physiological activity. A slight injury, requiring the amputation of a thumb, may have far more serious effects as a structure defect, than the removal of a portion of some hollow viscus by a major operation. The entire picture of juvenile activity may be altered by the loss of the thumb, if it limits activity in sports and handicaps the individual for definite and desired forms of manual activity or artistic function.

The entire nature of the child is represented in his total reaction as an organism. He is not as assemblage of parts, of organs, of systems. The structural coordination of his body, as well as its coordinated physiological activity, affects his entire being. His sensory and motor organization subserves the organism as a whole, and in turn is dependent upon the complete organization of the body. It is evident that the well-being and integration of the whole organism must have its effect upon subsidiary and interacting systems and organs. Reason grants that structural or functional defects of the sensory organs, or a lack of development of the osseo-muscular system must determine in large measure, not merely the nature of the child, but the ultimate range of many of his capacities and adaptabilities. It is equally true that such factors as color, height, weight, general appearance, chronic physical handicaps, and even acute disabilities and diseases effect physiologic function, influence emotional states, condition ideas and temperaments, and effect a wide range of social adjustment. The nature of every child is bound up in his physical organization and function, which in turn, must be evaluated in terms of interaction, coordination, and unity. These are fundamentals in the dynamics of child adjustment.

Physical organization, both in terms of structure and function, is a continuum beginning with conception and extending through the course of life. The significance of the moment of conception is frequently ignored, but insofar as the chromosomes then set up the hereditary characteristics which are to be revealed more and more during the process of maturation, one recognizes that a large part of the essence of the nature of a child is beyond modification at the time of birth. This applies particularly to levels of intelligence, which postnatal conditions may readily lower but rarely raise. To establish adjustment patterns as normal, superior, and inferior, in correlation with some mental measure, outrages science. It is unnecessary to discuss the deterministic concepts which revolve about typological systems. If transmitted genes are responsible for constitutional characteristics, the classification of children into athletic, asthenic, pycnic, and dysplastic types implies capacities for adjustment constitutionally predetermined. To discuss gall-bladder types and gastric ulcer types of persons is no more satisfactory than to revert to the ancient status aboplecticus and status phthisicus. admittedly plays a part adaptation and adaptability, but is not static and beyond external influence any more than many hereditary trends or determiners.

Many of the potentials of inheritance are conditioned in their realization by environmental factors which are more readily manipulated and regulated. The multiphased interactions of heredity and environment are such that they are vital, but variable, in their influence upon

structure and function in terms of personal social reactions. The chromosomic premise of height and weight cannot be realized without a socially provided food supply. On the other hand, the existence of one blue eye and one brown eye is beyond the control of any scheme of systemic correction. Growth and function are not wholly constitutional because both may be hampered by external Thus, improper footwear situations. may conduce to fallen arches; an inadequate diet may cause rachitic curvatures; an incorrect writing posture may lead to muscle cramps, or too little oxygen may foster fatigue and inattention. Heredity, then, insofar as it effects structure and function, must be regarded, in part, as predetermining and intangible and, in part, as predirecting but not compelling. The part that heredity and constitutional factors play in any specific adjustment is a problem for investigation rather than for conjecture or assumption.

Regardless of the physical differenobservable during natural periods (prenatal, natal, and postnatal), and despite an accepted set of norms for structure and function based upon various age averages or medians, it is wise to remember that anthropometry cannot be applied loosely to the individual in determining his particular norm of growth and function. Mensuration is artificial at best. To slavishly follow scales and measures for age, height and weight, for example, is to lose sight of individualization of structure and function in terms of hereditary factors, family trends, and environing conditions which facilitate or inhibit physical development. adjustment cannot be prophesized solely on the basis of tests of pulmonary content, strength of grip, the enumeration of physical defects, or the determination of an intelligence quotient.

Infancy, childhood, adolescence and maturity may be set up artificially by physical, legal, or social definition. Biologically, these stages represent mere markers along life's highway of progress. Maturation is a normal growth process, having several vaguely defined periods of acceleration which bring about marked structural modifications. Temporarily disregarding the tremendous functional

development of life's first two years, resulting from growth and expansion of traits established during the period of intrauterine development, no period of years is more significant for physical and physiological development than adolescence, which marks the transforming potency of gonadal activity. The primary and secondary effects of gonadal development, supported by the vital hormonic influences from ductless glands, bring about alterations in child nature arising from, and concerning physical reorganization

The incidence of the physiological potentials of procreation changes child nature and activity profoundly, especially the juvenile outlook upon life and living. This unusual period of development while maturing is, however, merely one of physiologic acceleration with psychological concomitants. The whole child and his total reactivity are modified especially in the emotional sphere. The profound inter-relationship between psychic activity and enhanced physical function is well illustrated by heightened sense of activity and power, by the struggle for independence, and by a growing though uncertain emotionality, influenced markedly by the development of the higher qualities of love and spiritual feeling. The rapid growth of bone and muscle, the oscillation between energy production and fatigue, development of pubescence, seminal fluid, and menses are not as significant in terms of structural re-formation as they are in the foundation of physiologic activations which tremendously affect ego reactions as manifested in social relationships. Self-consciousness. arrogance, aggressiveness, submissiveness, self-pity, anxiety, social timidity, and self-isolation are reflected in the personality reaction of the child to its own physique and physiology. Consciousness of one's own growth is a psychological influence more consequential than the physical fact. To be abnormally tall, short, fat or thin, too pimply or too hairy, etc., in fact to be overconscious of any deviation from a norm of beauty. strength, or accomplishment, adds an extra hazard to adjustment on the basis of structural and functional changes.

This maturation, so pronounced at

adolescence, is merely the expression of an innate capacity to develop in accordance with some principle of protoplasmic This principle is manifest in nutritive and reproductive development and consequent behaviors of the amoeba or campanularian hydroid, of molluses, fishes, reptiles, birds and mammals. All life implies the dynamics of growth, with irritability, responsiveness and adapta-The range and limit of function in terms of individual and group relationships, are inherent in, and determined by the level of structuralization this, in turn, are established the nature and potentials of physiological activity

It is needless to write in terms of The eye of the child specific functions is merely an expansion of the photosensitiveness which is observable among The kinesthetic capacities of school children are not far removed from the tactile sensitivities of obscure microorganisms These are only instruments for adaptation whose value inheres in then adaptability to the needs of the organism in the promotion of adjustments

Protoplasm, although structureless, is a structure possessing all the properties of general and specific adaptation which reveal the structural organization intensely related to levels of function The power of adaptability, representing (if not constituting) the personality of the child, depends in a large measure upon the vital spark operating through the structural dynamo, whose developed energy runs the motor activating func-The physical structure of the child offers potentials which may not be realized, or may be so badly managed as to work even contrary to the social welfare of their possessor necessary to differentiate the meaning and value of the physical and physiological functioning of childhool in terms of personal purpose and social goals Too frequently, even after the maturational process appears to have reached its plateau, the natural growth seems to run counter to environmental pressures The adjustment of the child is then defined in terms of some social judgment rather than in terms of his innate reactions and reactivity. His ideas satisfactory adjustment may differ widely from those of his parents, teachers or the community

It is needless to dwell upon the definite influence of an organ like the heart, of the circulatory function, or the gastrointestinal system Pitently, cardiac structure conditions its function. It is also accepted that emotional inadequacy may hamper cardiac function, and the two separately or together may interfere very severely with the capacity of the child for making social adjustments satisfactory to him-A discussion of the organization and physiological activity of the stomach and intestines together with the vital chemical and hormonic influences of the thyroid gland and the panercas, not to mention the liver and the pituitary gland, would yield ample illustrations of the modifiability of the child's nature and his consequent adaptability One need think only of the problems of height and weight, appetite and digestion, irritability, constipution and diariliea. instabilities, neurotic reactions, deficiencies in attention and concentration, or indeed, of interferences with intellectual growth and development. It would be redundant to specify in detail the particular effects of each structure or the participating contributions of each system, or the interactive effects of the structure of the total body, or indeed the diverse function of the body as a unit in order to make clear the degree to which the child's nature and adjustment are a function of his own total function-He adjusts himself in the light of what he can may, and wills to do he adjusts himself as he does, involves an investigation of his behavior in the light of concomitance and causability, upon these, all rational treatment depends

The nature of a child has two phases, the normative quality which exists in terms of his own evaluations of his structure and function, and the evaluation which society makes in terms of socially approved norms Social contrasts and systematic efforts to bring about conformities exist side by side, while there are no standardized efforts to function in terms of personal interests and enthusiasms The essence of selfevaluation for the individual inheres in his recognition, with or without his acceptance, of the norms of behavior set

up by his particular community as patterns to be accepted and followed. preservation of his individualism may be of significance to himself. The doctrine of individual differences looms larger in the development of pedagogical concepts than in social practice. It is evident that the adjustment of the child may be considered in the light of his personal ideation or in terms of social judgments. What may be thoroughly normal for the individual child may be regarded as abnormal by society. tainly dwarfism or gigantism may be familial and the natural physical norm for a child whom society would regard as This judgment of abnorabnormal. mality might have far greater significance in modifying his general physiology and adjustment than the structure responsible for social comment and the resultant emotional distress. Society has no power to alter such fixed structure. Undeniably, height is significant, but what constitutes unusual height is a matter of location. The stature of a Hottentot and that of a Viking cannot be compared and evaluated in terms of the same scale of measurement.

Normal lefthandedness illustrates the conflict between neuromuscular organization with consequent psychological function and social pressures. The effort to convert normal sinistrals to righthandedness frequently occasions maladjustments varying from restlessness and inattention to incoordination and stuttering, from dyslexia and non-promotion to stealing The sinistral is subjected and truancy. to many slight limitations in a righthanded world, but his adjustments are readily accomplished when his dominant hand is accepted as the normal instrument for meeting his world of causation. He functions most effectively when his total organization is respected and his physiology is accepted.

This article is written in terms of normality of function. There is much to be learned from a recognition of the meaning of what constitutes normality in structure and function. A theoretic norm, for the most part, is an intangible. For practical purposes, each individual's organization must be considered with relation to somewhat vague and artificially established criteria of normal

structure and function. Obviously to be microcephalic is abnormal, but if a child be a well-formed dwarf, although his brain may be no larger than that of a microcephalic idiot, he may still possess complete functional capacity of high order. To have more, or less, than five fingers on a hand is a more definite expression of abnormality, as five-fingeredness is accepted as normal. people with five fingers, however, may lack a bone or have an extra one; they may lack nails or have them actually concave instead of convex. Structurally, there may be many deviations from the established norm even though there may be no real limitation in function. mere possession of what is termed normal structure does not guarantee what is normal functioning. have thought and worked too long in terms of specific structural units. As a result many insufficiencies in the adjustment of children have been blamed upon some structural handicap or some specific structural inadequacy. This often extends into psychological fields when imagination and theory build up pyramidic conclusions upon pointed premises. To fasten maladjustment upon dental decay, flat feet, mental deficiency, or malnutrition is to ignore the concept of multiple causes in social living.

It is highly important to think of child nature and adjustment as a result of liv-Children may function in terms of adaptation in social relationships far more successfully than can be premised on the basis of particular structures. This is well-illustrated, for example, among many children who have spinal curvatures or who show limitations in speech due to dental deformities. dynamics of adjustment lie in vital principles which operate through all structures. To consider the body apart from the mind is an absurdity. To view the mind as merely a mechanism for employing intelligence is ridiculous. To think of the primary emotions such as fear, rage, and love as dependent only on visceral tonus and the sympathetic nervous system is a narrow concept. child is more than the sum total of his parts, viewed either as structures or as functional units. The child is a byproduct of his biological-social friction.

He is shaped from within and from with-His lungs will respond to a lack of oxygen or to a genial gesture His bladder will be responsive to pleasurable excitement at a circus or to a sense of fear at approaching examinations ability to see, to hear, to learn, and to do are as dependent upon his interest and enthusiasm, his ideas and aspirations, as they are upon the structural perfections or the physiological potentials of his eyes and ears. Life premises a capacity for adjustment. Living demands its expression regardless of the social level of activity. When pedagogic necessity calls for specific action it is wise to remember that passivity may be active by allowing adjustment to develop as a result of natural psychobiologic potentials and responses. The finest types of adjustment emerge by reason of internal needs and urges seeking realization in harmonious self-expression frustration is a linzard

The soul of a child characterizes his hving, just as the breath is a quickening principle of his life. His mind is but an attribute of his soul. Memory,

thought, feelings, and volition are behaviors organized within himself strength and power are largely dependent upon corporeal organization physical growth and organic development involve and condition his physiological activities, but his physiology is merely interpretative of his functional His functional capacity, in capacity turn, determines his structural effective ness, and may even impair structural Thus one sees and senses a growth circle of life in which structure and function, organic status and functional dynamics are integrated The child is neither structure nor function, but both Each conditions the other, but both are certain fundamental dependent upon hereditary materials, vitalized and nutrified to permit their development through progressive maturation to such limits as are set by a favorable or unfavorable environment The nature of the child his adjustment and his adjustability, are outgrowths of life and of living, of being and becoming of structure and function

Case Report

AN INSTITUTIONAL OUTBREAK OF BACILLARY DYSENTERY PARK-HISS TYPE

ISIDORF MILLER, MD, Port Richmond

Resident Physician, New York City Farm Colony West New Brighton Staten Island

Dysentery epidemics have usually oc curred in camps prisons, and institutions where large numbers of men are congregated Kruse was the first to call the non-Shiga type of dysentery "asylum dysentery" At the New York City Farm Colony, a home for the aged, with a capacity of 1300 immates, an epidemic of dysentery started September 16, 1935, and during the next four weeks, fifty one patients (43 males and 8 females) had been admitted to the infirmary Nine cases were admitted to the infirmary from September 16 to 19, no cases for the next three days, eleven cases from September 23 to 29, eleven cases in the next two days, fourteen cases from October 2 to 7, an absence of cases for the next three days, and five cases from October 2 to 7, an absence of cases from October 2 to 7, an absence of cases from October 2 to 7, an absence of cases from October 2 to 7, an absence of cases from October 2 to 7, an absence of cases from October 2 to 7, and ab

ber 11 to 14 On admission the chief complaints were abdominal pain, diarrhea, and tenesmus An early distinction could be made in most cases as regards mild and fatal cases, the number of bowel movements wis not a distinguishing feature, but toxicity was Those cases admitted in a toxic state, in a state of collapse, gave a bad prognosis

All fecal specimens were sent to a neighboring laboratory for examination for the typhoid paratyphoid dysentery groups and for amebic dysentery. The reports were negative for amebae and bacilli except in one case in which short chained streptococci were numerous (fatal case). Pus and red blood cells were found in most of the specimens. Arrangements were made with the

Bureau of Laboratories of the New York City Board of Health to have fecal specimens of the patients and foodhandlers examined at their laboratories. Six of the patients' specimens were positive for paradysentery bacillus, Park-Hiss type. Three of the foodhandlers also were found to be positive for paradysentery bacillus, Park-Hiss type.

Our cases included forty-three males, of whom eleven died, a mortality rate of 26 per cent; and eight females with one death, a mortality rate of 13 per cent. The mortality rate for our fifty-one cases was 24 per cent. Table I shows the average age, temperature, pulse, and duration of diarrhea in those cases that recovered and in those that died. Mucus and blood were present in almost all the cases. The presence of other symptoms is also shown in the table. An unusual symptom in two of the cases was urinary retention, which was present on admission and lasted for about Sedimentation rates on thirteen a week. cases of dysentery gave the following figures:

Two cases had rates under ten per cent, one a rate of fifteen per cent, five had rates between twenty-one and thirty per cent, two had rates between thirty-one and forty per cent, and three had rates between forty-five and fifty per cent. The average rate in these thirteen cases was twenty-nine per cent. Stained blood smears showed a high polynuclear neutrophile count with marked toxic granules. One autopsy was performed; an inflammatory condition of the mucous membrane of the entire large intestine was present.

Dicussion

Mild and fatal cases could be determined almost without an examination. The fatal cases had a higher temperature and pulse rate than those cases that survived; the average temperature and pulse rate in the former group were 102.7 and 105 F., in the latter group they were 101.3 and 93 F. Blood smears were not of prognostic value since a neutrophilic leukocytosis and toxic granules were invariably present. Blood sedimentation rates could not be used to differentiate the mild and fatal cases since

there were no appreciable differences in the

The principle means of spread is through a missed case of dysentery. At least twenty males with mild diarrhea never reported to the clinic or infirmary, and they may have been instrumental in spreading the infection. The mode of infection is usually through contact with infected persons or carriers. The contact may be through the use of the same dormitories or through the preparation and handling of food. The fifty-one cases were distributed among nineteen dormitories, from one to four cases per dormitory. Of the 250 infirmary patients, only three contracted the infection.

Our lack of laboratory facilities was a We had to send samples of feces to the Bureau of Laboratories of the New York City Department of Health for The containers had to be examination. transported by truck and did not reach their destination until several hours had elapsed. The low number of positive cultures are due to two factors: (1) the Bureau of Laboratories began to examine our specimens after more than two weeks of the epidemic had passed, (2) the time involved in the transportation of the specimens to the laboratory. The examination of the foodhandlers disclosed three carriers of the Park-Hiss type of paradysentery These carriers were immediately removed from their connection with the dietary division. The milk, food, water, and plumbing were inspected by the Department of Health. Changes were ordered in the sterilization of dishes and cooking utensils, and a well was ordered sealed. No evidence of the food or milk being at fault was found. No new case of diarrhea has been reported since October 14.

Summary

- 1. Fifty-one cases of bacillary dysentery occurred in four weeks with a mortality rate of 24 percent.
- 2. Six fecal specimens were positive for paradysentery bacillus, Park-Hiss type.
- 3. Three food handlers were found to be carriers of paradysentery bacillus, Park-Hiss type.
- 4. The food, milk, and water were not found to be the causative agents.
- 5. As a preventive measure, additional means of sterilization of dishes and utensils were ordered.

ACUTE "REFLEX" BONE ATROPHY (SUDECK'S DISEASE) Short Summary of Literature and Two Typical Cases

E. K. CRAVENER, M.D., F.A.C.S., Schenectady

For the benefit of those whose professional paths have not led them into the minutiae of bone chemistry, may I be permitted to describe bone atrophy and to briefly outline its manifestations.

Bone atrophy is exactly described by its name. It is a loss of calcium from hone and is a lacunar process; that is, the calcium salts are not simply lost but are removed by osteoclasis. To be visible in the x-ray, fifteen per cent of salts must be lost before Roentgen evidence occurs; below this point atrophy is not readily visible. Bone atrophy is purely quantitative. In the varieties to be described herein, there is no chemical change, the relations of water to the calcium salts remaining throughout exactly the same.

In short, all atrophy is based upon the physical principle that calcium is lost faster than it is replaced. In normal bone, constant interchange of old and new calcium takes place and this balance is

nicely kept.

Willich³ divides bone atrophy into: (1) nutritional atrophy, (2) atrophy of disuse, (3) senile atrophy, (4) neuropathic atrophy, and (5) the reflex acute

bone atrophy of Sudeck.

Atrophy of starvation. If less than the physiologic requirement (.45 grams) of calcium is ingested daily, bone loss occurs. This is the atrophy of nutrition of Willich. The deficit from dietary disorders is made up by bone loss, and when this bone loss reaches fifteen per cent, the bones become clearly radiolucent.2 A fascinating example of this is found in rickets. Adequate calcium ingestion with vitamin D deficiency allows a peculiar fuzzy appearance in the regions where calcium demands are great. That starvation, and not disuse, operates here is shown by the fact that starving bones subjected to undue strain will increase their calcium content. This is evidence that the atrophy is due to lack of or failure of utilization rather than usestimulus loss.

Atrophy of disuse: All of us know and

none of us can deny the fact that paralysis or fixation will cause the loss of calcium and an increased radiotransparency of bone. After fractures, a certain loss is nearly always seen. This begins from one to four weeks after the initial fixation and persists until nearly normal activity is attained. Again, it might be well to reiterate that we see neither the early stages nor the late stages since a certain amount must be lost before this disorder is apparent. In short, the stimulus of use must be necessary in a bone to maintain its normal structures and calcium content. This is atrophy of disuse.

Atrophy of old age: Senile atrophy is described by Willich. That this occurs we can not deny, but it is doubtful whether this is truly a disorder. I believe that it is (a) the atrophy of disuse due to advancing years, and/or (b) a nutritional disorder due to deficiency of calcium intake or to utilization. It is a symptom and not a disease and should be so regarded. It is plainly atrophy of disuse and atrophy

of starvation.

Neuropathic or trophic atrophy: Neuropathic atrophy occurs congenitally in Morquito's disease (familial neurotrophic atrophy), teprosy, syringonyelia, and to some extent in tabes dorsalis. In these, there is no disuse, but possible localized nutritional atrophy.

In the last analysis, there are only three factors operative in senile, nutritional, neuropathic, and disuse atrophy. These are (a) loss of calcium utilization, and/or (b) a loss of calcium intake, or (c) a

loss of calcium demand.

Acute reflex bone atrophy of Sudeck: The early inception of acute reflex bone atrophy stands in sharp contrast to the delayed onset of disuse atrophy. It differs strongly from nutritional atrophy by its localization in one extremity. It is not a disease of senility as the average age is about forty. We can not say that it is not a local trophoneurosis, but it is not a part of tabes dorsalis, syringomyelia, motor paralysis, or leprosy. It is much too

rapid and dramatic to be mistaken for Morquito's disease. No authority has made reference to more than one case in a family.

This disease (pending more knowledge of this disorder I have taken the liberty of calling it a disease) is commonly found in the regions occupied by many joints. The most common location is the ankle joint. It is found in the wrist; it can be found in the shoulder; and it is occasionally found in the back. All in all, the disease is more prone to localize itself where many cartilaginous surfaces are present.

Clinical course: Peculiarly enough, acute bone atrophy develops after a very minor injury, such as, a sprain of the ankle or wrist, or a slight strain of the back. It almost never follows a severe

injury.

Often the first symptom is pain in the region of the affected joint.^{3,5,6,7} In the case of hand injuries, the surgeon often removes the splints and examines the extremity to allay the suspicion of con-

Fig. 1. Anterior-posterior view of the hand of Case I taken two months after the primary injury. This exemplifies the transition stage from "Flachliche" atrophy into the stage of universal atrophy. Reproduction of this plate gives a false idea of bone density. In the x-ray plate these bones seem nearly translucent.

striction.7 Then, a glossiness of the skin is noted. The skin may be very hot to touch or it may be very cold; in any event, it is not normal. The slightest motion of the affected joint causes expressions of pain and the patient soon complains of continuous pain in the affected regions. At this time, the glossiness of the skin and the non-pitting edema simulates infection, and several cases have been unsuccessively incised. Next, the surgeon takes an x-ray, and speckled atrophy in the disordered joint region is found. Infection is again suspected for this picture is not unlike the atrophy seen in gonorrheal arthritis. It differs, however, in that the atrophy, earlier, is distal in the affected joint region and only later becomes proximal.

The pain persists and tuberculosis is now suspected.³ The x-rays, taken a month after the onset, show a universal clearing of the bone. Often this becomes so marked that the bones seem almost transparent to ordinary light. The cortex thins to a paper-like thickness. A few authors have found calcium shadows outside the joint and Cohn has pyramided an

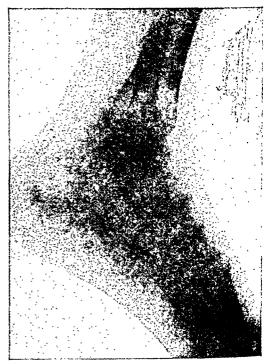

Fig. 2. Lateral view of the posterior foot and os calcis of Case II at the beginning of treatment. Reproduction attributes to this part more density than is seen in the x-ray negative.

elaborate theory thereupon. In my experience I have not seen such.

The suspicion of tuberculosis now causes the surgeon to encase the joint in fixation, but the pain persists.3 The persistence of pain, so uncommon in tuberculosis with adequate fixation, causes a removal of the plaster. The skin is now soft and shiny; it is cyanotic when dependent and is excessively sensitive to extremes of heat and cold. The fat layer is lost, but the joint remains large because of periarticular edema. The extremity sweats without cause. The nails show longitudinal grooves. In the hairy areas, hair becomes coarse. The joint is stiff and the slightest attempt to move it elicits expressions of severe pain. If we examine the blood-vessels for irritability, we find that they react slowly - totally unlike those of Raynaud's disease.

X-ray now shows a very marked bone att-ophy. The joint spaces are narrowed and some authors have found completely obliterated joints with true bony fusion. Retrogression can take place from this stage spontaneously and calcium can again be deposited in the bone.

Pathology: The actual pathology is bone loss and soft tissue swelling. The trabeculae are narrowed and eventually lost. Usually the longitudinal trabeculae remain while the horizontal disappear. In both youth and adult life, the lesion begins with eccentric atrophy; that is, wasting of the lacunae, possibly by cellular osteoclasis. In adult life the bone retains its usual shape. If this occurs before epiphyseal closure, the atrophy will be concentric; that is, bones will be distorted. The extremity may increase its length in youth, but more often, length is lost.

Theories of Acute Reflex Bone Atrophy

1. Several theories are brought forth for this condition. Sudeck, in his original article, felt that infection caused this disorder. From this he was converted by Kienbock who felt that the condition was a trophoneurosis. These writers with Paget, Charcot, Shubert, and others held that stimulation within the reflex arc of an extremity would cause an acute bone atrophy. Turner cited examples of cat bite which produced bone atrophy and explained this by supposing injury to sensory nerves.

2. Hilgenreiner believed that this was

entirely due to disuse plus predisposition in the individual patient. He explained the dystro-atrophy on the basis of ischemia and felt that pain was the direct cause of the atrophy. Hilgenreiner, however, almost negated his own theory in his attempt to explain the lack of atrophy in hysterical joint diseases. He felt that passive motion here prevented atrophy. This we know to be erroneous, since Key and others have shown that passive motion in itself will not prevent atrophy.

prevent atrophy.

3. No author now clings to the infection theory. While it is true that a compound fracture decalcifies much more rapidly than does a simple fracture, such a fact would hardly lay a reasonable base for a theory. In the compound fracture, the almost liquid calcium is lost through the open wound. In a closed fracture, such bone withdrawal could occur through the blood-stream. No one, however, has shown any tissues which can be interpreted as actual inflammation. This theory, in short, is either that the bone is destroyed by inflammation or by

impairment of nutrition.

4. Colin explains this disease by postulating a third method of bone production; that is, not endosteal or periosteal, but by calcium replacement through the lymph channels. According to this, calcium is taken up from the most distal portions of the extremities and carried into the region where repair is occurring. He further states that by the x-ray he can see this calcium in motion. A part of his theory is that these disorders occur most severely in cases where there is little periosteal damage. The pain of this disorder, he feels, is due to presence of calcium in the soft tissue.

5. Pawlow produced bone atrophy in dogs by continuous application of cold to the extremities. Such an experiment would lead to the belief that this disorder is due to a reflex irritation of trophic nerves, which

stimulates metabolism.

6. This condition is very similar in appearance to the normal bone atrophy which takes place after fractures and disturbances of venous extremity circulation. Lerichele has shown that bone atrophy—that is, liberation of calcium—is a necessary forerunner of bone healing. It would seem reasonable that this disease is simply a physiologic process secondary to blood-vessel obstruction which has persisted rather than spontaneously transformed itself into another stage.

Such things happen in the body. Cancer, at the moment, seems to be a persistence of growth far beyond normal limits. Therefore, I believe this disorder to be simply the initial stage of bone repair which has not checked itself at the usual physiologic stage. The increased vascularity of the periarticular tissues could be well-explained by the blocking of deep vessels (which must necessarily occur in bone repair) and reflex relaxation of collateral vessels.² The pain of this condition would well be explained by the irritation of the sympathetic system. If we accept this last theory, we can find a reason for the shiny skin, the edema, the sweating, the grooved finger nails, and the blood-vessel changes. We can also find a reason for the rapid destruction of joint cartilage and joint ankylosis.

Treatment

If the above assumptions be correct, the approach to effective treatment would be through the sympathetic system, and so it is. All authors, excepting Bohler, 11 condemn rigid immobilization. Most authors, Bohler dissenting, recommend measures to increase periarticular circulation. Sudeck, and notably Leriche, recommend sympathectomy.

The first measure must then be directed toward prevention of extraneous stimuli—that is, avoidance of passive motion of the joint, avoidance of exposure to marked heat and cold, avoidance of dependency (which merely engorges an already embarrassed extremity).

Active measures are: contrast bathing; diathermy, particularly with those machines which do not require the use of closely applied electrodes; very gentle massage (either effleurage or the use of a hot air blower); the use of foreign protein intravenously; hyperpyrexia by air conditioning, or other such devices.

Prognosis

The prognosis of this condition is good. The ordinary course with proper treatment varies from six weeks from the primary onset to four months. Untreated, this author has seen cases last from one to two years without signs of recovery. It is not intended to give the impression that this disease does not recover spontaneously. In a review of old x-ray plates, we have seen such cases which we now know to be Sudeck's atrophy. Not remarkably, these cases of simple injury took inordinate time for healing. Perhaps,

they were healed by some of the measures mentioned above which were applied empirically.

Relation of Bone Atrophy to Compensation

An extremely important part of this disorder is its compensation aspect. Some cases, to the author's knowledge, have been diagnosed as malingering, as tuberculosis, as trophoneurosis. Gurd⁵ justly states:

The author [Gurd] is of the opinion that the importance of acute bone atrophy as a cause of temporary disability is not sufficiently well-recognized by the majority of surgeons, in that, innocent persons are accused of malingering, and also that a small number of surgeons prove their unfamiliarity with the condition by recommending too heroic measures; e.g., amputation for its treatment. The opinion expressed under oath by surgeons of experience and authority, in connection with the results of injury leading to litigation, in which the author is interested, prove these facts to be true.

Summary

Acute "Reflex" Bone Atrophy (Sudeck's Disease) is herein described. The clinical course, beginning first with a minor trauma to a region inhabited by many cartilaginous surfaces, is followed early by exquisite pain and a periarticular rubor and non-pitting edema. Punchedout bone atrophy develops early. Later, spotted bone atrophy ("Flachlich") replaces the earlier x-ray findings. The final stage, with widespread loss of trabeculae, is outlined.

The confusion of this disease with gonorrheal arthritis, tuberculosis, and neuropathic bone disease is noted.

Advice is given lest this disorder be regarded as periarticular soft tissue infection. The many theories for this disorder are given, and a new one extolled.

A successful treatment is outlined.

A warning is given lest these cases suffer unjustly in compensation courts.

CASE 1. R. R., male, aged forty-five, was thrown from a horse, striking directly on his right hand, forty days before examination. He made few complaints the first day but within three days was complaining bitterly of severe pain in his right wrist. Motion of the wrist was very painful. He noted

marked swelling of the hand without rubor. His family physician, an excellent and careful surgeon x-rayed the hand and found no fracture. X splint was applied to miniobilize the painful joint and some diathermy was given. Pain persisted and the patient feared the loss of his hand.

There was nothing in the patient's past history relevant to this disorder

On examination August 13, 1935, six x-ray plates, taken at various angles and in various ways, failed to show any fracture or dislocation of the wrist or the bones comprising it. There was a marked swelling about the wrist with a non-pitting edemit Very slight voluntary or passive motions caused severe complaints. Application of ice to the lower arm increased the pain

X-ray at this time showed fairly complete atrophy of the carpal, upper metacarpal bones, and the lower radius Comparison of these with the plates taken within three days after the accident showed rapid progression of bone itrophy. However, in the very early plates it is possible to see some wasting

There was nothing else remarkable in the patient's physical examination. Blood counts were negative as regards this illness. There was slight change in the electrocardiograph suspicious of coronary spism.

This case was given six generalized hyperpyrexia treatments in a hyperthermia cabinet to the temperature of 103° sustained for two hours each. He was also given drily short wave diathermy and gentle massage over the affected wrist for six weeks Early in the treatment, the hand was protected against undue motions by a light splint This was abandoned as the prin on motion abited Contrast bathing in water at 110°, to water at 65°, to water at 110°, was advised and given daily. The patient improved very rapidly, attributing his improvement to hyperpyrexia treatments Tifty days after the first examination motion of his wrist was through nearly the normal range with slight pain in the extremes. The swelling and glossness of the skin was diminished He was allowed to use his hand slightly and only to the point of excitement of prin In the last thirty days before this writing he has continued to improve and is nearly free from symptoms at this time, eighty days after the beginning of active sympathetic system treatment. The course of this disease therefore, has been fully three months from the time of injury and promises very short disability from this time

Case 2 E K, female, aged forty two was seen fourteen months after a slight

"sprain of the right ankle" Three days after her sprain she complained bitterly of pain in her ankle and states that the ankle was swollen without signs of hemorrhage. She was seen in a clinic and was advised to apply dry heat to her ankle, which she did without avail. Treatments of various types were given by various physicians. An x-ray, taken about one month after the accident, showed some bone atrophy. (All these facts are from the putient's story and can not be further corroborated.)

At the time of this x-ray she was placed in plaster and kept so for eight full months X-rays taken about this time were seen by a general practitioner and a drignosis of tuberculosis was made An attempt was made to place her in a tuberculosis sanitarium, but on the patient's objections this was abandoned A rather desultory type of treatment followed for five months, consisting chiefly of alternate encouragement toward use and interspersed interdictions

against using it

Fourteen months after injury x-rays showed very marked bone atrophy of the lower tibia and fibula, astragalus, os calcis, and the middle tarsal bones. After one month treatment by contrast bathing and light massage the patient was admitted to the Ellis Hospital. At this time she was complaining bitterly of pain in her foot and ankle. The ankle was swollen without pitting edema and the slightest attempts to move the joints provoked complaints of severe pain.

She was given physiotherapy (dry heat and massage) for another month Pam persisted and finally she was given intravenous typhoid vaccine (25 000 000 killed typhoid bacill) every five drys for six doses. The results were almost muraculous. Pain diminished and motion increased. The glossness which had been present for the past three months to our knowledge, vanished and was replaced by smooth healthy skin. On discharge to home she continued to improve under contrast butting and light massage. Pain is now absent, motion almost normal and the later varys show a re-deposition of calcium in the atrophic areas.

In short, this patient suffered fourteen months, including eight months in a plaster cast (see Bohler's recommendation for plaster fixation in this disease), had a diagnosis of tuberculosis made, and improved only after stimulation of the sympathetic system by typhoid vaccine intravenously

Less than four months after institution of adequate treatment there has occurred clean cut physical improvement and cessation of puir

146 BARRETT ST

At the time of reading the proofs of this paper, May 5, 1936, investigation showed that Case 1 has regained full motion of his wrist, but has not regained the full strength of his forearm. There is no pain, and swelling, which was absent, occurred only once (early in March when patient strained his wrist on a golf course). This swelling lasted for three days,

and disappeared without treatment.

Examination of Case 2, made the same day, revealed a normal ankle without the skin glossiness and periarticular edema first mentioned. There is a loss of fifty per cent of ankle motion. The foot is painless and the patient walks on it, using crutches. These last are needful only because marked exertion seems to cause foot pain.

Both cases are markedly improved. In extenuation of the lack of complete cure, it might be stated that both cases abandoned systematic treatment shortly after the writing of this paper six months ago.

I am indebted to Dr. Stuart MacMillan, of 613 State Street, Schenectady, and Dr. C. Armstrong Spence, of 188 Market Street, Amsterdam, for the privilege of reviewing these cases.

BETWEEN MENTAL HEALTH AND MENTAL DISEASE

B. LIBER, M.D., DR. P.H., New York City

Editorial Note: Under this title will appear short summaries of "transition cases" from the service of this author in the New York Polyclinic Medical School and Hospital. The descriptions are not complete clinical studies, but will accentuate situations from the point of view of individual mental hygiene such as crop up in the every day practice of medicine

Art and Anxiety

A twenty-seven year old actor complained that he had always had "funny thoughts"; but for the last few months they had become unbearable.

He felt like jumping from the stage "into the audience," or he was rather afraid he

might do so while playing.

He was haunted by a desire or a fear of "walking in on the stage in the wrong time." Or in his own words: "It would be bad if I walked in on the stage in the wrong time" . . . "It would look terrible if I raised the skirt of a fellow-actress facing me on the stage or of a girl among friends in the street" . . 'Suppose I would not speak my line."

How could he play? He still did his part well and had a great satisfaction from the critics' praises in the press. But he was

not sure of himself.

The thought that he might "lose his mind" was ever present before him and he, who used to be sociable and jovial, cared nothing about friends and felt that "soon he would not be able to talk to them."

It was evidently a case of transition between mental health and what is-probably erroneously-called "dementia praecox."

Schizophrenia, the more general term, is more correct, but fails to cover the condition fully.

His conversation is characteristic for this kind of mental disturbance. Here are some of the sentences used by this patient at various occasions in his attempt to make himself understood:

It is peculiar that people walk, eat, come

I have a desire to break a window . . . I my body . . . Today, sitting among my col-leagues, I thought perhaps all of them are ghosts. . . . I started to rehearse, but those thoughts and the fear of insanity came again . At one time I said to myself that my father was a devil . . . I had a dream about the separation of life from the body and I was thinking whether it was true that we were living or not . . . Whenever I see a knife, I fear it . . . I speak like a phonograph record . . . Even this fear is not a part of me, it is something that wants to harm me . . I am separated from the world . I understand people, but they are all new to me . . . I doubt whether I live or exist me . . . I doubt whether I have of stand, but something in me says, words, words.

I cannot read; when I do read I understand, but something in me says, words, words. . . . I carry within me a hidden fear of my own self. . . . Who am I, what am I? . . . I really love life and the theatre and everything about it, but sometimes I get tired of it all . . . When I think I might do something wrong, I get very scared. I know I wouldn't do it the minute I think about it, but the thought of it makes me lose control

of myself. . . . May be all this is not real . Last Sunday I met a pretty woman who told me how moody and restless she was. I saw in her a similarity to myself and that gave me some relief . . . I think everything is strange, even my thinking . . . I am terribly self-conscious. I watch every step of my feet, every movement of my hands, I listen to every word I speak. Then I wonder how strange it is that I listen to myself, that I greet people, that I speak logically, although I am passive and without a bit of interest in whatever they speak to me. . . . When I feel well I grab in as much food as I can because I know I need strength to stand my mental . Thoughts come in which my parents are dead especially my father . . . When I want to do something a thought pops up, What for? When I do as you told me and do not make too much of an effort to get out of this state of mind I feel better. Also when I try to disregard my thoughts.

It is interesting to note that the schizothrenics always speak about themselves, even though it is about themselves in connection with the world or in contradistinc-

There was in this case a conflict between the conscious and the subconscious mind. The conscious mind wishes to play in the theatre, while its rival is opposed to it. Such conflicts are always present and in all of us. But trouble begins when we start to pay attention to them.

Some of these patients, if they don't degenerate or deteriorate, are extremely dependent on any person who can have some influence on them. This actor called me up several times daily asking me how to behave.

For instance:

"I feel like crying, shall I cry?"

"I cannot go out this morning, I see red spots dancing before my eyes. Shall I go?"

And he always obeyed my advice.

Like most schizophrenic patients he had a surprised face, a puzzled look, corresponding to his bewilderment. As he was not far advanced in the disease, the world was just beginning to be buried in cotton, sounds came from afar, outlines were dim and dull. He could not see why, and he wondered. Something was gliding away. He thought it was the world, but it was his own mind. The situation is vaguely painful. This is the incipient state of schizophrenic psychopathy. The patients are correct in their expectations, in their fear of insanity. But they have not fallen into the darkness as vet: they are only in a fog.

We may still be able to help them extricate themselves or bring light and definiteness and contours and tangibility to

In this case a temporary cessation of his work in the theatre was necessary, because there was a possible danger that he might have really done something obnoxious, which could have precipitated a progress into the disease or a disastrous ruin of his

In other cases, as long as some work is still possible, it should not be interrupted.

During our conversations this patient learned to ignore his own gradually thoughts and he was slowly led to selfconfidence.

After three months he resumed his acting, but treatment was not discontinued, as danger was pending for some time. Under great stress or unusual conditions the symptoms might have recurred.

Some people, even physicians, might think that marriage or some sexual association would be beneficial in such cases; very often it is fatal. This young man, as we might have expected, never had success in love. He has had a few sweethearts, but he saw them marry other boys, one after the other, although when feeling better, he was not unwilling or unable to have coitus with a woman in temporary and loose friendship.

As to the ctiology, the condition or tendency may have been congenital, but the real cause in this particular case was unknown. But perhaps a life of want and destitution in his parents' home and a strict father may have contributed chiefly to the outbreak of the symptoms. As a matter of fact, when I saw him he was still poor and still living in his parental house. His stage success was a moral one only, and the little he earned was sunk into the bottomless poverty of his family.

He has been well now for two years and functioning normally and uneventfully, although occasionally he comes for a comforting talk.

TOO MUCH

A Scot was engaged in an argument with a conductor as to whether the fare was 25 or 30 cents. Finally the disgusted conductor picked up the Scotsman's suitcase and tossed it off the train, just as they passed over a bridge.

"Mon," screamed Sandy, "isn't it enough to try and overcharge me, but now you try to drown my little boy."-Bulletin of Bronx Co. Med. Soc.

EDITORIALS

The President-Elect

It is many years now since Dr. Charles Howard Goodrich of Kings County became active in the affairs of the Medical Society of the State of New York. During these years we have all learned to value his worth and respect his judgments.

His most recent position was that of treasurer of the Medical Society of the State of New York, and his careful supervision over our expenditures and our budgetary requirements, his membership in the Council and on the Executive Committee, have fitted him for the position to which he was recently elected.

As president-elect he will have a year in which to observe further the functions of the various co-ordinating parts of our State medical machinery. We feel that we can congratulate Kings County for having given the Medical Society of the State of New York another fine executive.

Friendship in Fairness

Far from constituting a declaration of war, as some newspapers appear to believe, the resolutions adopted at the Annual Meeting of the State Society should result in closer cooperation between the medical profession and the hospitals. There is no basic antagonism between the rights of physicians and institutional in-

terests. Such differences as exist today are the product of lay administrative policies that exploit the doctor's traditional charity and usurp his professional prerogatives. Fair dealing breeds good feeling. Once the regulation of medical policy is restored to medical boards and the retardative effects of controversy are eliminated, hospital development should proceed at an accelerated pace, in greater harmony with the needs and resources of the community.

The rapid rise of the hospital to a dominant position in medical practice has not brought unalloyed benefits in its train. Administrative and financial considerations have been permitted to overshadow the basic purpose of medical care; and as control of policy has passed from medical boards to lay executives, undesirable industrial practices have crept into institutional life. To justify overbuilding and extravagant equipment, applicants for free service have been accepted without regard for financial eligibility. Large sections of the population have found pauperization easy and profitable; and the taxpayer, the philanthropist-and principally the medical profession—have had to shoulder the bill.

It is unreasonable and unjust to expect physicians to serve in posts and under policies that are destructive to their economic security. The profession has vainly sought to regain the helm of medical affairs by appeal to the fairness and good faith of hospital administrators. It will now employ its organized strength to recapture its rightful position, in the belief that medical participation in the direction of institutional policy will redound to the benefit of the public and the hospitals themselves, no less than of the doctor.

Basic Science Laws

In the past eleven years, ten states have adopted basic science requirements for the practice of healing by any system or method. Such legislation does not supplant medical practice laws. Its purpose is to protect the public against ignorant sectarian practitioners while refuting the charge that physicians claim a monopoly in the prevention and care of disease.

Dr. H. J. Lehnhoff appraises the results of Nebraska's eight-year-old basic science law in a recent issue of the A.M.A. Bulletin. His observations are of particular interest to physicians in states which do not possess similar statutes and are facing some of the problems which confronted Nebraskans prior to 1927.

At that time medical practice in Nebraska suffered from the rapidly growing encroachments of quacks of many persuasions. Not only chiropractic but neuropathy, naturopathy, and a host of other fantastic cults were established in open practice and preparing to seek legislative recognition. Instead of attacking any particular "ism," the Nebraska profession proposed that practitioners of all schools be "subjected to the same basic tests of ability." This proposal was enacted into law.

In the eight years that have since elapsed, two or three osteopaths have been licensed annually, compared to an average of over ten for each of the eight preceding years. No chiropractors have even applied for licensure.

Before actual experience with the Basic Science Law, some physicians questioned the wisdom of legalizing the competition of unorthodox cults under any circum-

stances. Events to date have allayed that fear, "Representatives of * * * peculiar and unrecognized cults are not seeking Nebraska as a field in which to apply their particular methods of healing."

There have been some flaws in the smooth operation of this legislation, many of them arising from problems of reciprocity with states without similar requirements. On the whole, however, the results in Nebraska and elsewhere invite physicians and legislators to consider whether a uniform basic science law might not raise the standards of healing and help to abolish quackery throughout the nation.

Luminal Poisoning

So many of our most useful drugs are attended by an untoward reaction in too many instances. We always attribute this happening to an "idiosyncrasy" on the part of the patient, and, in all probability, this explanation, for want of a better one, is correct. The bromide rash, the iodide eruption, the poisoning from minute doses of morphine, and the total collapse from a minimal dose of epinephrin all fall into this category. For the avoidance of these occurrences we have little to guide us, and it is only the prior experience of the patient which possibly may put us on our guard.

When it concerns the use of certain other drugs, clinical and laboratory investigations have furnished the practitioner with definite contraindications as to their employment. Ether is not to be used in the presence of renal or pulmonary disease. Digitalis will aggravate certain cardiac ailments. Mercurial preparations, when administered to a nephritic, may produce a considerable amount of damage.

The prevalent use of barbituric acid preparations for the control of the nervous system also seems to be not without danger. Eruptions of the skin have become increasingly prevalent from the use of phenobarbital (luminal). These have followed the usual dosage of 1½ grains so that they cannot be explained by ex-

cessive intake of the drug. Scarlett and Macnab, because of the number of cases which have exhibited a toxicity to this drug, have confined the use of this remedy to cases of epilepsy only.

These observers caution against the use of barbituric acid products in senile patients, in debilitated individuals, in arteriosclerotics and those suffering from myocarditis, and in those patients who have an advanced pulmonary lesion. Genitourinary disease, impaired hepatic function, and severe toxemia are also contraindications to the use of barbituric acid derivatives.

Air Conditioning

The problems concerned with air conditioning have been limited almost entirely to the field of ventilating engineering. The increasing use of this means of temperature and humidity control in hospitals and private homes has brought the physician into this field in the capacity of a consultant, since the requirements of the individual necessarily differ from those gathered in a public place where the sole objective is comfort for all.

Investigations have shown that people individually react differently to the types of air supplied by an air conditioning apparatus. An asthmatic patient is most comfortable when the relative humidity is maintained at forty percent. Air supplied at a temperature of sixty-eight degrees Fahrenheit and a humidity of approximately fifty percent will afford relief to a person suffering from a "stuffy nose." A humidity of about sixty percent and a temperature anywhere from eighty to one hundred degrees Fahrenheit represents the ideal supply of air for a premature infant.

Where hospital authorities are considering the installation of an air conditioning apparatus, the medical staff should be consulted along with the engineering

specialist. In this manner, a system will be selected which will afford the maximum of efficiency in that each room or suite of rooms will be able to be controlled individually for the ultimate comfort of the particular patient. Similarly, where a family contemplates the purchase of an air conditioning plant for private use, its physician, who is acquainted with the condition of the upper respiratory tract in each member of the family, will be of invaluable aid in the selection and use of such an apparatus.

CURRENT COMMENT

"BACH AND MOZART would be dead forever were it not for the living artists who are perpetually reviving their melodies. Pasteur and Koch would have lived in vain but for the everyday practitioners through whose activities their teachings are made effective. It is not so much the great theoreticians upon whom the health of the community depends, as the huge army of family doctors who succor the ailing from hour to hour." Dr. Henry E. Sigerist in the preface to his book *The Great Doctors*.

"THE FOLLOWING TABLE, using the United State census classifications and figures compiled from *The Sun's* survey, gives a summary of the findings on employment and unemployment in the nation:

Unem- ployed Jan. 1, 1936	Employed Jan. 1, 1936	Should be Employed 1936	Class
1,734,000	14,886,900	16,620,900	Industry, including clerical workers
1,518,000	2,929,200	4,447,200	Transportation and communications Mining (except oil
312,200	597,800	910,000	which is included in industry)

DOCTORS ASKED to Map Future for Med icine" was the heading the New York Herald Tribune of Sunday, April 26 gave to an article of considerable length anent the intionwide survey being made among 'vet erin members' of the profession by the American Foundation Studies in Govern ment The purpose of the survey is 'to determine whether there is a need for an essential change in the organization of med ical service * * * In view of widespread discussion in recent years about the future of American medicine, the foundation * * * is determined to find out in what direction the change should be, and if a change is desirable" Many replies have been received to the foundation's mailed inquiries and of them Miss Esther Everett I and (member in charge of the foundation's governing committee) states "'The replies are full and frank, startlingly individual thoughtful de The writers included undoubted leaders of medical science throughout the country, men so busy with the scientific aspects of medicine and the demands of urgent practice that they have little time for flyers in social science

Organized medicine characteristically and very naturally suspicious of lay efforts in investigation and reform has been fruith and inguarded in this case. Several state medical journals urged physicians to make "considered and studious rephes" * * * What the foundation does believe is that the problem needs to be much more accurately defined than it has been before any of us can know what solutions are in order and whether and where and how the government comes into the picture. * * * The concrete material now on hand * * * in our judgment put the whole discussion on a broader base diverts it from slogans and prejudices.

und loosely defined terms such as "state medicine," gives direction and depth to what is now shallow thinking—the kind of well thinking, for instance that loses sight of the simple fact that the considerable part of the population that is without adequate medical care is also without adequate housing and fuel and clothing and food, and most other thurs."

other things'"

The article continues '*** How should government and medical men cooperate to care for the indigent sick in some less hap hazard manner than now prevails in most places? How shall we define the indigent? Is the cost of their care, of whatever nature a logical charge on local or state tax funds?

* * * Above all, Miss Lape concluded, most physicians recognize the problem as one to be solved by medical men and community organization and they would reject any solution that involved compromise as to the primary consideration of maintaining the highest quality in medical care"

Wishincton's Miss Perkins, acting in accord with its move to check silicosis, has named a committee of fifty three to deal with the problem As stated by the New York Fimes of May 3 'They will tackle the problem of prevention from four different angles

The medical or catching the disease in incipient stages and seeking to fight it to a standstill

Engineering control or working out methods of equipping plants subject to silica dust so as to prevent any outbreak of the disease

Economic, legal and insurance phases, which will take into consideration the cost of the disease to industry because of claims, and the cost of combating it

Regulatory and administrative phases, dealing with regulations that might be put into effect to govern plants liable to an outbreak of the disease"

AIR HYGIENE-A NEW PROJECT

The Air Hygiene Foundation of America has recently been formed by a group of industries to conduct investigations and stimulate research in the field of air hygiene, to gather and disseminate facts relating thereto and to assist other agencies in the same activities. They will also, according to the plans of the founders cooperate in the coordination of similar research efforts. A comprehensive investigation has already been beguin, with the support of the new

foundation, of the hygienic, technologic, and economic aspects of air contamination, especially by dusts in the industries. The head-quarters of the foundation are to be in Pittsburgh and the directors are men of recognized standing in their special fields. In the light of much current discussion of the effect of air pollution on the health of industrial workers, considerable good should come of this new enterprise.

Correspondence

[The Journal reserves the right to print correspondence to its staff in whole or in part unless marked "private." All communications must carry the writer's full name and address, which will be omitted on publication if desired. Anonymous letters will be disregarded.]

186 Grove St., Brooklyn, N. Y.

To the Editor:

I wish to express my appreciation of the improvement in our Journal. Perhaps the reading matter was always as good as it is now, but certainly it is more attractively presented. The change from the white cover to the blue was very acceptable and the new glazed blue and white cover is very attractive. I handle my Journal with pleasure and read it with profit.

Sincerely,

ANNA E. RAY ROBINSON, M.D.

April 25, 1936

1408 President St., Brooklyn, N. Y.

To the Editor:

In reading your April 15 issue of the New York State Journal of Medicine, I noticed an error in one of your titles. On page 643, in your article on "Erythroblastic Anaemia," you have called illustra-tion number 4 "Reticulated erythrocytes seven months after splenectomy. (Cresyl Violet) X-120." The correct heading should be the title given figure number 5. The previously quoted title correctly describes figure 5.

The article proved to be of much interest in the light of the thoroughness of the clinical investigation and the use of the

illustrations.

Very truly yours,

HARRY BERMAN, M.D.

Re.: Traumatic Subdeltoid Bursitis by J. Echtman, 36, 9:503

To the Editor:

In view of the practical importance of the subject of bursitis of the shoulder may I be allowed to add a few comments to the article cited above?

In addition to the various types of bursitis there is occasionally found a distinct lesion of the subcoracoid bursa. Circumscribed halisteresis of the greater tubercle of the humerus has been mentioned elsewhere as characteristic of ossified supraspinatus tendon. However, this sign is noted too frequently in various disorders of the shoulder

to indicate any certain disease.

In acute bursitis abnormal soft tissue shadows may often be recognized on films taken with special technique. Stereoscopic studies and special tangential views with or without rotation of the humerus will often disclose two separate lesions in the same shoulder. For example, one may find ossified supraspinatus tendon in addition to acute subdeltoid bursitis or chronic subdeltoid bursitis in conjunction with acute subacromial bursitis. Unfortunately, small calcium shadows are easily masked by overlying bone and are frequently missed on routine films.

The question of whether calcific deposits persist or disappear is interesting but insignificant from a practical standpoint, because patients may become or remain entirely asymptomatic in spite of radiographic evi-

dence of disease.

Dr. Echtman rightfully emphasizes the avoidance of heat in acute cases. It is worth remembering that violation of this sound principle will intensify and prolong distress.

About three years ago I learnt of the great benefits derived from deep x-ray therapy of bursitis. The method originated in Sweden and became so popular in some European centers that other measures were given up. The advantages of this method are simplicity of application, quick response and uniformly good results.

Low voltage and medium deep x-ray therapy have proved not to be as satisfactory because of slower response and of occasional instances of recurrences and failures. Unfortunately, there is a certain limitation for this treatment because powerful x-ray equipment and experienced specialists are not

available everywhere.

For practical purposes it does not matter whether the case is of traumatic or rheumatic origin. Also the location is immaterial because all types of diseased bursae have proved to be radiosensitive. In acute cases a single treatment may suffice while in chronic cases three to six treatments may be needed at weekly or semiweekly intervals. The results have been gratifying even in cases with neurotic complications.

It is not intended to discourage competent physical therapy or surgery, but it is important to emphasize the distinct value of deep x-ray therapy in at least the few remaining refractory cases. Theoretically, one may object to this method in view of insufficient knowledge of biologic action of x-rays, but from the patient's point of view there is no doubt as to its superiority. I hope, therefore, that deep x-ray therapy will

be used more frequently, but only when adequate care is available.

Respectfully yours, ERNEST KRAFT, M.D.

Committee on Scientific Work

May 5, 1936

The Committee on Awards, Dr. C. Knight Deyo, Poughkeepsie, Chairman, Dr. Leon H. Cornwall, New York, and Dr. Harvey B. Mathews. Brooklyn, made the following awards on Scientific Exhibits; as announced at the Annual Banquet.

CLASS I-PURE RESEARCH

First Award: Drs. William E. Caldwell, Howard C. Moloy and D. Anthony D'Esopo, Sloane Hospital for Women, New York.

For: Clinical and Roentgenological Recognition of Anatomical Variations in Female Pelves and Their Obstetrical Significance.

Honorable Mention: Drs. Conrad Berens and Brittain F. Payne, Lighthouse Eye Clinic, New York.

For: Development of the Eye in the Human Embryo. CLASS II-New CLINICAL APPLICATIONS

First Award: Drs. William G. Exton and Anton R. Rose, New York.

> For: The differential Diagnosis of Conditions Associated with Sugar Exerction.

Honorable Mention: Drs. William M.
James, and Lawrence Getz,
The Herrick Clinic, Panama, R. P.

For: The Diagnosis and Pathology of Amebiasis.

Certificate of Merit: Drs. Adolph G. De-Sanctis, Edward W. Peterson, Leslie O. Ashton, F. D. McCormick and R. S. Ackerly, New York Post-Graduate Medical School and Hospital, New York.

For: Appendicitis in Children.
WILLIAM A. GROAT, Chairman

NURSES TAUGHT TO COO SWEETLY

Voices have been sadly neglected in the field of education, President James Laurence Meader of Russell Sage says. So a microphone and recording device are being used in that college to improve those of girls in the new nursing course.

When a girl has her voice recorded and then hears it, she seldom recognizes it, according to Dr. Meader.

"You probably wouldn't recognize yours," Dr. Meader said at Albany Medical Colege where he addressed a committee from Albany, Troy and Schenectady on the curriculum of the nursing course at Russell Sage. "By keeping a permanent file of our students' voices," he said, "we hope to improve them steadily, so that at the end of the four years' course, the young woman, who becomes a nurse may bring a soothing voice to the sick room."

Dr. Meader said students will spend the first year and a half at the college, the next two years in Albany Hospital, with the last year and a half back at the college. The course, which was inaugurated last fall by Russell Sage in cooperation with Albany Hospital and Albany Medical College, will turn out "good nurses," he said. The student will have as broad a cultural background as possible and full collegiate standards will be maintained. Even when the girls are pursuing their practical studies in Albany Hospital, their professional program will be paralleled with their cultural program. Each student will be compelled to choose a cultural major and follow it through the entire four years. Thus while she is learning what to do at the bedside of a sick person she will also be using a certain number of hours each week on English, fine arts or social science.

April 25, 1936

To the Editor Panettered in a wasteful In restactive manner, not only in private NEW Lice, but also in the wards of hospitals. Like all other effective agencies in the treatment of disease, if improperly handled because of lack of care or proper equipment, this therapy may not achieve the beneficial effects which may reasonably be expected from it.

The purpose of oxygen therapy is to overcome oxygen want, due to some interference with proper oxygenation of the blood, as in pneumonia, coronary thrombosis, congestive heart failure, emphysema, atelectasis. In the presence of fever, the metabolism is increased and the oxygen want is thereby increased. If the patient is to be benefited, the amount and concentration of the oxygen employed must be sufficient to compensate for the impairment in the oxygen exchange. It is important that the physician prescribe definitely the concentration of oxygen to be breathed by the patient, just as he prescribes the dose of drugs.

The optimum range of oxygen concentration will vary in different patients. In some cases thirty per cent will be adequate to correct deficiency; in other instances, as high as seventy per cent may be required. Continuous use of pure oxygen is harmful, but for periods not exceeding eight hours of the twenty-four, a concentration as high as ninety per cent has been found safe. In many cases forty-five to fifty per cent is the most desirable concentration.

However, this sign is noted too frequently in various disorders of the shoulder to indicate any certain disease.

In acute bursitis abnormal soft tissue shadows may often be recognized on films taken with special technique. Stereoscopic studies and special tangential views with or without rotation of the humerus will often disclose two separate lesions in the same shoulder. For example, one may find ossified supraspinatus tendon in addition to acute subdeltoid bursitis or chronic subdeltoid bursitis in conjunction with acute subacromial bursitis. Unfortunately, small calcium shadows are easily masked by overlying bone and are frequently missed on routine films.

The question of whether calcific deposits persist or disappear is interesting but insigtent is tested at least two or th. day and the results of the test recorded. The testing is so simple and yet so essential that no physician should ever employ a tent in his private or hospital practice unless provision is made for periodic testing of the oxygen concentration. This test should not be made immediately after filling the tent with oxygen. If the circulation is directly through the ice it takes an hour for the concentration of oxygen to be restored to its former height, unless after opening the icebox, the flow rate of oxygen is increased temporarily. The blower should be stopped when ice is added or inspected.

Oxygen Tent Therapy for Adults

In addition to the provision of a prescribed and tested oxygen concentration, three other important conditions must be met. (1) For adults a tent should have a capacity of at least eight cubic feet. (2) The temperature inside the tent should be maintainable at the desired temperature by means of a cooling device. In most patients with fever a temperature between 58 and 68 degrees Fahrenheit is preferred in winter and slightly higher temperature in summer. Higher temperatures are often desirable for older people and infants. (3) The relative humidity should be maintained between forty and sixty per cent. When tents are ventilated by a motor blower circulation which passes the air over a cooling medium such as ice, the humidity will usually be within this range. If the temperature and humidity are not maintained at these commaining refractory cases. Theoretically, one may object to this method in view of insufficient knowledge of biologic action of x-rays, but from the patient's point of view there is no doubt as to its superiority. I hope, therefore, that deep x-ray therapy will

be used more frequently, but only when adequate care is available.

Respectfully yours, Ernest Krait, M.D. May 5, 1936

Committee on Scientific Work

The Committee on Awards, Dr. C. Knight Deyo, Poughkeepsie, Chairman, Dr. Leon H. Cornwall, New York, and Dr. Harvey B. Mathews, Brooklyn, made the following awards on Scientific Exhibits; as announced at the Annual Banquet.

CLASS I-PURE RESEARCH

First Award: Drs. William E. Caldwell, Howard C. Moloy and D. Anthony D'Esopo, Stoane maxtures oit of the Women and

oxygen are not required for most illnesses. For short periods, such stimulation may be of value in such conditions as carbon monoxide poisoning, drowning, electrical shock, atelectasis of the newborn, and when there is shallow breathing.

Tents which are not equipped with a satisfactory method for cooling and drying the air may be detrimental to the patient and may cause death by heat stroke. No closed canopy should be put over a patient's head unless it is equipped with a cooling and dehumidifying apparatus. Tents without blowers are usually unsatisfactory in this climate.

Oxygen Tent Therapy for Infants

The same general principles apply to tents for infants, except that higher temperatures, and in some instances, higher humidities should be prescribed for very small infants. Smaller tents may be used. It is dangerous to deprive infants of heat by rapidly circulating cool air over them. A tent with an aperture at the top, and to which the oxygen is admitted at the base, may be used provided it is not placed near an open window or door where air currents may draw out the accumulated oxygen. The oxygen concentration should be tested and recorded. An umbrella or canopy tent without an air conditioner may be used for infants under two months of age since such infants produce insufficient heat, water or CO2 to permit harmful accumulation of these metabolites.

CLASS II-New CLINICAL APPLICATIONS

First Award: Drs. William G. Exton and Anton R. Rose, New York. For: The differential Diagnosis of Conditions Associated with Sugar Excretion.

Honorable Mention: Drs. William M. James, and Lawrence Getz,
The Herrick Clinic, Pan-

nangerous runes.

Nasal Catheter or Nasal Tube Administration

There are several effective methods of administering oxygen through the nose, employing a nasal catheter or nasal tube-inhaler with a calibrated gauge to fit on a high pressure tank. The oxygen must be passed through at least 3 inches of water to prevent drying the mucous membrane.

 A metal nasal tube inhaler with soft rubber tips which just enter each nostril may be employed.

2. A nasal catheter may be inserted into the nostril for a distance of approximately three inches, i.e., up to, but not touching the posterior wall of the nasopharynx. Five liters of oxygen in the inspired air. A single catheter may be changed from one nostril to the other if irritation should occur. With a double nasal catheter a slightly increased oxygen concentration is obtained at the same rate of flow. The terminal one inch of the catheter should be perforated with four holes in order to prevent a stream of oxygen impinging on one localized area of nucous membrane. The size of the catheter may be a No. 12 French or a somewhat larger calibre if it does not occlude the nasal passage completely.

3. The catheter may be employed in the oropharynx opposite the uvula. When it is used in this position caution must be exercised lest oxygen be passed into the stomach. The catheter should not be placed lower than the uvula. The throat should be sprayed every eight to twelve hours to prevent drying.

Whereas four or five liters per minute of oxygen is generally used with the nasal

Physician and Patient-Physician's Action for Compensation

A case which was decided a few years ago in a nearby state is an example of a typical situation in which physicians frequently find themselves when they seek to collect their fee for the rendering of professional services.*

A child received serious injuries when he was struck by an automobile driven by one B., who promptly took the child to the office of D., a practicing physician. The child was examined and the doctor informed the automobile driver that the injuries were serious. and the child needed hospital care. The doctor asked who would be financially responsible for the treatment and was told by B.; "I am responsible, Doctor, I will pay all bills." The child was taken to a hospital and remained under the doctor's care for more than a month. According to the doctor, B. later repeated that he expected to pay and asked the doctor to be as reasonable as possible.

When the doctor sought to collect his bill, he found it necessary to resort to litigation. The defendant, when the case was tried before a jury, denied, however, that he had ever promised to pay for the services rendered to the injured child. The jury accepted the physician's testimony, and there was a verdict in his favor. Upon appeal the verdict and judgment were affirmed, the Appellate Court finding that upon the plaintiff's testimony a case was established against the defendant.

The outcome of that case depended however upon the fact situation, whereby a specific contract to become liable for the services of the doctor was reasonably provable. In the ordinary case where a doctor is called to attend a patient and nothing is said about compensation the legal consequences may be very different. A leading case decided by our Court of Appeals sometime ago is interesting in that respect.**

A woman H. called a physician on the telephone, and told him that her daughter was very ill, and requested him to see her. The daughter was a married woman of full age. The physician told H. that he could not

make the call without the consent of the daughter's husband. Later he had an interview, at his office, with H. and the husband. The husband was introduced to the doctor, and H. again requested the physician to see her daughter. The doctor interpreted the interview as being a consent by the husband that he should attend the sick wife. He thereupon went with H. to the daughter, examined her, and informed her that the patient's condition was very grave and that he would like to withdraw from the case. H, then appealed to the doctor to treat the case, and said: "Doctor, you have been my friend; you have attended my family; you have attended my husband and our children. and I beg of you, for God's sake, don't desert Maude." The doctor had been the family physician of H. but had not attended either the patient or her husband previously. Upon that plea being made the doctor undertook the care of the patient until her death some two months lafer. At no time was there anything said about payment for his services by anyone.

In order to collect his fee the doctor instead of suing the husband brought an action against H., the mother. The result of the litigation was adverse to the doctor although he carried the case to the Court of Appeals. In the opinion that Court stated the legal principles which controlled the case as follows:

The only question upon this appeal is whether the defendant came under any obligation to the plaintiff. That turns upon whether the law will imply a promise on her part to compensate him. If we might assume the existence of a moral obligation, that would not determine that a legal, or enforceable, obligation existed. The rule in the United States has, generally, been that a physician is entitled to recover for his services, if not under an express contract therefor, then, under an implied agreement to pay quantum meruit; differing in earlier times, from the rule at common law, which, in England, before the passage of the Medical Act of 1858, in the absence of a special agreement, denied to the physician the right to sue for his professional services; the theory of any payment to him being that of an honorarium. The general rule, that, where a person requests of another the performance of services, which are per-formed, the law implies a promise by the

^{*} Douglass v. Brandt, 121 Atl. 179. ** McGuire v. Hughes, 207 N. Y. 516.

⁸³⁵

treatment in emergency cases, was laid April 15 at City Hall when hospital heads, physicians and city officials conferred. The outcome marks the first time that a definite agreement on the handling of such cases has been made between hospitals and the city.

In emergency illness other than accidents, where physicians order the patient to a hospital, the hospitals will accept the patient at once, under the agreement, and the city will assume the financial responsibility

for the first twenty-four hours.

The twenty-four hour period will permit the hospitals as well as city officials to investigate the case. If the patient is found deserving of municipal aid, the Welfare Department will take over the financial burden. When the investigation indicates that the emergency patient has private means, the matter will become strictly one for hospital adjustment with the patient.

Critical study of the physician from a layman's viewpoint, and the presentation of papers dealing with medical practice comprised the three-point program of the Rensselaer County Medical Society at the monthly meeting April 14 in the Health Center in Troy.

Dwight Marvin, editor of The Record Newspapers, gave the layman's viewpoint.

Discussion followed by Miss Grace E. Allison, superintendent of the Samaritan Hospital, Dr. James H. Flynn, health commissioner, Dr. John J. Rainey, Dr. Miles A. McGrane, Dr. Stephen H. Curtis and Dr. Nicholas F. Brignola.

Dr. Alson J. Hull presented a paper dealing with cooperative practice of medicine between physicians but distinct from clinical work. The discussion was conducted by Dr. Peter L. Harvie, Dr. Mussey and Dr. Curtis.

The final paper, concerning the hard of hearing problem among school children, was read by Dr. A. J. Hambrook.

Rockland County

The North Rockland Medical Society, which comprises all physicians of Stony Point and Haverstraw, has established an agreement for basic fees, effective May 1. The new fees conform with the basic fees charged by physicians elsewhere in Rockland County and accord with the schedule of the Rockland County Medical Society. The members have agreed that the base fee for an office visit will be \$2 and for a house call \$3. For calls after ten P. M., there will be an additional charge of \$1 and mileage of 50 cents a mile for calls beyond three miles.

St. Lawrence County

Dr. Marion B. Sulzberger of New York will address the St. Lawrence County Medical Society on May 21 on "Relationship of Dermatology to General Medicine."

Saratoga County

DR. ARTHUR J. LEONARD of Saratoga Springs will continue to guide the destinies of the Democratic party in Saratoga County as the result of his reappointment as chairman of the executive committee of the county committee by William H. Hickey of Mechanicville, Democratic county chairman.

Schenectady County

THREE MEN INTERNATIONALLY famous in the medical world were in Schenectady on April 15 to visit the Schenectady bronchoscopic clinic at the city hospital and to address the April meeting of the Eastern New York Eye, Ear, Nose and Throat Association. The men, all members of the Temple University faculty, were Dr. Chevalier Jackson, pioneer in bronchoscopic work and inventor of many ingenious instruments used in the treatment of bronchial ailments; his son, Dr. Chevalier L. Jackson, consultant of the Schenectady clinic, and Dr. Edward Chamberlain, professor of x-ray at Temple University.

Steuben County

A WOMAN'S AUXILIARY of the Steuben County Medical Society is being formed, with Mrs. Chauncey M. Lapp, of Corning, as temporary president for organization purposes.

Warren County

Dr. Edwards Albert Park of Baltimore, discussed "Scurvy" at a meeting of the Glens Falls Academy of Medicine April 16. Preceding the meeting, Dr. Park was guest of honor at a dinner given by members of the Academy.

Westchester County

DR. GEORGE P. SHIRMER, eighty-four, of Mount Vernon, celebrated his golden wedding anniversary on April 7, was struck by an automobile April 8, and died on April 9. Dr. Shirmer was graduated from Bellevue Medical College, now the Medical Department of New York University in February, 1873, and was, he believed, the oldest practicing alumnus of that college by eight years. During the Civil War he listened to a speech made by President Abraham Lincoln, and later attended General Grant's inauguration as President.

LORENZ J BROSNAN, ESQ Counsel, Medical Society of the State of New York

Physician and Patient-Physician's Action for Compensation

A case which was decided a few years ago in a nearby state is an example of a typical situation in which physicians frequently find themselves when they seek to collect their fee for the rendering of professional services.

A child received serious injuries when he was struck by an automobile driven by one B, who promptly took the child to the office of D, a practicing physician. The child was examined and the doctor informed the auto mobile driver that the injuries were serious, and the child needed hospital care. The doc tor asked who would be financially respon sible for the treatment and was told by B "I am responsible, Doctor, I will pay all bills" The child was taken to a hospital and remained under the doctor's care for more than a month According to the doctor, B later repeated that he expected to pay and asked the doctor to be is reisonable as possible

When the doctor sought to collect his bill, he found it necessary to recort to litigation. The defendant, when the case was tried be fore a jury, denied, however, that he had ever promised to pay for the services rendered to the injuried child. The jury accepted the physician's testimony, and there was a verdict in his favor. Upon appeal the verdict and judgment were affirmed, the Appellate Court finding that upon the plaintiff's testimony, a case was established against the defendant.

The outcome of that case depended how ever upon the fact situation, whereby a specific contract to become hable for the services of the doctor was reasonably provable. In the ordinary case where a doctor is called to attend a patient and nothing is said about compensation the legal consequences may be very different. A leading case decided by our Court of Appeals sometime ago is interesting in that respect **

A woman H called a physician on the telephone, and told him that her drughter was very ill, and requested him to see her The daughter was a married woman of full age The physician told H that he could not

make the call without the consent of the daughter's husband. Later he had an interview, at his office, with H and the husband The husband was introduced to the doctor, and H again requested the physician to see her daughter The doctor interpreted the interview as being a consent by the husband that he should attend the sick wife. He thereupon went with H to the daughter, examined her, and informed her that the patient's condition was very grave and that he would like to withdraw from the case II then appealed to the doctor to treat the case, and said "Doctor, you have been my friend, you have attended my family, you have attended my husband and our children. and I beg of you, for God's sake don't desert Maude" The doctor had been the family physici in of 11 but had not attended either the patient or her husband previously Upon that plea being made the doctor under took the care of the patient until her death some two months later. At no time was there anything said about payment for his services by anyone

In order to collect his fee the doctor in stead of suing the husband brought an action agrunst H, the mother. The result of the litigation was adverse to the doctor although he carried the case to the Court of Appeals. In the opinion that Court stated the legal principles which controlled the case as follows.

The only question upon this appeal is whether the defendant came under any obligation to the plaintiff That turns upon whether the law will imply a promise on her part to compensate him If we might assume the existence of a moral obligation, that would not determine that a legal or enforceable obligation existed The rule in the United States has, generally, been that a physician is entitled to recover for his services if not under an express contract therefor then under an implied agreement to pay quantum merint, differing, in earlier times from the rule at common law, which, in England, before the passage of the Medical Act of 1858 in the absence of a special agreement denied to the physician the right to sue for his professional services, the theory of any payment to him being that of an honorarium. The general rule that, where a person requests of another the performance of services which are performed, the law implies a promise by the

^{*}Douglass v Brandt, 121 Atl 179 ** McGuire v Hughes 207 N Y 516

former to pay their reasonable value, has no application in the case of a physician, rendering professional services to a third person, if the relation to the patient of the person, who requests them, be not such as imports the legal obligation to provide them.

The Court also said:

In the present case, notwithstanding the anxiety, the importunity, and the prayers of the defendant, how was the legal obligation of the husband shifted to, or assumed by, the defendant? According to the plaintiff's testimony, he refused to attend the patient until the husband had consented; which may be said to be a recognition, at least, of the marital relation, with its consequent responsibility, or liability. It, certainly, followed that, when the husband's consent was given, an obligation arose on his part to pay the reasonable value of the services which the plaintiff might render. As there was no express promise by the defendant to pay, can we hold, upon the facts disclosed by the plaintiff's evidence, that there was, also, an implied promise on her part? It would be a simple matter, in cases where the physician is called upon to attend a person, at the instance of some one not standing in a responsible relation to the patient, to inform himself as to whom he shall look for his compensation.

Another related fact situation is the one which arises where a doctor renders treatment in an emergency, and seeks compensation. A case of that sort also decided in this State some years ago states the legal principles involved.*

During the course of the trial of a lawsuit in the Supreme Court which involved a corporation, the president of this corporation, one B., who was present in the courtroom suddenly fell from his chair unconscious. At the particular moment S., a physician who specialized in eye, ear, nose, and throat work was on the witness stand as a witness against the corporation. Various persons in the room shouted for a doctor, and S. obtaining permission from the Court went over to where B, was and announced that he was a physician. One of the men associated with B. in the case that was being tried remonstrated and ex-claimed: "The hell you are; you are an oculist; what we want at a time like this is physicians, no oculists."

However, S. with the aid of another physician in the Courtroom at the time,

also a witness against the corporation, proceeded to render what they considered proper treatment to B. They loosened his clothes, examined his heart, lungs and pulse, and attempted artificial respiration. Although these attempts were continued from thirty to forty-five minutes, the stricken man did not regain consciousness, and was pronounced dead.

Later S. sent a bill for services, and the executors of B.'s estate refused to pay it, and he brought suit to recover his fee. In holding that the doctor was entitled to recover from the estate the reasonable value of his services the Court said:

In my opinion this case falls within the rule that one who becomes ill, and through unconsciousness or otherwise becomes incapable of acting or deciding for himself, is liable on the theory of an implied contract or promise that, having received the benefit of necessary medical aid and attendance, he must pay for them, no matter by whom the physician was summoned to perform them; and from the necessity of the case, any one is authorized to call a physician to treat him, without liability on the part of the person so calling the physician.

The plaintiff could have proceeded to treat the deceased, if no one had called him, or called for aid, and recover for his services. Mr. F. (who had objected) was a stranger to the deceased in the sense that he was under no legal obligation to supply medical attendance, and where a man is in extremis, it is the duty of a physician to treat that man regardless of the interference of strangers; and the language or opinion of Mr. F., after he and counsel called for aid, that the plaintiff's services were not welcome or desirable, or that the plaintiff had not the ability to treat the deceased because he was a specialist in eye diseases, or an oculist, putting it at the strongest interpretation of the language hastily used by Mr. F. at the time, did not justify the plaintiff in neglecting to render aid or defeat his right to a recovery therefor, or warrant him in assuming that the sick man, through the agency of Mr. F., did not desire the services.

Mr. B. was in a comatose state when the call for a physician was made in the courtroom and remained, during plaintiff's treatment, unconscious until his death, and this established the professional relation of physician and patient. * * *

The facts here show that immediate attention was necessary, as death occurred before the ambulance surgeon arrived and within a very short time after the plaintiff commenced his treatment, and it was proper and necessary that the doctor should attempt immediately to restore the patient to consciousness and prolong life.

Doctors in New York City and vicinity are warned that a sneak thief is visiting doctors' offices and making off with valuable

property. It is advised that office attendants be instructed to keep an eye on unknown callers.

^{*} Schoenberg v. Rose, 145 N. Y. Supp. 831.

Across the Desk

A Few Impressions of the Annual Meeting

"Why, he talks just like an Ameri-CAN." remarked one of the listeners after Lord Horder finished his address on "The Clinician's Function in Medicine" at the Tuesday afternoon session of the state convention. Perhaps the listener expected that the distinguished "physician in ordinary" to King Edward would talk like a stage Englishman in vaudeville, or like even some of the more cultured and literary English who visit our shores and speak with a sort of rising and falling sing-song and an "aw-awaw" that the peanut literati try in vain to imitate.

As a matter of fact the best English actors, visiting America, who make diction a life-study, and the best English speakers, as we hear them on the radio, talk much like the most cultured people here, and when a speaker has a marked "English accent" or "American accent," it merely shows that his diction is out of line with the best usage. The exchange of distinguished visitors between America and England, and the international radio programs, should help to unify and standardize the spoken language at a high cultural level on both sides of the Atlantic.

Another thing that must have struck Lord Horder's listeners was the incisive mental ability evident in the very glance of the eye, the expression of the face, the shrewd poise of the head, as he uttered his wise epigrams. When he spoke of the multiplicity of modern medical apparatus and observed that "the human brain is the best machine of all," one could not help feeling that a fine specimen of this machinery was facing us. And again, when he remarked that "there is a technic of the mind as well as of the eye and of the hand," and "quite as essential," and "it is not only what you find at the bedside, it is also what you bring to the bedside . . . the mind that sees," everyone felt that the man before us was a superb illustration of his own point.

Mind vs. Machinery in Medicine

It might be said, indeed, that Lord Horder's main theme was a plea for the medical mind as against medical machinery. He would not destroy a single piece of our new scientific apparatus, but would put it in its proper place. "Today we are witnessing the apotheosis of the machine in human life," he declared, "and it is not surprising to find that medicine is being mechanized." The danger comes when the machine predominates, "Where the machine is greater than the man, the patient perishes." Along the same line is the trend toward the multiplication of specialists and toward the diagnostic clinic and group medicine, All excellent, perhaps, but they tend to crowd the general clinician out of the picture, which is a great mistake. In the hands of the specialist and the group clinic, the patients too often "are handled as bundles of organs and functions and not as human beings." The general clinician is needed to see the patient as a whole.

In a few graceful and happy words Lord Horder turned to President Sondern and complimented him upon his efforts "to prevent the divorce of pathology from clinical medicine." Conspicuous among the clinicians who have "kept their heads," he remarked, "the future history of medicine, if written with a due sense of the importance of this epoch, will record your own name."

Lord Horder's address will appear in an early issue of the STATE JOURNAL, and will be well worth reading entire.

Automobile "Partners in Death"

How the medical profession can help to cut automobile accidents was told by Dr. Byron Stookey, Chairman of the Section on Neurology and Psychiatry. Up to this time the chief task of the doctor has been to patch up the injured. But wouldn't it be better to prevent the crash, before the injuries occur? Dr. Stookey, in an able analysis of the causes of motor wrecks, finds, among other things, that the human element has not improved to keep pace with the greater speed and power of today's cars. "The automobile and the driver are partners-partners in safety and partners in death. A moving machine must

have a properly functioning nervous system at the controls. "Sometimes a motor "is too powerful for the rear end," it is said, and Dr. Stookey asks pointedly: "May it not at times be too powerful for the head end?"

Yet no attention is paid in driving examinations to this vital fact. "Today a highly lethal weapon is placed in the hands of anyone who can read and execute a few simple maneuvers." Defects of the central nervous system receive no recognition. A locomotive engineer, guarded and guided every mile, must pass exhaustive tests required by law, and a searching examination probes each nook and cranny of the airplane pilot's system before he leaves the ground, but the automobile driver is let loose on the highway to hurl a ton of steel hither and you at a mile a minute without any test of his nervous reactions. Some nervous drivers go panicky and turn right instead of left, or push the accelerator instead of the brake. Others have defective vision, not detected in the simple tests at the licensing bureau, but fatal in a crisis.

What can the doctors do about this, it may be asked—is it not a matter for the lawmakers? Well, in the first place, it is a subject that the medical societies may well recommend to the legislature for action. Every applicant for a driving license should be examined by a qualified medical man for physical or nervous defects, the fee to be paid by the applicant. If that is too large an order, then every driver involved in an accident should be required to have such an examination.

It is possible, in fact, that something of the sort can be begun now, without waiting for any new legislation, which always takes a long time. Only a few weeks ago a boy with a long accident record was brought into court in New York City, the judge had him examined by a psychiatrist, he was found to be a moron, and his driving license was taken away from him. There is a precedent. When a judge is in doubt, he may very properly have a driver tested by a physician for physical or nervous defects that would endanger the public on the highway, and on the doctor's report he can revoke the driving license.

Dr. Stookey suggests that a medical board be appointed by the State to study the question of examining the driver's nervous system before granting a license. He would also have certain diseases reportable in the application for a license, such as dizzy spells, epilepsies, and other convulsive seizures, the license to be refused in such cases.

In short, here it a program which would bring the doctor strongly into the automoble accident picture—before the crash, instead of after it.

"Safe Manufacturers" Wanted

It is rather sardonically amusing to see the daily newspapers print prominently Dr. Stookey's strictures on the unsafe drivers and omit his criticisms of the manufacturers who build cars that grow more and more unsafe every year. The unlucky drivers do not advertise. Visibility is impaired in the new cars by the V-shaped windshields and the angle at which they are set. The mirror makes a blind spot directly ahead. Side vision is impaired by wide uprights, and rear vision by small rear windows, while low seats and high hoods add to the problem. Often neither the fenders nor the side of the road can be seen by the driver. The car's weight has been shifted forward, so that the rear wheels skid easier, while the engines are powered in excess of braking, road-holding, and steering capacity. One manufacturer is cited who made a stronger, swifter model -and its accident rate trebled that of its predecessor. "The driver is licensed," remarks Dr. Stookey, "why not the manufactured product? The campaign for safe drivers should be supplemented by a campaign for safe manufacturers."

We see clear evidence here, by the way, of the value of a profession that is independent of outside controls, untrammeled by hidden influences, free to speak out, for instance, on the sins of motor manufacturers. Heaven grant that the profession be able to keep forever this splendid and enviable freedom.

Pathways Beflowered with Smiles

It was a clever arrangement that made everyone pass all the displays of the technical exhibitors on the way to and from the ballroom where the meetings were held. In every booth was some man or woman of magnetic personality radiating an aura of welcome, so that the pathway was be-

flowered with smiles and warm handclasps. No official committee of welcome was necessary. Many of the men in the booths were the detail men who call upon the physicians of New York City and State regularly, so that they were old acquaintances. The medical and surgical manufacturers always have something new or some improvement on the old, so that the doctor who desires to be up to date finds it profitable to give attention and due consideration to what they have to offer. It was interesting to see the groups of medical men gathered at various exhibits, looking into the latest things produced to aid them in their work. If the doctor is the man in the forward trenches fighting the unending battle with disease and death, then the manufacturers are the munition makers who supply the powder and shot.

The celebrated "minute man" of '76 snatched his long musket from the antlers over the fireplace, seized his powder horn and his pouch of home-made bullets, cast from melted pewter plates and candlesticks, and was ready for anything from Bunker Hill to Yorktown. But he would be nowhere in the mechanized and highly scientific warfare of today. Precisely parallel has been the advance in the battle with disease. The two sciences of destroying life and saving life have been refined to the uth degree, and the marvelous progress in scientific medicine was apparent to anyone who took the time to stroll through the scientific and technical exhibits. The medical arms and ammunition of 1936 would merely bewilder the doctor of our grandfathers' day, and the array that lined the approach to the meetings at the Waldorf had a world of meaning to the reflective mind.

Many of the scientific exhibits presented by surgical and medical specialists were being closely studied by physicians who undoubtedly took away with them information and hints that will be invaluable in their practice. Some of these scientific exhibits were of a strikingly pictorial character, with brief printed explanations, that could be reproduced clearly in three or four pages of a medical magazine, and it may be logically questioned why such an exhibit. the result of years of experience and often of consummate skill, may not be equally as useful to the doctor as a paper read at a section meeting. The earnest attention that was being given to some exhibits was eloquent of their value, and suggests that it might be worth while to carry the best ones on the printed page to medical confreres not fortunate enough to attend the annual meeting.

The Medical Movie has Arrived

The little movie theatre was always crowded, a fact that argues for larger and better accommodations at the next convention. The medical movie is growing more and more popular among the profession, and the reports of the meetings of county societies around the state are increasingly sprinkled with the phrase that one or more of the papers were "illustrated with motion pictures." The crowds around the technical exhibit of moving-picture apparatus, too, were so great that it was often hard to pass. The alert program committees of the county societies are evidently awake to the drawing power of the flickering films, and perhaps we have the answer here to the eternal problem of how to get the members out. A few weeks ago the Brooklyn papers reported that a thief had stolen two reels of medical films from a doctor's car parked in front of a patient's home. There is a tribute. They are stealing them. The medical movie has arrived.

The films, the scientific exhibits, the papers read at the section meetings, give point to the remark of a western medical journal that "the physician who would gain stature in his profession should practice writing and speaking upon medical subjects in which he is interested." The value of his work will come before his colleagues. editors of medical journals, and the profession at large. He will at the same time perform a service to his confreres, to the public, and to himself. Doctors have a responsibility as teachers, and in this field, duty and privilege are happily combined. No one could help feeling at the convention that the papers, the exhibits, the delegates themselves, were the results of rigorous selection, the survival of the fittest. Even the most commercial product along the aisles' of the show-rooms had to pass an inexorable ethical scrutiny. Where a hundred were admitted, hundreds more would have jumped at the opportunity, but could not qualify.

At the same time the broadmindedness of the committee appeared in granting space for the exhibit of the League for Socialized Medicine, a cause strongly opposed by the State Society.

As Voltaire said:

I WHOLLY DISAFPROVE OF WHAT YOU SAY AND WILL DEFEND TO THE DEATH YOUR RIGHT TO SAY IT

The representative at the booth reported that the League has 2,000 members, of whom 1,000 are physicians in New York State. It would be interesting to check up how many of the 1,000 are members of their county societies.

Science and Religion in a Mixup

THOSE WHO THINK that science and religion won't mix are mistaken. The printer can mix them. In our March 1 issue, on page 362, the statement was made that outstanding scientists are investigating "antisceptic" solutions. When they find one, that will be news, and they will not need to stand out any longer. Just as we were feel-

ing all cut up about this slip, we happened to see a headline in a Long Island paper saying in large, black type: "Medical Society to Give Sermon to Cut Pneumonia Deaths." That must be the kind of sermon that makes 'em sit up. We are now "all agog," or something like that, for later reports.

Books

Books for review should be sent directly to the Book Review Department at 1313 Bedford Avenue, Brooklyn, N. Y. Acknowledgment of receipt will be made in these columns and deemed sufficient notification. Selection for review will be based on merit and the interest to our readers.

Aphasia a Clinical and Psychological Study. By Theodore Weisenburg, M.D. and Katharine E. McBride, Ph.D. Octavo of 634 pages, illustrated. New York, The Commonwealth Fund. 1935. Cloth, \$5.00. Octavo

Aphasia and cognate disorders have long attracted some of the oustanding neuropsychiatric work, especially in Europe. The field has by no means been exhausted, however, as this American work amply demonstrates. Dr. Weisenburg's last work will be a monument, both to his name and to American medicine, since this is doubtless the outstanding American contribution to this branch of neurology and neuro-psychiatry.

The exhaustive case studies as well as the

complete analysis of the literature and the formulation of more up-to-date technical and psychological methods, make this book an invaluable base of operations for any future studies in related branches of neuropsychiatry. The authors display an admirable sanity and objectiveness about their conclusions, which will be permanently helpful in a field where many great names have served as banners for theories. The book is an indispensable addition, not only to libraries, but to the shelves of all neuropsychiatrists. Its physical makeup is exemplary and contains an extensive bibliography and an index, SAM PARKER

A Textbook of Clinical Neurology with an Introduction to the History of Neurology. By Israel S. Wechsler, M.D. Third edition. Octavo of 826 pages, illustrated. Philadelphia, W. B. Saunders Company, 1935. Cloth, 67,00

This, the third edition, continues to maintain the lofty established position of its predecessors. In its physical makeup and arrangement—826 pages, including the index—its character is essentially that of Vol. II. Part I deals with Method of Examination; Part II, The Spinal Cord; Part III, Peripheral Nerves; Part IV, The Brain; Part V, The Neuroses. The use of a bolder type for descriptive paragraph headings is welcomed as a favorable change.

As an innovation, at the extreme end of the volume, and not as yet dignified as a part in the Index, we find a brief introduction to the history of Neurology. This new and attractive departure is presented in an interesting and stimulating fashion. We suggest that in future editions of the volume it be dignified by a separate part and head the parade rather than form the modest tail of the book. Now that the ice has been broken what is to prevent the author from pursuing his own apt suggestion of preparing a more elaborate history of Neurology. Certainly, the specialty, no longer crawling but progressing with rapid strides, deserves such an expression of its place in medicine.

The Textbook should continue its large appeal to third and fourth year medical students.

HAROLD R. MERWARTH

A Treatise on Medical Jurisprudence. By Benton S. Oppenheimer, LL.B. Duodecimo of 290 pages. Baltimore, William Wood & Company. 1935. Cloth, \$400.

The subjects of law and medicine have each received wide and extensive treatment at the hands of most competent students and authorities. But there are few brave lawyers, doctors, writers, professors and students who have had the knowledge and sufficient courage to plunge into the cold pool of medico-legal jurisprudence.

The author spends no time with conjectures and speculations. He delves into the subject backed by authority and defuly unveils the wide panorama revealing briefly and concisely the history of the medical profession. The time dates back to the expert apothecaries, concocting their herbial remedies, and the "barbitonsores," some so sufficiently skilled in the use of sharp instruments, to be called the chief surgeons of that time.

As the time clapsed, there grew up such a confusion of laws as to the rights, duties and responsibilities arising out of the relationship between doctor and patient, couched in such incomprehensible, technical legal terminology as to necessitate clarification and explanation; hence the new science of medico-legal jurisprudence.

Covering as it does the authorities throughout the United States and England, with footnotes and citations, this book becomes equally indispensable to both doctor and lawyer. It is concise, yet complete, lucid, exhaustive, covering all the ramifications of the medical profession.

The simplicity of its treatment makes the subject understandable even to the ordinary layman, and should make delightful and instructive reading.

S. INGRAM HYRKIN

Practical Clinical Psychiatry for Students and Practitioners. By Edward A. Strecker, M.D. and Franklin G. Ebaugh, M.D. Fourth edition. Octavo of 705 pages, illustrated. Philadelphia, P. Blakiston's Son & Co. 1935. Cloth, \$5.00.

One sometimes wonders why there are so many different text-books on any branch of medical practice. There may be little obvious excuse for some, while in others the authors have evolved certain methods of teaching and presenting cases, and these methods are incorporated in their books.

In Psychiatry there are many text-books and, without serious thought, one is apt to say "What is the use of having more than one, they are all good," but after reading several it becomes obvious that each may have some special advantages in the way the subject is presented. While Psychiatry is a specialty, books on the subject, broad in scope and considering the patient from many angles are of necessity. In this book the authors present mental diseases in a comprehensive manner, drawing attention to the various reaction types, attempting to understand the significance of the prepsychotic personalities and the psychological mechanisms underlying the psychoses. Illustrative cases are presented and studied and the best methods of treatment suggested. A careful reader of this book can scarcely escape the feeling that in better understanding the patient and his environment, he will be better able to deal with the ailment, which after all is only influenced by careful attention to and treatment of the patient, Much of the information has evidently come from personal experience but other sources are utilized and valuable data brought together for presentation. It is evident that these authors are keeping their book abreast of the times and are making definite contributions to the study of Psychiatry. It can be highly recommended to both students and practitioners.

Clinical Diagnosis by Laboratory Methods. A Working Manual of Clinical Pathology. By James C. Todd, M.D. and Arthur H. Sanford, M.D. Eighth edition. Octavo of 792 pages, illustrated. Philadelphia, W. B. Saunders Company. 1935. Cloth, \$6.00.

A comparison of the new the Edition of

A comparison of the new 8th Edition of this book with its first edition indicates the huge strides that are being made in Clinical Diagnosis by Laboratory Methods. Dr. Sanford has nobly carried on the work that Todd began. Many new additions and changes have contributed to maintain the excellent standards that the original author set. Much of the work has been rewritten and many new and clear illustrations adorn the text.

The popularity which this book has attained in the past must certainly be widened by the excellence of this last edition.

It is heartily recommended to all labor-

atory workers and physicians.

MAX LEDERER

Midwifery. Edited by Sir Comyns Berkeley, J. S. Fairbairn & Clifford White. Fifth edition. Octavo of 740 pages, illustrated. Baltimore, William Wood & Company. 1935.

Cloth, \$6.00.

The 5th edition of this standard work is, as heretofore, written by ten English teachers, though not separately. All share

the common responsibility of the opinions expressed; opinions which are in many re-

spects distinctly English.

As stated in the preface, this book is, "frankly written for students." However, general practitioners who do not wish to read lengthy treatises, will find this book thoroughly up-to-date, well arranged and readable.

This edition shows complete revision, particularly as to the newer concepts of the ovarian cycle, toxemias of pregnancy, pyelitis, etc. We, in this country, however, might take exception to some of the views

expressed by our English cousins.

The indications for cesarean section in placenta previa have been greatly extended in this country. These authors believe, however, that section has only a limited field in such conditions. They have discarded the old classification of complete, incomplete, marginal and lateral types, and substituted merely the terms "complete and incomplete." This is, undoubtedly, an advantageous classification for students.

Douching of the uterus in incomplete abortion or after curettage is being advised. This method is hardly favored in this

country.

The authors recommend immediate operation as soon as puerperal salpingitis is diagnosed. Is that not too radical?

For giving intravenous medication they advise exposing, by incision, the cubital

vein. Several illustrations show how it should be done. They add casually, that puncture of the vein through the skin "may be substituted." In this country, exposure of the vein is done only, when puncture is absolutely impossible.

We are also not accustomed to examine and deliver our patients in the English (side) position, as illustrated in the book. Particularly does this method seem cumbersome and inconvenient, when applying forceps. It seems to us that the American position (dorsal lithotomy), is of greater advantage in all respects, to patient, obstetrician, anesthetist, nurses and assistants.

Except for our differences of opinion, the book is well written, excellently arranged, and well illustrated. It should prove useful to those who need a concise and authoritative treatise on obstetrics. J. HALPERIN

Diseases of the Nose and Thoat for Practitioners and Students. By Charles J. Imperatori, M.D. and Herman J. Burman, M.D. Octavo of 723 pages, illustrated. Philadelphia, J. B. Lippincott Company. 1935. Cloth, \$7.00.

This is a text-book which features system and simplicity in an attempt to give the student and practitioner a ready guide to diseases of the nose and throat. In this the authors have succeeded admirably. thirty years of teaching by Dr. Imperatori are well reflected in the scope and plan of the contents of this work. The chapters on Plastic Surgery, x-ray Technique and Interpretation, and Radiotherapy are invaluable and not to be found in other text books. The unusually large number of illustrations, the table of arrangements at the beginning of the chapters, and the methods of presentation of each subject should satisfy the most discerning rhinolaryngologist.

MERVIN C. MYERSON

Human Pathology. A Textbook by Howard T. Karsner, M.D. Fourth edition, revised. Octavo of 1013 pages, illustrated. Philadelphia, J. B. Lippincott Company. 1935.

The attitude of the author that the reader has satisfied the prerequisites of the subject has resulted in his extremely practical and standard textbook. Without slighting necessary data, "graveyard" topics frequently usual in standard texts, have been elided to provide a clear and modern discussion of each factual subject and in sufficient elaboration. This revision has admitted much recent material, particularly notable in the chapters on tumors, hematopoiesis, the endocrine, and the nervous systems. Particularly useful is the progressively important arrangement of modern references, which are preponderantly modern.

Sound Advice

MILLIONS smoke cigarettes apparently without harm. In a small minority of cases, smokers with sensitive throats are affected by the irritant properties of smoke. Physician's advice to stop smoking, at least temporarily, is too often not obeyed. The next best advice is, try Philip Morris—the only cigarette proved less irritating.*

Even normal conditions suggest smoking a cigarette known to be milder and less likely to cause disturbance of the mucous membrane.

In Philip Morris cigarettes only diethylene glycol (instead of glycerine) is used as the hygroscopic agent.

CHARLES B. TOWNS HOSPITAL

FOR THE EXCLUSIVE TREATMENT OF

ALCOHOLISM and DRUG ADDICTION

This hospital has specialized solely in addictions for over thirty years. Our experience has shown us that best results could not be obtained when associated with any other type of case. Its method of treatment has been fully described in the journal of the American Medical Association and other scientific literature. The treatment is a hospital procedure and provides a defirate means of eliminating the craving and the toxic products of alcohol and drugs. Emphasizing the after care and with appreciation of the seriousness of the alcoholic problem we devote the convalescent period to minimizing the possibility of relapse. In the classification of the City of New York hospitals this institution has been granted a special license by the Commissioner of Hospitals for the exclusive treatment of alcoholic and drug addiction.

Dermetics departs completely from cosmetic theory and practice—involves no massage, no strong astringents, no "skin foods", no packs, no mechanics. DERMETICS recognizes that cell structure of the body is nourished and renewed by the blood stream.

DERMETICS voids dangers of forcing foreign matter into the pores; uses the "blushing" principle. aiding skin's self-cleansing, self-renewal; gives skin an INVISIBLE COMPLEXION DRESS, an extremely thin film permitting skin to function normally while protecting against sun, wind and soil. Dermetics moisture proof Powder and Color Complements will not streak or cake. Write Dept. J-5 for free booklet "Dermetics Replacing Cosmetics".

Doctors' wives and nurses are invited to have a free demonstration, Suite 230, Rockefeller Center, 630 Fifth Avenue.

Time to Start Thinking About Camp

Readers of this journal are safeguarded by the fact that no school or camp is admitted to our advertising pages unless it is endorsed by a physician. Parents will do well, when writing to any school or camp, to ask for definite information on this vital point.

One of the best criteria to use in judging a camp is the quality of medical care and supervision that it provides. Every camp that considers itself first rate, remarks a writer in Hygeia, should have a well qualified experienced physician as health officer. should have available in the summer the type of medical care to which he is accustomed at home. An experienced physician can provide the type of medical care to which the child is entitled. His presence gives peace of mind to the parents and to the camp directors. Some directors who conduct brother and sister camps fairly close together have solved the problem

by having one physician care for both camps. In addition to the doctor the camp should have a trained nurse and also a well equipped infirmary.

On admission, the children should receive a thorough examination. Individual programs of diet, rest and exercise can then be instituted for the underweight and overweight children. Special exercises for the correction of poor posture and flatfoot can easily be carried out. Ringworm of the feet, which is so common among children, can be treated and its spread prevented by appropriate prophylactic measures. This program cannot be accomplished satisfactorily without the constant supervision of a well trained physician.

It is advisable, too, that all the camp help be examined by the camp physician before they are permitted to handle food.

CAMP PASSACONAWAY

For Boys 6-16 Eight glorious weeks in the Est. 1909 woods of Maine with happy counselors. Highest health rational mountain, cance, and horseback woodcraft, salling, speed boat, and private golf Excellent medical attention. Fee reduced.

Travel and Resorts

Write Your Own Travel Prescription

Have you been going steadily for a year? Then it's time to stop, look around and decide where you are going to take that much needed rest. It's time to prescribe for your own good.

Go somewhere—to nature in the woods; to the rolling sea; to a mountain top; to new scenes as far from home as your vacation budget and time will permit. Forget your auto—make it a complete change—

use ships and trains, and surround yourself with the luxuries that these modes of transportation

are equipped with today.

The travel section of your JOURNAL is intended to aid you as well as to furnish you with information helpful when it becomes necessary to prescribe travel for some patient. In addition, a Travel Department is maintained to assist you without charge or obligation—if you are the least bit uncertain about the kind of a trip you want to make, the hotel you would like to stop at, or the place most apt to have the recreation you like, then this department can make suggestions which may not only prove beneficial to assure a pleasant vacation, but result in getting more for your money too.

On the facing page is furnished a blank to facilitate your inquiries, and which by the way portrays the faith that has been shown in your JOURNAL by truly distinctive travel advertisers. It was impossible to display every advertiser that uses the travel section, and unfortunately many fine hotels had to be omitted.

The growth of the travel section has been astounding and its scope of influence is surprising. Besides being the only department of its kind in medical journalism, and naturally the largest, it has several other distinctions of being first to its credit.

Among the accomplishments of the Travel Department of your JOURNAL is the booking of the first "pay passenger" on the first trip of the Zeppelin "Hindenburg" to the United States.

That many physicians have been using these travel pages to advantage is evidenced by the increasing number of doctors stopping at hotels advertised here, far more than space permits mentioning in our Travel Brevities.

A Trip of Exploration into the Adventurous Past

With but a very little stretch of imagination the traveller steps back into the ages when adventure and romance supplied more dangers than our modern high-speed life, when he steps from the gangplank of a Grace Line steamer at almost any one of its ports of call.

Sailing from New York (every other Saturday) the Grace Liner takes you south past the Virginia Capes and on into the Caribbean to

Peurto Colombia, northeastern outlet for the products of the rich and beautiful Republic of Colombia. This haven, seeming to doze in the sun and the trade winds, lies at the landward end of one of the longest piers in the Americas. Down that pier you roll by motor onto a magnificent highway for an hour or so to the immaculate and modern little city of Barranquilla. Here you get your first glimpse of one side of the enchanting medal which is South America-modernity in its ultimate forms yet somehow modified by the atmosphere of antiquity. All this coast served as the beat for notable sea rogues, privateers, and pirates 200 years ago. The present site of the splendid Hotel Prado is the trysting place of "ghosts" of that ruffianly group of gentry who slew and skinned wild cattle for a livelihood in the seventeen hundreds, and from this-"boucan" as the French termed it, became buccaneers.

Back to your liner you clear away for Cartagena, just the reverse of Barranquilla. For Cartagena is in essence Colonial Spain and modern South America touches it only slightly. Its hotels are modern, its streets reminiscent of the 20th Century but the strangely vital quality with which the air in Cartagena is charged, is oddly enough a quality which must have been more familiar in the 16th and 17th Centuries than to ours.

Walled by bastions many yards in thickness, guarded by cannon which, though failing to repel Sir Francis Drake, did hold off Vernon, another and later British admiral. Cartagena is responsible for the name of our national shrine. Por Vernon brought with him to this assault Lawrence Washington, elder brother of George, who was to call his country estate in Virginia. Mount Vernon, after his chief. Cartagena is the last true stronghold of history on the Caribbean. You will not forget it. The few hours you spend there are hours which will

(Continued on nert page)

stick in your mind like photographs in an album.

Then on to Cristobal in the Panama Canal Zone, through the mighty cut in the single backbone of two continents which is the Canal to Balboa, the Pacific entrance, and from where according to your choice, you sail down the west coast of South America or north to Costa Rica, El Salvador, Guatemala, Mexico, and California. Always finding new, but old, attractions—glimpses of the long, long ago, as if you were travelling on a time machine of some fantastic story.

Spa Celebrates 500th Anniversary

The spa of Badgastein in Austria, possessor of the most celebrated radio-active thermal springs in the world will celebrate its five hundredth anniversary this season. It was in the summer of 1436 that a toiling caravan worked its tortuous way up the steep trails of the Gastein Valley bearing Frederick, Duke of Styria and his retinue to Badgastein. Duke Frederick was ill unto death from a gangrenous wound of the leg. All other prescriptions having failed, Duke Frederick was coming to the Gasteiner springs of which he had heard many rumors.

The Duke had not much hope of being cured, but he bathed in the mysterious waters nevertheless and a few weeks thereafter rode back down the Gastein Valley and off into the great world to fulfill his destiny as Holy Roman Emperor. His visit to the Gasteiner Spa found its way into the chronicles of the time and the ceaseless caravan of the ailing began to pour its way down the valley toward the newly found "spring of eternal youth." In 1492 the family Straubinger opened its famous hostel; the family Straubinger stills owns that hostel which is now a great palace-like hotel. The waters of Gastein remain today as mysterious as they were yesterday. Science recognizes that they are highly radio-active, but it recognizes also that they contain a mineral element or a rare gas that defies analysis and isolation. Century after century the visitors have never failed. Accommodations, diversions have changed with the tempo of varying times, but Badgastein's cure remains the most amazing in the world. The bathing cure is efficacious in many of the degenerative and nervous disorders but its rejuvenating properties have brought it the most sensational kind of fame. The spa will celebrate with a round of festive occasions.

Going to Europe this Year?

As a friendly tip, the Red Star and Arnold Bernstein Lines (the One Class Fleet) are suggesting early reservation for those planning to visit the Olympics in Germany this summer.

Forecasts of the regular tourist bookings intimate a heavy increase in addition to the many thousands of sport enthusiasts who will naturally storm trans-Atlantic steamship offices between now and August 1st.

Besides the economy of transportation provided by these lines, the appeal of having access to every part of the ship makes the Red Star and Arnold Bernstein Lines steamers even more popular and desirable.

Full privileges and unrestricted use of the entire vessel belongs to the tourist for everyone sails "top class." There is no discrimination. No one may exclusively enjoy a better part of the ship.

The Seas and Shores of England

O, it's a snug little island!
A right little, tight little island!
All the globe round, none can be found
As happy as this little island.

-from an old English song.

Edmund Vale believes that each of the five British seas—he names them lovingly, the Irish Sea, St. George's Channel, the Severn Sea, the English Channel and the North Sea—has a personality of its own, "more subtle and influential than we are generally aware of," and the aim of his book "Seas and Shores of England" is to assist "the sightseer who has a keen eye, a quick ear, and a sea sense" to an appreciation of each distinctive fascination.

The coast he divides under three heads—the offing, the shore, and the entrance. The offing is "that part of the sea which lies immediately off the land—say as far as the horizon line"; by shore he means "the region of that invisible line mentioned on maps and charts as H.W.O.T.—High-Water-mark Ordinary Tides—and is made to include the cliff verge as well as the beach of sand, gravel and shingle, and the mudflat"; an entrance signifies "any point in a coastline where human contacts can be made between the sea and the land."

The cliff scenery, Mr. Vale asserts, is probably the most varied in the world, "as the Isles of Britain seem to have been singled out by geology as a concentration-point of representative exhibits from nearly every period in the world's known rock history."

The book is commended enthusiastically by Quiller-Couch "as a coast-dweller and descendant of coast-dwellers." It has all the particular merits of a Batsford Book, including numerous and excellent photographs.

This Year, you'll ENJOY GROSSINGER'S more than ever!

DAVE SCHOOLER

stage favorite of millions, will direct Grossinger entertainment. Dave holds big run records at the Roxy and Capitol where he headlined for over a year.

 Unanimous opinion of DARNEY ROSS and other celebratics, stern of stage, sereen and radio who have travelled the world over and rate Grostinger's as the Top Vacation Spot. ADE LYMAN says: "This is the only vacation place for me. I can't wait to come the only vacation place for me. I can't wait to come

1936 GOLF CHAMPIONSHIP

Last season we inaugurated a new idea in golf tournaments to decide the 1935 champion. The low scorers for each week returned in the Fall as our guests to compete for The Grossinger championship. It was so successful in 1935 that we are repeating the tournament this year. The 1935 Grossinger Golf Champion was Dr. Louis Danetz of Mt. Vernon, N. Y. CONGRATU-LATIONS, DOC!

These cruises are as follows:

First Cruise: Aug. 22nd, S.S. Rotterdam, visiting Kingston, Curacao, La Guayra and San Juan—13 days duration—Minimum rate \$1.45.

Same duration—Minimum rate \$145.

Third Cruise: Sept. 26th, visiting Bermuda, Kingston, Havana and Nassau—13 days duration—Minimum rate \$145.

Fourth Cruise: Oct. 10th, visiting Bermuda, Kingston, Havana and Nassau—13 days duration—Minimum rate \$135.

Fifth Cruise: Oct. 24th, visiting Bermuda, Kingston, Havana and Nassau—13 days duration—Minimum rate \$135.

Descriptive circulars may be had from your local travel agent or by writing to the Travel Department of your State Journal.

Getting There-Today!

Long ago various ingenious writers elaborated stories in which the chief character devised a mysterious but successful way of getting from the

earth to the moon. At that time men supposed the moon inhabited by a race of strange beings well worth an informal visit. So the hero set off blithely in a kind of flying boat, or simply sat down carefully on a well-chosen light ray and in no time at all found himself safely on the moon. In our own day no author has been cleverer than Mr. H. G. Wells in composing tales wherein someone or other reaches the moon or Mars or some other terminus in the sky. It is all very fantastic and exciting, but in actuality and like the moon it leaves us cold. Have we not terrestrial places we can visit in complete comfort and swift journeys? The moon is a barren planet and doubtless the famous "canals" of Mars have no gondolas and swan boats.

Indeed we are inclined to pity the ancients for their slow methods of transportation. They had to rely on camels and elephants and horses and tiny sailing ships and even their own two feet. Often a country gentleman took three weeks to go from his estate to his city house.

In those days Columbus did not cross the Atlantic for his summer vacation; and no college student could spend four days in Europe during the Yale or Harvard two weeks' Christmas vacation. Nowadays we can reach England and the Continent in less than five days by the "Bremen" and "Europa" of the North German Lloyd. The "Graf Zeppelin" will take us there in three days. Once we are in Europe we can dash about in such renowned express trains as the Royal Scot in England, the Blue Train in France, or the Rheingold Express from Holland through Germany to Switzerland. The world's fastest train, The Flying Hamburger, averages over 70 miles an hour in the jaunt from Hamburg to Berlin. So we need little time to take our trips. In fact we save so much time on the way that we have more time to enjoy our selected vacation land. We are the fortunate people of destiny.

None the less we should admire rather than pity the ancients for their courage in braving strange oceans and their perseverance under hard odds in going places and seeing things The Chinese merchant who traveled over wastes and deserts to Egypt, the Mongolian soldier who rode by pony from the Yellow Sea to the Black Sea, the hardy Vikings who fought through storm and ice from Norway to our own coast over arctic seas, these were real men. Yet we must remember that not all of these early ones traveled for conquest or business. Many went forth just from sheer curiosity. As many more journeyed for pleasure or seeking new health. To them the odds did not appear fearful. The distances did not appear formidable. They were used to those methods of conveyance. The camel and the horse were beasts of incredible speed, the fastest things going. Born into our own world a Roman would jitter at the chance of traveling in the "Bremen" or the Flying Hamburger.

Now of all early peoples the Romans did the most traveling. Once the Empire was firmly established they went anywhere and everywhere. They were extremely broadminded and allowed conquered peoples to retain their own customs and religion. They appreciated what they found and patronized what they appreciated. Perhaps the most interesting of their travels were their journeys over the Alps to drink and bathe in the miraculous, wonderworking springs they had discovered in Germany. For the Romans suffered, if for different reasons, from various kinds of ailments and they learned that neither pills nor medical compounds cured them half as quickly as Nature's own medicine. For as today you travel through the Rhine country you will find

Victoria Lodge

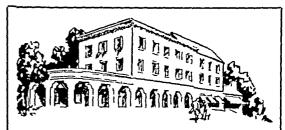

OVERLOOKING VICTORIA PARK

BERMUDA HAMILTON,

old Roman streets and memorials both in the little villages and also in the German places we now call spas and watering places. The Germans call them "Baden": that is to say, baths. But baths in a very special sense. For centuries they have been famous for their curative springs and mineral waters. Today they are famous not only for their cures but likewise for their lovely natural settings, social and artistic life, and all kinds of sports.

One naturally thinks of a sanitorium as a rather dreary place where one goes for a specific cure. The doctors are specialists, the nurses are kindly and efficient, but with all due allowances the experience is not one to be hoped for with any degree of enthusiasm. It is bad enough to need a cure. It is perhaps worse to go to a place that most of us classify with hospitals. For these places we have the greatest respect, but to go there comes rather in the nature of a painful necessity.

(Continued on page xxxviii)

UP TO THE DOCTORS' STANDARD

Things that a physician recommends regularly . . . fresh fruits, berries and vegetables from the Langton's and vegetables from the Langton's own gardens . . . abundant fresh cream and milk from its own dairy . . . a restful atmosphere of comfort and geniality, large airy rooms, facilities for all types of outdoor exercise and recreation . . . the ideal spot where even the rates are attractive. And truly up to the doctors' standard for living.

WHOLESALE DISTRIBUTOR

Telephone Columbus 5-8300 One of a series of advertisements prepared and published by PARKE, DAVIS & CO in behalf of the medical profession. This 'See Your Doctor' campaign is running in the Saturday Evening Post and other leading magazines

The heart as represented in an anatomical drawing of the 18th Century

That heart of yours ...

EIGHING only 8 to 12 ounces, that heart of yours must each day do an amount of work equivalent to lifting a man of 150 pounds one and a quarter times the height of the Empire State Building

It can never rest On and on it must beat 72 times each minute. 4320 times each hour, 37,843 200 times each year

Its Herculean 10b 15 made still more difficult by the strain and accelerated pace of modern life This, perhaps is one of the rea sons heart disease is increasing Today, it leads all other causes of death-one person in six above the age of 40 dies of heart disease

That is an alarming figure It makes the thoughtful person wonder, What about my heart?

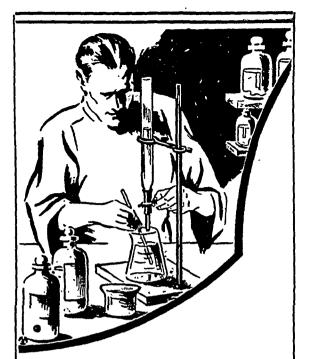

And the only person who can answer that question for you is your doctor

The answer most people get is one that takes a load off their minds - There is a anything wrong But if something should be wrong, your greatest security lies in knowing about it prompt ly For the heart has remarkable properties of recuperation It re sponds to treatment if started in time, better than most organs in the body Even people with badly crippled hearts often live happy, active lives after they have been taught what precautions they should observe

Today physicians know more about the ills of the heart and ways of the heart than ever be fore They are better equipped than ever before to treat and con trol heart disease-and to guard against it as well

Shortness of breath-fluttering of the heart-numbness of the extremities-these are among the symptoms that suggest an immed tate trip to the doctor's But even without warning symptoms, many a wise man sees his doctor at regular intervals-far less ser vicing than he gives his car, yet obviously, infinitely more im portant

Maintain Mineral Alkali Balance

WITH

KALAK

Hypertonic—Alkaline—Carbonated—Not Laxative

The years of experience with physicians who have used Kalak show that the use of a formula containing calcium, magnesium, sodium and potassium salts represents a correctly balanced solution. This is Kalak which, as such, aids in maintaining a balanced base reserve.

How Alkaline Is Kalak?

One liter of Kalak requires more than 700 cc. N/10 HCl for neutralization of bases present as bicarbonates. Kalak is capable of neutralizing approximately three-quarters its volume of decinormal hydrochloric acid.

Nutritional Anemia in Infants

Hemoslobia level in the blood of infants of various ages. Note fall in hemoslobia, which is closely parallel to that of diminishing iron reserve in liver of average infant. Charadpared from Mackay. It is possible to increase significantly the iron intake of the bottle fed from birth by feeding Destri-Mailose With Visiamia B in the milk formula. After the thard month Palbim offers substantial amounts of iron for both preast and bottle fed babies.

Reasons for Early Pablum Feedings

- 1. The iron stored in the infant's liver at birth is rapidly depleted during the first months of life. (Mackay, 1 Elvehjem.2)
- During this period the infant's diet contains very little iron—1.44 mg. per day from the average bottle formulae of 20 ounces, or possibly 1.7 mg. per day from 28 ounces of breast milk. (Holt.3)

For these reasons, and also because of the low hemoglobin values so frequent among pregnant and nursing mothers (Coons,4 Galloway3), the pediatric trend is constantly toward the addition of iron-containing foods at an earlier age, as early as the third or fourth month. (Blatt,6 Glazier,7 Lynch8).

The Choice of the Iron-Containing Food

- Many foods reputed to be high in iron actually add very few milligrams to the diet because much of the uron is lost in cooking or because the amount fed is necessarily small or because the food has a high percentage of water. Strained spinach, for instance, contains only 1 to 1.4 mg. of iron per 100 gm. (Bridges.?)
- 2. To be effective, food iron should be in soluble form. Some foods fairly high in total tron are low in soluble iron. (Summerfeldt. 10)
- 3. Pablum is high both in total iron (30 mg. per 100 gm.) and soluble iron (7.8 mg. per 100 gm.) and can be fed in significant amounts without digestive upsets as early as the third month, before the initial store of iron in the liver is depleted. Pablum also forms an iron-valuable addition to the diet of pregnant and nursing mothers.

Pablum (Mead's Cereal thoroughly cooked and dried) consists of wheatmeal, oatmeal, cornmeal, wheat embryo, brewers' yeast, alfalfa leaf, beef bone, tron salt and sodium chloride.

The Radiologist Extends the Scope of His Diagnostic Skill

Lipiodol (Lafay) discloses an abscess of the lung.

INDICATIONS

Lapiodol (Lafay)—the original French rodized oil—may be adsantageously used in the roemgenographic exploration of the following systems with of course proper consideration of suitable technique and contraindications in each case

- 1. Broncho-pulmonary apparatus.
- 2 Uterus and Fallopian tubes
- 3 Paranasal sinuses
- 4 Bladder, urethra, and seminal vesicles
- 5. Lacrimal ducts
- 6. Fistulae and abscess cavines.

MODERN roentgenologists realize that the ordinary radiograph is frequently insufficient ... that progress in radiologic technique has depended to a large extent upon the development of adequate contrast media. By the use of a suitable opaque medium, conditions previously obscure may now be accurately visualized.

The introduction of Lipiodol (Lafay) for radiologic exploration

has added considerably to the scope of the radiologist. It makes possible

radiologic examination of various body cavities and organs which otherwise are not practically amenable to such examination. It facilitates more accurate diagnosis and therefore more efficient treatment.

If you have not received a copy of the illustrated book "Lipiodol in Radiologic Diagnosis", please write for it.

Out of the wilderness-

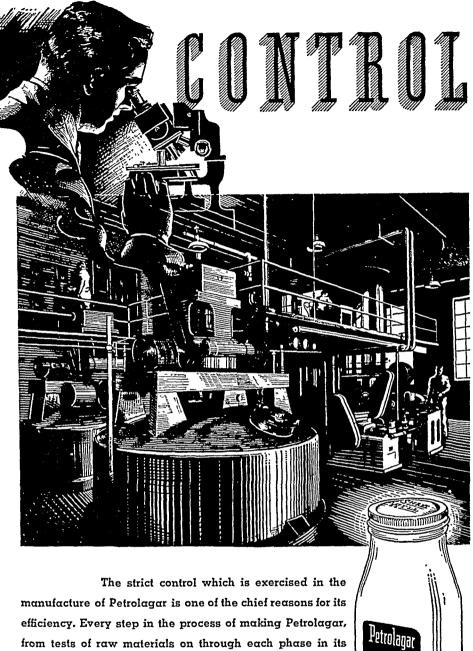

The first squawk of the newborn is an advertisement.

It may be a protest, a demand, or a declaration—but in every sense of the word it is "advertising" even though amateurish. Funny how little we realize that every sign or gesture we make, every word we speak, is a published announcement. In fact there is hardly one thing in the entire world that is not in some way an "advertisement." The man displays himself through his business or profession—the woman through every device created to enhance her charm and beauty. And so we might go on indefinitely enumerating the things that can be interpreted as "advertising."

In all this wilderness of effort to attract attention, power, and sustenance there are these things which we more commonly associate as advertisements.

Out of this wilderness, we come to concentrate on the advertisements that will enlarge our own mental equipment. Many such advertisements find their way into this JOURNAL, largely because the advertiser realizes that here is the proper place to find you interested and knows that this is the one place you are most apt to see his message.

Thus past results have advertised this JOURNAL's drawing power, just as its recent increase in circulation, greater than any other medical journal, advertises its recognition by more physicians.

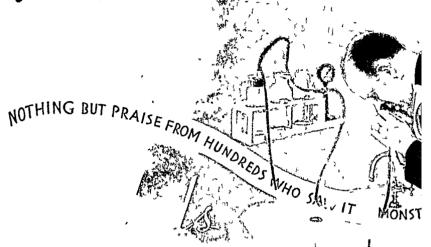

from tests of raw materials on through each phase in its production, literally comes under the exacting scrutiny of the microscope. Because of this control Petrolagar can always be relied upon for its uniform consistency and action.

TETANUS ANTITOXIN

GIONULINI LEGICILE MODIFIED

The world war prought Tetanus-Antitoxin into wide use because the doctors saw the incidence of Tetanus among the wounded fall almost to zero following the universal injection of 1500 units of Tetanus Antitoxin as a first-aid measure.

This custom is now routine in civilian medical practice in the treatment of all wounds where Tetanus infection is considered liable to occur.

In recent years the use of 3000 units of Tetanus Antitoxin instead of the usual prophylactic dose of 1500 units has become more common because a few exceptional cases have developed Tetanus within 10 days after the 1500-unit dose. With the present highly potent antitoxin, the Lederle 3000-unit dose is not larger in volume or protein content than the 1500-unit dose of a few years ago. A 3000-unit prophylactic dose has been advocated by the New York City Department of Health.

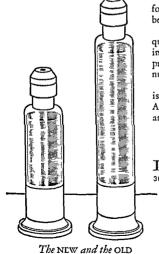

If the wound is extensive and contaminated with foreign matter, Tetanus-Gas Gangrene Antitoxin may be preferred to Tetanus Antitoxin alone.

Following the reports of Vener and others, the quickest possible use of a complete dose (200,000 units in divided dosage) of tetanus antitoxin seems to give promise of elevating the antitoxin treatment of tetanus to a more satisfactory position.

TETANUS ANTITOXIN''GLOBULIN MODIFIED'' Lederle is antitoxin of high concentration and purity. Adequate dosage is obtainable in convenient volume and in this form reactions have been reduced materially.

All Antitoxius sold by Lederle are now Globulin Modified, averaging 40% less bulk.

CANNED FOODS AND THE PUBLIC HEALTH

V. FOOD IN THE OPEN CAN

• In September 1935, the facts about food in the open can were presented on this page It was stated that there was no reason, from the standpoint of food poisoning, why food must be removed immediately after the can is opened. This state ment bore the Seal of Acceptance of The Committee on Foods of the American Medical Association.

However, since that time, two incidents have occurred which lead us to present again the facts concerning food in the open can

First, late last fall, a national organiza tion dedicated to the relief of human dis tress during war and disaster, issued a list of precautions designed to reduce acci dents in the home, in which it was erron eously recommended that food be removed from the can immediately. The Depart ment of Agriculture detected this error and called it to the attention of those responsible for issuance of the recommen dations. A correction was made as soon as possible but the damage had already been done. The original safety recommendations had meanwhile been issued in schools and newspapers throughout the country, thus giving further support to this old unbased prejudice against canned foods

Second, in the early months of 1936, a release regarding food in the open can was made by a national press service to newspapers throughout the land The strong inference was made in this press re

lease that food left in the open can might become hazardous to consumer health

This dissemination of misinformation, referred to in the two instances cited above, has caused an increase in the number of consumer inquiries concerning the safety of food in the open can To reply to these requests for reliable information, we can well quote from a recent release made by the Department of Agriculture (1)

(1) USDA Press Release, Feb 23, 1936

'It is just as safe to keep canned food in the can it comes in—if the can is cool and covered—as it is to empty the food into another container. Thousands of housewives are firm in the faith that canned goods ought to be emptied as soon as the can is opened, or at least before the remainder of the food goes into the refrigerator—one of the per sistent food fullacies. The question keeps coming to the Bureau of Home Economics in letters from home makers.

"A few acid foods may dissolve a little iron from the can but this is not harmful not dangerous to health Cans and foods are sterilized in the 'processing' But the dish into which the food might be empited is far from sterile In other words, it is likely to have on it bacteria that cause food to spoil

"Whether in the original can or in another container, the principal precau tions for keeping food are—Keep it cool and keep it covered"

AMERICAN CAN COMPANY

230 Park Avenue, New York City

This is the thirteenth in a series of monthly articles, which will summa rize, for your convenience, the conclusions about canned foods which authorities in nutritional research have reached We want to make this series valuable to you, and so we ask your help Will you tell us on a post card addressed to the American Can Company, New York, N Y, what phases of canned foods knowledge are of greatest interest to you? Your suggestions will determine the subject matter of future articles

The Seal of Acceptance denotes that the statements in this advertisement are acceptable to the Committee on Foods of the American Medical Association

FACILITIES FOR BALNEOTHERAPY completely supplemented with all those other factors which make for its most successful application.

The New SPA at Saratoga offers to the physician much more than the group usefulness of its seven great buildings, and the ordered therapeutic utilization of its naturally carbonated mineral waters. This is a health resort of pleasant surroundings, comfortable living accommodations, possibility for suitable diets, adequate diversions and healthful exercise. The new hotel, The Gideon Putnam, adjoins the Spa proper.

Here, in the proper atmosphere, Spa therapy holds great possibilities for the care and alleviation of chronic disease. Treatments are given entirely at the direction of the private physician. The medical staff of the Spa does not prescribe. Its function is supervisory only.

Literature describing the physical appointments of this \$8,500,000 health center, and its specialized therapies will be sent to physicians on request.

INDIVIDUAL
CARE
OF
MENTAL
PATIENTS

THE most beautifully situated—the most complete—and the most attractive of the sanitaria in this section of America. Conveniently located.

Individual care of a limited number of mental and nervous cases features this sanitarium.

Patients are cared for in suites, practically all with private bath, under supervision of a fully qualified medical and nursing staff.

From a medical standpoint, this permits as much or as little contact with others as the case indicates. Violent, dangerous, noisy, or otherwise objectionable patients are not admitted.

Administration of the sanitarium and arrangement of buildings effect greater economy than generally found.

Write for complete data for your reference files.

THE CLINICIAN'S FUNCTION IN MEDICINE

1 HI RT HON LORD HORDER, KCVO, FRCP, London, England
Consulting Physician to St. Bartholomeu Hospital

I begin very initiarily, and very pleasurably, by a word of sincere appreciation of the kindness of your President in inviting me to address this distinguished gathering met under the auspices of the New York State Medical Society

I should plend for your indulgence were it not for two facts. The first is my assurance of that genial hospitality for which this country is so justly notori-The second is the realization that medicine has a brotherhood that is world wide, so that, although technically a stranger, the sense of colleagueship is already in my mind as I make this appearance before you There is a corollary to this last named piece of comfort in the recollection of the fact that between the medical men and women of your country and mine there has always existed a closer bond of fellowship than between the medical profession of any other two nations, and probably also a closer bond than exists between groups of men and women who follow any other profession or calling than ours

I Whatever may be the special branch of medicine that attracts us, it is com-, monly accepted that it is at the bedside where, on the one hand, the vital expres sions of diseases the manifested and where on the other, the contributions made by the laboratory, both to diagnosis and to therapy, must eventually be fested In the words of the great French clim unn, "Les malades, toujours les malades" But medicine provides such a large field for human interest and activity that there are many points at which a man may branch off into a whole life's work of relatively detached scientific effort. Any one of these digressions may take him so far away from the patient that, quite joyfully and quite successfully he may make valuable contributions to what becomes, in effect, pure science. He may then be tempted to consider clinical medicine but a poor affair, scarcely worth the pursuit of a trained intelligence Whereas I regard it as a very inviting field for the most highly cultivated minds -1 field in which meager achievement. far from indicating an essential poverty in the soil that is being tilled, signifies only that the husbandman is not always as alert and well equipped as he might However, what I say today is not intended as an apologia for the clinician so much as a brief survey of his place in medicine and how his functions are, in my judgment, best performed

In the view of some people the clinician has not advanced, or developed, proportionately with those of his colleagues who are primarily concerned with the uncillary subjects of surgical technic, bucteriology, and biochemistry Or, alternatively, the clinician's function has by some been considered to be super seded by those who engage in these lastnamed pursuits I cannot accept these estimates and I think they are due to a false, or a forgotten, conception of the clinician's function Although remains what it fundamentally always was-the collection and evaluation of all available data which are pertinent to the diagnosis and the treatment of the sick person-I believe that the growth of the means by which this function is achieved has been even greater in the case of the clinician than in the case of any one of his colleagues, for the reason that the

whole of their combined knowledge is available for him if he is familiar with it, and cares to use it.

As I say, the fundamental function of the clinician is to collect and to evaluate data. But what data? The clinician is not a mere collector of data. If he were, diagnosis, and successful treatment, would be as easy for one doctor as for another. Nor is he a mere recorder of cases seen. If he were, the palm would go to the hospital registrar or to the practitioner whose card-index system is the best-a consideration which waives a fact of which we are well-aware, that it is possible, nay easy, to see a great number of patients and yet not see their diseases. It is the *essential* data that we want, not the unessential. It is data that are associated, not data that are disassociated. The capacity to neglect is as important as the capacity to take notice. True, the more obscure the case the less we can afford, in the first survey, to omit any examination; but after a time there comes what may seem to some an almost astounding negligence. This is not forgetfulness, nor a lapse from methods; it is the ability safely to omit.

Of late years the clinician's function has fallen a good deal into disrepute. I want to analyze, as briefly as may be possible, some of the reasons for this.

The first reason that calls for comment, because it is undoubtedly a potent one, is the development, during the past thirty years, of laboratory methods of diagnosis. The study of the patient, qua patient, has been supplemented by the study of materials derived from the patient. Some of us saw the birth of clinical pathology, and many of us have watched this lusty babe grow up to a vigorous manhood.

As is wont with the virile adolescent, there have been times when he thought himself more important than he really was, when he sought to bestride the whole world of medical knowledge, when he firmly believed he was medicine rather than merely making his contribution to medicine. His incursion into the sick room was apt to be somewhat brusque, not to say at times truculent. Cuckoo-like, he jostled and pushed and oft-times succeeded in ousting his more timid and gentle colleague from the latter's legitimate sphere. He took to

describing himself in the telephone directory as "physician," and he invited the credulous sick to consult him. The public, with its child-like confidence in apparatus, loved him, welcoming his advent as signalling the millennium of exact medicine, and unaware that the human brain is the best machine of all. A catalogue of the flora of the fauces and/or of the faces, a complete blood count, a chemical analysis of the urine to the third place of decimals: "What further may be sought for or declared?" Not only was the new gospel about to dispel the darkness that shrouded diagnosis, it was about to illumine the therapeutic field also. The "opsonic index" for an exact diagnosis, the hypodermic syringe, charged with the appropriate antigen, for effective treatment, and medicine was "taped" at last. The clinician came to be regarded by some with amused tolerance; by others, even less generously minded, as obstructive to real Nosology disappeared and progress. pathology contracted down to the name of the infecting agent; patients no longer suffered from diseases but from microorganisms. To the question-"What is the matter with the man in bed 4?" the answer came—"T.B. . . . "

But fortunately for the patient, for whom, like the soul of Faustus, the powers of good and evil were fighting, some clinicians kept their heads. absorbed what was good in these clinicopathological advances, seeing in them important supplemental aids to their methods rather than a substitution for them. Conspicuously amongst these, Mr. President, the future history of medicine, if written with a due sense of the importance of this epoch, will record your own name, and I should like to pay you this tribute—that you have sought as much as any man to prevent the divorce of pathology from clinical medicine. the result of the new development was that the older and cruder notions of infection had to be entirely revised; and gaps in the knowledge of metabolism had to be filled. Not only was it necessary that the clinician should think vitally and morbid-anatomically, it was necessary that he should think bacteriologically and biochemically also.

During the recent period of intensive laboratory investigation on the clinicopathological side of diagnosis, the notion has arisen that the clinician's observations are not really scientific, that they are of the nature of guess-work, whereas every thing that happens in the laboratory is controlled by the infallible rules of logic. The argument went rather like this. The test-tube and the microscope cannot lie. But God alone knows if what the physician thinks is an enlarged spleen is the spleen; or if rose spots are not "any old spots;" or the association of a soft and infrequent pulse with a continued high fever is not some odd trick of Nature designed to intrigue the curious-minded; and why should not a week of intense headache pass away somewhat suddenly and be replaced by a muttering delirium; and an unexplained deafness appear? Funny things like these do happen to people who suffer from a disease of microbic origin. But the one certain thing is that the disease isn't typhoid fever, or any infection in the T.A.B. group, because there is no agglutination of the laboratory stains of those organ-

isms by the patient's serum.

Strange, this idea that facts have a different value according as they are observed at the bedside or in the labora-Stranger still, the idea that one negative observation in the laboratory should, even by responsible clinicians, be regarded as more important than the co-existence of six positive observations at the bedside. In the words of the logician, "we can never, by a single experiment, prove the non-existence of a supposed effect." If "science arises from the discovery of identity amidst diversity" then it matters not if the identity be discovered by careful observation of the patient clinically or pathologically. whole question is, is it a true identity? But this, in the last resort, depends upon the critical judgment of the observer. Granted that the exercise of judgment at the bedside is more difficult than it is in the laboratory, mistakes in judgment are not confined to the bedside. We have only to send a specimen of the same stool to two, or even to six, bacteriologists, equally expert, to find that failure to "discover identity" is by no means only a bedside difficulty. Here the question of criteria is involved, as we know, and criteria are not always uniform even

amongst laboratory workers. Their results are therefore, of necessity, not always comparable. Now the clinician's criteria are, in general, less exact than the pathologist's, nor can they be made so exact very easily; but if they are made severe, as they should be-if nothing is termed positive which is only doubtfully positive; if the clinician's judgment concerning his observations is controlled by reliable technic: if discovered identities are unequivocal-then the clinician's "facts" are as scientific and as logical as are those of the pathologist. The truth is that clear-thinking, with forbearance, is essential to the satisfactory solution of a diagnostic problem whether the contribution comes from the laboratory or from the bedside.

There is a technic of the mind as well as of the eye and of the hand, and the former is quite as essential as the latter. It is not only what you find at the bedside, it is also what you bring to the The eve sees bedside that matters. what it takes with it the power of seeing; in other words, it is the mind that sees. And surely it is the same in the laboratory? In both spheres there comes to some-slowly, painfully, towards the end (alas!)-facility born by patient practice out of time. Clinician and pathologist are more akin than they sometimes realize. Each of them takes a pride (which the other regards as excessive) in his small discoveries, and each of them lacks humility (or so the other thinks) in face of the certain fact that every day, whether it be in the ward or in the laboratory, momentous things are happening under their very eyes, yet they see them not, for they are both under the same ban—they cannot live in advance of their generation,

But clinical medicine is just now coming back into its own. The prince has taken notice of the neglected charms of our modest Cinderella. A marriage is being arranged. Professors are leading the bride to the altar, and the name of her bridegroom is Research. just time for me, as an interested and loving uncle, to give the pair my blessing.

"Let me not to the marriage of true minds Admit impediments. Love is not love Which alters when it alteration finds, Or bends with the remover to remove: . . ." And so is resumed afresh the long line of clinical observers which has been lit by the genius of Hippocrates, of Sydenham, of Trousseau, of Osler, and of many others—masters in clinical research.

II. Today we are witnessing the apotheosis of the machine in human life and it is not surprising to find that medicine. like other spheres of action, is being mechanized. The public has come to believe that machinery is revolutionizing the healing art and is dispensing with the need for human judgment. It is true that the introduction of instruments of precision into medicine has been of great service but the interpretation of the results obtained by them in the individual case still demands wisdom and experience on the part of the doctor. Where the machine is greater than the man the patient perishes. A large section of the public does not understand this. such an incorrigible love for apparatus, and what it produces, that it hailed with acclamation a box of gadgets, constructed in defiance of all scientific principles, which claimed to hand out an exact diagnosis, and even the appropriate treatment, and thus make the application of so fala thing as the human unnecessary.

Failing the reduction of medicine to machinery, the public seeks salvation in the specialist and the expert; and the more apparatus, and the more complicated, employed by these, the greater its confidence. The number of really intelligent citizens, whose health is their best asset, and yet who have no physician or general practitioner, has greatly increased of late years. In consequence of this fact, situations arise which are not only ludicrous but dangerous. Awaking in the night with a pain in the belly the immediate anxiety is not whether he will find the physician available, but whether the right specialist will be sent for. Is it the appendix, or the gallbladder—or the stomach—or the kidney-man he needs? What if he rings up the wrong one? Perhaps the trouble isn't in his belly at all, for he suddenly remembers that what his business friend thought was a severe attack of indigestion last week turned out to be coronary thrombosis. So perhaps it is a cardiologist he needs? God! how difficult life and especially medicine—is!

With the growth of specialism have appeared the diagnostic clinic and group medicine. I do not propose to discuss the pros and cons of this development. Undoubtedly the group system has its advantages, but I am quite sure that unless the team, whatever name it bears, has on its panel a general clinician of experience, it cannot effect the best service for the patient. For in the process involved there are two key points, both of them vital, at which his help is essential. There is the point at which, after a complete history of the case is obtained, and a general and thorough overhaul is made, the decision is arrived at as to what special examinations shall be undertaken; and then there is the point at which the correlation and interpretation of the results of such special examinations are considered in relation to the particular case. If there is no assessor whose duty it is to undertake these two important functions, the whole system breaks down. In regard to the first point, a sensitive and apprehensive patient may easily be made still more so by elaborate investigations which are not really indicated, or invalids may be constructed where previously they did not exist. In regard to the second point the danger is equally great. Patients' dossiers are apt, in these days to be so full and so heterogeneous that the courage to say of some of the reports, "noted, nothing doing," is often the first step in the elucidation of the problem. It falls to the clinician alone to become familiar with the range of health, to be sensitive to what lies within it, and to what lies outside it. The exercise of this sensitiveness becomes more and more essential the more meticulously exact the reports of the experts may be. And these reports tend to be more and more meticulously exact with the increasing tendency to specialism and the myopia which goes with it. The number of patients whose hearts are healthy is in inverse proportion to the number of cardiologists they consult, and the frequency with which they are "electrocardiographed." An upper respiratory tract which is passed as "normal" by a careful "nose and throat man" will soon be so rare as to merit demonstration at the Academy of Medicine

Some one must preserve his poise, and if the clinician does not, no one does. Think of the stunts—in diet, in exercise,

in clothes, in liabits-that the patient is besought to follow in order to be saved Think of the panaceas by way of drugs, or of operations Think of the many adventures in numerous therapeutic fields concerning which one can only say, when all is done, that one has been witnessing the triumph of technic over reason, Think, again, of the fears that are bred in the minds even of those who are well, that if they do not follow this cult, or that, they will die the death There are in my country, and I believe you are not free from them in yours, pernicious folk who try to plant in the public mind the idea that to preserve health is a very ticklish thing. The citizen is led to believe that only by a series of close observances, and equally close restrictions, can he hope for physical salvation The way of health is pictured as a tightrope along which we make a slow and trepidating progress The least bias to right or left, not immediately corrected or corrected maccurately and we plunge headlong into the abyss Here awaits us inflammations and ulcers and cancer—especially cancer Of the people who disseminate these ideas the worst enemies are those of our own household, because they are thought to speak with authority It is for the gen eral clinician to prick this kind of bubble, and to point out that health is really a broad and well-paved road and, speaking generally, and given a modicum of good fortune, the wayfaring man must be a fool indeed if he errs therein

Again, if the physician drops out there 15 no one left to make real contact with the patient on the psychological side. This becomes more and more a function of the doctor as men and women take more and more control of their lives the difficulty facing men and women is no longer that they are cramped by au thority and by convention but that they get fatigued, or even run themselves to destruction, by their new found freedom Realizing that the causes of their unhap piness, as of their physical ills, lie in the biological sphere, they seek the physician rather than the priest Bewildered by the prospect which their liberty opens out to them, and all unaccustomed to deal with the raw material of their natures as it is now revealed, they not seldom mistake their emotional confusion for physical illness and they come to us for guidance To them the doctor is the realist, the link between the "fine abstraction" which still beckons them, and the particular application" for which they The doctor is in the privileged position of the Almighty he, and only he, has—or can have if he will—all the "He that sinneth evidence before him before his Maker, let him fall into the hands of the physician" Why? Because to the physician the individual is not a metaphysical constant but a physical variable and this outlook enables him to lift up the weary head and to comfort the sorrowing heart. First the explanation, then the guidance, and hope, the best of tonics, is reborn

To be a little more concrete may I remind you that patients go in and out of our consulting rooms, and pass through clinics and groups, with the salient points of their cases undiscovered because they are handled as bundles of organs and functions and not as human beings. One such case in illustration A short time ago I was asked to examine a woman who had been put to bed on the advice of a cardiologist Half of the estimated six weeks had passed and my permission was sought to waive the other half on the ground that she seemed so well examined her and found no signs of Puzzled, I asked if I might see disease her alone When the doctor and the nurse had left the room the patient said, "You haven't found anything the matter with me, have you, doctor?" "No." I replied "I didn't think you would," said the patient "But why are you in bed?" I asked 'Well, you see, doctor, it was like this I am very attached to my husband and I suddenly discovered he was keeping another establishment shock was terrible, and I got no sleep for three nights Then I looked so ill that my husband insisted upon sending for the He found my pulse was very quick so he sent me to a heart specialist After his examination he advised me to go to bed for six weeks" "But why didn't you tell him what had caused your palpitation' I asked "I tried to" said the patient, "I tried to tell him twice, but each time he put his hand up and said Don't interrupt me, please, I am making my observations'

You may be saying to yourselves at this point, or long before it, "but all this boils down to a plea for the maintenance of the family physician, the general practitioner, that is." Very good; that is what I am saying, that and some other things. This because I see a gradual, but definite tendency to eliminate the physician that I advance many of these points. The spread of specialism and the increased interest of the public in medical matters have both of them combined to narrow the function of the general practioner, who is, or who should be, the clinician par excellence, almost to the vanishing point. I regard this as being no less dangerous to the public than it would be for the passengers of the ship if the captain left the bridge and the chief engineer, or the chief steward, or the radio operator, took his place. But I see the equivalent of this being done day after Whereas formerly, the physician kept control of the case and exercised his judgment in deciding the program of treatment, he now, all too often, stands aside and allows his specialist colleagues to take charge, over the shoulders of whom, as it were, he gets an occasional and momentary glance of his patient. Or and this experience becomes more and more frequent—he isn't there at all. The specialist is there from the first, one, or a number, for it is not uncommon to see a patient being treated by a committee, just as though he were a banking concern, run by a board of directors; only the patient is in a worse plight, because even a bank has its manager.

But the trouble is not alone on account of the growth of specialism and the egregiousness of the public. "The fault . . . is . . . in ourselves that we are

underlings."

To tell the truth, we are afraid of simplicity, and yet it is simplicity alone that can prevent the rot from spreading. Simplicity, with a dash of courage and independence. We are scared stiff, if the fact be known, lest, whilst we slept last night, or whilst we took our brief holiday, some great advance may have taken place in medicine of which we are un-But we needn't worry, for science, like nature, never proceeds by leaps. Besides, we shall hear all about it soon enough, either from the chemist's traveller, or from our patients, or from the headlines in the daily press. In other words, that lag, which is often called conservation, and for which we are so often censured, is an extremely useful asset in the doctor's mental equipment. For nature is herself conservative, and yields little or nothing to our hustling.

Meantime, we must try, quite tactfully, to break up the situation resulting from the patient's own knowledge ability—if I may use such a word, since this actually obstructs us in our getting to the root of his trouble. He knows a lot of technical terms, and quite often he can no longer tell us his symptoms in plain language. "What is the matter with you?" we ask him. "Blood-pressure, doctor," he replies. "No, but what are you suffering from?" "I told you, doctor, blood-pressure." And since we must make a beginning somehow we say, "Yes, but tell me how it is affecting you." "Oh, you mean my giddiness," or "my headache," and at last we are back at scratch. He carries his electrocardiographic tracing about with him and points out to us the deviations of the T-wave from the accepted normal. The x-ray pictures of his opaque meal have preceded his visit—with excess postage to pay-so-also have the results of a bio-chemical research, duly recorded, with a zeal more excessive than commendable, upon a form of enormous size . . . And if now we gently push these things aside and ask him a few simple questions and then examine him with our unaided senses, he thinks our methods are mediaeval. He little knows how ultramodern they really are . . .

Some of this pseudomedical knowledge on the part of the patient is paraded with a genuine hope that it may save time and also expense. Indeed, a wholesome corrective to the excesses of the clinic system is being made apparent nowadays by the necessity for economy on the patient's part. For it is a fact that modern doctoring has become too expensive for many people. When I asked a patient recently to let me examine him, he demurred, saying, "No, please give me something for my headache; I don't want a diagnosis, it costs too much."

But the path by which we regain our clinical acumen, as we must regain it in the patient's and our own interest, matters little: whether it be by the new road of clinical research or by frustration, or by economy or by sheer mother-wit. We never should have left the bed-rock of clinical medicine. And the sooner we return to it the better.

THE PROBLEM OF TUBERCULOSIS

KARL FISCHEL, M.D., Saranac Lake

This essay was awarded the Merritt H. Cash prize at the Annual Meeting of the Medical Society of the State of New York, New York City, April 27, 1936

Epidemiology

The difficulties of predicting changes in the tuberculosis death rate are so great and manifold that any prophesy as to its future trend is a rather hazardous undertaking. On the basis of innumerable statistics coming from most civilized countries and compiled under the most varying conditions, favorable forecasts are frequently made which are apt to full us into a feeling of false security. Statisticians are even inclined to project the future trend of the tuberculosis mortality for years to come and state that the death rate for 1940 will be thirty-five per 100,000 of the population.

Such positive statements, however, are hardly justified because the interpretation of tuberculosis statistics is fraught with many pitfalls, for morbidity and mortality rates are the results of numerous and complex factors; and the knowledge and significance of each single factor cannot be ascertained unless its variations can be observed in a series of surveys in which all other contributory factors remain constant. In tuberculosis more than in any other disease, the death rate is affected by so many racial, constitutional, economic, and climatic factors, that even wide fluctuations were not foreseen by competent experts. For instance the remarkable reduction in the incidence of tuberculosis since 1918 and particularly the steady decline during the five years of a severe economic crisis came as a pleasant surprise to many who are interested in the control of the disease. On the other hand the sensational rise in the death rate in all countries that participated in the World War was an unexpected blow to all those who believed implicity in the effectiveness of specific antituberculosis measures.

Optimistic observers may claim that it should be possible to foretell the trend of the mortality curve with some degree of accuracy. After all, tuberculosis is an endemic disease with a marked tendency

to a chronic course, and we are safe in assuming that not even the most adverse conditions could produce sudden changes in its epidemiological features. We can hardly conceive of tuberculosis as the cause of an acute epidemic, such as plague, cholera or influenza, with unexpected and sudden exacerbations and equally dramatic remissions. But if tuberculosis, as other infectious diseases, follows a cyclic course and if, as experienced observers claimed, the descending mor-tality curve may be interpreted as the phase of remission in the wave-like periodic fluctuations which are characteristic of all true epidemics, then no one can deny the possibility of an increase in the incidence due to the periodic return of the wave. Is the eternal rhythm of push and recoil, of up and down noticeable in tuberculosis too? Are we really, while at the height of our hopes, at the bottom of the periodic ebb to be carried again to the crest of another wave by the next turn of the tide? It does not seem probable, yet no one can answer these questions with any semblance of definiteness because the few decades which are covered by dependable vital statistics do not allow us to recognize or deny wave-like fluctuations in the trend line. We may assume, however, that if tuberculosis follows the law of epidemic periodicity and if rise and fall in its mortality are to be interpreted as cyclic movements, then the waves of increasing or declining incidence peculiar to this disease must be of greater length than depth, and bear little resemblance to the tidal waves which are noted in true epidemics,

If we accept the theory that all epidemic manifestations are the outcome of loss of equilibrium between the infecting agent and the resistance of the population at large, a discussion of all factors which are apt to change this balance one way or the other will serve to throw light on our problem.

The Reservoir of Infection

Because the tubercle bacillus is an obligatory parasite and cannot exist for any length of time outside the human or animal body, the sum total of open tuberculosis is equivalent to the reservoir of infection. On account of the sharp and accelerated decline in tuberculosis mortality, it is at present smaller than it has ever been and it is moreover steadily diminished by the segregation of carriers; by early diagnosis and above all, by the systematic education and instruction of generations of sanatorium patients in the simple rules of prophylaxis. It is more than a mere coincidence that the greatest strides in the control of the disease have been made in countries with a welldeveloped system of sanatoria and clinics, whereas inversely the specific death rate is comparatively high where the sanatorium movement was started much later and the number of available beds in institutions is still small. The density of infection in the population is at present at an unheard of minimum, with less exposure than ever before; a fact which is evidenced by numerous tuberculin surveys which clearly demonstrate the steadily declining frequency of infection. Numerically the decrease in the number of potential sources of infection is indicated by morbidity statistics (made possible by laws adopted in most of the States which made tuberculosis a reportable disease). But the exposure to infection has actually been reduced to a much greater extent by the systematic antituberculosis campaign. The reservoir of infection—which seemed so inexhaustible thirty years ago that tuberculosis always was called ubiquitous—is definitely being emptied. From the epidemiological point of view and disregarding for the time being all other favorable developments, it can be said that the greatest achievement and one for which credit must be given to human enterprise and organized efforts, is the quantitative reduction in the amount of infection in the population. The result of our improved defensive measures which began in 1900 is the most remarkable change in the relative strength of infection and defense.

The Parasite Factor

The tubercle bacillus is of lesser

importance as an epidemiological factor than in other respiratory infections which from time to time cause rapidly spreading and devastating epidemics. It is a slowly growing organism which cannot multiply outside of the host under the most favorable circumstances; it is mostly transmitted from a carrier by direct or close contact. Differences in virulence have been observed and we know that strains of greater or lesser virulence can be cultured from the sputa of patients who show wide variations in the clinical picture and course of their disease. In this connection, a question which, to our knowledge has never been raised, presents itself. One may ask whether or not the clinical aspects of pulmonary tuberculosis have changed in the course of the last two decades? In other words, whether or not qualitative as well as quantitative changes in the parasite have occurred which would have a bearing on our problem. The increasing frequency of infiltrative forms with a history of an acute onset and unusual localization below the clavicle is hardly explained by improved diagnostic methods because, even in the short time since these lesions have become fully known, a high percentage of infiltrative processes is being reported. The textbook type of chronic phthisis with its slow apico-caudal extension, on the other hand, seems to be on the decrease. The childhood type which, as name indicates, was considered atypical in adults, is at present found more frequently in age groups above twenty, and is distinguished by accentuated allergic symptoms. If such changes in the clinical picture of pulmonary tuberculosis should be corroborated by further observations they could be ascribed either to overwhelming doses of infection, to a greater virulence of the infecting parasite, or to an alteration in the reaction of the subject due to a delayed contact with the tubercle bacillus and concomitant increased sensitiveness. The latter possibility will be discussed under the next heading.

The Immunobiological Factor

Ever since Koch's time the view has been generally accepted that contact with the bacillus confers a certain degree of immunity in tuberculosis, and that, as a rule, the course of a subsequent reinfection is milder. Then, after the introduction of tuberculin tests, the first surveys disclosed the enormous diffusion of tuberculosis throughout the world and led to the belief that infection with the tubercle bacillus is an inevitable event in civilized countries. "In human beings as in animals an infection of a mild nature is very desirable" stated Calmette. added "Viewed in this light the practical prophylaxis of tuberculosis ceases to be that of the infection and becomes the prevention of the disease." Consequently attempts were made to induce this theoretically desirable state of immunity artificially and intentionally by well-measured doses of infection instead of waiting for the unavoidable chance infection which may prove excessive. Calmette's method of vaccination with the mitigated B.C.G. strain has been and is still being used on a large scale in various European countries. Diametrically opposed to this method, which aims at the prevention of clinical disease by immunization of the child shortly after birth, is the principle of prevention of infection on which the fight against tuberculosis in England, Germany, the United States and other countries, has been successfully organized. Judging from the greatly reduced mortality and the steadily decreasing incidence of infection as evidenced by the low percentage of positive skin reactions, the progress made since 1900 is truly remarkable and it seems that success in the control of tuberculosis by the method of prevention of infection is within sight.

A comparison of early and late tuberculin surveys demonstrates the success of our prophylactic measures. Group examinations made in Framingham in 1917 and repeated under similar conditions in 1926 showed a reduction of twenty-three per cent in positive skin reactions. In other districts, particularly in rural communities, the figures were even lower. While there are considerable variations in the number of reactors in different communities, the average for the age of fifteen has been estimated at approximately fifty per cent. Now, with the prevailing views on tuberculoimmunity, it is rather difficult to evaluate the part which the increasing anergy of children

of school age may play in the incidence, development, and clinical course of active disease in later life. The frequency of exposure measured by tuberculin reactions must have a definite relationship to future morbidity and mortality, but only the correlation of present surveys to the death rate of 1945 will tell us whether the increased anergy created a situation to be worried about or elated upon. If we remember the malignant course of acute forms of tuberculosis in races that had no previous contact with the bacillus of Koch; if we consider the higher incidence in rural immigrants to big cities; the greater percentage of disease among nurses who had reacted negatively, and finally if contact with the tubercle bacillus confers any degree of protection, then we must hesitate to interpret the prevailing tendency anergy unconditionally as a desirable phenomenon. This view seems to be supported also by reports made at the Second International Pacific Health Conference held in Sydney in 1935, which indicated that native races (Maoris, Solomon Island, etc.), are now capable of withstanding the invasion of tuberculosis. At the same time there were observed positive skin reactions of between sixty and eighty-seven per cent for adult and fiftyseven per cent for children between six and sixteen.

One is tempted to speculate that the immunobiological factor must have some influence on the mortality and morbidity rate in tuberculosis inasmuch as with a higher death rate the number of contacts with positive reactions will be greater, which fact will tend to reduce the incidence of active and progressive disease. Then with lessened exposure, the number of contacts and positive reactors will drop and a greater number of anergics will grow up without the protection of . an early infection, thus establishing alternating cycles of anergy and allergy. One cannot doubt that anergy is a potential source of danger in exposed groups but the role it may play as an epidemiological factor for the population at large is not known at all. The only conclusion that can be drawn at the present time is that prevention of infection becomes the more imperative the higher the percentage of negative reactors rises.

· The Transmission Factor

The recognized method of combating epidemics by the isolation of the sick can hardly be applied in respiratory infections, which for this reason at times run out of control. In tuberculosis, very fortunately, it is possible to stop a spread effectively at the source of infection. The effectiveness of all preventative measures consequently depends primarily on the early detection of open cases and prompt hospitalization. Obviously, the length of time between the first appearance of bacilli in the sputum and the time when the case is reported, is equally important as the absolute number of reported cases. A real problem for the public health authorities is, therefore, diagnosis and management of certain symptomless forms of incipient tuberculosis. On account of the frequent absence or insignificance of subjective and objective signs and the onset which is in no way characteristic, cases of early infiltrates cannot be diagnosed by the usual methods of physical examination, but require the use of special procedures. On the basis of the newer views, other methods have in fact, therefore, been devised. A systematic search for the unknown source of infection by tuberculin tests and investigation in every reported case of open tuberculosis; regular examinations of certain exposed or occupational groups, and the wider use of serial roentgenograms, have given very encouraging results. These methods will undoubtedly prove of great value in prevention if provisions are made for the immediate hospitalization of such patients.

The Economic Factor

For many years living conditions in the United States have been so favorable and the standard of living so high that the well-known contributory economic factors which are considered pacemakers for phthisis and present problems in other countries, required but little attention in preventive work here. The significance of each single factor, such as income, wages, food prices, housing conditions, size of families, occupations, and so on, have been studied in numerous painstaking surveys which seem to prove uniformly that adverse living conditions

make for the break-down of human resistance, and tend to increase the incidence of tuberculosis. Unfortunately, however, all these studies are based on an arbitrary isolation of facts and fail to take into account the complexity of all factors which must be held responsible for the confusing variations in the death rate in different groups.

At the beginning of the depression these studies, and particularly the experience of the war and after-war years, caused considerable apprehension in the minds of many observers who anticipated an increase in our tuberculosis mortality if we had to face a long period of abnormal economic conditions. Contrary to the expectations the specific death rate has continued on its downward course and we can now look at the prolonged crisis as another experiment similar to the war and on an equally gigantic scale—affecting as it does over thirty three millions of unemployed the world over-which takes place under our very eyes but under entirely different conditions.

In the first place the immediate action of modern war runs counter to natural selection since the strongest and fittest are first exposed to injury and death and the less fit have, at least in the beginning, a better chance to survive and to propagate. Modern war, however, has a second phase which affects mostly the stock of lesser quality. With the enormous losses in the most valuable groups of the male population the less fit were drafted in all war countries for military service and industrial duties. At this stage the tuberculosis death rate began to climb sharply in proportion to the scarcity of food and living conditions in general. The second human reserve simply could not adapt itself to increased exposure, hardships of all kinds and long working hours, and the rising tuberculosis death rate is the tale of many "an unknown consumptive" or potential consumptive who died from changed environment. The disastrous influence of this sudden industrialization is strikingly reflected in the female rate, which to give an example, jumped in Germany from 137 to 228 between 1914 and 1918.

Another combination of variables presented itself with the onset of the depression which caused the demobilization of all those below par. Those who were less resistant and less fit for work were the first to be laid off. The chronic consumptive, partially disabled, who in normal times had frequent relapses because of his attempts to be self-supporting had, with increased unemployment, no chance to find part-time work which he was able and anxious to do. He was compelled to discontinue working. Malnutrition and starvation are, of course, the most serious dangers in long periods of economic distress but do not seem to affect the specific mortality unless combined with the excessive labor and uncertainty of war times. If the minimum food requirements are met, the weak and less resistant and the chronic consumptive with arrested or quiescent lesions, who in normal times are severely handicapped in their struggle for employment, appear to be definitely better off by being forced to be idle.

The comparison between the influence

of warfare and economic war will serve to throw into holder relief the overwhelming importance of environment. At the same time the essential difference in the action of the forces at play will be recognizable. During the war the concurrence of a great number of adverse circumstances resulted in a sharp increase in the incidence of tuberculosis in most war countries, while during the present world depression the single factor of nutrition is apparently counterbalanced by the protective elimination of the weak from the labor market. As far as tuberculosis is concerned, the deleterious effect of deficient nutrition seems to have been neutralized or at least delayed by the powerful factor of enforced rest and avoidance of fatigue; principles which have been applied with great success in the treatment of the disease. We may, therefore, look upon the depression as an experiment on a large scale which demonstrates the significance of overexertion as an undesirable environmental factor.

The Diagnostic-Therapeutic Factor

To what extent improvements in diagnosis and treatment have contributed to the reduction in the specific death rate is a matter of mere guessing. Morbidity reports alone or in conjunction with vital statistics do not permit us to estimate the number of cures or the slowing down of

the death rate due to prolongation of life by early or more effective treatment unless all the cases are followed up. The only accurate statistics have thus far come from Norway, the first country to adopt a tuberculosis law (1900). According to Roesle who compared the records of the city of Oslo for the year 1920 with those of 1927, the percentage of cures there has increased within six years from three per cent to 6.7 per cent of the entire morbidity. Since then further progress has undoubtedly been made and we can assume that a greater number of cures is effected by the wider use of artificial pneumothorax and more radical surgery, while prognosis for the incipient case has been rendered more favorable by early diagnosis and immediate treatment.

The innumerable disconnected reports on small groups do not give a true picture of results obtained with pneumothorax and cannot be used for composite figures. There are wide variations of indications, a lack of standard of classification of the final outcome and great differences in the time of observation. Very often no distinction is made between early and late pneumothorax. The percentage of clinical and economic cures can be roughly estimated at fifty per cent. (Rist, Matson, Roloff, and others.) A further reduction in therapeutic failures and an increase in the percentage of sputum conversion can be expected from the early application of artificial pneumothorax and a more extensive use of intrapleural pneumolysis.

Similar difficulties are encountered if one attempts to evaluate the therapeutic effect of thoracoplastic operations. Here again lack of unformity in indications, time of observation, and particularly in operative technic, accounts for considerable differences in the final results and in the ratio of sputum conversions. More radical surgeons may have a higher operative but better late mortality, while more cautious workers have, as a rule, more favorable immediate results but have to resort to re-operations more frequently. The percentage of cures ranges between forty and fifty per cent and that of definite improvement between fifteen and twenty per cent.

Since success or failure of treatment and of all preventive measures depend primarily on our ability to recognize pulmonary tuberculosis at the very onset and to treat and isolate potential sources of infection, the diagnostic-therapeutic factor must in future assume greater significance in proportion to the progress in our ability of finding the early cases. The so-called newer views on the pathogenesis of tuberculosis, with the conception of an essentially acute infectious disease, are supported by such convincing evidence that they must be considered in the discussion of our problem. We are at present not concerned with hair-splitting debates about the first localization of the focus of reinfection or the merits of Ranke's classification. The facts which are of enormous practical importance are that tuberculosis very often begins in regions where it cannot be recognized by physical exploration alone; that the initial symptoms are frequently insignificant and misleading; that infiltrates may progress rapidly, and that a great number of patients reach the far-advanced stage in a much shorter time than could be expected with the slow apico-caudal extension which is still taught in text books. This new conception must necessarily bring about profound changes in our present therapeutic and preventive methods.

This chronic, slowly developing disease led logically to a cure extended over a long period and the most conservative treatment seemed justified. But if tuberculosis develops and advances rather acutely, the main reason why the disease is still considered chronic is the fact that the damage suffered by lung tissue during short and acute periods cannot be repaired in a short time. Heretofore our therapeutic efforts have been focused on phases of repair during which the patient was kept in institutions in order to recuperate from the after-effects of acute exacerbations. The question may be raised whether the results could not be improved if our efforts were concentrated on these short periods of exacerbations and by hospitalizing the patient promptly at a time when rapid progression and extensive tissue destruction are imminent, dangers which must be and frequently can be averted by immediate action. Disregarding financial considerations which create a demand for more time-saving and a less expensive way of treatment, the fact must be decried that public institutions

are blocked by patients in the stage of repair who are admitted after much "redtape" and thorough investigations at a time when most of them had gone through the most critical periods of their disease.

From the mere fact that, in the course of the disease, acute exacerbations occur which resemble surgical conditions inasmuch as they demand immediate attention and very often prompt action, the necessity of admission of these emergency cases to public institutions seems obvious. The mills of bureaucracy grind slowly, too slowly for the proper management of acute forms of tuberculosis. Time is an important factor and prompt placement in a sanatorium or pneumothorax in time may decide between a localized lesion and rapidly advancing tuberculosis. There are still State sanatoria for the care of incipient tuberculosis while clinics and physicians in the big cities are forced to resort ambulatory treatment by bilateral pneumothorax, which fact in itself is proof that we need an increase in and a more advantageous utilization of available hospital facilities.

The old sanatorium, situated in health resorts and frequently at some distance from the metropolis which it serves, is probably a thing of the past and will be replaced by the tuberculosis hospital with a large surgical ward. To give best service it should be easy of access. One can visualize it as a lying-in hospital with a quick turn-over for the acute stages and with a well-organized outpatient department for the ambulant patient and finally a large visiting medical and nursing staff to supervise the patients in home care and bring treatment to them. Under these conditions a five hundred bed hospital should have a yearly turn-over of one thousand patients or more, and could take care of all discharged patients in its district who could be readmitted at once if

the necessity presented itself.

The discovery of the early infiltrate with its unobtrusive symptoms created an entirely new situation for public health agencies. Before the disease manifests itself the infection can be spread in schools, work-shops, boarding-houses, and households, and it is, therefore, the task of dispensary workers to go more systematically than heretofore after the incipient

case It is necessary to search for the early infiltrate by radiographic and other examinations, it does not force itself upon the observer but it is more danger ous while unknown as an unsuspected center from which households or workshop infections can spread. Once such a case of pulmonary tuberculosis is diagnosed in its very incipiency a search for the offending carrier should be started and no history should be considered complete unless the source and mode of infection is established. The feverish activities into which public health departments are thrown by the report of a single case of typhoid or diphtheria is still in strik ing contrast to the indifference toward a new case of a disease which still rates seventh in the list of causes of death

Early diagnosis campaigns and the wider use of Roentgen examinations have been of great value in case findings but these methods should be supplemented with a systematic examination of certain occupational (teachers, nurses, barbers and food handlers) and exposed groups Instances of active tuberculosis have been repeatedly found in apparently healthy groups where one would least expect to detect the presence of open tuberculosis It is well-known that from such sporadic cases small household or workshop epi demics develop unless the carrier of the braille is promptly detected. In order to trace the road of infection from the unknown source of infection to the known case of clinical disease, investigations must be resorted to which at times require real detective abilities. In rural communi ties, a positive skin reaction in children who live in the same house or the same neighborhood has been used as an excellent means of locating the source Be cause transmission from a heretofore un known carrier may have taken place, all contacts must be considered an exposed group and supervised as such It will be seen that knowledge of infiltrative lesions should enable us to stop loop holes in our system of preventive measures which were not recognized before

It was not the purpose of this article to discuss any of the many aspects of tuberculosis in detail, but rather to analyze the influence of the numerous complex, and often interrelated factors

which by their combined action determine the rate of death in tuberculosis. The strides which have been made are so impressive because we have good reason to believe that the deep indentation which the mortality curve shows between 1900 and 1930 is due to dichberate and conscious human efforts, even though circumstances over which we have no control may have been in our favor. It will be up to civilized society to continue the work, which is far from being completed

Under normal circumstances, the prediction should be ventured that we can hope for a further reduction in the frequency of tuberculosis. The turning point will obviously be reached at the time when the incidence of clinical disease is so low that the recognized methods of combating communicable diseases-by isolation of the sick and all contacts-can be applied Until such time, the conquest of tuberculosis is not accomplished, and we must be prepared for reversals, especially if in the course of the prolonged economic crisis lack of funds should cause a general letting down in organized anti tuberculosis work. At a time when all values have tumbled and so many assets had to be classified as frozen, the health and productivity of the great mass of people remain the outstanding and most tangible assets of a nation and it would be the short sighted policy of the penny-wise and dollar-foolish to curtail preventive activities at this critical time, for the sake of economy

At a period which finds the whole world in turmoil and out of balance, any definite prophesy as to the future trend of the specific death rate would amount to a prediction of the march of events in world affairs Tuberculosis is so intimately bound up with universal economic factors that the final conquest depends on the restoration of normal conditions and the preservation of civilization. The tuberculosis problem, with its wide rami fications, is closely linked up with, and cannot be separated from, other momentous issues of the day, and the tuberculosis mortality of the future is, therefore, bound to show reverberations from the solution of other urgent problems, be it inflation, commodity prices, unemployment, free trade or disarmament

SURGICAL MOTION PICTURES SIMPLIFIED

BOARDMAN M. BOSWORTH, M.D., New York City

Perhaps the chief explanation of the regrettable fact that more motion pictures are not taken of surgical procedures lies in the two-fold difficulty of providing adequate illumination and camera facility at close range without impeding the operating team. It is a simple enough matter for any photographer to set up his camera tripod and a number of light standards and produce a fairly good picture of some simple operation-provided the surgeon and his assistants are willing and able to slow down their work and even interrupt it from time to time. This, however, is neither desirable nor permissible in the majority Good surgery demands of procedures. undivided attention to the work in hand: smooth teamwork is essential; and the distraction entailed by photographic paraphernalia scattered about the room is not conducive to either the one or the other. So it has come about that the photographer is hardly a welcome addition to any operating room.

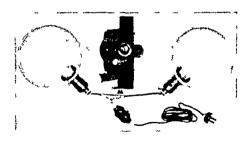

Fig. 1. Light bracket mounted on camera.

Fig 2. From subtotal thyroidectomy filmed with bracket. (Courtesy of Dr. John Garlock, New York Hospital).

It was in an effort to solve this problem that the light bracket shown in the accompanying illustration (Fig. 1) was devised. It consists simply of a narrow strip of steel supporting a photoflood bulb (with reflector) on either side of the camera. As the lights are thus mounted directly on the camera, no tripod is necessary. The photographer actually takes what he sees. with excellent illumination, wherever he points the camera. In this way it is possible for him, clad in sterile gown, to stand directly alongside the surgeon at the table and take pictures at varying angles and distances, between eighteen inches and four feet from the field.

The single wire from the bracket is draped over the photographer's shoulder, pinned to the back of his gown and plugged into an ordinary extension cord, which permits him to move to any part of the table without danger to the sterile operative technic. It is also possible to stand on a stool and take pictures looking directly down on and into the field, as in filming a gastrectomy, cholecystectomy, hysterectomy, with complete illumination of the depths of the wound.

Each light has its own switch, of course, but a master switch is incorporated in the line just beneath the bracket. As the lights are mounted 71/4 inches apart and are tilted away from each other, their cross-illumination eliminates deep shadows.

The apparatus is simple, light, strong, compact, and easy and inexpensive to make. The specifications are:

- 1 Strip of sheet metal 8¼" x 1" x ½", bent down at an angle of 135 degrees ¾" from each end; ¼" hole in the center for knurled camera screw; hole in each end for brass bushing.
- 1 Knurled screw for attaching camera to bracket.
- 1/8" brass bushings 2 Ordinary light sockets.
- 2 Small light reflectors.
- Photoflood bulbs.
- Line switch.
- 1 Outlet plug. Electric light wire 6 feet.

Much of the above material can be purchased in any five and ten cent store.

Dr. Joseph C. Doane, Medical Director of the Jewish Hospital, Philadelphia, is to give the short course in hospital operation offered this summer at Cornell University in the

Summer School of Hotel Administration, June 29 to July 11. Information may be had from Prof. Howard B. Meek, Cornell University, Ithaca, N. Y.

SILICOSIS

Diagnostic Difficulties

EDGAR MAYER, M.D., New York City Assistant I rolessor of Clinical Medicine, Cornell University Medical College

Silicosis is a pathologic condition of the lungs due to the inhalation of silica, free or combined, in such a state as to be capable of setting up its characteristic pathogenic effects. Principal factors that determine the incidence of silicosis are; (1) the percentage of free silica in the inhaled dust; (2) the concentration of silica particles less than ten micra in diameter in the atmosphere; (3) the duration of exposure to the dust; (4) the susceptibility of the individual exposed as modified by complicating infections.

This disease is essentially a fibrosis of the lungs developing especially in such industries as hard-rock metal mining, granite cutting, metal grinding, and sandblasting. The pathological changes are believed to result from two causes, a blocking of the lung lymphatics by mononuclear cells laden with dust in addition to the action of silica, the exact manner of its action being in doubt. The small particles under ten micra are the only ones capable of penetrating the

lung tissue. Although silica plays the dominant role in the production of silicosis, the admixture of other dusts tends to modify the pathological changes in the lungs and the modification bears some relation to the percentage of free silica in the mixture. Silicates, as in asbestos, produce a definite change in the lung. Such changes are represented by a fibrosis due to insoluble minute particles of minerals in sufficient concentration being brought by the activity of phagocytic cells into intimate contact with the pulmonary connective tissue. This fibrosis is a diffuse cellular one that occurs in the walls of the smaller bronchi and of all their finer divisions, and extends to involve the supporting connective tissue of the adjacent blood vessels and to some extent also the walls of adjacent air spaces. However, when the great majority of the inhaled particles are composed of or contain silica, there develops, in addition, a specific and localized type of fibrosis called the silicotic nodule-an orderly whorled arrangement of cells and fibers, and with sharp definition from the adjacent parenchyma. Many dusts create a generalized fibrosis but only one, namely dust containing silicon dioxide, produces the special fibrosis of silicosis. Sericite. known as white mica, which is a hydrated silicate of aluminum and potassium, has not produced in animal experiments the silicotic nodule but instead a

generalized fibrosis.

Dusts must be differentiated into those which are chemically active and those which are inert when inhaled into the respiratory tract. Silica is a chemically active dust which most likely is soluble to a degree in the body fluids; its activity probably depends on its solubility,* This activity which is manifested in the areas where dust particles are carried along the lymph stream by phagocytes, causes lesions of two types, "toxic" and "sclerotic," both of which have been reproduced experimentally. Toxic lesions depend upon local necrosis and slow death, and appear to favor the growth of tubercle bacilli; the sclerotic lesions produce the nodular fibrosis. The inert dusts are insoluble in body fluids and cannot exert chemical action in the lung tissue, but if they accumulate to a marked extent, their effect is mechanical which may lead to a certain amount of diffuse fibrosis around the dust deposits. Certain dusts, such as carbon, may have physical effects, they may adsorb toxic substances and it has been suggested that on this basis there is a relatively lower incidence of active clinical tuber-

From The New York Hospital, and The Department of Medicine of Cornell University Medical College

^{*} Heffernan,1 of Derbyshire, England, most recently stresses not the solubility, but the electro-chemical activity of the free ions of silica at the "open" surfaces of dust produced from silica crystals as the damaging factor in setting up fibrosis.

culosis in silico-anthracotics than in silicotic lungs.²

Diagnostic difficulties often prevail in the recognition of silicosis in the general hospital. A definite history of exposure must be established. In general hospitals where patients are migratory, conditions under which they worked may be vaguely described and inasmuch as data on dust counts and silica concentration are not available, the history may be misleading. It may be necessary under such circumstances to visit the industry in which the man worked and to determine from the employer the exact amount of time spent in different portions of the plant.

The diagnosis of silicosis is made primarily on two findings, the proper history of occupational exposure to silicious dust and the presence of abnormal shadows on pulmonary x-ray. The physical examination and the patient's symptoms are of less value. There are other diagnostic aids such as the finding of large quantities of silica particles in the sputum. quantitative determinations of silica in urine, and at postmortem, chemical analyses of the lung ash, supplemented by petrographic examination, Roentgenray spectrum analysis and special incinerating studies of lung tissue. We must at times fall back on the pathologist to determine the amount and distribution of fibrosis due to silica, and from microscopic studies give an opinion on the importance of this fibrosis as the ultimate cause of death.

Lung fibrosis may be present without any silica. Silica may be present in lung tissue or the pulmonary lyinph channels without associated Finely divided silicious particles from lung tissue may contain innocuous silicates which cannot be distinguished from harmful silica particles. Hydrated silica which is not doubly refractive cannot be demonstrated with prisms. Therefore in the pathological section the presence of silicious fibrosis can be suspected but cannot be specifically identified with the silicious material that it may contain. Accordingly the microincineration method of Irwin³ with hydrochloric acid is now included in the examination of any lung "as a means toward a surer diagnosis."

The diagnosis of silicosis must be distinct from the clinical evaluation of the patient's functional disability. To a

degree, emphysema seems to be compensatory in nature although it may become a causative factor in the development of functional impairment. Emphysema, present to the degree of causing decompensation, cannot be determined from physical or roentgen signs until it is quite far advanced. At this stage clinical functional findings such as carbon dioxide retention and O2 diminution in the alveolar air, body retention of alkali compensate for CO₂ retention). increased hemoglobin and red cells due to decreased O₂ capacity, have all proven humoral criteria of functional disturbances in emphysema and may be looked for in severe silicotic functional disability. although they do not necessarily occur proportionately to the degree of silicotic fibrosis.

It must be emphasized, however, that due to the ever-present combination of fibrosis with emphysema of compensatory or contrary nature, the functional disability is often out of proportion with the degree of the silicotic fibrosis. This disproportion is evident in two directions; one may have obvious marked silicotic fibrosis with much compensatory emplysema when the functional impairment is slight, or one may have very severe functional impairment in cases where the real extent of the silicotic fibrosis is obscured by the associated emphysema. Obviously an individual appraisal functional disability must be made in each case on the basis of functional capacity tests which should corroborate clinical subjective or objective evidence. There are great individual variations in the ability of pulmonary tissue to compensate for pulmonary fibrosis. Compensatory emphysema or possibly compensatory lung hypertrophy may, in one patient, prove adequate in preventing functional disability of extensive fibrosis, and yet in another patient prove inadequate for a fibrosis of much lesser degree. Emphysema is not necessarily a sign of functional impairment.

Diagnostic difficulties in clinical medicine may be more obvious if we examine first the occupational history. Workers in the same industry, indeed in the same room, experience different degrees of exposure dependent upon perhaps the dust-filtering capacity of the nose and the functional condition of the lung as deter-

mined by constitutional characteristics and antecedent disease. The size of the particles of silica, as well as the dosage, will influence the rate of development of the disease. A definite history of exposure must be established. In general hospitals where patients are migratory, conditions under which they worked are very vaguely described, and there being no available data on dust counts and silica concentration, the history is often misleading.

As to symptoms, patients can often perform strenuous labor despite extensive disease and the symptoms of dyspnea and cough are common to many diseases. Fever is absent unless infection occurs, but most important is the great disproportion between a patient's complaints and what is seen on the x-ray, the latter showing extensive abnormal shadows in comparison with the symptoms.

On physical examination, extensive disease may be present and few abnormal physical signs. The physical signs are those of a general pulmonary fibrosis with emphysema such as restriction of costal and diaphragmatic movement, diminution of or intensified breath sounds, and a hyperresonant note. Rales are usually absent unless infection is present.

As to the x-ray, there are three essential types of shadows described: linear strands, small discrete shadows, and homogeneous shadows of varying sizes; these correspond to the fibrous strands, silicotic nodules, and the conglomerate masses of fibrosis. The nodular shadows are usually characteristically around the hilum or may be distributed in the upper two-thirds of the lung fields, perhaps more pronounced on the right side, with the lower third kept clear by emphysema; or conglomerate nodular shadows of batwing appearance often extend into both upper lung fields. With infection present. the shadows are less sharp or the linear strands interconnect or fuse. Large conglomerate shadows appearing out from the hilum often leave the periphery of the lung clear throughout because of emphysema. Variations from these patterns are seen in the x-ray, especially under excessive exposure or when other dusts are inhaled, or in the presence of infection.

It is probable that the main source of the diagnostic diffculties is caused by the emphysema which obscures the physical signs and is responsible in great part for the absence of symptoms. It may blot out, even on x-ray, the silicotic lesions of fine size. Examples of such difficulties in diagnosis as encountered by us are the following:

Case 1. A forty-five year old man entered the New York Hospital complaining of mild cough and expectoration of four months' duration. He appeared acutely ill, his fever was 103° F., and respirations twenty-eight. Rales were elicited over the upper half of the left chest. Examination of his eye grounds revealed bilateral retinal tubercles; his sputum contained numerous acid-fast organisms. The x-ray revealed fine mottled shadows distributed throughout both lung fields and a small cavity at the left apex. A diagnosis of pulmonary and miliary tuberculosis was made. However, after one week's stay in the hospital, his temperature and pulse returned to normal, and during the following month he gained eighteen pounds. The signs in his chest now became confined to the left apex. In view of his unusual progress the diagnosis of miliary tuberculosis was doubted. His occupational history revealed that until three years before entrance to the hospital he had worked for twenty years polishing leather on a sandpaper wheel. There were numerous machines in the work room and no precautions were observed to clear the very dusty air. His sputum was examined by incineration and micropolarization through the kindness of Dr. H. Burke of Raybrook, N. Y., who found it laden with numerous doubly refractive mineral particles. expressed the opinion that this was consistent with silicosis, for he had found such numerous particles only in cases of silicosis. The patient subsequently died of a tuberculosis meningitis. Retinal tubercles were demonstrated on microscopic section. The pathological report was miliary tuberculosis with no silicosis. Ashing of the lung showed increased silica content, consistent with undue exposure to dust (more than 2 mgm. silica per gram dried tissue).

CASE 2. A male, aged fifty-four, entered the New York Hospital complaining of recurrent hemoptyses, dyspnea, and chest pain for one year. On physical examination there were rales and dullness over the upper third of the right chest anteriorly. He ran a low grade fever, but was robust and felt quite well. The chest x-ray disclosed enlarged hilms shadows, particularly on the right, and diffuse mottled discrete shadows throughout

both lung fields with a circumscribed density near the right apex. He gave a history of having worked for twenty-four years as a cutter and sizer of asbestos-containing paper box boards. The rooms were in a continuous cloud of dust. Examination of the dust revealed five per cent silica content as well as Sputum examination showed numerous doubly refractive mineral particles and no tubercle bacilli. The hemoptyses, we felt, were to be explained on the basis of infection or neoplasm, but we did not know whether we were dealing with one of these processes alone or an associated silicosis or asbestosis. A small node in the neck was subsequently removed and showed carcinoma. We are inclined to believe this does not explain the whole process, as the man is still alive (after two years) and certainly, from the x-ray standpoint, we cannot say there is no silicosis.

Case 3. A dish-washer, aged forty-six, entered Bellevue Hospital on the service of Drs. Miller and Amberson, because of cough and expectoration, associated with dyspnea for three months. There was some duliness and rales at the right base posteriorly. Chest x-ray revealed a homogenous shadow at the right base. His sputum contained no tubercle bacilli and lipiodol study revealed no abnormalities. Bronchoscopic examination disclosed a bleeding mass in the right main bronchus. Symptoms and disease progressed during the following four years. Discrete mottled shadows first appeared in the upper right lung field and the shadow at the right base cleared somewhat. Three years later extensive abnormal shadows were present throughout both lung fields, particularly on the right. A diagnosis of chronic pneumonia of unknown etiology was made. At no time was a diagnosis of silicosis entertained, because as far as could be determined, he had no history of exposure. Furthermore if there were silicosis it behaved very atypically having the lesion confined practically to the right base at the beginning, and then spreading to the left lung. Autopsy findings of Dr. J. W. Grethmann, however, were a typical far-advanced silicosis of both lungs, more in the right, associated with a small amount of tuberculosis. There was stenosis of the right middle lobe bronchus with bronchiectasis in this lobe. Chronic infection in this lung field probably accounted for the unusual localization. This case illustrates how necessary it is to have the history of dust exposure, for without it we are unable to even suggest a diagnosis.

A forty-five year old male entered New York Hospital complaining of slight cough and expectoration with dyspnea

for two years, and gave a history of having worked for many years repairing tires, using talc powder. It was difficult to obtain accurate details as to the possibility of silica exposure except that the rooms were filled with clouds of dust. Rales were present at both apices and a few tubercle bacilli were found in the sputum. Discrete and stringy shadows were disseminated throughout both lung fields with bilateral apical shadows. We learned from the positive sputum that tuberculosis was present. Sputum examined for mineral particles was negative. The patient has, however, kept fairly well for two years since the miliary shadows were first seen. The doubtful history of exposure together with the numerous discrete nodular shadows present in his lung, which are consistent with silicosis, makes this patient a problem. Is this tuberculosis alone of a chronic miliary form or is this tuberculosis with silicosis? The patient is still living a year later, and working.

Conclusions

The cases cited are indeed exceptional, but their existence must always be borne in mind. If occupational history is inadequate, and x-ray clinical and laboratory studies prove misleading, the diagnosis may present great difficulty. However, a comprehensive analysis of all possible data usually clears up the problem with reasonable certainty.

A most detailed occupational history of exposure from all aspects, including dust study, is essential. Admixture of dusts must be considered. X-rays, not only stereoscopic, but also of varying degrees of exposure are required to avoid, if possible, elimination of shadows because of emphysema. Sputum and urine as well as postmortem studies, both pathological and chemical, with incineration and spectral analysis may be necessary.

Impairment of function in silicosis does not necessarily run parallel with the anatomic changes of the lungs as evidenced in the roentgenogram. From the standpoint of compensation, the severity of disease should be judged from the functional disability. Roentgen and clinical laboratory evidence not infrequently aid in determining this impairment of function.

SILICOSIS

Present Knowledge Summarized for the Practising Physician

D M BRUMFIEI, MD, Saranac Lake

As indicated in the title, this article is conceived for, and directed at, the practising physician It has been common medical knowledge, for many generations, that prolonged occupation in certain dusty trades may result in peculiar changes in the lungs of workers so employed Since the turn of the century and particularly in the last decade, there has been an increasing flood of original contributions to our knowledge of the subject from the various special points of view of the many contributing investigators Engineers, chemists, physicists, and in the more strictly medical field, industrial hygienists, publie health officers, clinicians, physiologists, descriptive and experimental pathologists, roentgenologists, have all added their valuable findings to our sum of knowledge By and large, the publications on the subject have been in the nature of orig mal contributions from special fields of investigation, and our actual knowledge of the subject as a whole is in such a state of flux that few of the original axioms have withstood the influence of new data which are appearing year by year. This obviously accounts for the fact that there have been few attempts to epitomize the subject and the practising physician has been left to feel that the whole thing is a highly specialized field of medicine, quite outside his provmce-something reserved for the industrial physician and the medical expert on the witness stand

But the great wave of cases being tried for damages in our civil and compensation courts has made for a public consciousness as well as an increased professional consciousness of the problem. At present it is safe to say that many trial lawvers have at their command a much more comprehensive smattering of the available information on the subject than the average physician.

Etiology

The etiology of these so called "industrial fibroses" is implied in the definition The term pneumocomosis was coined to describe any condition of the lung produced by the long continued inhalation of dust. For many years it was assumed that the inhalation of any type of dust would produce fibrosis but modern research is indicating that this is true of only a limited number of dusts.

Kinds of Dust While the term pneumocomosis is not specific and includes all forms of pulmonny dust reactions, current usage gives preference to specific terms which refer to the particular causative dusts, e.g. "silicosis" (silica), "asbestosis" (asbestos), "anthracosis" (coal), "siderosis" (iron), etc. Of these there are only two, silicosis and asbestosis which are recognized as having climical significance, the others being of academic interest only

Our present knowledge indicates that, in general, the presence of silica, in some form, is required to cause the development of fibrous tissue in the lung in any significant amounts. This may be in the form of free silica (SiO2) eg, quartz, or in the form of silicates, e.g., asbestos, or the two in combination, eg, granite In other words, non silicious dusts are wholly or relatively insignificant in comparison with silicious dusts. The specific quality possessed by silica particles of stimulating the production of fibrous tissue is due to some chemical property rather than to the physical property of hardness and sharpness. This is shown by the fact that diamond dust, the hardest known natural substance is innocuous

Inasmuch as silica itself is of such widespread distribution and constitutes such a large component of most metal-bearing hard rocks and sands, besides being used widely and extensively in manufacturing and other industrial operations, silicosis is by far the most prevalent and most significant of the known industrial fibroses

Size and concentration The mere presence of silicous dust is not sufficient of itself to constitute a hazard The size of the particles and their concentration in the inspired air are also of primary

importance in setting up a pulmonary fibrosis. In general, the smaller the particles and the greater the concentration, the more hazardous the occupation be-Particles larger than ten micra in diameter are innocuous because they are not inhalable, but particles of smaller size are toxic in inverse proportion to As to concentration, the their size. standards of safety are set at ten million particles per cubic foot of inspired air for mixtures containing less than thirty per cent silica, and five million for higher concentrations. Both size and concentration are now subject to sufficiently accurate determination, by standard methods, for surveying the probable hazard existing with any industrial operation. Special apparatus for sampling atmospheric dust are available, which permit both measurement and counting of these particles.

862

Length of exposure. In addition to the presence of a fine dust in high concentration, a definitely prolonged exposure on the part of any worker is required to produce the fibrous tissue proliferation under consideration. Just as the body defenses are able to withstand dust particles of low concentration for a long time, so are they able to cope with dangerously high concentrations for a short time

Before silicosis, or any other pneumoconiosis can develop, it is necessary that there be not only a definite hazard, but also prolonged exposure to that hazard. The length of time necessary to produce detectable and identifiable monary changes will vary from probably two years, in the worst possible conditions, to many years in others. length of time will depend, not only upon the fineness and concentration of the injurious dust, but also upon varying toxicities of the particular dust, inhibiting or accelerating substances mixed with the dust, and lastly upon the individual susceptibility of the workers themselves.

Coincidental modifying substances. Even among the various forms of pure silica there is considerable difference in their injurious properties, finely divided quartz being perhaps the most dangerous. When other dusts are present in mixture, even the most dangerous siliceous dusts may have their action greatly modified.

Each combination needs to be carefully studied by field surveys of the workers and animal experimentation before reliable conclusions can be reached. For example, silica particles in a concentration ten times greater than that considered safe, have been found to be rendered harmless when mixed with gypsum dust. Iron oxide not only delays the development of silicosis but retards its progress when once established.

Individual variation among workers. Tust as human beings vary widely in their physiological and pathological responses to other stimuli, so do they differ in their tendency to develop silicosis under identical conditions. Men working side by side, engaged in the same industrial operation, under exactly the same working conditions may display a difference of several years in the length of exposure necessary to produce significant pulmonary changes. Some of the factors responsible for this difference are doubtless general state of health and nutrition, susceptibility to intercurrent respiratory infections, certain variations in the minute anatomy, and the physiology of the respiratory system, etc. For example, there is evidence that mouth-breathers may be more susceptible than others.

Incidence and Distribution

Obviously such special forms of pneumoconiosis as asbestosis will be limited in distribution and incidence to the few industries dealing with the particular in-Therefore, they criminating material. come in for secondary consideration in a discussion of the general and broader problem. Silicosis, however, being by far the most prevalent, and of such widespread distribution and high incidence, becomes really the major point of our An understanding of it will pave the way for the special consideration of its corollary conditions should the occasion arise.

Silicosis is to be anticipated among the workers engaged in any operation in which the air contains a sufficient quantity of silicious dust. Its distribution is, therefore, nation-wide, but patchy. Its actual incidence is probably astounding—a fair estimate being that, at a minimum, several hundred thousand cases occur in

some demonstrable stage of development. A few of the many so-called hazardous occupations in this respect are: all mining operations involving hard rock, all manufacturing processes using finely divided silica, pulverizing plants, sandblasting, foundries, granite-cutting plants, etc.

Pathology

A very brief consideration of the common and typical pathological changes which occur in the lung is essential to an understanding of the roentgenograms and for the diagnosis. Here, also, the discussion will be limited to the commonest of all the pneumoconiosis, nodular silicosis. The various other forms, while important in themselves, require separate consideration and cannot be included in this very general article.

A certain number of the inspired dust particles are left deposited upon the walls of the pulmonary air sacs. There they are engulfed by wandering phagocytic cells which return into the alveolar walls and find their way to the lymph channels. Once in these channels they start their slow way toward the hilum, and to a much less extent, toward the pleural drainage, to rid the lung tissue of the particles. Strangely enough the preferred route for this migration is through the periarterial lymph vessels, rather than the perivenous lymphoids. At every place of lodgment in this return lymph stream, such as the tiny bits of lymphoid tissue at the bifurcation of pulmonary bronchioles, these dust-laden cells may become lodged, and local tissue reactions set up. This tissue response is at first the typical foreign body reaction, which, however, in the presence of silica, does not subside, but proceeds to the formation of excess connective tissue and results in a permanent proliferative lesion. This in turn results in deformity of the lymph channels themselves with partial occlusions, distentions, and a considerable degree of chronic perivascular inflammation along the course of the vessels involved. Undetained dust cells find their way into the tracheo-bronchial lymph nodes and set up a similar reaction there. At first these pathological changes are microscopic only, and cannot be detected either by the naked eye in the gross specimen, or in the roentgen-film of the patient. However, as the condition progresses, there appears a thickening, and a roughening of the vascular trunks, with occasional delicate nodules at the arterial bifurcations. This is recognizable both grossly and radiologically and may be called the stage of perivascular lymphatic infiltration. This stage, however, is not specific for silica. It is a type of reaction that may be the result of a host of irritative, infectious, or even innocuous agents, and is of no clinical significance.

From this stage there is a gradual progression into a stage in which the lymphatic drainage is actually interfered with and the dust cells establish foci in the parenchyma of the lung, followed by the development of a detectable, clear-cut fibrous nodule about each of the multitudinous foci of dust cells. This is called first degree nodulation. The nodules are just visible and recognizable, both in the gross and in the x-ray. They are clear-cut, discrete, and usually of uniform distribution throughout the lung fields, except at the extreme bases where they appear less numerous.

The next stage, that of second degree nodulation, includes all gradations of increasing size of the nodules as long as they remain individually discrete. This applies to all cases with discrete nodules larger than those typical of first degree nodulation up to six mm. in size. Incidentally, as the individual nodules increase in size, they tend to surround the branch of the pulmonary artery which they oppose and to constrict its lumen.

The final stage is that of coalescence of the individual nodules. Here some of the adjacent nodules have, by their own increase in size, become contiguous. By further growth of the fibrous tissue they coalesce and form great masses of fibrosis, obliterating, of course, any lung parenchyma which originally occupied this position.

As the pulmonary fibrosis proceeds there is a definite tendency toward the formation of areas of localized emphysema. These are chiefly at the bases which are quite generally emphysematous, but in addition there are frequently areas of bullous emphysema at the periphery of the lung, most common in the narrower margins.

There is no marked tendency toward adhesive pleuritis unless infection

supervenes.

The tracheo-bronchial lymph nodes, likewise, have increased in size by virtue of the progressive development of connective tissue within their substance.

Diagnosis

The diagnosis of silicosis on clinical data alone cannot be made. In the extremely far advanced cases, it may be suspected from the symptoms and physical signs, but an actual diagnosis is never justified without the confirmation of a definite history of exposure and the characteristic x-ray pattern.

From the practitioner's viewpoint it would be well to consider all silicosis cases as falling into two great classes—clinical or symptomatic silicosis, and preclinical or asymptomatic silicosis. There is a very reasonable doubt that purely nodular silicosis ever causes disability, or even becomes symptomatic. Some observers feel that the appearance of symptoms in nodular silicosis is prima facie evidence of superimposed infection.

The clinical or symptomatic cases are those of far advanced pulmonary fibrosis and represent the late stages of the con-The symptoms are those due to embarrassed physiology of the respiratory and circulatory systems, and may not appear until remarkably late. Having once appeared, they constitute a definite physical handicap and render the individual definitely and permanently disabled in proportion to their severity. Their onset is extremely insidious. Perhaps the very first clinical indication of silicosis is a gradual slowing down of the working efficiency of the individual. This may be first detected in the decreased earnings of the piece worker. Later there appears a slowly progressive shortness of breath, an irritative, unproductive cough, ease of fatigue, and rather frequently a vague, but troublesome "indigestion." If respiratory infections If respiratory infections supervene, the picture may be considerably complicated and this feature will be dealt with separately.

The physical signs are notoriously scanty and unreliable: a fixed barrel chest, with definitely limited expansion; usually hyperresonant percussion notes; diminished breath sounds, frequently with a prolonged expiratory phase; rales are usually few or absent. Briefly, the clinical picture closely

approximates that seen in emphysema, or even chronic asthmatic bronchitis. In fact, the usual presence of some degree of basal or peripheral emphysema may contribute to the physical findings. However, a helpful hint in differentiating pulmonary fibrosis from true emphysema is that in the latter the diaphragm, in its resting position, is near the point of full inspiration, while in the former it is near the point of full expiration. In other words, the purely emphysematous individual, from rest, can forcibly exhale more than he can forcibly inhale, while the silicotic can forcibly inhale more than he can forcibly exhale. Fluoroscopy, of course, is required for this demonstration. Helpful as this fact may be in many cases, it alone is not sufficient as yet to justify its being considered as pathognomonic. The symptom complex stated leads to the suspicion of silicosis; the diagnosis requires the confirmation of a typical x-ray pattern and a history of exposure.

Preclinical or asymptomatic silicosis exists in many individuals who do not exhibit symptoms. Being symptomless, the individual in this group is wholly unaware of his condition, and in ordinary circumstances remains undiagnosed and unsuspected except by accident. His silicosis is revealed only upon the unusual circumstance of receiving a chest x-ray for some incidental reason. Even then he may scoff at the whole idea of there being any menace to his future health in his present employment. Yet, he is potentially a disabled worker, if his hazard continues or his pulmonary changes progress.

In accord with the lack of symptoms, these cases present few if any physical signs. When any signs do occur, they are equivocal and are of no real value in either estimating the degree of fibrosis, or even in establishing the diagnosis. Therefore, in the preclinical stages, the diagnosis of silicosis depends solely and absolutely upon a history of significant exposure plus a characteristic pulmonary pattern in the

x-ray films.

X-ray. The pattern of the shadows cast in the x-ray film corresponds exactly to that of the pathological conditions which produce them, as is to be expected. In the stage of perivascular lymphatic infiltration there is an exaggeration of the normal linear markings, which represent the vascular tree. This is particularly noticeable in the finer ramifications, just within the range of visibility. Not only are they more prominent but they are more irregular in outline, with perhaps

a suggestion of beading. This also applies to the greater trunks, as well as the hilum shadows, which are decidedly more prominent, as an aggregate, but individually less sharply cut than in the normal.

In the stage of first degree nodulation we find minute and barely visible, discrete rounded nodular shadows added to

the foregoing picture

In the succeeding stages, there is the obvious and conspicuous increase in size of the nodular shadows, each remaining discrete and sharply outlined. As these increase in size there is a corresponding obliteration of the linear pattern of the first stage owing to the superimposition of the more conspicuous nodular shadows over the delicate fretwork of the perivascular infiltration.

The presence of conglomerate nodules is revealed on the film in an unmistakable

manner

Also, the partial emphysema at the bases is brought out by the darkening of the image cast by the more translucent lung. Even the peripheral bullae can sometimes be recognized in good stereo-

scopic films

A word regarding the x-ray technic itself is important The conspicuous shadows of advanced silicosis will show up in films taken in almost any common technic, in stereoscopic films or flat, front to back, back to front, lateral or oblique, moderately overexposed, moderately underexposed, slow or fast Such films will show the gross manifestations and will reveal the mere presence of some abnormality within the lung, but cannot be relied upon for accurate diag-Also, in most of the perivascular lymphatic infiltration cases and even in many of the first degree nodulation cases, the pattern will be lost unless the most carefully standardized and delicate technic is observed. This likewise holds true for many of the finer details of the more advanced cases, and no attempt should be made to evaluate the shadows except with perfect films

The author is not competent to prescribe such a standard technic, but it must conform to certain fundamentals. The films must be stereoscopic, that the observer can interpret the spacial relations and sort out any superimposed

shadows, the distance must be great enough (at least five feet) to avoid magnification and blurring by divergent rays, the time of exposure must be fast enough (not over 1/10 of a second) to arrest all intrathoracic motion, not only of the bronch, but of the heart and pulmonary vessels, the penetration must be just sufficient to pick up all the details and yet give a soft film, the focal spot must be small to secure sharp definition

865

Even so, there are certain other conditions which present enough similarity in the films to require the constant attention of the roentgenologist in interpreting the films for differential diagnosis Some of these are mycotic infections of the lungs, miliary tuberculosis, miliary pulmalignant metastascs from growths, etc. The differentiation of these conditions, especially in the border line cases, should never be attempted except with the highest possible quality of films Even with the most perfect technic, and suspiciously characteristic shadows, the final diagnosis of silicosis should not be made without the history of prolonged

No one will gainsay the importance of diagnosing these cases when they do occur The great and far reaching motive for discovering and locating silicosis must always be that of identifying the conditions which cause it, and eradicating them in the interests of human welfare IIow ever, on the other side of the picture, great harm can, and does, result from hasty, ill considered, and therefore unjustified, diagnoses of silicosis This can not be too strongly emphasized. In the last few years, since the medical and mdustrial worlds have been investigating these problems, hundreds, and perhaps even thousands, of workmen have been incorrectly branded as having "silicosis," or "industrial fibrosis" This has inflicted a grave injustice on both the workmen and their employers Every pospulmonary affliction which capable of altering the x-ray shadows, and many which are not, has been labeled "silicosis" by some uninformed or overzealous diagnostician Ordinary tuberculosis, bronchiectasis, unresolved pneumonias, chronic bronchitis, asthma, pure emphysema, chronic passive conges tion, and many other conditions have

been so misconstrued. Along with the real, bona fide cases of industrial fibrosis, the calendars of our civil and compensation courts are clogged with suits by claimants whose cause for action is based on a silicosis which does not exist. Careful and competent diagnosis would have saved this great burden on our social economic structure.

866

The Progress of Silicosis and the Prognosis

In a small number of exceptional cases of so-called "rapid silicosis" the pulmonary fibrosis may develop to the point of causing disability within a few months—eighteen to twenty-four. These occur only in those individuals who are exposed to the most extreme hazards, such as could exist only in the worst possible working conditions. Even then, the possibility of a coexisting infection must be most thoroughly kept in mind.

Ordinary silicosis, on the other hand, arising in ordinarily dusty working conditions, develops very slowly indeed. Its onset is very insidious, requiring several years—usually a minimum of from three to five before it becomes demonstrable by x-ray. Its progress is usually equally slow, requiring from several to many years more before symptoms begin to appear, if ever. Even then after the first symptoms become evident, several additional years may elapse before the victim becomes disabled. Thus it happens that in any large group of preclinical or asymptomatic silicotic individuals the vast majority will have died of other causes, such as unrelated intercurrent diseases, accidents, etc., long before disability can oc-Others will change occupation and thus automatically remove themselves from the hazard before enough fibrosis has developed to form, of itself, a menace to health and earning power. However, it is known that when a certain stage has been reached, the pulmonary fibrosis continues to progress and proceeds to the more advanced stages even though no further silica is inhaled. Unfortunately we do not know at present just when this self-progressive stage begins, whether it is the same for all individuals exposed to the same dust, and whether it varies for different forms of silica. We do know, however, that it does not occur until some time after parenchymatous nodules have appeared in large numbers.

On the whole these men tolerate a remarkably large amount of dust fibrosis without incapacity and even without symptoms. Also, there is very wide variation in the individuals concerned as to the amount of silicosis required to cause symptoms.

There is no conclusive evidence at present that silicosis, of itself, is fatal. A few of the cases which remain uncomplicated by pulmonary infections may ultimately die of cardiac decompensation, due presumably to the severe handicap placed on the circulatory system. However, these individuals are in the later decades of life, and degenerative myocardial changes may play a part in their demise. But by far the greatest single cause of death among such individuals is the complicating pulmonary infection, tuberculosis.

Complications

The mitigating influence of other substances associated with the silica in the dust itself has already been mentioned.

Theoretically the occurrence of this fibrosis in the lung, especially with its disturbance of the lymphatic drainage, would seem to render the silicotic individual especially susceptible to acute respiratory infections, such as pneumonia, and it would further seem that it should interfere with recovery and make for an unfavorable prognosis. Absolute proof of this, however, is lacking at present, although some studies tend to support the theory.

But, it is well-established that silicosis increases the predisposition to pulmonary tuberculosis, and the latter disease now constitutes the one important complica-If it were not for the additional menace of the complicating tuberculosis, silicosis itself would be an insignificant and almost negligible disease. combination has given rise to the term silico-tuberculosis. It is a well-established fact that the incidence of tuberculosis is much higher in a group of silicotic workmen than in a similar group of the same age distribution and of the same economic status. Among these silico-tuberculous persons there is the occasional case of extremely rapid and

fulminating type of "phthisis florida" in which the disease runs to its fatal termination within a few months, doubtful, however, if these acute cases occur in any higher percentage than that seen in uncomplicated tuberculosis. The very fact that these cases are so spectacular has led to their having been given disproportionate attention.

The usual course of the complicating tuberculosis is toward chronicity with a slow progression of the disease. very chronic course leads to delayed diagnosis, and may help to keep up the incidence of the disease by affording opportunity for one workman to infect his fellows by the constant sowing of bacilli on already fertile soil. A prompt diagnosis is complicated by the fact that the bacilli are frequently difficult to demonstrate in the sputum by direct smear and ordinary technic. Sometimes they are found only after repeated examinations of concentrated specimens or animal inoculations. The explanation for this fact that sputum, which is found negative upon examination, may be positive upon animal inoculation, is not yet clear. It is possible that the association of the bacilli with silica in the tissues alters their characteristic staining reaction in some way.

The ultimate prognosis of silicotuberculosis has formerly been considered very grave indeed. Indeed it is, if either, or both, of the conditions have progressed to a far advanced stage before the victim stops work. Evidence is accumulating, however, to show that in the earlier stages of silicosis, the tuberculosis may respond quite favorably to the ordinary treatment rendered uncomplicated tuberculosis. Hence, the obvious desirability of diagnosing both conditions as early as possible and instituting the proper treatment for the tuberculosis when it coexists.

Here again the x-ray is immeasurably The first sign of superimposed infection is that of the blending together of the nodular shadows into a localized blurry patch or patches when the individual nodules are not yet large enough to fuse by direct contiguity. This may or may not be associated, at first, with a blurring of the margins of the nodular shadows, which should be quite sharp and clear-cut in the noninfectious case. Intrapulmonary cavities, of course, speak for themselves. Any or all these changes in the lung shadows spell infection, and as such, demand the presumption that this infection is tuberculosis, unless proven otherwise by bacteriology.

Prevention

Silicosis is a preventable disease. Its complete eradication can be accomplished only by the cooperation of industrial engineering and medical research. When the time arrives that no workman is subjected to an injurious dust, in sufficient concentration, or for a sufficiently prolonged time, to cause this pulmonary change, silicosis will have ceased to be a reality. The generation following this millennium will know of it only as an interesting phase of industrial medical history. The progress made in the last few years has already shown that this millennium is not impossible to achieve, in fact it is not impracticable, and may even be accomplished in this country within the current generation. Industry, itself, is quick to see the economic importance of preserving the health of its employecs.

In the work toward prevention, engineering affords the direct means of reducing or eliminating the hazard. Improved systems of ventilation, dust exhaust systems which remove the particles from the scene of their production before they can get into the air to be inspired, dust traps which catch the particles, etc., all operate to keep the inspired air either dust-free or below the danger level. The efficacy of all these devices is subject to control by dust In those operations in which such ventilating, dust-catching, and dustremoving apparatus is impracticable, the individual workmen can receive adequate protection by wearing especially constructed respirators. If, for some most exceptional operation, the wearing of a respirator is impossible, no workman should be allowed to spend longer than the briefest term of employment at this particular job.

The medical side of prevention must take the form of determining which dusts, or combination of dusts, are injurious, and of warning both employer and

employee of this fact. The medical profession must be alert to discover silicosis and its allied conditions in the earliest possible stages, for such early recognition will enable the industry involved to eliminate its hazard before any real harm has been done.

Several of the more important industrial companies have seen the light and are making a great stride forward by a careful inventory of the situation in their own plants where men are employed in dusty trades. Such surveys, to be complete and of real value, include a determination of the hazard by dust counts that reveal the size and concentration of its particles, as well as chemical analysis; a determination of the toxicity of the specific dust by animal experiments; an estimation of the rate of pulmonary change in the lungs of workmen exposed, by physical examination and x-rays of all employees, including serial x-rays at regular intervals. The x-ray procedure will also give information as to the prevalence of tuberculosis, as well as give the employer a fair idea as to the probabilities of future disabilities, due to pulmonary fibroses among his employees.

Public Health Aspect

There is a definite public health aspect to this problem which falls directly into the practitioner's province, as well as the economic and sociological aspect. The economic phase is obvious in the loss to the employee of wages owing to his disability, and the loss to industry and state in compensation grants. The sociological phase lies chiefly in the problems that

arise in connection with, and center about, any unemployed, and unemployable, chronic invalid.

The public health aspect has to do not only with preventing the disability of the potentially silicotic workman himself, but with the possibility of his becoming a victim of tuberculosis and an unsuspected focus for the dissemination of that disease.

Role of the Practising Physician

From this very brief summary of the silicosis situation, it must be obvious to the practising physician that it is his problem too. Silicosis exists completely unsuspected in many localities. it is in many of the smaller centers, where there are no large industrial concerns, that it is most likely to go unsuspected and undetected. The private physician has an opportunity to forestall many a case of disability if he becomes alert in anticipating the presence of early pulmonary reactions in his workmen Frequently the family doctor patients. has much more influence in securing the necessary cooperation for x-rays, etc., than the company doctor whose motives might be suspected by an unintelligent employee.

Likewise, and equally important, the practitioner, with his levelheadedness, can do much to restrain the uncontrolled enthusiast from snap diagnoses, and prevent the grave injustice arising from such

misbranding.

Lastly, there is the public health phase—and the private physician is, after all, the principal guardian of the public health.

MEDICAL LIBRARY ASSOCIATION MEETING

The Thirty-eighth Annual Meeting of the Medical Library Association will be held in St. Paul, Minnesota, June 22 and 23, and in Rochester, Minnesota, June 24. Sessions will be held at the Ramsey County Medical Society, New Lowry Medical Arts Building, St. Paul, and at the Mayo Clinic, Rochester.

The program will include addresses, discussions, and demonstrations on library procedure, medical history, and literature.

This Association consists of about 175 of the medical libraries of this country and Canada, together with their librarians and

a group of supporting members who are physicians interested in the advancement of medical libraries.

The officers of the Association are as follows: President, Dr. W. W. Francis, Montreal; Vice-President, Dr. A. H. Sanford, Rochester, Minn.; Secretary, Miss Janet Doe, New York; Treasurer, Miss Mary Louise Marshall, New Orleans; Chairman of Executive Committee, Miss Mariorie J. Darrach, Detroit.

All interested in the development of medical libraries and a wider knowledge of medical literature are invited to attend.

PETROUS PYRAMID SUPPURATION Histopathology

JOSEPH G. DRUSS, M.D., New York City.

From the Otologic Service of Dr. Friesner and the Department of Laboratories of the Mount Singi Hospital

Within the past five years, a large number of publications dealing with suppuration of the petrous pyramid have appeared in the literature. Although many phases of this subject were considered, relatively few reports dealt with the histopathology of this condition. Between the years 1928-34 we have sectioned serially the temporal bones of twenty-four cases of suppuration of the petrous pyramid. Of these, twenty included sections up to the extreme tip of the apex. Certain data were obtained which we feel are of great value in establishing a clearer conception of the pathology and in forming the basis for a clearer understanding of the treatment of this condition. Limited time prevents a detailed discussion of all our findings. Only a few of the more significant ones will therefore be given at this time.

Suppuration in the petrous pyramid was found histologically in the routine examination of our material in a large number of cases who died of intracranial complications but who showed no evidence of such condition clinically. It may be present without any characteristic signs or symptoms referable to the petrosa. Also it must be borne in mind that in the early stages of an acute middle ear suppuration there is not only an associinvolvement of the pneumatic ated spaces of the mastoid, but also of those in the petrous pyramid. The inflammatory changes vary from a thickening and infiltration of the mucosa lining these cells to an extravasation of pus.

It is of importance to emphasize the fact that not in all cases of petrositis does the lesion extend to the apex, nor are the symptoms dependent upon such extension. In some cases the inflammatory changes are limited chiefly to the perilabyrinthine structures within the petrosa.

We have stated in previous communications^{1,2} that as a rule the greater the degree of pneumatization in the temporal bone the greater is the facility with which infection spreads through it. Bearing this in mind we have attempted to classify our twenty-four cases according to the degree of pneumatization in the three main structures of the temporal bonemastoid process, petrous pyramid, and apex. (Fig. 1.) Of the twenty-four cases of petrositis, the mastoid process was pneumatic in twelve (50%), mixed in nine (371/2%), and diploetic in three (121/2%). The petrous pyramid was pneumatic in four cases (162/3%), mixed in eighteen (75%), and diploetic in two (81/3%). Of the twenty cases in which the apex was sectioned, it was pneumatic in one (5%), mixed in six (30%), and diploetic in thirteen (65%). (Table I). The above figures indicate that pneumatization takes place more frequently in the mastoid than in the petrous pyramid and apex. Occasionally, however, pneumatization in the petrous pyramid is farther advanced than in the mastoid. In our own series of cases we found the presence of some pneumatic structure (i.e. the mixed type) more frequently in the petrosa than in the mastoid. This may be due to the fact that the

(U) Utrick. (V) Vestibule. The infectious process spread from the antrum along the superior posterior perilabyrinthine structures.

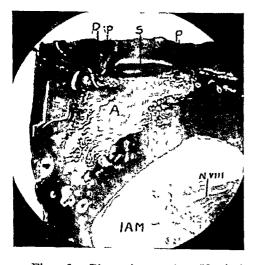

Fig. 3. Photomicrograph: Vertical section through the internal auditory meatus (same case as Figure 2 but section taken more medially) showing the extension of the lesion along the superior posterior margin of the petrosa. The pathologic changes are quite similar to those in Fig. 2. Note the sequestrum of cortex of middle fossa and multiple perforations. (A) Suppurative process. (D) Inflamed dura. (I.A.M) Internal auditory meatus (N) Eighth nerve. (P) Perforation. (S) Sequestrum.

process of pneumatization which is similar for both the petrosa and the mastoid may continue in the former after it has terminated in the latter.

We are cognizant of the fact that no final conclusions can be drawn from so small a series of cases. However, since the above tabulations were made from a histologic study in serial sections the findings are of definite significance. Here, the factor of personal interpretation plays a relatively small role and chances of error are diminished. The results of the various authors who have been interested in this phase of the subject were based mainly on observations made on the gross

temporal bone.

In the majority of cases, the infection spreads from the tympanum and antrum along the perilabyrinthine cells, viz: supralabyrinthine, post labyrinthine, anterior labyrinthine, that is, along the eustachian tube, and infralabyrinthine. Since these groups of cells communicate with each other, no sharp line of demarcation can be made between them. It must be borne in mind that as the infection spreads through the petrosa, the marrow spaces are also involved so that an osteitis in the strict sense of the term is not produced, but the picture is rather that of a combined osteitis and osteomylitis.

The exact pathway of infection can not always be determined even by histologic study since the perilabyrinthine groups

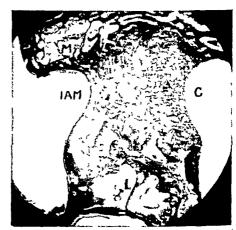

Fig. 4. Microphotograph: Vertical section through the apex (same case as last two figures) showing little or no inflammatory changes within. (C) Carotid canal. (I.A.M) Internal auditory meatus (inner lip). (M) Marrow spaces.

of cells have no definite lines of demarcation and the infection may extend along more than one pathway Where more than one route was involved, we decided upon the one which showed the most marked inflammatory changes

In nuncteen of the twenty four cases the infection spread from the tympanum and antrum along the superior and posperilaby rintline structures terior fourteen of the twenty-four cases this route of extension was the predominint one The infralaby finthing route was predominant in two cases. In one case the fossa subarcuata was the main route. In three cases the extension took place along the peritubal cells (anterior labyrinthine) In two cases the infection extended along the carotid canal. In two cases the route could not be determined with accuracy (Table II) From the above figures it appears that the superior posterior route is the most frequent. Also the lesion was the most manifest at the superior posterior margin of the petrosa, between the superior semicircular canal and internal auditory mentus (Figs 2 and 3) The suppurative process in the petrous pyramid frequently extends to the apex but here the pathologic changes are usually not so marked as in the lateral por-Thus in the twenty apices sectioned the findings were relatively normal in five (Fig 4), there were slight changes

TABLE I -PAGUMATIZATION OF TEMPORAL BONF Pneumatic
Mastoid 12 (50%)
Petrous Pyramid 4 (16%)

TABLE II - PATHWAYS OF INFECTION Supralabyrinthine Route I redominant in 14 Cases Infralabyrinthine Route Predominant in 2 Cases Fossa Subarcusta Route I redominant in 1 Cases Anterior Labyrinthine Route Predominant in 3 Cases (Pertitual) Along the Carottd Canal in 2 Cases Undetermined in 2 Cases

in four, and in only three was the inflammatory process of greater severity in the apex than in the remainder of the petrosa These findings bear out our contention that the lesion need not always extend into the apex nor are symptoms dependent upon this circumstance. The suppurative process frequently breaks through the cortex along the middle or posterior fossa at a considerable distance from the anex produces an extradural abscess (See Figs 2 and 3) In eleven of the twenty-four cases studied there was evidence of an extradural abscess varying in size from a small microscopic lesion to a frank extradural accumulation of pus The dura of the middle fossa was chiefly involved in seven cases, that of the posterior fossa in four cases. Multiple perforation of the cortex of the middle or posterior fossa or both were also noted

Summary and Conclusions

1 Suppuration of the petrous pyramid may be present in the absence of physical signs or symptoms

2 In the majority of cases of suppuration of the petrous pyramid (19 of 24) the infection spread from the tympanum and antrum along the superior posterior perilabyrintline structures. It was the predominant pathway in fourteen of the twenty-four cases

3 Not all lesions in the petrous pyramid extend into the anex

4 In the majority of our cases, the greatest expression of the disease process was most manifest in the petrous pyramid between the superior semicircular canal and the internal auditory meatus

Discussion

12 342 1930 Druss ĬG

DR HARRY ROSENWASSER, New York City-Suppuration of the petrous pyramid is as a rule associated with a well defined nevertheless, symptomatology, but clinical and pathologic material definitely indicates that there are no signs and symp toms that are invariably pathognomonic of this condition. The literature as well as our own clinical experience, indicates that suppuration in the petrous pyramid has a marked tendency to drain and heal spontaneously We have observed many instances of petrositis presenting pain in or about the cye profuse otorrhea involvement of the sixth nerve, fever, and corroborative roent genographic findings which recovered following invringotomy or simple mastoidec tomy

The material presented by Dr Druss is of great significance not only from the histopathologic standpoint, but also because the knowledge gained has been translated directly into terms of effective therapy. The material demonstrates among other things that: (1) The posterior superior portion of the petrous pyramid is the site of maximal involvement in a large percentage of the cases: (2) There is a marked tendency for spontaneous healing to occur, which is at times concomitant with extension of infection into the depths of the pyramid: (3) That the lateral portion of the pyramid is frequently involved more extensively than the apex.

Time does not permit discussion of the many practical applications of these facts, therefore we wish to emphasize but one fact, namely, that the surgical treatment of petrositis should be directed towards drainage of those areas which the pathologic material indicates are most frequently and extensively involved. The two following cases illustrate how our method of treating petrosal suppuration has changed in recent

years.

CASE I. R. W., male, aged six, was admitted to the service of Dr. I. Friesner complaining of repeated colds, intermittent pain in the left ear, headaches, and a temperature which varied between 100-102° F. for three weeks. On admission, with temperature of 105.6° F., the patient vomited three times and complained of

very severe pain in the left cye.

The right ear was normal. The left ear drum was full, no landmarks were visible, and there was a pulsating discharge issuing from an anteroinferior perforation. There was no canal wall change and the mastoid was tender. There was a rigid neck, a positive Kernig sign, and a positive Brudzinski. The deep reflexes were hyperactive. Lumbar puncture was performed, the spinal fluid being under increased pressure and containing 2500 cells with ninety-six per cent polymorphonuclears. No organisms were

seen on smear.

A diagnosis of otitic meningitis was made, and the patient was immediately operated upon. Complete simple mastoidectomy was performed. Thruout the mastoid, small scattered abscesses were noted, especially under the cortex and in the initial groove. The middle fossa and sinus plate were purposefully removed in order to inspect the dura and lateral sinus. These structures appeared normal. With a brain retractor we attempted to elevate the dura from the floor of the middle fossa but because the posterior buttress had not been removed, the exploration was unsatisfactory.

The neck rigidity and the Kernig sign became more marked. There were 3000 cells with seventy per cent polymorphonuclears in the spinal fluid. Three days later the neurological examination was negative. One week after operation all reports of bacteriologic cultures of the spinal fluid, taken following the operation, were negative. The patient did well for two weeks, was seemingly on the road to recovery when, suddenly on the twenty-first postoperative day, he vomited, his temperature rose to 104° F. and

he developed drowsiness, a rigid neck, and bilateral Kernig signs. Spinal puncture revealed cloudy fluid, under markedly increased pressure with 4600 cells; ninety-nine per cent polymorphonuclears and organisms were noted on smear. The patient lapsed into coma and died twenty-three days after his original operation of a streptococcus hemolyticus meningitis.

Histologic examination of the petrous pyramid revealed extensive suppuration with the most manifest disease in the posterior portion of the pyramid, and with an extradural abscess of the middle fossa, and a terminal bacterial meningitis.

Comment: If we had this case to treat now, in the light of our present understanding, our method of treatment would be different. We would explore the mastoid exenterating all cellular structure, searching everywhere for leads, particularly in the solid angle where according to our histologic material, infections very frequently spread into the pyramid. Not finding any evidence of an extradural abscess or perisinus abscess, or badly diseased mastoid, we now believe it is not enough to stop at this point as we did in this case four years ago. We would proceed with an extensive decompression operation, which we have adopted and which, but for few minor modifications, is similar to that described by Eagleton. This procedure allows for adequate exploration of the middle and posterior fossa, at the same time conserving the middle ear. We have not found it necessary to perform radical mastoidectomy in our acute cases.

Case II. E. B., female, aged six, was admitted to the service of Dr. I. Friesner with a four week history of bilateral acute suppurative otitis media following an infection which simulated scarlet fever. The left car stopped discharging at the end of two weeks, but the right ear was still discharging on admission. Five days prior to admission (the 23rd day of the otitis) the patient complained of severe frontal headache and diplopia. Two days later she vomited twice. On admission, with a temperature of 99° F., she vomited again, and held her hand over the right eye because of the intense pain and headache.

The left ear was normal. The right drum was full, no landmarks were visible, and there was a herniation of the superior portion of the drum. There was no canal wall change. There was moderate tenderness over the mastoid antrum. The patient could hear a soft whisper. There was a complete right sixth nerve paralysis, bilateral ankle clonus while the remainder of the neurological examination was negative.

Immediate exploration was decided upon and was carried out by my colleague, Dr. Rosen, who first did a complete simple mastoidectomy. Pus was found immediately on removing the cortex. The mastoid proper, which was pneumatic, was the site of moderate destruction and softening. In the routine manner, following all

leads no matter how minute, to the limit, a small granuloma was noted just in front of the superior semicircular canal. This was curetted and pus issuing from the depths of the pyramid medial to the granuloma could be seen. The dura was lifted up after performing an extensive temporal decompression, and a large extradural abscess with a defect in the bone of the superior surface of the petrous pyramid was exposed, curetted, and drained. A large piece of rubber dam was placed between the dura and the bone focus.

The patient's headache and pain in the eye which had been excruciating, disappeared after operation. She was alert and took food readily. Eight days after operation the sixth nerve paralysis had disappeared entirely. On the forty-seventh postoperative day, the drains were removed and the child was discharged well.

Comment: This case illustrates our present method of treating suppuration in the petrous pyramid especially when the process no longer is confined to the pyramid proper.

Conclusion

In the treatment of suppuration of the petrous pyramid with signs of a sympathetic meningitis, our clinical experience and our histopathologic studies indicate that the decompression type of operation is the one of choice and should be carried out, provided, in the opinion of the operator, there is not sufficient disease present during the performance of the complete simple mastoidectomy to account for the clinical picture. An epidural abscess over the mastoid tegmen, a perisinus abscess, a very extensively diseased mastoid or an undrained small epidural abscess in the root of the zygoma as reported by Schambaugh, are some of the findings which we consider adequate to explain the clinical picture. Obviously in the final analysis, the judgment of the operator is most important.

IT'S BEEN JUST GREAT FOR DAFOE

Dr. Allan Roy Dafoe admits that he has "learned a great deal regarding infant care" while attending the Dionne quintuplets—two years old on May 28. Regiments of volunteer advisers have kindly deluged him with instructions on what to do at every turn. In a paper read before the Ontario Medical Association and printed in the Canadian Medical Association Journal he gives us a delicious account of it.

His education, he says, has been augmented through the medium of an international correspondence course in Medicine, Pædiatrics, Bacteriology, and Therapeutics! My preceptors in this course have been varied, and included Christian Science followers, astrologers, chiropractors, veterinary surgeons, nurses, fathers, mothers, and maiden ladies. Many superstitious beliefs and ancient ideas regarding medicine and disease were passed along to me for my help.

Letters containing advice and offers of help were received from Great Britain, India, Germany, France, Central America, Mexico, Australia, Philippine Islands, and from all over North America. I am quite sure that every milk preparation either "in" or "off" the market was mentioned in some of the letters. Goats and prize cows were offered to provide the necessary milk for the babies, and wet nurses made application for dairy appointments.

It was suggested that a healthy lactating

Yorkshire sow would solve our feeding problems. Her milk could either be obtained by pumping, or else preparing a place in the house whereby the babies could be directly suckled. It was intimated that the sow could be trained to adapt herself to this maternal duty. The reported onset of intestinal toxenia produced an avalanche of letters, all of which contained suggested measures of treatment. Waternelon juice, infusions of blackberry root, horsetail plant, sassafras, and knot weed were said to have produced spectacular results in similar cases.

Whiskey was a common ingredient of many suggested remedics, and was to be used both internally and externally. The use of spirits, however, produced several letters of criticism for starting the children at such a tender age on a downward path. Sheep's dung tea, sweetened and warmed, was offered as a cure for "The Blue Spells." Placental blood in warm water was another secret imparted to me, for use in saving the babies.

Of course, the usual letters containing messages from the stars, dreams of kidnapping, and warnings against poisoned food were plentiful. A beauty specialist, in her own words, "a rather noted one," advised the use of her marvellous cream to remove the wrinkles from the premature babies.

County medical societies are strongly advised by their state journal in Indiana to begin purging the state legislature of enemies in the primaries. "Lick 'em in the Primaries," is the crisp title of its editorial.

"We doctors," observes the editor, "do a lot of talking about what legislators do after they once get into operation in the legislatures. The time to clean house is in the primaries, not in the annual elections."

TREATMENT OF VINCENT'S ANGINA WITH ACETARSONE

CYRUS H. MAXWELL, JR., M.S., M.D., Auburn

Introduction

The widespread belief that the spirochete and fusiform bacillus of Plaut-Vincent are etiologically related to certain types of stomatitis and angina has led to the use of arsenicals in their treatment.

In this condition, Rechford and Baker¹ (1920) reported that the local application of ten per cent arsphenamine in glycerin was superior to any of the following: tincture of iodine, two per cent chromic acid, colloidal silver, flavine, powdered methylene blue; and a mixture of wine of ipecac ½ ounce, glycerin one ounce, and Fowler's solution one ounce.

Morgan² (1923) wrote of the use of intravenous neoarsphenamine. Treatment with Bowman's solution (solution potassium arsenite, twelve c.c.; wine of ipecac, twelve c.c.; glycerin, eight c.c.) was found to give only temporary relief. To eight cases, neoarsphenamine was given intravenously and Bowman's solution applied locally several times a day. The improvement was marked in two to four days; and the patient regarded as cured in 53/4 days. Seventeen cases were treated with neoarsphenamine only. Two of the cases were given two injections each and the remainder only one. Improvement was marked in $2\frac{1}{2}$ days in the average case, and cure was effected in 53% days. No recurrences were reported.

Barenburg and Bloomberg³ (1924) reported the treatment with intramuscular sulpharsphenamine of forty-two cases of Vincent's angina and stomatitis in children. Twenty-seven cases of stomatitis were treated with one to three doses of 0.1 or 0.2 gm. intramuscularly. Some received, in addition, local treatment with sulpharsphenamine. The cases receiving only the intramuscular treatments healed in seven days, while those receiving local treatment, in addition, were healed in five days.

Fifteen cases of angina were treated with one or two similar injections of this drug; seven of them received, in addition, local applications three times a day with sulpharsphenamine, and recovered in four days, as compared to 6½

days for the eight who received only injections. A high-vitamin diet was used as well.

Harris⁴ (1932) reported the use of sulpharsphenamine in an epidemic of Vincent's angina. Four hundred cases were treated by three weekly intravenous injections of 0.1 to 0.6 gm., depending on age. Generally the patients were improved within twenty-four hours and clinically cured within forty-eight hours. There were relapses unless three doses were given. In a few cases sulpharsphenamine in glycerin also was used locally. He reported one death in a thirty-eight year-old married woman.

In 1933 Harris reported⁵ three cases of arsenical dermatitis, one case of shock and collapse, and one nitritoid crisis from the use of sulpharsphenamine in Vincent's angina. He recommended that sodium thiosulphate be available for the treatment of these reactions.

In 1921 a purified form of acetarsone⁶ was introduced for the treatment of spirochetal infections. Couvy⁷ (1924) enthusiastically reported the favorable treatment of fifteen cases of angina and ulceromembranous stomatitis associated with fuso-spirochetal infections. drug was applied locally; a tablet of 0.25 gm. was triturated with a few cubic centimeters of water, or better, glycerin and applied to the previously cleaned lesion, three or four times daily. As an accessory measure, the mouth was washed with a dilute solution of acetarsone (.25 gm. to 100 gm. of water) or hydrogen peroxide one-third strength. stated:

The patient perceives almost immediate relief, the improvement is already manifest in twelve hours. At the end of twenty-four hours the lesions have lost their sanious appearance, the exudates have disappeared, and the breath is no longer fetid. The microscopical examination of the smear, taken at this time, showed nothing more than very rare spirochetes and fusiform bacilli. The cure is obtained most often in forty-eight hours. Never in the observed cases did the treatment have to be prolonged beyond three days.

Hutter⁸ (1927) reported the treatment of nine cases of Vincent's angina with acetarsone. The dose varied from 2 tablets (0.5 gm.) in one case in one day, to seventeen tablets (4.25 gm.) in 11 days in another case. In one case, he used four tablets locally, and three tablets by mouth in one day—a total dosage of 1.75 gm. He recommended a paste of acetarsone locally along with the internal medication. An "indifferent" mouthwash was used in addition. The spirochetes disappeared in twenty-four to forty-eight hours. One case of diarrhea was the only complication reported. Hutter reported a case that had persisted two weeks and then cleared quickly with acetarsone. In conclusion, he wrote:

We have in acetarsone a means which makes possible simple and very effective control of Vincent's angina, and opens up the possibility of a very therapeutic adjuvant in cases of diseases of the buccal cavity due to other spirochetal infections.

Rosenbaum (1931) reported[®] the treatment of eight cases of this disease with acetarsone. The ages were from seventeen months to eight years, and the dose of acetarsone was ½ tablet (0.0625 gm.) daily. The temperature fell to normal in twenty-four hours and there was relief from pain within twenty-four hours, when food was eagerly taken. The spirochetes decreased rapidly in all cases and disappeared in some. The fusiform bacilli persisted. In his discussion, he recommended that:

Local treatment, if given, should be most careful, as if not carefully done, it can do more harm than good. Moreover, it does not appear necessary. It would seem, however, that where possible, bland and cleansing mouth washes, as diluted hydrogen peroxide, sodium perhorate solution, and so on, might well be used.

He treated no adults but suggested that it might be successfully used in doses of 1½ tablets (0.37 gm.) daily.

Report of Cases

Our interest in the use of acetarsone in the treatment of Vincent's infection originated in a review of the literature concerning the use of the drug in congenital syphilis. The failure of two cases treated by arsphenamine locally to improve satisfactorily caused us to search

for a more effective drug. The high incidence of Vincent's infection in this locality afforded a further stimulus to our investigation.

All cases included in this series were clinically and bacteriologically Vincent's infection of the tonsils, gums, or pharynx. There was a definite membrane, marked inflammation, or edema with bleeding on slight pressure. Unless spiral and fusiform bacilli were abundant in smears, the case was not included in our study.

Fifteen cases were treated with ten per cent arsphenamine in glycerin applied locally once daily. A mouth wash and gargle every three hours with sodium perborate was employed. Thirteen cases responded quite satisfactorily with clinical improvement in forty-eight to seventy-two hours. However, two cases became progressively worse during treatment. One was a nine-year-old boy with severe infection of the gums, showing marked inflammation with edema, and bleeding upon the slightest pressure. The mouth could only be opened sufficiently to admit a glass tube for feeding.

The marked cervical adenitis suggested the "bull neck" of diphtheria. The temperature varied from 102° to 103° F, for a week. Improvement started at this time, the temperature fell gradually to normal, and the gums gradually returned to normal. There was no recurrence.

The second child, also nine years old, developed a heavy membrane on both tonsils, the fauces became purple; his condition was considered critical; the temperature remained at 104° F. for two days, and then fell gradually to normal over a period of four days. He was very toxic and drowsy for a week after the onset. Improvement was steady but slow, and there was no recurrence. Both of these cases received treatment from the onset, but became worse before improvement occurred.

A group of twenty-eight cases was treated with arsphenamine and glycerin, and sodium perborate as above, but, in addition, received acetarsone by mouth in the dosage shown in the accompanying table. The doses may seem large and may not be justified since previous experience has shown the drug is without its dangers.¹⁰ However, smaller doses used at the start did not give as rapid

results. The disease in its acute form may be very distressing and requires immediate attention. Hence, we have used large doses as above for three days; have given a rest period of three days to allow for elimination of the drug, and have then repeated the three-day treatment as above.

In all these cases the temperature, if elevated, returned to normal within thirty-six hours, and generally within twenty-four hours. There was symptomatic improvement in a like period of time and a gradual steady change to normal in the appearance of the gums and fauces, the patient being able to eat without difficulty in four or five days after treatment was instituted.

A third group of thirty-six cases was treated with acetarsone and sodium perborate as above, but instead of arsphenamine locally, one of the following was used: Weak sodium bicarbonate solution; two per cent mercurochrome solution; or tincture of metaphen, one part, with glycerin three parts. Apparently the withdrawal of arsphenamine did not lessen the effectiveness of the treatment excepting in one case with slight infection of the gums-apparently a chronic case with caries of the teeth. As these are difficult to treat by any method, the case was soon referred to a dentist who pulled one tooth, cleaned the tartar from the teeth, and reported that the girl was improved but that the smear was positive at the time of discharge.

Two case reports from the same family seem suggestive.

A boy, eleven years old, became ill with sore throat, malaise, listlessness, fever, anorexia of five days' duration, with all symptoms becoming gradually more severe. Examination showed a well-developed acutely ill boy with a temperature of 104° F. by mouth. The pharynx and tonsils were inflamed and a white membrane covered about half the exposed area of the tonsils. The gums were swollen, red,

First Day	Second and Third Days
0.125 gm. 4	0.25 gm. 3
0.125 gm. 3	0.125 gm, 4
0.0625 gm. 3	0.125 gm. 3 times a day
0.0625 gm	0.0625 gm. 3 times a day
	0.125 gm. 4 times a day 0.125 gm. 3 times a day 0.0625 gm. 3 times a day

and bled on slight pressure. Smears at this time showed fusiform bacilli but no spirilli. Antipyretics were given by mouth, the gums were painted daily with tincture of metaphen, one part, and glycerin, three parts, and the patient gargled hourly with a hot solution of sodium bicarbonate, one dram, and sodium chloride, one dram to a pint of water. The temperature fell to between 102° and 103° F., but the gums pharynx remained unchanged, and eating was so painful that only liquids could be taken. On the fifth day after the patient was first seen, a three-year-old sister also developed a similar "sore throat." The temperature in each case was 102° F. and the above mentioned mercurial was again Smears for each patient at this time showed fusiform bacilli and spirochetes in abundance.

The following day all previous medication was discontinued, and application and ingestion of acetarsone according to the routine dosage was instituted. At this time, the gingivae in both cases were edematous, red, and bled on the slightest pressure, and all foods but liquids were refused. Temperature was 102° F. by mouth in the boy, and 102.5° F. rectally in the girl. In twenty-four hours the temperature was normal in each case. The gums and fauces showed marked improvement and the patients were able to enjoy soft foods. Two days later the gingivae were almost normal in appearance and smears showed only occasional fusiform bacilli.

A final group was treated with acetarsone only. Ten cases used the doses outlined above, using a paste of the drug. In the smaller children this was applied with a cotton swab to the lesions and the patients encouraged to swallow all the drug. The older patients rubbed the paste gently into the gums with their fingers, and in this group the most dramatic results were obtained. In twentyfour hours most of them could eat without difficulty. The treatment was as effective as when other drugs were used in addition. At times the improvement was remarkably fast.

One case history is typical:

A seven-year-old boy compained of "sore mouth" of two days' duration. The temperature was 103° F. by mouth, and the gingivae swollen, inflamed, edematous, and bled freely on the slightest pressure. There was white exudate around some of the teeth. The gums were so tender that all but liquid foods were refused. A paste was made of acetarsone and gently mas-

saged into the gums by the boy with his finger as an applicator, with the crution that he should not use enough pressure to One hundred twenty-five hurt himself milligrams three times the first day and four times a day for the next two days were ordered. The mother was told to expect some improvement in twenty-four hours, and definite results in two or three days Her comment the next day was, "When you told me that he would be better today, I could not conceive of his being as well as he is now" There was marked clinical improvement, and he was then taking soft foods eagerly and without pain Two days later, he was discharged with gums almost normal in appearance and fusiform bacilly only in the smear Several weeks later, when he was seen for another reason, the gums were normal and a smear showed neither spirochetes nor fusiform

In three cases treated by other physicians, the treatment has not been considered satisfactory. In one patient the smaller dose of acetarsone advised by Rosenbaum was used, and when improvement did not occur quickly, sulpharsphenamine was resorted to Another patient took a large enough dose of acetarsone by mouth but it was not applied locally. Since there was a delayed response and since the patient was seriously ill, large doses of sulpharsphenamine were given mtravenously. The angina improved, but the patient developed severe arsenical derimatitis.

A third case was a housewife, thirty years old with chronic gingivitis around all her front teeth, particularly about a peg tooth with an enamel cap White exudate could be expressed from around the gums on moderate pressure Seven months before treatment with acctarsone, she had been treated with wine of specie and Fowler's solution for six weeks. Then she was given two doses of 0.45 gm of neoarsphena-Improvement was transient, and because of severe generalized reaction to the intravenous medication, local applications were resumed with the Fowler's solution and wine of ipecac Peroxide of hydrogen was used locally three times a day and Merril's "Detoxol" toothpaste was used The condition remained stationary, so acetarsone locally and internally was started with definite improvement in three days, yet the result was not entirely satisfacory, and she was referred to a dentist for further treatment

The only toxic symptom encountered was mild indefinite abdominal pain in two cases. The acetarsone was promptly discontinued, and on resuming treatment, liter, this symptom did not recur. Urine Communations carried out in many of the cases, revealed no abnormalities.

Discussion

The relation of the spirochete to the fusiform bacillus is not settled Tunnicliff,11 in studying the colonies of the bacterium fusiforms, found the bacillary forms in the smooth colonies, and the spiral organisms associated with the fusiform bacilli in the rough colonies. She thought the spiral organism might be a dissociant of the fusiform bacillus Varney 12 found the spiral-like forms began to disappear in cultures older than seventy two hours, leaving straight or slightly curved pointed bacilli Rosenbaum reported that the spiral forms disappeared first on treatment author's experience has been that in the early stages of the disease only the fusiform bacillus is found Later, both the fusiform and spiral forms are found, and as the patient improves, the spiral forms first disappear from the smears severe cases of stomatitis giving a clinical nicture of Vincent's infection, is one justified in omitting vigorous treatment until bacteriological evidence is obtained?

The significance of fusiform bacilli and spirochetes found in smears from stomatitis and angina is open to question Lictenberg, Werner, and Lucch¹⁸ presented material which they interpreted to mean that these organisms are not pathogenic D T Simth¹⁴ ably answered them and Bayne-Jones and Zinsser, in their recent textbook,¹⁸ agreed with

Many cases of Vincent's infection clear up with little or no treatment. The author has observed that several mild cases did well without arsenicals, but, nevertheless, has considered arsenic in some form to be indicated in severe cases.

The use of acetarsone in amebic infections suggests that in Vincent's infection superimposed upon pyorrhea, in which Entameba bucallis predominates, acetarsone might be more efficacious than other arsenicals

Since acetarsone is the most effective arsenical given by mouth in syphilis, local applications of the drug in spirochetal infections would seem to be more effective than the other arsenicals used similarly. The ingestion of the drug should add to its effectiveness because this would reach the deep seated infection. injection method of treatment with arsenicals is objectionable particularly in children. Sulpharsphenamine gives more frequent reactions than any other of the arsphenamine group, and in our experience has also given more frequent and more severe reactions than acetarsone. Sulpharsphenamine has been shown to have its greatest parasiticidal effect in three to four days.17 Glaser18 and Rosenbaum⁹ reported a delayed period in response to acetarsone, using smaller doses than we did. This interval has not been so noticeable in our cases. Should we no longer fear reactions to this drug and use it as vigorously as Hutter and Couvy recommended, we might further shorten this interval.

Local treatment with strong oxidizing or cauterizing agents is contraindicated as it breaks down nature's lines of resistance.19 Cleansing mouth washes and solutions of sodium perborate or hydrogen peroxide are helpful and indicated since one is dealing with anaerobic bacteria. Since they are also spirochetcidal, the mercury derivitaves, metaphen, merthiolate, mercurochrome applied and locally might be expected to be helpful. If all these fail, the intravenous injection of five c.c. of one per cent aqueous solution, antimony, and potassium tartrate is said to be specific in cases not yielding to arsenicals.20 Large amounts of orange

juice should be given to correct the possible condition of relative vitamin C deficiency.14

In general, cases of gingivitis should be referred to a dentist after the acute state is past.21 The teeth should be cleaned and all cavities filled and occasionally carious teeth extracted since these harbor foci for reinfection.

Summary

- 1. Fifteen cases of Vincent's infection of gums or fauces were treated with ten per cent arsphenamine in glycerin, locally, plus a mouthwash and gargle of sodium perborate. Results were satisfactory in all but two cases.
- 2. Twenty-eight cases received acetarsone by mouth, in addition. All made recoveries distinctly more rapidly than when acetarsone was not used.
- 3. Thirty-six cases were treated with acetarsone by mouth usually employing murcurial solution locally in addition to a sodium perborate mouthwash. Recovery was as rapid as in the above group.

4. Ten cases were treated only with acetarsone by ingestion and as a paste gently massaged into the affected part. All improved rapidly. The most rapid recoveries were in this group.

One chronic case of gingivitis previously unsuccessfully treated with neoarsphenamine intravenously improved but was not cured with acetarsone.

Conclusion

Acetarsone is a satisfactory arsenical for the treatment of Vincent's angina and stomatitis. Concurrent local application and ingestion of the drug are 6 WILLIAM STREET suggested.

Case Report

TORSION OF HYDROSALPINX

RICHARD A. LEONARDO, M.D., Rochester

A twisted ovarian cyst is common enough, but torsion of the pedicle of a hydrosalpinx is a surgical curiosity, Eastman' carefully reviewed the literature in 1927 and his summary indicates that only ninety-one cases have been reported, most of them occurring on the right side. Some seven additional cases have since been The condition is of sufficient reported. rarity, therefore, to warrant reporting my own case.

The torsion may involve either left-sided or right-sided hydrosalpinx; and, theoretically, it should be counter-clockwise in all right-sided cases and clockwise in all leftsided cases, because of the action of increased intra-abdominal pressure which has the tendency to twist and turn the hydrosalpinx by forcing it downward and inward, towards the median line, along the brim of the true pelvis. In my case, which occurred on the right side, the torsion was counter-

clockwise, 1½ turns, as one would expect.

Mrs. L. F., age twenty-nine, with a previous record of sound health and one child six months old, on April 18, 1935, had a sudden attack of nausea and vomiting without pain which lasted one hour. On April 20, she had a second attack of nausea and vomiting, this time with pain, which lasted only one-half hour. Three hours

later pain recurred in the right lower quadrant. It was steady and persistent without nausea or vomiting. The pain centered about McBurney's point (where there was tenderness) and radiated down the right thigh almost to the knee.

Examination showed not only pain and tenderness over McBurney's point but also a mass in Douglas' culdesac which was somewhat tender and was thought to be a

retroverted uterus.

She was admitted to hospital on April 23 with a preoperative diagnosis of subacute appendicitis and retroverted uterus. At operation through a midline incision, it was found that what was supposedly a large boggy, retroverted uterus was in fact a gangrenous hydrosalpinx on the right side with torsion of the pedicle, counter-clockwise, 11/2 turns.

The distended tube was jet black and contained sero-sanguineous fluid. The ovary was normal; the uterus, anteverted, was normal in size and appearance.

The postoperative course was uneventful, with prompt relief of symptoms and complete recovery, excellent in every way, 277 ALEXANDER ST.

BETWEEN MENTAL HEALTH AND MENTAL DISEASE

B. LIBER, M.D., DR.P.H., New York City

Editorial Note: Under this title will appear short summaries of "transition cases" from the service of this author in the New York Polyclinic Medical School and Hospital. The descriptions are not complete clinical studies, but will accentuate situations from the point of view of individual mental hygiene such as crop up in the every day practice of medicine

Dark Clouds

A tall young man of twenty-eight sits down in the doctor's office. His correctly featured face is serious and appears indifferent. It is as if tarnished, as if the luster from a shiny surface had faded or had been removed. The eyes are open and show some sleepy intelligence. They are show some sleepy intelligence. They are directed toward the doctor, but they lack brilliancy and interest. The lips are closed as if determined not to speak, their ends slightly drawn downward. The entire body is motionless and passive, with no tendency to bend toward his interlocutor. It seems to be unconsiously satisfied to stay put. There is no sign of eagerness.

This patient has a wife and a small child

and she is pregnant again.

One learns about the trouble from an informant.

Patient has been working as a mechanical engineer for the last ten years. not acquired his knowledge in school. He was wide awake, attentive, studious and unafraid of work. In the last three years he holds a high and responsible position. He came into a small shop with two or three employees and through skill and devotion he has worked it up into a place where fifty men are busy. One of them, brought into the shop by our client, is a graduate from a college of technology and now almost as high-priced as this patient. The latter's work now is confined to managerial duties, buying and other similar things. His job is in the office and he is losing more and more contact with the actual mechanical work. He feels, therefore, that in a pinch he can be replaced as unnecessary and useless. But the owner of the firm still stands in admiration before this young miraculous fellow who has raised his shop to such a high degree and

880

employer seems to make it clear.

Patient earns a good living and spends his money for his comfort and that of his family, without saving a penny.

has helped him, incidentally, to make a for-

tune. There is no question of dispensing with the services of this manager: the

Lately, patient is reluctant to go to work. When he gets up in the morning he is tired and shivers at the thought of leaving the house. In the working place he accomplishes little. He is doing his routine duties, but there is no progress. He creates no new problems and is uninterested in those that come up. He feels inferior to the chief engineer whom he himself appointed and who is able to untangle difficulties by mathematical methods which our patient does not understand.

There is, of course, a growing fear of losing the position—a fear, which, after examination, is easily explained by an actual desire to get rid of the job. Indeed, questioning reveals the fact that he would like to get into some other work, but cannot tell which—probably because the real answer, unknown to himself, should be: none,

There are no conflicts with the wife or with any member of the family. Marital relations are fine from all points of view. Family history seems to be negative for mental disturbances. Patient's past as a whole fails to explain his present mental state, which is akin to a depressed type of a "manic-depressive" psychosis. It is true that it has happened to him before to be "morose," but never to any appreciable extent, we are told. The impression prevails, however, that he is and has always been a melancholy person and that now his

condition is a great exacerbation of his usual state.

Some members of his family came to urge the doctor to "scold" him so that he make an effort to "extricate himself from his silly behavior." They had to be told how futile or harmful both the scolding and the effort might be. They had to be shown how much harm they could do particularly by "scolding" him.

His illness consists of a mental complex which makes him feel inferior and guilty and induces him to blame himself. It would, therefore, be utter folly to add fuel to the fire. He himself can hardly be expected—at least within a reasonable length of time—to get out of his difficult position. One might as well demand that a patient with fever remove his febrile state by sheer will-power! The symptoms which to a lay person or to an inexperienced physician may seem so easy to shake off are the very symptoms which constitute the patient's illness, and for which he seeks advice!

The social aspect of this young man's problem consists of his insecurity in case he lose his job and his fear of his lack of protection. Also the impossibility of getting any help for an extended vacation, his relatives being able to provide for a short rest from work only.

The physician begins by conversing with him a few times. Then patient is sent away for a month to one of his relations whom he likes and who provides him with a sufficient amount of physical work that is entirely different in nature from his usual occupation.

Later, after his return, he still finds his job open and his employer willing and eager to accept him. He has improved, but after a few months he falls back into his previous condition.

New sessions with the proper conversations and a change of work within the same plant finally effected a cure; that is a good adjustment and non-recurrence of the trouble for the last two years.

611 W. 158 St.

Public health authorities, meeting at the annual conference of the Milbank Memorial Fund at the New York Academy of Medicine on March 27, were told that 25,000 to 30,000 lives might be saved annually in the country if inexpensive or free pneumonia serum were generally and quickly available.

Dr. Russell L. Cecil, chairman of the subcommittee on pneumonia of the Medical Society of New York State, told of the progress in the use of pneumonia serum in a paper summarized before the full conference. The possible saving in life, he explained, could not be accomplished for some time because of the expense of the serum and the difficulty of typing the cases quickly enough, especially in country districts.

The treatment is most effective in Type 1 pneumonia, in which the serum can effect a two-thirds reduction in the death rate, he said, but there are also "promising" serums in Types 2, 5, 7 and 8. The Neufeld method of typing makes it possible to discover the type of the case in two or three hours, Dr. Cecil declared.

EDITORIALS

The Medical Credo

The tragic circumstances surrounding the inauguration in absentia of President J. Tate Mason threw a pall of sorrow over the otherwise brilliant meeting of the American Medical Association. In such solemn moments fundamental beliefs, emerge clear-cut from the mists of controversy and transitory opinion. It was therefore as a binding reaffirmation of faith that the assembled physicians received the message brought from Dr. Mason by Dr. Brien T. King.

"To the public he asked me to say (knowing full well that this would probably be his last message to you) that the medical profession stands ready now to serve you, rich or poor, as it has always in the past; that it offers no apology for its past record, and that it looks forward to greater achievement in the future.

"To the medical profession (and again may I remind you that this may, and probably will he, his last message to you) he asked me to say: 'I have an abiding and unlimited faith in your integrity. I know you will keep faith with the public and never let selfish interests for one moment divert you from the high purpose to which you have dedicated your efforts and your lives.'"

The convictions voiced in this dying credo are the convictions that govern the living practice of medicine and have governed it for thousands of years. Disease is no respecter of wealth or power; and the physicians of America desire to retain the responsibility that has heretofore assured rich and poor, famous and obscure, of the same high quality of medical care,

"The medical profession offers no apology for its past record"—and needs no defense. In spite of changing political conditions and shifting economic views, the doctors of the country have continued unfalteringly on the road of devoted public service. They have endured countless impositions on their traditional charity and borne the economic burden of the needy sick. No matter how grave the threat to their security and welfare, they have forborn to employ the customary weapons of affronted interests.

In the face of American medicine's remarkable record of service and achievement, it is difficult to see how any one dares impute its opposition to compulsory health insurance to selfish motives. No one knows better than the physician how "the high purpose to which he has dedicated himself" can best be served. Medical integrity and initiative thrive best in the wholesome air of professional independence. They do not flourish in the stultifying atmosphere of political bureaucracy.

New York at the A.M.A. Meeting

It is a source of pride for those of us who attended the A.M.A. convention in Kansas City to note the fine role New York plays in the national association.

Our members contributed freely to the scientific sessions and to the Scientific The eloquent report of Dr. Arthur Bedell, reference committee chairman on scientific sessions, etc., was unanimously adopted. In his summations of the official activities and reports of the last year Dr. Fred Sondern's important and convincing reference committee report was accorded enthusiastic approval. Dr. Van Etten proved a genial and efficient Speaker and was unanimously reelected. The general popularity of Dr. Arthur Booth, a Trustee, bespeaks his effectiveness in an office which carries the responsibility of being one of those whose actual directional force governs A.M.A. policy. Dr. Edward Cunniffe has been placed on the Judicial Council.

In view of the precarious condition of health in which Dr. Tate Mason lives, it was a signal mark of honor for the national association to turn to New York to draft one of its most distinguished sons to fill the office of vice-president. need not introduce Dr. Charles Gordon Heyd to New York. At present, acting for the stricken President, we are indeed proud of the honor which Dr. Heyd has brought our State. We know him, and are therefore confident in predicting that the American Medical Association has made a wise choice.

Now that the shouting and acclaim have passed, it remains the task of all of us to touch shoulders and walk together toward our ever-beckoning goal whose objective is our constant aim. Let us continue to work for all projects and ideas which will enhance our service to the public, and let us, while guarding all that is worthwhile in our profession, meet the current trends in public affairs una-A profession united in work for fraid. the welfare of the public, and for the maintenance of the highest possible type of medical care for all, cannot fail.

An Ounce of Prevention -

The Annual Report of Counsel to the State Society again emphasizes the part that careless criticism frequently plays in the instigation of malpractice litigation. Patients are rarely informed or dispassionate enough to evaluate justly a reflection cast by one physician on another's A remark made hastily and without malicious intent may be the starting point of a lawsuit which will cost a colleague heavily in money or reputation, or both.

It is true that the agreement on which the Society's group insurance plan is based prevents exploitation of the profession by nuisance settlements. The carrier is pledged to combat all claims that have no valid basis. Even when the outcome of a case is complete vindication, however, the practitioner forced into the role of defendant loses time, practice, and the spotless good name that has never been tainted with suspicion.

Physicians can help protect their colleagues against groundless malpractice actions by maintaining a careful check on their tongues at all times. It is possible to change medication or alter treatment without reflecting on the competence or good faith of antecedent practitioners on a case.

Doctors can safeguard themselves, too, by a variety of simple precautions. Medicine bottles should be carefully labeled, with a distinctive mark on poisons to set them apart from harmless drugs. Strict antisepsis should be observed in all procedures and no surgery, no matter how trifling, performed without a written consent. Accurate records should be kept—and kept confidential.

Every practitioner of medicine should have in his library a handy volume summarizing his statutory rights and duties. It goes without saying that no physician can afford to be without malpractice insurance—and there is no likelihood of lowering the costs of this essential protection until the proverbial ounce of prevention comes into its own in every medical office.

Rheumatic Fever and Rheumatoid Arthritis

From a practical standpoint, the clinical differentiation between rheumatic fever and rheumatoid arthritis is a necessary one because each has its characteristic syndrome and each requires an individual type of therapy. When viewed from the theoretical side, however, the separation of the two conditions may not be justified.

Dawson and Tyson¹ who have considered the problem front its many phases—familial, seasonal, geographical, etc.—are convinced that the two diseases are interrelated and merely represent different forms of a common pathological process. Exactly what may determine these variations in reactions to a supposedly identical etiological agent still remains to be determined. Age, and the susceptibility of the individual are considered as important factors, although other circumstances may still play an important role.

While the hypothesis advanced by Dawson and Tyson does not coincide with the one generally accepted by the American and British clinicians who regard rheumatic fever and rheumatoid arthritis as distinct entities, a definite opinion cannot be formulated until the etiology of both conditions has been established. At the present time a streptococcus of the hemolytic group is suspected as the cause, but the evidence is not conclusive.

Physicians are always interested in the discussion of medical problems, theoretical or otherwise. They are interested vitally, however, in the practical outcome of these controversies. Therefore, until this problem has been settled to their satisfaction, rheumatic fever still will be treated in one way while rheumatoid arthritis is coped with by other means. The care of the sick is still the foremost concern of our profession.

Von Gierke's Disease

An important contribution to the understanding of "glycogen disease" has been made by Ellis and Payne.¹ This affliction is recognized but rarely despite the fact that it presents characteristic biochemical abnormalities. The latter include acetonuria, an increase in the glycogen content of the blood, a low fasting blood sugar, and a failure of a rise in sugar following the administration of adrenalin. In addition, an increased blood cholesterol is commonly associated with a delayed failure of the blood sugar to fall after a test meal of dextrose.

The symptoms presented by involvement of the vital organs often overshadow the true cause of the patient's complaint. While the glycogen which accumulates in the organs produces an enlargement of the liver, kidneys, heart, and pylorus, the obesity, cyanosis, and signs of cardiac failure may mask the clinical picture which this ailment presents.

The enlargement of the liver is rarely accompanied by jaundice, and bile has not been recovered in the urine. The cause of this disease has not been established, although everything seems to point to a deficiency of a glycogen splitting ferment. Ellis and Payne believe that a dysfunction of the anterior pituitary gland is the probable cause. They also comment on the possible congenital nature of this disease. While they have not been able to demonstrate any case of direct transmission, consanguinity was a factor in three of twenty-five family groups.

CURRENT COMMENT

Dr. S. Weir Mitchell once said, "However far medicine may develop as a science, the successful treatment of the sick will always be an art."—According to the Supplement to *The Bulletin* of the Bronx County Medical Society.

LANGDON W. Post, in Today of May 9, says: "There is one thing which everyone

^{1.} Dawson, M. H., and Tysen, T. H.: J. Lab. and Clin. Med. XX 21:551, 1936.

^{1.} Ellis, R. W. B. and Payne, W. W.: Quarterly J. of Med., 5:31, 1936.

interested in housing can agree upon, namely the need for housing. From that point on, however, the roads to solution and method go off in as many different directions as there are ideas. * * * One fundamental question * * * arises: Should the government, the state, the city or the county undertake to subsidize housing for those whom private initiative cannot reach?

The answer to this question, of course, is the first step in the solution of the problem. Only when this is settled can the ensuing problems be taken up with any chance of their being satisfactorily solved. * * * "

Writing of youth, its education and attitude in regard to state medicine, the editors of the Sedgwick County Medical Bulletin state that: "For centuries statesmen and educators have realized that the best place to influence public opinion and to spread an idea is among the youth. seems rather significant, therefore, that those groups which have been most active in proposing socialized medicine, should now be working in the schools of the country. Efforts to build sentiment for state medicine will continue, and if the youth, who are to decide our problems tomorrow, are to have a rational outlook upon the medical aspect of these problems, it is imperative that physicians take the time and the effort to give them this point of view. The physician through the very nature of his work and through his contact with the family group should be able to obtain a sympathetic hearing on these things, which are so vital Some serious and to medical progress. conscientious work individually among our patients, and as a group in our schools, will in the future bring big dividends to us in a more enlightened and sympathetic citizenry."

"WITHOUT FREE SPEECH no search for truth is possible, without free speech no discovery of truth is useful, without free speech progress is checked and the nations no longer march forward toward the nobler life which the future holds for man. Better a thousandfold abuse of free speech than denial of free speech. The abuse dies in a day but the denial slays the life of the people and entombs the hope of the race."—Charles Bradlaugh quoted in the St. Louis County Medical Society Bulletin.

"THE AMERICAN MEDICAL ASSOCIATION must use its ingenuity and by the concerted action of physicians, welfare agencies, sympathetic public and other auxiliary forces,

and at the same time furnish constructive plans to defeat compulsory health insurance, as would insure adequate compensation to the physician and a high quality of medical service to the people. Only then will organized medicine have the right to expect full cooperation from the entire profession."—Harry Projector, M.D., in the Bronx County Medical Bulletin.

Mr. J. Weston Walch, the man, it will be remembered, who compiled the "Handbook on State Medicine" used by so many of the 100,000 high school students who debated the topic this past winter, says that: "The case against state medicine is strong enough, if only the medical profession generally would bring it to the attention of the general public! But the public is not simply going to take the doctor's word for it that socialization is bad. The average patient respects the physician's advice on medical He has never been given any reason to believe the doctor is also an expert on finance and administration. It will not do for physicians and their organizations merely to continue to pass resolutions—the public must be continually reminded of the real facts and dangers of public encroachment on private medicine."-From Medical Economics of May, 1936.

"In an election year, when all the candidates are making earnest appeals to the common sense of the normal and average citizen, it is unkind of Dr. L. W. Darrah, head of a Massachusetts State hospital, to say that the normal man is a very difficult fellow to find—and probably doesn't exist at all."—So say the editors of *Today* in their May 16 issue.

"THE HEALTH OF THE FUTURE will not be a health officer's product, a negative achievement of reduced death rates, but the accomplishment of individuals who choose their ways of life with understanding, according to their inheritance, their ambition to survive and be superior, and consistent with the immutable laws of human biol-* * * Our society and the nations ogy. that are everywhere our neighbors, will owe an increasing debt to those who can make the science and art of curative medicine less and less necessary, by reason of the understanding in childhood and youth of the good way of life."-Dr. Haven Emerson, quoted in part from a talk presented before the Sixteenth Annual Meeting of the American Student Health Association held in New York City.

COMMENTING UPON THE ONSLAUGHT on the physician by the drug manufacturers The Weckly Roster and Medical Digest of the Philadelphia County Medical Society states that: "There is the herculean project of trying to get the physicians to understand that the tricky names in the medical advertisements are but disguises for old friends. Drug therapy has changed very little in its essentials in the last twenty-five years, but the philological variations are wonderful to gaze upon. In following the lead of the advertising copy and the persuasive guidance of the detail man, the

practitioner may find himself in a maze of trouble. Cincophen, pyramidol, and other products with musical sound are not restricted in their effects to one single beneficial result. How many of us know anything about them, except what has been pumped into us by high-powered and high-priced salesmanship? Our materia medica is still ample to withstand all the demands we may put upon it, and when we depart from it, we not only load an unnecessary expense on our patients but drive them into self-drugging. * * * * *

62 West 87 Street, New York City

To the Editor:

At the close of the Scientific Exhibit of the Medical Society of the State of New York held at the Waldorf-Astoria Hotel, New York City, on April 29, 1936, the entire exhibit of twenty-four charts on the Management of the Pneumonias shown in space 18 by Dr. Jesse G. M. Bullowa was taken and has not been returned nor has the owner been notified. Much of this unpublished material was shown for the first time and no photographs of the charts were made. It would cost more than three hundred dollars (\$300.00) to redraw the charts.

The exhibit consisted of three charts showing the method of Sputum Typing, drawn by Edith T. Woolf and labeled Lit-tauer Pneumonia Research Fund, New York University; charts showing the relation of sex and age to the incidence and mortality of the lobar pneumonias; a chart showing the type distribution in 4,000 cases of lobar pneumonia by decades; a series of charts showing the concentration of oxygen in the alveolar air by the forked nasal inhaler and by catheter administration and the concentration of oxygen in the alveolar air in an oxygen chamber with various concentrations of oxygen. To one chart with drawings signed Sturm was attached a Bullowa metal oxygen inhaler, Foregger, and a soft rubber nasal catheter. Another series of charts showed the results of specific serums in shortening the illness and in reducing the mortality in pneumonias due to pneumococcus type V and to pneumococcus type VII.

A reward is offered for information

concerning the present location of these charts. No questions will be asked, Call SChuyler 4-8123.

Very truly yours,
JESSE G. M. BULLOWA, M.D.

May 8, 1936

1192 Park Avenue, New York City

To the Editor:

Kindly give space in the next issue of

the JOURNAL to the following letter:
On page 740, Volume 36, Number 9,
May 1, 1936 in the New York State Jour-NAL OF MEDICINE appeared a letter by Dr. Cravener, in which he criticizes the physical therapy treatment of traumatic subdeltoid bursitis described in my article in the Journal of April 1, 1936. The doctor seems to be imbittered, thinking, probably, that physical therapy is interfering with his business. But, as a matter of fact, yet at the dawn of physical therapy, famous surgeons, like the noted Codman of Boston, have tried to treat traumatic subdeltoid bursitis by non-surgical methods. Their efforts were not at all successful while modern physical therapy is successful in over ninetyfive per cent of such cases.

Dr. Cravener does not realize that the article on bursitis is a result of my ten year experience in a large physical therapy clinic in the city of New York where the greatest number of my patients were treated. He does not realize that the cases were referred by the surgeons and the orthopedic surgeons of the corresponding clinics, and that these New York surgeons know as much about and are interested in the "exact ctiologic diagnoses of subdeltoid bursitis

and its contraindications for physical therapy" as Dr. Cravener of Schenectady. I wish to assure the doctor that many physicians and surgeons who happened to see me since my article was published had nothing but hearty praise for it. Their experience with me proved to them that my methods are employed with benefit for the suffering patient, as can again be illustrated by the following interesting case:

During the winter's cold spell and snow blizzards which affected a number of states of our country, including New York and New Jersey, a young woman, a resident of the latter, and a mother of two children, became afflicted with traumatic subdeltoid bursitis (as diagnosed by her physicians and later by myself). She was treated by good men; she was even treated in an institution. But somehow the pain was not relieved by those treatments. The severe pain drove the woman almost to craziness, and she started to talk of suicide.

became so despondent that she did not even care to have her shoulder radiographed. But the surgeon did not operate. The suffering woman was referred to me, and her husband drove her to my office in his Ford daily in spite of the snow blizzards and difficulty of transportation. Five consecutive treatments totally relieved her pain. An x-ray of the patient's shoulder was then taken by Dr. A. C. Linden of New York. The radiologic study indicated the presence of a calcified subdeltoid bursitis. This relatively quick relief of pain not only avoided much trouble in a happy, peaceful American family, but was probably lifesaving to the young mother.

I hope that this letter may stimulate Dr. Cravener's interest in Physical Therapy so that he may eventually crave the cooperation of the worthy physical therapist.

> Very sincerely yours, Joseph Echtman, M.D.

Society Activities

Legislative Session-1936

BILLS SIGNED BY THE GOVERNOR

Senate Int. 219—Schwartzwald; Health Dept. to supply blank forms, etc., for recording marriage licenses.

Senate Int. 220-Schwartzwald; stillbirths without attendance of physicians or midwife shall be treated as deaths without medical attendance.

Senate Int. 233—Budget Bill: appropriat-

ing \$10,000,000 for TERA.

Senate Int. 377—Quinn; misdemeanor to bring indigent persons into State for care or treatment at State expense in institutions within Mental Hygiene Dept.

Senate Int. 535—Schwartzwald; Mental Hygiene Law, requirements necessary to gain residence in this State to be not less than those required for acquiring residence in state from which non-resident comes.

Senate Int. 536—Schwartzwald; permitting State Health Commissioner to deputize any assistant to perform in his place any

act he is empowered to do.

855—Schwartzwald; Int. direct reports to State Health Dept. or district health officer of certain communicable diseases in districts of less than 50,000 not having whole-time health offi-

Assembly Int. 136—Taylor; Civil Practice Act, embodying in new section testimony of physicians, surgeons, and nurses.

Assembly Int. 814—Swartz; prisoner sent to hospital because of sickness must be kept in custody of officials in charge of jail to which he is committed.

Assembly Int. 963—Parsons; hospital lien bill.

Assembly Int. 1158—Swartz; qualifications of supt. of Napanoch institution to be prescribed by Correction Commissioner.

Assembly Int. 1793—Robinson; creating board of psychiatric examiners in Mental Hygiene Dept. for making rules and regulations governing practice of psychiatry, etc.

Assembly Int. 1794—Robinson; relative to inquiry into insanity or mental condition of a defendant before or during trial or before sentence.

Assembly Int. 1823—Breitbart; N. Y. City Inferior Criminal Courts Act, relative to blood-grouping tests of mother, her child, and the defendant.

Assembly Int. 1872—Breitbart; Civil Practice Act, relative to blood-grouping

Assembly Int. 1884—Brownell; New York City maternity hospitals to be licensed by Commissioner of Hospitals.

BILLS IN THE HANDS OF THE GOVERNOR

Senate Int. 12—Buckley; providing jury duty exemption only for lawyers, doctors, etc.

Senate Int. 17-Fearon; for optional

forms of county government. Senate Int. 1084—Schwartzwald; compensation for silicosis and certain injuries to respiratory tract resulting from inhalation of harmful dust, and for prevention of dust hazard in pub. works.

Senate Int. 1559-Schwartzwald; to make studies and disseminate information on subject of control and prevention of diseases

caused by inhaling harmful dust. Senate Int. 1569-Feld; Education Law,

practice of podiatry.

Senate Int. 1589-Livingston; tests for hearing to be made with audiometers or such other scientific devices as may meet approval of Education Commissioner, etc.

Senate Int. 1649-D. T. O'Brien; requiring applicants for learners' permit to take a vision test or other examination to dis-

cover defective eyesight.

Senate Int. 1695—Schwartzwald; Mental Hygiene Law, relative to mental defectives

and institutions therefor.

Senate Int. 1771-Livingston; requiring immediate report by physician or nurse, parent or guardian in charge of any minor under six years who is totally deaf or whose hearing is impaired, for proper treatment by welfare or other agency and for giving information as to proper instruction.

Senate Int. 1791—Esquirol; Domestic Relations Law, relative to blood-grouping tests of mother, her child, and the defendant.

Senate Int. 1947-Mandelbaum; for pro-

duction of records of any department or bureau of a municipal corporation showing entries or records or any other data relating to physical condition or treatment of a hospital patient.

Assembly Int. 988-Miss Byrne; excepting from provisions of Workmen's Compensation Law an intern in a prison, reformatory, insane asylum or hospital maintained by a municipality or other subdivision of State.

Assembly Int. 1356—Crews; appropriating \$100,000 for payment of expenses of Labor Dept. for prevention of silicosis and

other dust diseases.

Assembly Int. 1613-Sherman; name of State tuberculosis hospital near Oneonta to be the Homer Folks Tuberculosis Hospital.

Assembly Int. 1690—Bush; defines wholesaler, as applied to narcotic drugs, to be person who supplies others than consumers with narcotic drugs or preparations containing narcotics that he himself has not produced or prepared.
Assembly Int. 1842—Allen; appropriates

\$10,000 for the Cornell State Veterinary College to study prevention and control of Bang's disease in bovine animals by vaccina-

tion, and suppression of mastitis. Assembly Int. 2220—Wadsworth; for reorganizing State Department of Social Welfare and for transferring thereto the functions of TERA.

Assembly Int. 2277-Holley; relative to records of births.

Committee on Workmen's Compensation

May 13, 1936

Under section 13-j, chapter 258, of the amended workmen's compensation law, entitled medical or surgical treatment by insurance carriers and employers (paragraph 2), an employer may maintain a compensation bureau at the place or places of employment, if such bureau is required because of the nature of the industrial hazards or the frequency of injuries to employees arising out of industry. Such bureau or bureaus shall be authorized and licensed pursuant to section 13-c, and their use by an injured employee shall be optional in accordance with the provisions of section 13-a.

After a number of hearings, the following rules and regulations have been established by the Industrial Commissioner in respect to the licensing and operation of

compensation medical bureaus:

Rule No. 1. The character and frequency of accidents, the number of employees in a given plant, and the availability of qualified medical care in the immediate vicinity of the place of employment should be considered in relation to the authorization of an employer's compensation medical bureau.

Rule No. 2. The bureau should be located in the Industrial plant or in the immediate vicinity.

Rule No. 3. The question of the necessity of the presence of a physician during working hours, or the availability of a physician at stated hours should be determined by an inspection of the plant to ascertain the nature of the hazards and the frequency of accidents.

Rule No. 4. The bureau shall be well housed with sufficient space, light and air, and shall conform to reasonable sanitary requirements. Proper facilities in the form of personnel for assistance in emergencies, instruments, sterilizers, dressings, drugs, shall be available at all times and in amounts proportionate to the size of the plant and the number of employees. Such facilities shall be adequate for more than mere emergency care and for the more severe type of industrial injury.

Rule No. 5. A bureau license may be given for a stated project which, because of the hazards of the project and the frequency of acci-dents, requires continued medical care and such license shall be for the life of the given project only. In such cases all employees of all sub-contractors shall be covered by the license.

Rule No. 6. No license shall be issued to an employer to cover any but his own employees, except as indicated in Rule No. 5.

Rule No. 7. First Aid Stations-No license is required to operate a first aid station by an employer of labor. Such first aid or emergency station should be properly equipped for first aid in accordance with the type of hazard encountered at the particular place of employ-

Rule No. 8. Form C-105, a notice of the rights of an injured employee and the responsibilities of the employer, shall be posted in each compensation medical bureau and first aid station.

The licensing of employers medical bureaus is dependent upon the recommendation of the county medical society or its Workmen's Compensation Board, therefore the above rules and regulations have been adopted for the guidance of county medical boards. They are requested to proceed at once with the inspection of the premises of all employers who have applied for bureau licenses. Application forms for employers bureaus may be obtained from the district offices of the Department of Labor. After a thorough investigation and consideration of the number of accidents, the character of same, and the hazards presented at a given place of employment, etc., the County Society Board shall either recommend or reject and report its findings to the Industrial Commissioner at 80 Centre Street, New York City. If the County Society Boards so desire, they may send their recommendations to this Committee for submission to the Industrial Commissioner.

Any further information in regard to the licensing of employers medical bureaus may be obtained by addressing the Committee:

> DAVID J. KALISKI, M.D., Chairman FREDERIC E. ELLIOTT, M.D. B. WALLACE HAMILTON, M.D.

Postgraduate Lecture Courses

conducted by

The Committee on Public Health and Medical Education

On April 8, Doctor Charles A, Weymuller concluded a course on General Medicine, given to the Sullivan County Medical Society, with a lecture on "Diabetes in Child-hood". This lecture was considered by the society to be a "very fine presentation of a difficult subject." Previously, Doctor Lambert Krahulik had spoken on "Rheumatism and Rheumatic Carditis in Childhood", and Doctor George H. Roberts on "Recent Advances in Therapeutics". Both of these lectures were very well-received.

A course on General Medicine has been given in Chemung County with lectures at the Arnot Ogden and St. Joseph Hospital in Elmira, alternately, on Wednesday evenings. The first lecture was given by Doctor O. W. H. Mitchell on "Staphylococcic Diseases" and the second by Doctor James K. Quigley on "Practical, Everyday Obstetrics". On April 15, Doctor Russell Cecil spoke on "Pneumonia", and on April 22 Doctor Martin B. Tinker spoke on "The Diagnosis and Treatment of Thyroid Diseases from the Standpoint of the General Practitioner". The remaining lectures of the course were on May 8 on "The Newer Endocrinology and Gynecology", by Doctor Thomas P. Farmer, and on May 13, "The Management of Hypertension" by Doctor Clayton W. Greene. This same course is

being given to the Steuben and Tioga County Medical Societies on Thursdays in May and June, the first lecture having been given on April 23. The first three lectures in this course are coincidal with the last

three in the Chemung County Course. St. Lawrence and Jefferson County Medical Societies have had a course of lectures as follows:

Skin Discases

May 14.......Dr. Duncan Macpherson
The Relationship of Rhinolaryngology
to General Medicine

21......Dr. M. Sulzberger
The Relationship of Dermatology
to General Medicine May 21.....

A course on Orthopedics and Orthopedic Surgery, arranged by Doctor Leo Mayer, was started in Herkimer and Montgomery County Medical Societies, the meetings held at Herkimer at 4:00 P.M., and at Amsterdam at 8:30 P.M., on Thursdays through May. The first lecture by Doctor Samuel Kleinberg, on "Back Pain" was an excellent one.

The President's Medal

The following remarks were made during the Ceremony of the Investiture of Frederic Kondern, M. D. with the President's Medal at the 130th Annual Meeting of the Medical Society of the State of New York, New York City, April 28, 1936 by Harry R. Trick, M. D., Chairman of the Board of Trustees.

Throughout the long lifetime of the Medical Society of the State of New York a very kindly and appropriate custom of extending a vote of thanks to the retiring President for his service to this Society has been preserved.

This vote of thanks has always been deeply appreciated by the recipient and became one of his most cherished memories as well as his reward.

For one hundred and twenty-nine years men have come and gone as Presidents of the Medical Society of the State of New York with no other formal recognition of their service than that just mentioned.

The only dissatisfaction with the procedure in the minds of a large number of the members seemed to be that the incident was of such a transient character it failed to express the true feelings of the members and something more tangible and permanent has long been desired.

During the recent past this idea has been brought to a complete fruition in the form of a medal, appropriately inscribed and suspended from a ribbon to be worn around the neck of the one so honored on all formal social functions of the medical profession.

It is singularly appropriate that our present retiring president should be the first to be so honored and it now becomes my very pleasant duty as Chairman of the Board of Trustees to confer it upon him.

Doctor Sondern, because of your unfailing devotion to Organized Medicine, and because of your incorruptible belief in the Ideals of Medicine and most particularly because of your faithful and diligent service to this Society, I confer this honor upon you.

May you live long to enjoy this mark of our appreciation and affection.

Public Health News

Poisonous Fruit and Vegetable Sprays

From the column sponsored by the Associated Press titled "How's Your Health?" and edited for the New York Academy of Medicine by Dr. Iago Galdston.

No one seriously had faith in the old saw that an apple a day keeps the doctor away. Now, however, since the practice of spraying fruits and vegetables with poisonous insecticides has become widespread, an apple a day, on the contrary, may necessitate the doctor's services, especially if, as is the case in many instances, the apple comes to the consumer with a fine coating of arsenic and lead.

The fruit and vegetable industry and the consumer are both confronted with a serious and difficult problem. To combat the ever-increasing insect infestation, the growers of fruits and vegetables must utilize poisonous chemical sprays. To make these syrays more effective they have in recent years been combined with so-called binders, consisting of casein (a milk derivative) or oil. While the insecticides are thus rendered more poisonous for the insect, they also mount as a threat to the health of the consumer, for insecticides thus applied are not removed by ordinary wiping and indeed

require an acid washing solution to be removed effectively.

Fruit growers have given attention to this important health problem, but that not all is as well as it ought to be, may be witnessed in the fact that during the fiscal year of 1935 the United States Food and Drug Administration made 338 seizures of fruits and vegetables in interstate commerce. Of these 299 were apple shipments. All of these shipments contained more residual poisonous spray than is allowed by law.

Since the Food and Drug Administration has authority only over foods in interstate commerce, the following warning is of pertinence:

Since interstate shipments alone are subject to regulation under the Federal Act, the public will never be entirely protected as long as poisonous sprays are applied until all state authorities exercise the same degree of effective surveillance that is now maintained in some states.

Medical News

Secretaries of County and local Medical Societies are requested to send the programs of coming meetings of this department one month in advance, for the information of members who may be interested.

Bronx County

THE BRONX COUNTY MEDICAL SOCIETY at its meeting on May 20 listened to addresses on State Legislative activities by Harry Aranow, M.D., and on Industrial Medicine by Herman B. Schoenberg, M.D., with discussion by McIvor Woody, M.D., Herbert C. Chase, M.D., and Michael Lake, M.D.

Erie County

A SERIES OF IMPORTANT studies are being made by the Survey Committee of the Medical Society, County of Erie, with a two-fold purpose, viz.: (1) To establish a unified and one hundred per cent cooperative medical society, and (2) to find ways and means to correct present economic ills. The committee is asking each member to cooperate in furnishing data, confidential reports and other materials necessary. The chief agenda:

1. A study of the entire problem of splitting of fees.

2. The present causes of fraternal dis-

sension and the remedies.

3. Our relations to the subsidiary divisions of the Health Department: (T. B. Division; Well Baby Clinic, Vaccination and Inoculation.)

4. Hospital and dispensary practices in re-

lation to the practicing physician.

5. A study of so-called hospital insurance plans.

6. A rating and collection bureau.

- 7. Public education and radio programs.
- 8. The compensation law and its operation and enforcement in Erie County.

9. The present drug situation.

Greene County

THE MAY MEETING of the Greene County Medical society was held at the New Saulpaugh hotel in Catskill on May 12. Dr. James Rooney, Albany, was the principal speaker.

Kings County

THE DOCTORS' CLUB of Brooklyn held their annual adventure session and dinner on May 16 at the Hotel Bossert. Dr. William E. Aughinbaugh of Newfoundland, Labrador, Iceland, Asia, Africa, and Latin America, was toastmaster. The Doctors'

Club was organized by Dr. Charles F. Fisher, in 1931, to discuss everything except scientific medicine. That policy still continues with Dr. William L. Wolfson now the president. Dr. Fisher still continues as an active member of the board of governors. The guest speakers included Clyde Eddy, only white man to survive two trips down the Colorado River; Tracy Richardson, professional soldier specializing in Mexican revolts; Jack O'Brien, member of the Byrd Antarctic Expedition; and Kenneth Dick, who toured the world on \$2 and returned with some change.

Monroe County

RESEARCH IN THE laboratories of the University of Rochester School of Medicine and Dentistry, will be aided by two grants, totaling \$16,400, from the Rockefeller Foundation. A maximum of \$10,000 to be used over three years, has been granted to further the investigation into filterable viruses—sleeping sickness, influenza, smallpox and rabies producers—being carried on under direction of Dr. George Packer Berry, professor of bacteriology.

The other \$6,400 will go to aid Dr. Stafford L. Warren, associate professor of medicine and radiology, in his study of the biological effects of heat (artificial fever).

Montgomery County

THE SECOND MEETING in the post-graduate course of the Medical Society of the County of Montgomery was held on May 8 at Amsterdam. The meeting was addressed by Dr. Nicholas Ransohoff and Dr. J. E. Milgram, from New York City. Dr. Ransohoff spoke on "Posture and Health," and "Correction of Paralytic Deformities of the Upper Extremity" was Dr. Milgram's topic.

New York County

Dr. John M. Wheeler, professor of ophthalmology in the Medical School of Columbia University and director of the Eye Institute at the Columbia-Presbyterian Medical Center was presented with the Leslie Dana Gold Medal for "outstanding achievements in the prevention of blindness and the conservation of vision" at a dinner in his honor in St. Louis on May 9. Dr. Wheeler was selected for the award by the

National Society for the Prevention of Blindness in cooperation with the St. Louis Society for the Blind which offers this highly prized mark of recognition annually.

Onondaga County

THE FEATURE OF THE JOINT DINNER OF the Onondaga Medical Society and the Onondaga County Bar Association in Syracuse on May 2 was an address by Dr. Floyd S. Winslow of Rochester, the new president of the State Medical Society. Dr. Winslow urged both professions to place less dependence on organizations and more on individual improvement. He added:

"Wouldn't it be a good thing if we all worried a little more about our personal efficiency and the importance of kindness and consideration for patients and clients?"

L. Earl Higbee, county bar association president, and Dr. Earle E. Mack, who heads the medical society, staged a mock battle for the honor of presiding and finally compromised by yielding the floor to Assemblyman Horace M. Stone as toastmaster, who convulsed the 500 guests with dry quips, aimed particularly at alleged "lobbying" of both professions' representatives at Albany.

Ontario County

An Appreciative "write-up" in the Rochester Times-Union tells us that Doctor Allan R. Dafoe's job of guarding the health of the quintuplets must be a cinch compared to the work of Dr. Barton T. McDowell of Bristol Center. Doctor McDowell, Ontario County director of school hygiene, personally minds the health of 6,000 children in sixteen towns.

Annually he visits every school in the county with the exception of those in the cities of Geneva and Canandaigua. He examines the eyes, ears, nose, throat, teeth, and heart of every pupil, Reports of the examination and suggested corrections are then sent to parents from the Canandaigua office of Doctor McDowell, who lives in Bristol Center. Next a checkup is made on the corrections.

The work keeps Doctor McDowell busy from September until the next July. He is assisted by the school nurses, Miss Elizabeth Jepson, Canandaigua, and Miss Muriel Rector, Gorham, and an office girl.

Now in its eighth year, this county school hygicne department is the only one of its kind in New York State. It is supported by the county. Doctor McDowell has been reappointed annually by the chairman of the Ontario County Board of Supervisors

and three district superintendents of schools. From five per cent the first year the number of corrections made in defects revealed by the examinations has increased to 47 1/2 per cent last year.

Orange County

THE ORANGE COUNTY MEDICAL SOCIETY held its annual banquet at the Occidental Hotel at Goshen on May 12. About fifty were present.

Queens County

THE STABLE FOINT of population in the metropolitan area will be reached about 1965 when the population will be eighteen million, Dr. Haven Emerson, professor of public health practice at the College of Physicians and Surgeons, said on April 21 before the Queens Medical Society at the Medical Center in Forest Hills.

He pointed out that stabilization of the population will be reached only if the immigration laws are not changed. The population of the United States will reach its stable point in 1960, five years before the metropolitan area which includes the five boroughs, Westchester and some counties in New Jersey. His figures are based, he stated, on the narrowing of the margin between birth and death rates within the past few years.

Dr. Emerson said that these figures were compiled by a survey committee which investigated exact population, hospitalization facilities, cost of hospitalization and what future hospitalization needs and costs will be. He said the survey considered hospitals, ambulance service, convalescent and chronic homes, visiting nurse and social services and home care of the sick.

A CHILD HEALTH DAY program was sponsored by the Medical Society of Queens in the Society Building on May 1. Grade schools were awarded silver cups for showing the highest percentage in the correction of physicial defects. The cups presented by Dr. James M. Dobbins of Astoria, the president of the society, were received by child representatives of P. S. 129, 11, 90, 7, 12, 88, 101, and 81. Daniel P. Higgins, president of the Catholic Youth Association was the principal speaker.

Schenectady County

THE SCHENECTADY COUNTY MEDICAL SO-CLETY listened to an address on the treatment of cancer by Dr. Francis C. Wood of New York City at its meeting at the Ellis Hospital auditorium in Schenectady on May 5.

Medicolegal

LORENZ J. BROSNAN, Esq.
Counsel, Medical Society of the State of New York

Physician and Patient-The Value of Professional Services

A few years ago the highest Court of one of the eastern states handed down an interesting decision involving the question of the manner in which a physician is entitled to compute the amount of the fee that he may properly charge a patient.*

The plaintiff in the case was a physician of concededly high standing in the profession as a surgeon. He was called into consultation concerning the condition of a certain Mrs. D. who had been in poor health for some time. Various doctors had been attending her but they had been unable to reach a diagnosis of her ailment. The surgeon subjected her to a physical examination and placed her under observation making various blood tests and x-ray examinations. He finally concluded that she was suffering from cancer of the intestine, and advised operation.

The patient's condition was discussed by the doctor with her husband, and he was told that an operation was absolutely necessary if she was to live. Upon one such interview the subject of fees came up and the husband told the doctor he was going to ask the amount of the charges, but said, "but I won't bother about that. I am able to pay." The doctor named no fee but stated that he usually made a charge satisfactory to the patient, the family doctor.

and himself.

While the operation was still being considered, but not definitely agreed upon, the patient developed an obstruction of the bowel, calling for immediate operation. The surgeon then performed an operation in three stages upon her, which was later described as a rare operation requiring the highest degree of surgical skill. The series of operations were performed over a period of five weeks. The surgeon succeeded in obliterating the obstruction in the bowel, removed the cancer, and restored the continuity of the bowel following the dissection of the malignancy. The operation undoubtedly saved the life of the patient, and three years after it had been completed there had been no evidence of recurrence and the patient was in good health.

After the completion of the services the surgeon consulted with various other com-

* Pfeiffer v. Dyer, 145 Atl. 284.

petent physicians in the locality, including the family doctor, and obtained from them expressions of opinion as to the value of the services. Such opinions ranged from \$2000 to \$5000. The surgeon finally concluded that \$3000 was a proper amount to charge and sent the husband a bill for that amount. The husband angrily refused to pay the bill, stating that he thought the charge should be \$300 but that he was willing to pay as much as \$500.

Being unable to come to a satisfactory arrangement with the husband the doctor wrote a letter to the patient herself in an attempt to see that the bill should be paid. In the course of the letter so written by the doctor he made the following statement:

Taking the very remarkable results secured into consideration, as well as the long continued treatment in separate stages, calling for unusual qualification for such work I felt that everyone would agree that a generous compensation was justified. I sent Mr. D—— a bill for \$3000 which is, I admit, a large fee and more than I would have asked on my own initiative, as I am distinctly a modest charger, but I did this on excellent advice and in the belief that it would work no hardship on you, as I know that Mr. D—— is a prosperous man who does not hesitate over such a sum when it concerns anything that pleases him.

The doctor being unable to obtain payment of his bill brought suit against the husband for the sum named by him and the action came on for trial before a jury and a verdict was rendered in his favor for the sum of \$3,000 with interest. An appeal from the judgment entered upon the verdict was taken by the defendant to the highest court in the State.

Upon the appeal the argument was made on behalf of the defendant that taking all the facts of the case into consideration it appeared that the plaintiff himself regarded the fee as excessive and that since he had never charged so large a fee for a similar operation in the past, he was not entitled to do so in this case.

The Appellate Court, however, determined that the verdict of the Trial Court was a proper one and affirmed the judgment,

saying in the course of the opinion:

Appellant's able counsel in the second branch of his argument advances a somewhat novel

and startling proposition as to the fees of pro fessional men-that A surgeon, without any agreement as to the amount of his fee, may not recover a fee based on what other surgeons would have charged or think proper, which fee is admittedly more than his own customary charge for the particular services which would mean that a physician once having fixed his fee for a given service, never could increase it, or that the modest surgeon who has been a modest charger and who has attained great skill, could not in a proper case receive the fair compensation to which others also of high professional standing believe him entitled. We would hesitate long before subscribing to such a rule particularly in view of the services rendered by physicians to the afflicted without thought of compensation customary or otherwise, of which plaintiff's own experiences are we think a fair sample Pressed on cross examination to state his customary fee for such an operation as that here involved he said that in over twenty years experience in surgery he has performed the operation six times three times for nothing and in explanation added that over half of his professional work was This state of affairs the done for charity law must recognize that physicians should not have their services valued as you would com-modities in trade by a fixed standard, what would be a proper charge for the same services to a man fully able to pay would be excessive to a man of limited means and what would be willingly done for the indigent without thought of financial reward should be com pensated for by one who can afford to pay on the scale which doctors of repute measure as the proper one Only on such a basis can those who devote their lives to ministering to the human suffering in some degree be fairly paid As was said in the Levitan case (79

It is a matter of common information that physicians and surgeons do not regulate their charges by any fixed standard of pecumary value but to a certain extent base them on the ability of the patient to pay, and on that hasis more frequently than otherwise, perhaps are but poorly compensated"

Claimed Infection Following Diphtheria Injection

A two year old child was brought to the office of a doctor specializing in pediatrics for a routine examination The doctor found the child well but administered an injection of diphtheria antitoxin child was next brought to the doctor about six months later and no objective symptoms of any ailment were found He, at that time, administered to the child a so called Schick test injecting a test fluid by hypo dermic under the skin of the arm child was brought back to the doctor a few days later and at that time a reaction to the The skin was red about test was observed the site of the injection. As a further precaution against diphtheria another injection

of antitoxin was administered. Two days later the doctor was called to the home of the child and found evidence of a red throat accompanied by a fever. He gave a pre scription for said condition and called upon the child a few days later. At that time he found the arm swollen near the site of the second injection for diphtheria and applied wet dressings. The next day before he had an opportunity to call upon the child he received a telephone call at his office that his services were no longer required.

The next the doctor heard from the matter was when a law suit was instituted against him in which the charge was made that the last inoculation had been improp erly rendered and had caused the child permanent injuries A physical examination made on behalf of the defendant showed that there was a small round scar on the arm about the size of the head of a match which was claimed to have been due to an infection which followed the injection of the toxin antitoxin. The case came on for trial as a non jury case and attempts were made on behalf of the infant plaintiff to show that the defendant had fulled to take proper precautions in administering the injection to sterilize the arm and his instruments. The defendant testified that he had taken all customary precau tions At the close of the entire testimony judgment was directed in favor of the defendant

Redness following Diathermy Treatment

A middle aged woman called upon a general practitioner with respect to complaints of pain in the shoulder. He examined her and diagnosed the condition as neutritis and suggested diathermy treatments. He proceeded to administer such treatment to her applying one electrode to the shoulder and the other to her back. The duration of the treatment was ten minutes. A couple of days liter the patient came to the doctor and complained of a reddened spot on the shoulder. The doctor found that there was no blistering, applied salve and a dressing, and the patient went away.

The doctor never heard from the patient until a year later when she instituted an action against him charging him with having caused her to sustain a severe burn

The burn was apparently never any more serious than when the doctor saw it for when the case was placed on the calendar and reached for trial the plaintiff's attorney made no attempt to actually try the case and in due time the case was dismissed for failure to prosecute

Across the Desk

From the Rough and Ready School of Medicine

Suppose you are on a barkantine in midocean, half way from New York to Rio, with no surgical apparatus but your two hands, and one of the crew slips on the deck and "breaches himself," as the sailors say. What do you do then? Well, it seems from good medical authority that the proper procedure is to grab the sufferer by the ankles, drape him head downward over your back like a bag of meal, and shake him as a terrier does a rat. When he yells, "All right," let him down and tie him up with woolen yarn.

Maybe you will not find this method given in the books, or taught in the medical schools, but it is related in the Maine Medical Journal by a veteran physician of that State, a former President of the Maine Medical Association, Dr. Stanley P. Warren of Portland, who will celebrate his ninetieth birthday in September. He sets it down as told by the first mate of the barkantine Cromwell to the surgeon in the sick bay of the S.S. Dartagnan.

It Was "As Good as a Fight"

The injured sailor was found groaning in his bunk with a bunch in his right groin the size of half an orange. "I tried to push the damn lump away, but I couldn't do it, and it got so sore and ached so bad I sent for you," he told the mate. The mate recalled hearing the bosun yarning about a similar case, and summoned him. Yes, it was "three years ago when we was comin' out of London."

"Well, what did you do?"

"We shook him, Sir."

"The devil you did. Shook him?"

"Get onto the deck," said the bosun to Jack, "and I'll show ye."

He was barefooted as were most of the crew in that weather. So he crawled slowly out of the bunk and lay down flat on the deck. First the bosun pulled off Jack's trousers, then he backed between his legs and grasped each of Jack's ankles with his

strong, calloused hands. Next he pulled him up from the deck with his legs straddle of his own neck. It was as good as a fight to see the bosun cursing and straining with Jack hanging down his back, and Jack himself groaning with pain, struggling in the grasp of the bosun.

"Hold hard, damn your eyes," yelled the bosun, and slowly and carefully lifted Jack up, then shook him up and down. He yelled but the bosun only said, "Are ye all right now?"

"Just the same," said Jack.

The bosun gave him another shake and Jack gasped out, "All right. Let me down."

We all heard a noise like a rush of water through the hawse pipe, and when Jack got onto his feet the bunch was gone.

"Git Some Doctor Swab to Fix Ye Up"

"Now," says the bosun, "we must batten him up so the breech won't come again. Steward, get Sails to come here." Presently Sails appeared. "Has you got a skein of woolen yarn?" "Yes," says Sails, "I got a big hank of yarn at Cork last v'yage to mend my stockings." "Cut away and get it." The bosun took the skein and separated it into two equal skeins which he looped together and pulled the loop tight.

Then he made Jack lie down on the deck again and put the yarn around his body with the knot of the loop across the place where the bunch had been. Next he pulled the yarn tight around Jack like a belt and fastened it at the back with a bit of spun-yarn.

"That feels good," said Jack, "and I guess I am all right now."

"You will be," says the bosun, "so long as you wears the yarn until we gits ashore where ye can git some doctor swab to fix ye up with a rigular stopper."

Jack had no more trouble with his side because he wore the yarn belt night and day until we reached Rio, where he went to the hospital and was fitted with a proper "stopper," as the bosun called it.

"Discharged Cured"

NO ONE REALIZES RETTER than the skillful physician that the patient is much more than a mere collection of organs, and that he is not restored to health at the instant when the organs start to resume their normal workings. This important fact has been seized upon by Dr. I. Seth Hirsch and deftly expressed in clay in a statuette entitled "Discharged Cured." Dr. Hirsch is an expert roentgenologist, and is used to seeing through things, and he sees through the transparent fiction that the patient is cured just because his temperature and pulse have stopped cutting capers. The pitiful figurine of the "cured" patient is used as a cover picture by the Roentgen Economist. Its editor remarks:

Dr. Hirsch in this piece of art expresses the incompleteness of some of our medical service He has picked up the discouragement, the mus-cular and mental weaknesses, the general inability of this patient to cope with the problems of the world

The patient has been discharged as cured; but the carriage, facial expression and general appearance of the patient shows that, while there may have been sufficient improvement in pathology to discharge him and get his bed for another, he is not cured

The artist here expresses that a human being is made up of body, mind and spirit; and that in this case the patient is facing the world again with an incomplete restoration of bodily function and an absolute need of further service to mind, spirit and economic status.

Medicine is more than a science; it is an art. The physician treats not only the discase; he treats the patient. The disease may be gone, but is the patient well? Here is at once the perplexity and the fascination of medical practice. If medicine were an exact science, a robot could do it, and socialized medicine would be possible and reasonable. but it is not. It is the study of a complex individual, body and soul, by the physician, who brings to the case the art and skill matured by years of experience with many other human lives. That is why the relation of doctor and patient must always be personal. Our medical socializers, trying perhaps to be humanitarian, would make medi-

I. Seth Hirsch cine not more human, or humane, but more dehumanized, and no doubt in some cases. under political institutionalism, inhuman,

Gangsters Attacking Doctors

THE RECENT REPORTS OF ATTACKS ON doctors in New York City, lured out on fake night calls for that purpose, are echoed

from Chicago, where the thugs are said to consider it a clever racket. A few months ago, in fact, a respected and valued member

of the medical profession in Chicago was brutally murdered by a gang of hoodlums, and several others have been the victims of "stick-ups." The members of one gang of degenerate youngsters confessed that doctors were their favorite victims. "Doctors are a cinch," the ringleader told the police. "Doctors always come when they are called, and they never mind where they are told to go. Easy to get them to go to the sticks and way out in funny places. We could do 'em up good there."

Which leads the *Illinois Medical Journal* to quote the motto: "Tonjours pret et toujours fidele," Always ready, always faithful. The doctors "are a trusting, credulous
crew," it remarks, "with hands ever eager
to aid, ears ever open to hear, and feet ever
waiting to rush to the help of humanity.
Doctors are always on the job. Where need
is, there is found the capable, conscientious
physician." So Dr. Silber C. Peacock left
his home, his wife, his baby daughter, and
the prospect of another expected child, to
answer a fake summons to help a "sick
child," and next afternoon his murdered
body was found in an isolated neighborhood.

A Martyr to Medical Ideals

A cynical sequel was that, instead of being praised for his unquesting response to the call of duty, he "was by intimation accused of practically every unseemly action in the calendar, from malpractice and mayhem to illicit intrigue and actual dishonesty," while "the heartbroken family and friends were spared neither inquiry nor insult." The only ones to stand staunch and true were his own medical confreres. They offered a reward for the apprehension of the murderer, and "not for an instant did their faith waver." Their faith was rewarded. Gangsters arrested for another crime were identified by medical victims of hold-ups, and a quick-witted police-officer snapped: "What about the Peacock murder?" One of the gang paled, the cue was seized, and confession followed. Now Dr. Peacock is recognized in his own city as a martyr to the ideals of his profession: "Always ready, always faithful."

Who Is to Blame?

Well, who is to blame for the saturnalia of thuggery which is taking its deadly toll even of physicians on their errands of mercy. No one, probably, can speak with

more authority on this point than Mr. J. Edgar Hoover, chief of the G-men. He says. for one thing, that the neglect of our children's training is letting them grow up into lives of crime. The average years of the gangsters who killed Dr. Peacock were below the voting age. The doctors, then, clearly have an interest in child welfare and right moral training. "We find," said Mr. Hoover, in a recent address, "these children committing almost 1,000 murders every year; we find that there are tens of thousands of burglaries and larcenies perpetrated by boys and girls who in any other generation would have been under the discipline of vigilant parents. This is an undeniable indictment of the American parent today."

Again, we read in various medical journals around the country how hard it is to get the doctors to take an interest in political affairs, or even to take the trouble to vote, and at the same time we are told in another address by Mr. Hoover that gangdom is allowed to flourish by its alliance with political corruptionists. Here is reason enough for the doctor to help clean up home-town politics, if needed. Mr. Hoover declared flatly in a speech before the D. A. R. in Washington that if every incumbent of public office in the United States were fingerprinted and records of law violation were spread before the country in a "single summary" the results would "amount to a scandal which would rock the country." Mr. Hoover told the D. A. R. members that there were 150,000 murderers roaming at large throughout the nation, and asked them to apply the spirit of their forefathers in a war against crime and "crime-affiliated politics."

Forced Into the Fight

It would seem that we have a sickness abroad in our fair land that is not of the body, an epidemic that ranks with the worst plagues of history. The doctor might leave it to the law enforcement authorities and pursue his quiet path of healing the sick, but like all epidemics, it lashes out viciously at those who would ignore it and leave it alone. The doctor is forced into the fight, if his midnight errands of succor are to be safe. No one can read Mr. Hoover's statements without feeling a call to arms. As we read in a press report, Mr. Hoover said that statistics showed that within the life-

time of every one alive today 200,000 persons will commit murder and more than

300 000 persons will be murdered

Mr Hoover then detailed his theory that crime and politics are allied and that "law enforcement has been hampered, hamstrung and strangled by the blood caked hand of crime affiliated politics" He said

"This political alliance with crime exists in State after State, municipality after municipality. It halts the policeman, it halts the law-enforcement officer, even as he reaches for his gun and holds him there, a target for bullets of the coward he has been attempting to arrest

"It stalks into our courts, brushing aside indictments trials and even convictions with a wave of the hand. It enters our penitentiaries, swinging wide the heavy prison gates for men who otherwise would have paid their debt to society in punishment for crime

"It condones nonfeasance in office and provides actual malfeasance. It supports bribery, perjury and gangdom, and it has been known to place more than one ex-convict upon the force of a police department"

Is it enough for the medical profession to patch up the wounded and submit tamely to the outrages of our criminal army-or, as Mr Hoover well calls them, "rats"? The doctors are 'always ready" and "always faithful," but there is also the good old Scotch motto 'Nemo me impune lacessit!'

REVIEWS

The Story of Medicine in the Middle Ages By David Riesman, M.D. Octavo of 402 pages, illustrated New York, Paul B Hoeber, Inc. 1935 Cloth, \$5 00

The Middle Ages are called the Dark Ages by historians While Drs Walsh and Fiske give excessive praise to the achievements made in medicine during the Medieval period, Drs Singer, Camac, and Pagel find little of value in its accomplishments and, in fact, stress its processes of retrogression Such an extreme diversity of opinion merits a thorough investigation

Dr Riesman, in his present work, subnects this issue to a careful analysis. On the one hand, he treats in detail the cruelty, barbarism and superstition of this historical period, at the same time, he does not disparage its achievements, won against great odds. It was an age when sectarian

intred was deemed a major virtue and toleration was condemned as a heresy and a crime

Probably the greatest accomplishment of the Middle Ages was the founding of the universities However, this era is also deserving of glory for it saw the organization of hospitals and the development of nursing While the actual additions made to the fund of medical knowledge were not proportionate to the time elapsed, nevertheless credit must be given for the preservation of Greek. Roman, Arabic, and Jewish tracts, without which the progress of medicine and culture in general would have been seriously hampered Full praise is accorded Arabic medicine for its discoveries in chemistry and dietetics, its minute descriptions of certain diseases and its development of newer medications in the vegetable group

The alchemists failed to find the Philosopher's Stone; but they discovered many useful chemicals, including antimony, bismuth, phosphorous, zinc, volatile oils, compounds of mercury and strong acids. Surgery was less hampered by Scholasticism than medicine. Slowly and steadily, with the development of a more tolerant attitude toward anatomical dissection, surgery advanced in several directions.

This book presents with great scientific accuracy an impartial review of the status of medicine and surgery during Medieval times. It is well written and beautifully illustrated. It is heartily recommended to physicians interested in the history of medicine.

WILLIAM RACHLIN

Public Health Administration in the United States. By Wilson G. Smillie, M.D. Octavo of 458 pages, illustrated. New York, The Macmillan Company. 1935. Cloth, \$3.50.

This is a book primarily for health officers and centers largely around administrative matters in the public health field. On the other hand, the practicing physician is concerned more and more with community health affairs as personal hygiene assumes greater importance in the control of communicable disease. For this reason books on matters of public health such as this volume are of present-day interest to the medical profession.

In the discussion of communicable diseases certain procedures are explained which at times the physician considers irksome but which are necessary for effective com-

munity control.

Eleven basic health activities in a modern health organization are described among which of particular interest to the practicing physician are child hygiene, mental

hygiene, nutrition and adult hygiene.

Finally, the section on public health programs explains the difference in health administration as conducted in rural and municipal areas; next it contrasts state and federal government health work. A chapter on "The Practicing Physician and the Public Health Department" gives many practical points of value to the profession.

ALFRED E. SHIPLEY

A Textbook of Laboratory Diagnosis. With Clinical Applications for Practitioners and Students. By Edwin E. Osgood, M.D. Second edition. Octavo of 585 pages, illustrated. Philadelphia, P. Blakiston's Son & Co. 1935. Cloth, \$6.00.

This is the second edition of a book which has proven its value as a practical text-book for students and general practitioners. The author has adopted the plan of reserving the first half of the book for the discussion of the more theoretical aspects of laboratory

tests, whereas in the second half of the book, actual technique is described. The presentation is direct and to the point and reads easily and pleasantly. In describing technique, the author has largely limited himself to those methods which he has found satisfactory in his extensive laboratory experience. The book has been brought up to date with a discussion of such tests as Paul and Bunnell's test, the Friedman test, etc. This book deserves unqualified recommendation. ALEXANDER S. WIENER

Diseases of the Thyroid Gland. By Arthur E. Hertzler, M.D. Third edition. Octavo of 348 pages, illustrated. St. Louis, The C. V. Mosby Company. 1935. Cloth, \$7.50.

This third edition has been completely rewritten. The type, the paper, the illustrations and the entire make up of the book are superb. It is dedicated to Henry S. Plummer for the great service he has rendered goitre surgeons.

The author does his own thinking and never hesitates to exprss his opinion even when it differs from commonly accepted

theories or facts.

His style is simple and direct and he has the happy faculty of clothing what might at times be a dry subject in charming language. Some of his philosophic observations are extremely humorous.

Speaking of the fear that iodized table salt might do harm he says "The amount seems to me to be quite incapable of harm to the persons using the salt and it helps the salt makers."

"The small boy with jelly on his face is not interested in the topography of the pantry." "The majority of operative failures come from trying to cure family rows by removing a simple colloid goitre."

Under symptomatology he writes "With much travail and lamentation and with the alleviations of the hot water bottle they achieve a college course, often with high honors, only to drop exhausted in the end under the weight of their diplomas."

The final quotation has a world of cynicism and humor combined "The surgeons here wear no masks but they keep their mouths shut. With practice this can be done

without pain."

All the chapters are interesting. The one by Doctor Chesky on the Hospital Management of Goitre Patients is a valuable one. Those on Anatomy and The Technic of Operations may be especially mentioned.

This volume is not an encyclopedia of all knowledge of goitre but it does cover almost all the important phases of the disease. Both the surgeon and the internist will benefit by reading this book and will have an enjoyable time doing so.

HENRY F. GRAHAM

INTRINSICALLY DIFFERENT

that there is no comparision!

Made from a blend of selected tree-ripe apples, Wegner Apple Sauce is actually superior in flavor and food-value to the best homemade apple sauce. From the recipe of a master of canning, and modern scientific kitchens, this apple sauce comes rich in the natural delicious juices of freshpicked New York fruit.

Chosen for character and beneficial environments

Looking Forward to Camp

At this moment more than two million boys and girls are looking forward to a summer in camp. Thousands of skilled and trained men and women are getting ready to care for them as camp counselors. The camp has become a national institution. Parents are convinced of the good it does for their boys They become more self-reliant, better adjusted socially, and healthier, says a writer in The Camping Magazine. They have new experiences, new ambitions.

To be off on one's own, to wait on one's self, make one's own bed, and feel that it is the thing to do, develops self-reliance. The boy finds that his canoe goes as fast as he paddles it; that his daily tasks are as pleasant as his attitude toward them.

Camp is a happy place for a child to make the first break from home. Here he finds a multitude of interesting activities. Here, under the leadership of college men and women, the camper is taught the fundamentals of such skills as swimming, riding, athletics, rifle shooting, sailing, handicraft, dramatics, art, nature lore, marionette making and performing, canoeing and boating, scouting, roping and a score of other activities that develop muscle and mind.

Thus the timid girl or boy learns self-The domineering learns selfcontrol and more satisfying means of expression. The selfish boy learns to share his equip-

Travel and Resorts

Pack Up and Go!

If it were only as easy as that! But getting away is not such a simple matter. It requires weeks of planning, discussing, and perusing of travel literature. It takes the entire board of directors (the family) to decide the where, which and how of vacationing—and perhaps who is going.

Sometimes Dad's left completely out of the picture, at least as far as

"going" is concerned, but just because business detains him is no reason that he can't sit in and vote his family their greatest vacation year. After all, in a majority of cases, it's Dad's check that is the magic carpet which transports the family to vacation land.

So we recommend that the head of the family prepare himself for dictating or suggesting (depending on his status in the family circle) by carefully scanning these pages.

Most of the places advertising, will permit your spending weekends with the family at least, if you are unable to get away for a longer period. There is Bermuda, not too far away; Atlantic City for which little need be said; Canada, our neighbor to the North; the mountains of New England; and many other places not quite as well known, but deserving of your consideration nevertheless.

Of course Europe is bound to be popular this year, and if time is going to hang heavy on your hands this summer, England, Germany, France, Austria, and Switzerland will furnish you with all the entertainment and sightseeing that you could wish for.

The world is yours-take the most of it!

Air-Water Cruises-the Newest Thing

Sponsors of the first planned air-water tours of South America, the Grace Line and Pan-American Grace Airways report a steadily growing popularity with travellers in this new way of seeing a maximum of the southern continent in the minimum of time.

These tours vary in length from three to five weeks and are arranged flexibly so as to meet nearly any holiday time allowance. Either the Santa Clara or the Santa Maria sails every two weeks from New York on the first lap of one of these extraordinarily comprehensive tours of Latin America.

Panama, Colombia, Ecuador, Peru, Chile, and Argentina are the countries visited and the opportunity to fly over some of these offers a most unusual chance to really see a greater

The World

portion of the delightful countries of South America.

Fares are exceptionally reasonable for such a large return—running from \$495 to \$1190.

Vichy prepares for New Season

Vichy, the famous French Spa on the River Allier is preparing to welcome its 1936 visitors, and the beautiful Parc des Sources and Parc de l'Allier are fresh with the new green of the Chestnut trees and the colors of the flowers.

Although the new building of the Callou Baths remains open all year, and the bottling works and "Pastilleric" also operate the year round, with the reopening of the Grand Thermal Establishment and the Sporting Club, of big hotels, and with music once more sounding in the Casino and under the trees, one gets the impression that each year he or she witnesses a renaissance.

Every year sees new improvements. Since the opening of the Callou Baths, a model of their kind, the Grand Thermal Establishment has been so enlarged and improved that it seems almost an entire new construction. Its special services, such as the Mecanotherape Institute and the mud treatments, are well patronized, while the famous Vichy underwater massage, the Vichy douche, and other treatments to revitalize sluggish livers, attract their thousands yearly.

The new third class bath down near the river, and a great recreation and physical culture park for children with all sorts of attractions, are among new constructions now practically completed.

Sports always begin early in the season at Vichy. Tennis and golf are especially good in the spring months, and the courts and greens are in perfect condition.

Belgian Doctors to Visit Montreal

The Canadian Pacific is sending a liner to Antwerp to pick up members of the Belgium Medical Association coming to Montreal for their annual convention in July.

The Montclarc on her eastbound trip from Montreal, July 4, will go to Antwerp after calling at Havre and Southampton, reaching there July 14. She will make a quick turn around, embarking Canada-bound passengers the same day and sailing the same evening.

of every primate back to St. Augustine; lovely little Wells; noble York Minster; St. David's; Cashel, Cork and Melrose . . . glorious cathedrals and abbeys of Great Britain and Ireland steeped in thrilling history and tradition? • Who's for medieval castles and for-tiesses? Then see the Tower of London, Edinburgh, Caernarvon and Blarney Castles, all breathing the spirit of the Medicval Ages-scenes of dashing romances, sinister plots and vivid life that Time and History will ever remember! Unique architecture, works of art and treasures that took a thousand years to create! • England, Ireland, Scotland and Wales are brimming full of grand surprises. Everything different, unusual and unexpected. World-famous trains and swift cross-Channel steamers whisk you luxuriously wherever you want to go. Fishguard Rosslare, Holyhead-Kingstown, Stranraer Larne, Heysham Belfast be-tween Great Britain and Ireland; via Harwich and the Hook of Holland and English Channel ports to the Continent. . Empress of Britain Resumes Summer Service

Having completed her annual cruise around the world, the Canadian Pacific liner *Empress* of *Britain* has resumed regular trans-oceanic service for Cherbourg and Southampton.

But hardly settled to its accustomed run, plans as a result of previous success, are already being made for another world cruise starting from New York next Jan. 9.

As in previous years, the route followed will be across the Atlantic and via the Mediterranean and Suez Canal to India and the Far East, spanning the Pacific to California, after which the liner traverses the Panama Canal by daylight en route to New York. At their journey's end the tourists will have cruised almost 31,000 miles aboard the Empress, exclusive of side trips, and will have been away just 125 days. They will have seen the Holy Land and Egypt, visited exotic Bali, tropical islands and great cities, crossed and recrossed the Equator, wandered through temples and gardens in China and Japan and absorbed the color and atmosphere of the many historic places which have long been a magnet for world travellers.

The Empress of Britain's ports of call will be: Madeira, Gibraltar, Barcelona, Monaco, Naples, Athens, Haifa, Port Said, Suez, Bombay, Colombo, Penang, Singapore, Bangkok, Batavia, Semarang, Bali, Manila, Hong Kong, Shanghai, Chinwangtao, Beppu, Kobe, Yokohama, Honolulu, San Francisco, Los Angeles, Balboa, Cristobal and New York.

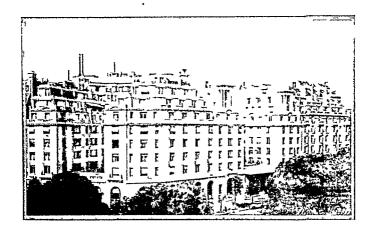

Sightseeing excursions are conducted from each port and many optional trips of varying length have been arranged.

Cruising the Great Lakes

If you're looking for a cruise this summer, it need not be to "foreign" ports. There is a section of our own country, storied and redolent with our own historic past, that provides travelers all the thrills of cruising to foreign lands. It is the Great Lakes district, our own inland waterways—2,230 miles of sparkling water travel that constitutes a memorable voyage for even the most seasoned traveler.

The liners that ply this route are splendid vessels, with commodious accommodations, incomparable cuisine and courteous service. From their decks you may view an ever changing scene of beautiful shoreland, historic cities and the wide expanse of waters that have ever played a part in the progress

of America. The shadows of past ages glide by . . . forests that sheltered war-painted Indians, bays that beckoned to LaSalle and his crew of hardy French explorers, forts where the pioneer and British Redecats made history to the tune of musketry. And interspersed with these associations of the past is ample evidence of stupendous modern achievement in the architecture and industry of the many ports of call.

You can, if you wish, arrange to go one way by water on the Great Lakes and return by rail. But since we are here concerned with cruises it is the complete nine-day Buffalo to Duluth Voyage that is of most interest. Incidentally, you can take your own car along on these cruises, using it whenever you wish

at the ports.

A Popular Tour

For motoring, one of the finest trips is along the well conditioned highway of 534 miles between Toronto and Ouebec.

From the thundering magnitude of Niagara Falls, on the Canadan side, to the bridal veil effects of Montmorency Falls, Quebec, 100 feet higher than Niagara, the motorist may span an area comprising the most interesting and historic in Eastern Canada, in a trip which could be made in two days but should be covered much more profitably in two weeks.

Long before General John Graves Simcoe, first Governor of Upper Canada, established the site of what is now the largest city in Ontario as his capital, the various Indian Tribes knew Toronto as "the place of meeting"; and such it has been ever since, being the "base of operations" for motor tourists bound north, west and east in the Dominion.

Along the route there are fine parks, drives, flower gardens, bathing beaches, golf courses, and desirable fishing spots. There are fortifications and other interesting historic structures to visit in addition to some of nature's most beautiful scenic splendors. Everywhere there are the things reminiscent of France and England, while the hotels where you will stay at night are undoubtedly criterions of hospitality, comfort, and service.

Here indeed is vacation, sightseeing, touring, and recreation rolled up in one.

Iceland a Land of Hot Springs

Strange as it may seem, Iceland is not the cold forbidding place you might expect from its name, says Mr. Elliot I. Liman, Cruise

Manager of the Holland-America Line. As passengers on the Rotterdam North Cape Russia Cruise will discover this summer, the proximity of the Gulf Stream gives Iceland a delightfully mild climate.

Another unique feature of Iceland is that while the mountains are covered with snow for the greater part of the year, there are numerous burning sulphur beds and bubbling hot springs. Always ingenious, many Icelanders obtain heat for their homes direct from these hot springs.

Icelanders also use their hot springs as laundries, and it is not an uncommon sight to see housewives doing the week's wash with hot water supplied free by nature.

Iceland is only one of the many interesting points included on the Rotterdam North Cape Explorers Cruise. Other high spots will be four days in Russia, visits to seven northern capitals and the exploring of nine fjords.

World Golf Contest to Follow Olympic Games

For the first time in the history of the game, all nations in which this pastime plays an important part will have an opportunity next August to play at one time and in one place for international fame and trophics.

This contest will be held immediately after the Olympics in Baden-Baden, the famous resort in the Black Forest.

The event will be one of a series of competitions to which, upon initiative of the Reich Sport Leader, von Tschammer und Osten, followers of the three great non-Olympic sports, golf, tennis and horse-racing, have been invited, and all of which will take place in Baden-Baden. The golf matches will be under the management of the Deutscher Golf Verband (German Golf Association) on the 18-hole course of the Baden-Baden Golf Club, on August 26 and 27.

The cup which will go to the winning country has been presented by the Fuehrer and Chancellor, Adolf Hitler, a second prize by the Reich Sport Leader, and a third one by the Reich Governor of Baden. The players of the three winning teams will receive gold, silver and bronze medals respectively, together with a piece of plate presented by the Deutscher Golf Verband, which will also give special prizes for the best results over 72, 54, 36 and 18 holes.

The contest is a 72-holes medal play from

scratch for all nations, each represented by a team of two amateurs (men). The length of the course is 4513 yards—standard scratch score 68.

The team with the lowest total score for the 72 holes medal play will win the "Grand Golf Prize of the Nations" outright. The cup becomes the property of the winning nation.

Entries can be made by golf unions, associations, federations or any other recognized golf organization. These should be forwarded to: Deutscher Golf Verband, Wiesbaden-Biebrich, Henkellsfeld, Germany. They must contain: Name, Address, Club, Handicap and Certificate of Amateur Status of each Player.—No Entry Fee. Only one Team may be entered by each Nation.

The representative players must comply with the National Status as defined by the Olympic Committee.

Until the close of the Entries (July 15, 1936) each nation may enter two reserve players besides their team of two players. The names of the finally selected team of two players must be in the hands of the Deutscher Golf Verband by August 15, 1936. After this date a reserve may only be substituted on grounds of illness or other similar energencies After the start of the competition on August 26 no player of any team may be replaced.

The competition will be played in accordance with the rules of the German Golf Association (Rules of the "Royal and Ancient") and the local rules of Badeu-Badeu.

The draw will be made by a Committee appointed by the German Golf Association. No two players of one nation will be allowed to play together. A new draw will be made for the second day (August 27th).

Travel Brevities

Robert D. Blackman, whose activities since entering the hotel business thirty-eight years ago have contributed so much to present-day high standards of management and service, has been appointed general manager of the Castle Harbour, the great hostelry in Bermuda over-looking the bay from which it derives its name. Mr. Blackman's career began early in this century when he became interested in resort management while holding a minor position at the Chalfonte in Atlantic City. Mr. Blackman has been connected with many other hotels and with hotel associations and was treasurer of the Explorers' Club for fourteen years.

SQUIBB Sex Hormone Products

have met the test of clinical experience

FORTUNATELY the confusion which characterized the introduction of sex endocrine products is disappearing. These products are now finding increased use as the result of a constantly accumulating number of favorable clinical reports. The House of Squibb has available three important sex hormone products with definite advantages both for the physician and his patients.

Amniotin-Physiologically tested estrogenic substance. Effective in the relief of menopausal symptoms, dysmenorrhea due to estrin deficiency, involutional melan-cholia, senile vaginitis, gonorrheal vagi-nitis. Recent clinical applications include missed abortion, uterine inertia in labor, and breast hyperplasia of the lobular type.

Amniotin is highly purified, accurately assayed and available in a variety of dosage forms: Amniotin in Oil (for hypodermic use) 10,000 International units per cc.; boxes of 3-1-cc. all-glass ampuls; 2000 International units per cc.; boxes of 6 and 100—1-cc. all-glass ampuls. Am-niotin Capsules (for oral use) 1000 International units per capsule; boxes of 20 and 100 capsules. Amniotin Pessaries (vaginal suppositories) - 2000 International units per pessary; boxes of 6 pessaries.

Follutein-The anterior pituitary-like fac-Folurem—Ane anterior premary-like rac-tor from pregnancy urine. It is useful in certain less-common types of functional uterine bleeding, and, in the male, in the treatment of undescended testicles and azoospermia. Supplied in 1-cc. vials containing 500 rat units and a 4-cc, vial of diluent and in 2-cc. vials containing 1000 rat units and an 8-cc. vial of diluent.

Anterior Pituitary Extract - An alkaline aqueous extract of the anterior pituitary glands of cattle; contains growth, thyrotropic and sex-complementary factors. Supplied in 10-cc. vials containing 100 growth units.

Maintain Mineral Alkali Balance

WITH

Kalak

Hypertonic-Alkaline-Carbonated-Not Laxative

The years of experience with physicians who have used Kalak show that the use of a formula containing calcium, magnesium, sodium and potassium salts represents a correctly balanced solution. This is Kalak which, as such, aids in maintaining a balanced base reserve.

How Alkaline Is Kalak?

One liter of Kalak requires more than 700 cc. N/10 HCl for neutralization of bases present as bicarbonates. Kalak is capable of neutralizing approximately three-quarters its volume of decinormal hydrochloric acid.

FEWER CLINIC BABIES... MORE PRIVATE BABIES

the doctor's office. But the doctor must be prepared to do more for the baby than the clinic can do! Mothers want their babies treated as individ-

uals, not as cases; their babies followed, not their charts; their physiques treated, not the labelled conditions; and the doctoring done economically and effectively.

With improved economic conditions, the trend is consequently returning to private practice. Encourage it!

The doctor knows his practice, the mother her economies. When the infant feeding materials prescribed are within the reach of every budget, mothers will appreciate the physician and babies will thrive.

Karo is a most economical milk-modifier. It consists of dextrins, maltose and dextrose (with a small percentage of sucrose added for flavor) and is suitable for every formula. Karo costs about one-fourth as much as expensive modifiers. A tablespoon of Karo gives twice the number of calories (60) in comparison with a tablespoon of any powdered maltose-dextrins, including Karo powdered. Karo is well tolerated, highly digestible, not readily fermentable and effectively utilized by infants.

Corn Products Consulting Serv Lorn Froducts Consulting Service for Physicians is available for further clinical information regarding Karo Please Address Corn Products Sales Company, Dept NM-6, 17 Battery Place, New York City.

A SCOURGE OF CIVILIZATION CHECKED * * * * VIOSTEROL

Civilization lives in temperate climates, shields itself from the sun with clothing, walls, glass, shades, and the smoke pall of great cities.

For hundreds of years this situation has prevailed. Shutting out the sun's rays cut off civilized peoples from the sun as a source of Vitamin D benefits, and thus has invited "the scourge of rickets". In modern times this situation has rapidly grown worse. As late as 1920 it was said that "every child in Central Europe was . . . rickety".

Today the disease of rickets is in retreat. The medical profession is adequately armed to deal with both its cure and its prevention. With the perfection of the Steenbock Process for developing Vitamin D effect by Irradiation in both pharmaceuticals and foods,

the way has been opened to provide this sunshine effect in our homes every day of the year.

Viosterol in oil is concentrated, easily administered, palatable, uniform in potency and accurate in dosage.

Five eminent American pharmaceutical houses known for their inflexible tradition of quality, produce Viosterol and Viosterol products as exclusive licensees. Through continuous biological assays, this Foundation further assures the maintenance of those rigid standards which supply a proper basis for publicand professional confidence in Viosterol products. The vast amount of research work and clinical evidence by which the uniform potency and efficiency of Viosterol are maintained has added materially to its usefulness.

ABBOTT • MEAD JOHNSON • PARKE, DAVIS • SQUIBB • WINTHROP

Exclusive Licensees of

WISCONSIN ALUMNI RESEARCH FOUNDATION*

M A D I S O N W I S C O N S I N *A corporation not for private profit...founded in 1925...to accept and administer, voluntarily assigned patents and patentable scientific discoveries developed at the University of Wisconsin. By continuous biological assays, the public and professional confidence in accurately standardized Vitamin D is maintained. All net avails above operating costs are dedicated to scientific research.

Doctors find many uses for this delicious food-drink

THE use of Cocomalt by the medical profession continually increases. This delicious chocolate flavor food-drink has a rich content of Iron, Calcium, Phosphorus, Vitamin D. An ounce of Cocomalt (the amount used to make one glass) provides 5 milligrams of Iron in easily assimilated form. Three glasses provide 15 milligrams of available Iron, the amount recognized as the average daily nutritional requirement.

Each glass of Cocomalt in milk also provides .33 gram of Calcium, .26 gram of Phosphorus, 81 U.S.P. units of Vitamin D.

Helps bring sound sleep

Cocomalt is easily digested, quickly assimilated. It is delicious hot or cold, tempting to young and old alike. Taken hot before retiring, it helps induce sound, restful sleep.

Sold at grocery, drug and department stores in ½-lb. and 1-lb. air-tight cans. Also available in 5-lb. cans for professional use, at a special price.

FREE TO DOCTORS:

We will be glad to send a professional sample of Cocomalt to any doctor requesting it. Simply mail this coupon with your name and address.

R. B DAVIS Co., Dept. 51-F, Hoboken, N. J. Please send me a trial-size can of Cocomalt without charge.

Words, words, words—

In an issue of the JOURNAL there are from 86,000 to 115,000 printed words.

A fair estimate of the time required by an average reader to read every word, would be about fourteen hours.

Of course, no one is expected to be so devoted to reading the JOURNAL, and aside from the editorial staff and proofreaders probably no individual has ever cast an eye on every word printed. And even among these, the case of a complete reading is very rare.

So to be thorough in your reading, doesn't mean that it is necessary to pore over every paragraph that appears from cover to cover. Thoroughness, in its broader sense, is just scanning the entire contents to be certain that you haven't missed one single item that is of particular interest to you and of possible usefulness in your practice.

This naturally includes checking advertisements, for even if all are not of immediate value, every advertisement should register sufficiently in your mind to be recalled when the emergency or necessity arises.

Being familiar with the advertisers in your JOURNAL will save you much time and annoyance in getting information at the particular time needed.

Distance hydrochloride)

Council Accepted

In place of Morphine

DOSE:

Oral, subcutaneous and rectal.

For Pain: 1/48 to 1/16 grain

For Cough: 1/64 to 1/32 grain

The dose of Dilaudid is about 1/5 that of morphine, that is, 1/20 gr. Dilaudid is generally equal to 1/4 gr. morphine in analgesic effect.

Dilaudid is made in U.S.A.

For Pain - - In inoperable carcinoma, terminal tuberculosis and other conditions requiring extended analgesia. In renal colic, tabetic crises, and angina pectoris.

In Surgery - - Pre-operatively, as an adjunct to anesthesia and post-operatively. Less likely to cause nausea or constipation than morphine; a stronger analgesic with a less pronounced soporific action.

In Obstetrics - - For pain during labor or postpartum. Very soluble, acts quickly.

For trial package send your Federal Narcotic Order Form for Ix20 H. T. 1/20 gr. and Ix10 O. T. 1/24 gr. Dilaudid

that will show you how to increase your income

Will you accept FREE a unique administrative plan that will enable you to collect your old accounts quickly, amicably and WITHOUT COST TO YOU?

Our plan is simple, automatic and efficient. It relieves you of the irksome task of writing letters to slow pay patients. It involves no change in your office routine—except to simplify it. All payments are made to you direct.

This plan works. Checks arrive with apologies. Patients who have been avoiding you, pay up and return for treatment. The plan is friendly, persuasive, constructive. It is amazingly resultful.

Full details will be supplied upon receipt of your card or prescription blank. No letter necessary.

FOR PALATABLE DIETARY RECIPES

CONCENTRATIONS OF KNOX GELATINE

nb: 4,0)

10%

Knox Gelatine contains 25% of glycine, (amino-acetic acid) and is an easy, pleasant means of augmenting the diet of those persons needing this acid.

Knox Gelatine surpasses in every respect the minimum U. S. P. requirements; pH about 6.0; contains no carbohydrates; bacteriologically safe.

TO MAKE DESSERTS CONTAINING ABOUT 8% OF KNOX GELATINE

Any beverage can be utilized as a dessert. Usually fruit juices are used. Put 2 envelopes of Knox Gelatine in a bowl. Add 1½ ounces of cold water. Heat 5½ ounces of fruit juice and pour over soaked gelatine. Stir well until mixture is dissolved. Let stand until firm. To mold, rinse a mold in cold water and pour in the gelatine mixture. A seven ounce portion gives an additional 13 grams of gelatine-protein, or 60 calories.

TO MAKE
FRUIT JUICES
CONTAINING 10% OF
KNOX
GELATINE

Place 2 envelopes of Knox Gelatine in a glass. Add 5 ounces fruit juice, orange, pincapple, grape, lemon, etc. Stir well. Dissolve over hot water. Sugar or lemon juice may be added if desired. Have the patient drink at once. Five ounces of such fruit juice drink give an additional 13 grams of gelatine protein or 60 calor graph protein or 60 calor graph gra

THIS PHYSICIAN, HELPING A WELL KNOWN MAN TO A MIGHTY PERSONAL VICTORY, WAS LAUDED BY SCORES!

Of course many never knew the terrific struggle through which this man went—before his physician persuaded him to present himself at Charles B. Towns Hospital in New York. But his decided improvement upon his quick return caused many favorable references to the doctor, naturally. First of all the physician had pictured to him the confidence-inspiring methods used here—the consul-

tive rather than compulsory attentions. Doctor — send for "Drug and Alcoholic Sickness" and note that many are returned to respond to the physician's care in from two to four weeks.

Golf, and Infant Feeding

It is possible to play over the entire course with a single club and bring in a fair score. But playing with only one club is a handicap. The best scores are made when the player carefully studies each shot, determining in advance how he is going to make it, and selecting from his bag the particular club best adapted to execute that shot.

For many years, Mead Johnson & Company have offered "matched clubs," so to speak, best adapted to meet the individual requirements of the individual baby.

We believe this to be a more intelligent approach than the use of a single "baby food" to meet the many situations presented by many babies. "There is no average baby."—Adv.

PURE JUICE of Big Red-Ripe Whole Tomatoes

OPHTHALMOSCOPY IN GENERAL PRACTICE

CONRAD BERENS, M.D., AND JOSHUA ZUCKERMAN, M.D., New York City

Ophthalmoscopy permits the study of the interior of the eyeball. It serves not only to detect local intraocular changes in the media and fundus but also to diagnose remote and general diseases (arteriosclerosis, syphilis, diabetes, nephritis, brain tumor, etc.). A clinical knowledge of the eye obtained by means of the ophthalmoscope is essential to every progressive practitioner of general medicine.

The importance of ophthalmoscopy can be appreciated when it is realized that the eye is the only organ in the body in which a living nerve can be visualized and studied and the functioning arteries and veins observed and followed to and from their finest ramifications. Because the optic nerve is a part of the brain, diseases of the brain may manifest themselves by visible changes in the optic nerve. The retinal blood vessels belong to the cerebral vascular system. Diseases of the circulatory system therefore may be evidenced by alterations in the retinal vessels.

It is important to have a definite knowledge of the appearance of the normal fundus so that the abnormal will be recognized by its departure from normal. A careful study of the normal fundus as illustrated in Figs. 1 and 2 is suggested.

Ophthalmoscopy may be performed in an illuminated room and without dilatation of the pupil (mydriasis) but it is facilitated by darkening the room, and rendered more accurate when the pupil is fully dilated. To dilate the pupil sufficiently to permit thorough examination of all parts of the fundus, instill three or four drops at three minute intervals of one of the following mydriatics:

epinephrin (1:1000), three per cent ephedrine, three per cent euphthalmine, or two per cent homatropine.

Direct ophthalmoscopy

To examine the patient's right eye by direct ophthalmoscopy hold the electric or battery handle ophthalmoscope in your right hand in front of your right eye and stand on the patient's right side. To examine the patient's left eye hold the ophthalmoscope in your left hand before your left eye and stand on the patient's left side.

Rotate the lens-carrying disk of the ophthalmoscope to zero. Hold the ophthalmoscope in your hand with your index finger placed against the lens disk so that you can rotate any lens into place without changing your position. Direct the beam of light from a distance of one meter into the patient's eye from the ophthalmoscope held closely against your eye. Look at the patient's eye through the aperture in the ophthalmoscope.

In the normal eye, a red fundus reflex is seen filling the entire pupil. Now hold the ophthalmoscope at 0.5 meter from the patient's eye and with your index finger rotate the lens-carrying disk clockwise, bringing a plus 4.00 lens into place and at closer range a plus 10.00 and finally still closer a plus 20.00 lens while you study the details of media (cornea, anterior chamber, lens, vitreous) to exclude any obstruction to your view of the fundus.

Interference with the red fundus reflex may be due to obstruction by opacities of the cornea or lens, by exudates in the anterior chamber, by pupillary membranes, or by a massive intraocular hemorrhage, abscess, exudate, or tumor in the vitreous.

Opacities of the cornea or lens appear black or grayish against a red back-To determine the location of these opacities direct the patient to look down, then up, while you observe the direction of the movement of the opacity. Opacities of the cornea (and of the anterior lens capsule) move down with the downward movement of the patient's eye, and up with the upward movement of the patient's eye. Opacities near the posterior surface of the lens move up with the downward movement of the patient's eye, and down with the upward movement of his eye. Normally the lens is transparent and therefore not visible. It loses its transparency, i.e., it becomes cataractous, as a result of interference with its nutrition. It may then be seen with a plus 10.00 lens in the ophthalmoscope held close to the patient's eye as one or more black areas occupying the pupillary region. These cataractous areas stand out against the red fundus background. Examine the lens for the presence of peripheral spoke-like opacities (called riders) arranged like the spokes of a wheel and for central (or nuclear) opacities (Figs. 3, 4). These are the two most common forms of cataract. Cataracts are most commonly caused by (1) senility: the most frequent cause after fifty years of age; (2) general diseases: diabetes, epilepsy, pellagra, poisoning by naphthalin, ergot; and

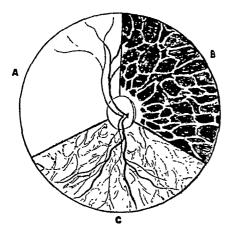

Fig. 1. Normal fundi. A, uniform stippled fundus; B, tesselated fundus; C, albinotic fundus.

recently dinitrophenol;² (3) faulty development: congenital cataract; (4) trauma in cases of direct injury to the eye which dislocates the lens or which tears the anterior capsule and permits the aqueous to penetrate the lens fibers, rendering them opaque; indirect trauma: excessive heat, sunlight or electric light; (5) eye diseases: choroiditis, retinitis, and infected ulcers.

The periphery or margin of the lens may be seen in cases of dislocation or subluxation of the lens and in patients with coloboma (incompleteness or defect) of the iris, whether congenital or acquired after iridectomy (an operation for the removal of a portion of the iris).

Vitreous. With the ophthalmoscope held close to your eye, rotate plus lenses into place by turning the lens disk from zero clockwise so that all depths of the vitreous may be studied. A normal vitreous is clear and transparent. To facilitate the examination of the vitreous the patient is requested to look quickly up and down and from right to left so that opacities in the vitreous may be stirred into motion and brought into view. The vitreous should be carefully studied in order to detect cloudiness, discoloration, and small and large masses.

1. Cloudiness. This may be due to inflammation of the choroid (choroiditis) or of

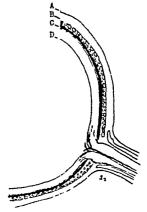

Fig. 2. Cross section of the sclera (A), choroid (B), pigment layer (C), retina (D) of the eye to illustrate that ophthalmoscopically the choroidal vessels are concealed when the pigment layer is normal; (2) The choroidal vessels are visible when the pigment layer is destroyed (chorioretinitis), thinned, or poorly developed (in blond people and in albinos).

the iris and ciliary body (iridocyclitis), or of the iris, ciliary body and choroid (inveitis), retinitis, inflammation of the optic nerve (papillitis), or distachment of the retina. A vitreous filled with dust-like opacities is frequently of syphilistic origin Vitreous opacities are often seen in progressive myopia (neirisightedness) and are the result of stretching caused by a low grade inflammation of the sclera and choroid (posterior sclerochoroiditis).

2 Discoloration A red discoloration in the due to a humorrhage into the vitreous A white or yellow reflex from the vitreous may be produced by a tumor (glioma), abscess of the vitreous, massive exudate in the retina, tubercle of the retina or choroid, metastatic inflammation of the eye (metastatic ophthilmia) or to a congenital defect (coloboma) of the choroid

3 Small masses in the attreous Vitreous opacities are movable and are seen with the ophthalmoscope as black dots, flakes or threads against a red background. Patients frequently complain that they see annoying specks which float before their eyes, particularly in bright light or in sunlight. These opacities are found in high myopia (nearsightedness), in inflammators conditions of the eye (choroiditis, uveitis, iridocyclitis, retunitis, pipillitis), and in trauma, detachment of the retima, synchysis semtillans, and asteroid hyalitis.

Ophthalmoscopic examination of the vitreous may reveal small glistening opicities which seem to fall when the patient glances quickly in any direction. This condition is called synchysis sentitlant. In asteroid hydritis (which resembles synchysis seintillans except that the glistening bodies are spherical) all the particles in the vitreous move en masse.

A foreign body in the vitreous may result from a perforating wound of the eyeball

The crystalline lens may be dislocated into the vitreous as a result of direct or indirect trauma to the eyeball

4 Large Masses in the Vitrous Glioma of the retina appears as a yellowish gray

Fig 3 Ophthalmoscopic appearance of a nuclear cataract (A), a cortical cataract (B)

mass in the vitreous of a child, usually under six years of age

Sarcoma or detachment of the choroid may be seen as a pigmented mass in the vitreous of an adult

A tubercle of the choroid or an abscess of the vitreous may appear as a white or yellowish mass in the vitreous

Large bands or strands of connective tissue which appear black against a red breckground are usually due to organized exidate of the vitreous, in both syphilitic and nonsyphilitic retunits. The lens in fetal life is nourished by the hyaloid artery lins may persist and appear as a dark strand against a red background extending from the optic disk toward the lens.

Fundus Just as a diagnosis in general medicine is made by observing any local deviation from the normal in conjunction with the general findings, so in ophthalmoscopy the details of the fundus are studied in contrast with the normal appearance and these details are correlated with the general clinical and laboratory findings before a diagnosis is made.

In this article we shall study the details of the fundus ophthalmoscopically, and point out the changes that may be found in the optic disk, the macula, the retinal arteries and veins, and in the retina and choroid

The correlation of the eye symptoms and signs with the general findings (blood pressure, albuminuria, hyperglycemia, Roentgen ray, Wassermann reaction, etc.) usually results in a complete picture which aids in the diagnosis

Ask the patient to look at a point directly ahead and on a level with his

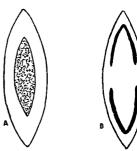

Fig 4 Cross section of nuclear cataract (A); of cortical cataract (B).

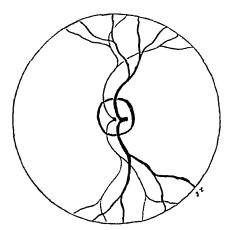

Fig. 5. Schematic drawing of vessels of fundus to demonstrate bifurcation (branching) of central artery and veins.

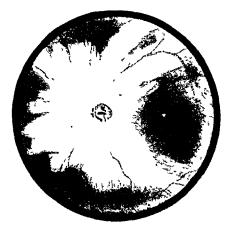

Fig. 6. Medullated nerve fibers.

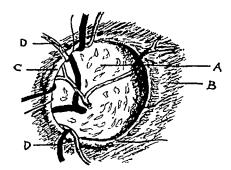

Fig. 7. Optic disk in glaucoma (schematic). The drawing illustrates the cup-shaped depression of the nerve head (A). The blood vessels (D) bend sharply outward as they emerge from the cup, the vein (D), disappears from view as it enters the glaucomatous cup. (B), retina (C) margin of cup.

eye. Hold the ophthalmoscope before your eye and as close to the patient's eye as possible while you look at the patient's eye through the peep hole in the ophthalmoscope. Rotate the lenses into place until the optic nerve head is brought into focus. In order to bring the details of the fundus clearly into view it is necessary to rotate into place a lens which will correct the patient's refractive error; e.g., if he is myopic a minus lens will be necessary; if he is hyperopic, a plus lens will be needed. If the amount of myopia is 10.00 diopters a lens of approximately minus 10.00 diopters will be necessary; if the amount of hyperopia is 3.00 diopters a plus 3.00 diopter lens will be required. It is unnecessary to have a technical knowledge of the value of plus or minus lenses or to know the patient's error of refraction or to observe what lens is rotated into place; it suffices to observe the fundus and rotate the lens disk until the optic disk and the vessels of the retina become most distinct.

As we look into the fundus, when the patient's eye is directed straight ahead, the first thing that comes into view is the head of the optic nerve, if no obstruction is present. It can be readily distinguished from the rest of the fundus by its circular shape, lighter color, and by the fact that the blood vessels emerge from it and divide into branches from that point. If some difficulty is experienced in locating the disk it may be readily found by following the course of the vessels of the retina toward the point at which they converge. They will lead to the disk (Fig. 5). The retinal arteries are usually arranged in the following manner: on the disk the central retinal artery divides into two branches, superior and inferior; each of these divides into two, superior temporal and superior nasal, inferior temporal and inferior nasal; each of these again divides into two, from which arise smaller branches and thus division continues to form the finest ramifications.

It will be evident that the arteries are named according to the area of the retina in which they lie. The veins follow the course of the arteries and are named in the same manner.

An artery can be distinguished from a vein by the following characteristics: the

arteries are lighter, straighter, narrower, and sharper in outline than the veins. The veins are darker, more tortuous, and wider than the arteries.

Optic disk. In studying the optic disk the following should be noted:

a Stee. It appears small in hyperopia and large in my opia, papillits and papilledema. Actually its horizontal diameter varies from 126 to 16 mm (a mean of 1.5 mm) (Salzmann) but when viewed through the ophthalmoscope it is magnified about thirteen times. The vertical diameter is a trifle greater.

b. Shape: It is normally circular but may

appear oval in astigmatism.

c Color: The disk is normally pinkish white and its temporal half is somewhat highter than its nasal half.

The disk is congested in eyestrain, iritis, uveitis, papillitis, retrobulbar neuritis, and in generalized passive congestion.

It is pale white in atrophy of the optic nerve, occlusion of the central retinal ar-

tery, and in severe anemia

d Center of the disk: Normally the center of the disk is usually seen as a funnel-shaped depression, lighter in color In disease, the than the rest of the disk disk (papilla) may be cupped or elevated The depression may be poorly marked. In papillitis it may be entirely absent and replaced by a forward protrusion of the disk In papilledema (due to increased intracramal pressure-intracranial tumor) the center of the disk may remain normal, but the margins are indistinct and the forward protrusion of the disk is marked depression may extend to the border of the disk in glaucoma

The lamina cribrosa which is seen as a seve-like area at the bottom of the cup in most disks may be distinct in normal eyes and unusually distinct in simple optic atrophy and in advanced glaucoma. It may be indistinct in some normal eyes but more indistinct in papillitis in which it is covered by edematous nerve fibers or by recent exudates and in the optic atrophy following papillitis (postpapillitic atrophy) in which an organized exudate may cover the lamina cribrosa

e. Disk margin: It is usually well-defined normally by a pigmented choroidal ring but may be normally indistinct in hyperopia (called pseudoneuritis). It is well-defined in simple optic atrophy and indistinct in secondary optic atrophy, papilledema, and papillitus In papilledema the poorly defined margin is associated with swelling and forward protrusion of the disk. In papillitus

this indistinctness of the margin of the

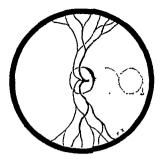

Fig 8 Schematic diagram to indicate the method of locating the macula which is two disk diameters temporal to the optic disk.

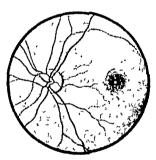

Fig 9 Semile degeneration and pigmentation of the macula,

Fig 10 Occlusion of the central artery of the retina

disk is usually associated with hemorrhages in the retina.

f. Disk vessels: In glaucoma the vessels at the margin of the disk appear broken where they bend backward into the cupshaped depression of the disk.

In papilledema the vessels protrude forward over the margin of the swollen disk.

The amount of depression or protrusion of the disk (or of the vessels) is measured by noting the difference in diopters between the strength of the lens (in the ophthalmoscope) required to focus a vessel on the retina and one on the disk. For greater accuracy, it is advisable to note the weakest minus lens used or the strongest plus lens necessary to focus these two areas. Three diopters represent one mm. of displacement, e.g., if a vessel on the retina appears distinct with a plus 1.00 diopter lens and a vessel on the disk with a plus 4.00 diopter lens, there are three diopters of difference in level-one mm. actual difference. If a minus 1.00 diopter lens and a plus 2.00 diopter lens are necessary there are also three diopters of difference (1 mm.).

The vessels on Obscuration of vessels. the disk may be completely or partially concealed by medullated nerve fibers (a congenital condition, which appears as white areas with feathery peripheral edges) or by an edematous retina in papillitis or

papilledema (Fig. 6).

Pulsation of the vessels on the disk may present. Venous pulsation is normal; be present. arterial pulsation is pathologic. pulsation may be found in acute glaucoma (increased intraocular pressure) (Fig. 7), exophthalmic goiter, aortic regurgitation and in marked hypertension or hypotension.

g. Disk surroundings: A halo may be seen around the disk in peripapillary atrophy (chorioretinal atrophy) and in the later

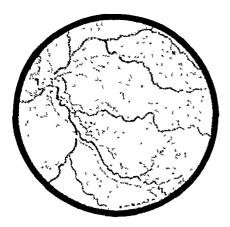

Fig. 11. The ophthalmoscopic appearance of the retina in diabetes

stages of glaucoma (glaucomatous halo) (Fig. 7).

A crescent may appear at the disk margin in normal and astigmatic eyes but it may be particularly marked in myopic eyes, due to stretching of the sclera and degeneration of the choroid, and of the pigment layer of the retina (myopic crescent).

Medullated nerve fibers may be seen, partially covering the retinal blood vessels a short distance from the optic disk or directly on it (Fig. 6).

The part of the fundus surrounding the optic disk (papilla) is subject to the same lesions which affect the retina in general (see retina).

Macula.—The macula is about two disk diameters temporal to the optic disk and on a level with its lower edge (Fig. 8). Normally, the macular region is somewhat darker than the rest of the fundus, and is devoid of blood vessels. Blood vessels surround and direct their ramifications toward the macula but do not reach it. A bright spot (the fovea centralis) is usually seen in its center.

Color of the macula: It is gravish and usually mottled in senile degeneration of the macula (Fig. 9), in central choroiditis, and in edema of the retina. It is black in pigmentation of the macula.

It is red in occlusion of the central retinal artery, amaurotic family idiocy, hole in the macula, hemorrhage in the macula, and in commotio retinae (edema of the retina surrounding the macula following trauma).

Surroundings of the macula: White lines radiating from the macula are seen in renal retinitis; white irregular areas are seen in diabetic retinitis. A white area with a central cherry red spot (representing the fovea centralis) is seen in occlusion of the central retinal artery (Fig. 10) and in commotio retinae.

The vessels of the fundus: The vessels of the retina are subject to the same changes that take place in those of any other part of the body, e.g., tortuosity of the vessels, thickening or thinning, increased permeability (with transudation), inflammatory changes in and about the vessel walls (exudation and perivasculitis), alterations in caliber, and interference with the blood stream (occlusion —Fig. 10—by thrombosis or embolism).

Note whether some of the retinal vessels are concealed. The vessels may be

hidden by a preretinal hemorrhage (situated between the vitreous and the retina), medullated nerve fibers, proliferating retinitis (strands of scar tissue which usually follow the larger vessels in the retina), papilledema (choked disk), or papillitis.

Note: Color of the vessels. They are dark in cyanosis, mitral stenosis, congenital heart lesions, detachment of the retina, and in tumor of the orbit. The veins are dark in thrombosis

of the central retinal vein.

Fullness The vessels are full in polycythemia, leukemia, varicosities of the retinal vessels, and in congestive glaucoma. Local dilatations are found in arteriosclerosis, syphilis, and diabetes. Empty or bloodless vessels are found in occlusion of the central artery and in

arteriosclerosis.

Course, caliber, contour, light reflex, and pulsation of the vessels of the retina Tortuosity and changes in caliber of the arteries occur in arteriosclerosis, diabetes, and syphilis. Compression of a vein at a point where an artery crosses it (arteriovenous compression) may be observed. This is indicative of hypertension. Normally the veins and arteries have a light reflex; that of the vem is much broader than that of the artery. In disease, this light reflex is altered. As previously mentioned, venous pulsation is not pathologic; arterial pulsation occurs in acute glaucoma, exophthalmic goiter, marked hypertension or hypotension, and in aortic regurgitation.

Fundus in general: In order to avoid overlooking lesions in the retina, it is necessary to study carefully the peripheral parts of the fundus. It is most convenient to follow the course of the vessels in all directions from the disk to the periphery instead of looking up, down, left, and right at random. Because the examiner has his own movements under better control than those of the patient it is usually advisable not to direct the patient to look in these directions but to look straight ahead. In order to see a part of the fundus that does not lie directly ahead of you, it may be necessary to move your head in a direction opposite to that in which this part lies, i.e., you examine the fundus through the pupil as you would a room through a keyliole.

Note the presence of hemorrhages in the periphery of the fundus. These occur in hypertension, arteriosclerosis, nephritis, diabetes (Fig. 11), tuberculosis, and

syphilis.

Exudates, fuzzy-looking white areas, in the fundus occur in diabetes, tuberculosis, nephritis, arteriosclerosis, and syphilis.

Pigment migrates into old hemorrhages and exudates. Pigment spots, shaped like bone-corpuscles, scattered throughout the periphery of the fundus occur in retinitis pigmentosa and in syphilitic retinitis.

Detachment of the retina may occur as a flat detachment in which the retina is somewhat cloudy, its level more anterior, and its vessels slightly darker and more tortuous than the healthy part of the fundus or as a protruding detachment which is seen as bluish-gray or greenish folds in wave-like fashion, the crests of which are grayish white (Fig. 12). These folds usually move with the movements of the eye. The blood vessels on the detachment are dark and tortuous, and course appears interrupted broken where they are hidden behind the folds of the detached retina. A retinal detachment can usually be seen during the examination of the vitreous with a plus 10.00 diopter lens in the ophthalmoscope.

Choroid. With the ophthalmoscope choroidal vessels are not seen in normally pigmented fundi but are visible when the layer of pigment epithelium of the retina (Fig. 2), which lies in front of the choroid, is scanty (e.g., in blond people and in albinism) or destroyed as a result of disease (chorioretinitis). The layer of pigment becomes atrophic and permits the vessels of the choroid to become ophthalmoscopically visible.

Conclusions

With few exceptions, diseases of the fundus are really only symptoms of general diseases and the changes in the

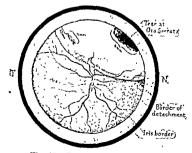

Fig. 12. Detachment of the retina.

fundus frequently precede signs in other parts of the body. Any disturbance of circulation or change in the composition of the blood may be evidenced by lesions in the delicate tissues of the fundus.

The general practitioner does not require a profound knowledge of ophthalmoscopy. It is necessary only for him to locate the optic disk and the macula, to know the normal appearance of the fundus, and to be able to recognize as pathologic the following:

- 1. Changes in the optic nerve disk: Whiteness of the optic nerve disk, elevation (swelling) or depression (cupping) of the disk, or indistinctness of its margins.
- 2. Changes in the fundus: The presence of white spots (exudates or depigmenta-

tions), black spots (pigmentation), opaque areas, hemorrhages, or cloudiness accompanied by elevation or folds (detachment) in the fundus.

3. Changes in the blood vessels: Alterations in the caliber and course of blood vessels, and arteriovenous compression.

4. Changes in the macula: White spots, pigmented spots or red areas (hemorrhages). or a hole in the macula.

It is necessary for the general practitioner to appreciate the fact that these findings usually indicate that a general disease is or has been present, and that thorough investigation and treatment of the patient's general condition may be indicated.

THE NATIONAL HEALTH SURVEY

TREASURY DEPARTMENT PUBLIC HEALTH SERVICE WASHINGTON

Dr. Daniel S. Dougherty, Secretary Medical Society of the State of New York 5th Avenue & 103rd Street New York, New York

My dear Dr. Dougherty:

The field staff of the National Health Survey, carefully trained in gathering detailed, accurate information, has completed the extensive canvass of chronic and disabling illness conducted by the United States Public Health Service in ninetcen states.

When the study was initiated last fall, the program was discussed in the October 5 issue of the Journal of the American Medical Association. As announced at that time, there was special realization of the great value that would accrue to this scientific survey if supplementary facts could be obtained from physicans in cases of medically attended illnesses. Accordingly, when medical attendance was reported, permission to secure additional data from the doctor was requested of the family by the

field worker. Assured that the information would be regarded as confidential and would be used for purposes of statistical compilation only, families were cooperative in grantting the privelege of confirming diagnoses.

Appropriate forms are now being received by the attending physicians named by informants, and the Health Survey is asking the cooperation of members of the medical profession in this very important phase of the study. It will be appreciated if you will announce the confirmation plan to your Society, urging the desirability of having the forms returned as promptly as

For each form filled and returned the physician will receive a fee of twenty-five cents, a small compensation for the service he will render in executing the blank. By supplying the information requested he will contribute invaluable data to this study and assure the scientific accuracy of the results.

Very sincerely yours,

W. F. DRAPER Acting Surgeon General

May 9, 1936

NEW YORK STATE ASSOCIATION OF SCHOOL PHYSICIANS

The annual meeting of the New York State Association of School Physicians will take place at the Grand Union Hotel, Saratoga Springs, June 22 and 23, meeting in

conjunction with the State Department of Health. All school physicians and others interested in the school health program are urged to be present.

ENCEPHALITIS FOLLOWING GERMAN MEASLES

E A BAUMGARTNER, M.D., Newark, N.Y. State of New York Department of Mental Hygiene

Encephalitis following German measles is unusual. A recent report of a case in the Journal of the American Medical Association! is the only one found recorded in that journal for several years. The attack of German measles in this case was not serious, the encephalitis following was sudden in onset, and the patient appeared seriously ill.

The following case involving a pitient of Dr Ralph Sheldon of Lyons, N Y, was seen in the hospital only once, the

afternoon of April 1, 1935

II B a ten year old girl, had German measles on March 30, a typical rash slight fever slight indisposition in a child in school where some mild cases had occurred The child felt better that evening and the rash was disappearing. The next day about noon, she had, what the parents said was a convulsion. She was seen within a few minutes by Dr Sheldon She still had a slight rish, was extremely nervous, but was out of her convulsion. In about a half hour, she had another convulsion, her arms and legs were rigid and slie was taken to the hospital There was some twitching of her extremities The first day she had some projectile vomiting After some time, she was given an enema and some of the castor oil given earlier, was seen in the return from the enema. The next day (April 1), she was given orange juice, but she gagged easily A spinal puncture done that morn ing was said not to be under increased pressure and clear fluid was obtained

The patient had had scarlet fever some months ago. She was of normal size, normally bright in her class work and did average school work, but had complained in the past two weeks that she could not keep pace with the others. She had been going to school, had played as usual and did not complain of headaches nor of tiring.

On March 31, after the convulsion, the temperature was 1028° Γ, pulse rate was 120 The next dry with the child still in stupor, the temperature was 1014 After the spinal puncture the temperature reached 104 F, rectally, pulse was about 110, and 14 PM the temperature was 1036 F. The patient had received grain 1/14 of morphine on arriving at the hospital the dry before, grain 1/12 at 6 PM and grain 1/12 at 2 30 AM the next day, April 1

The spinal fluid, most of which was inadvertently lost, was brought to the laboratory where it was seen to be clear, gave a positive Pandy reaction and contained eighty-two cells per cu mm. A differential count of a dried smear gave three neutrophiles, sayy nine lymphocytes, and twenty-

eight red cells

The child was seen about 4 PM April 1 She was a well-developed and fairly wellnourished girl. She was lying in bed with her eyes partly closed, mouth open, breathing quietly, rate twenty-five. The skin was warm and moist The pupils were dilated notwithstanding the 1/12 grain morphine by hypo early that morning The eyes moved continuously from side to side pupils reacted slightly to light. The disks showed blurred margins and the vessels with slightly fuzzy edges were dilated. The mouth could not be pried open with a There was no jaw tongue depressor The neck was slightly resistive, clonus but later could be moved easily. The elbows were flexed so that the hands were near the face both elbows were definitely resistive at first then could be moved. When allowed to be free, they would again become flexed with the hands near the face and were again resistive. The wrists were freely movable, the fingers flexed and slightly resistive. No biceps or triceps reflexes were obtained. The abdominal reflexes were not obtained nor were kneejerks or Achilles reflexes present knees, slightly flexed, were, at first, somewhat rigid so that the leg could be raised with a hand under the knee After slight manipulation, the knees would relax somewhat and the ankles were freely movable There were positive Babinski and Oppenheim reflexes on both sides and a suggestive ankle clonus on the left The Kernig sign was negative. A diagnosis of encephalitis was mide, possibly following German measles, which was concurred in by the attending physician and hospital staff

The child looked seriously ill and a poor prognosis was given to both the family physician and family, although it was later felt that, if this were a sequel to German measles the child would recover quickly

and probably completely

What seemed to be unusual findings were the widely dilated pupils even if about fourteen hours had passed since morphine was given and the flexed resistive elbows,

fingers, and knees with freely movable wrists and ankles. Another peculiar finding was that the spinal fluid was said not to be under increased pressure. The following day (April 2), the temperature remained over 103 and reached 105 in the afternoon. She was in a stupor, frequently twitched, and was rigid. Tepid baths were given for the high temperature and liquids were given by a nasal tube. The next day, she was less rigid and had less twitching. eyes would follow moving objects. Liquids were taken poorly but the following day she took water better, was restless at times, and talked a little. The temperature reached normal and did not again rise. That night and the next day (April 5), she was restless, irrational at night and screamed. That night, she was again given morphine and had to be restrained. April 7, a week after her first convulsion, she cooperated well, and seemed normal. She was discharged from the hospital the following day.

From this time until April 25, the child acted normally. On that day, she had a fever of 102 and was nauseated, without any apparent reason. She was quite normal again three days later when seen by Dr. Sheldon and returned to school. She has been well since that time.

I am indebted to Dr. Sheldon for his notes and the hospital records of this case subsequent to April 1.

Cecil in his text book on Medicine

says nothing about encephalitis following measles. There is no statement on this subject in Osler's text and nothing in Holt's text on pediatrics. A recent report by Skinner¹ is of a similar case except the case here reported was in stupor a longer time. In both cases apparently the attack of German measles was not severe. It is interesting that these cases can appear so dangerously ill and recover so quickly and completely.

Peterman and Fox² discuss thirteen cases of encephalitis following measles. Only one of these cases had an onset About half of them with convulsions. showed an increased spinal fluid pressure and there was often an increased number of cells, usually the lymphocyte type. They discuss the possible etiology of the encephalitis and apparently believe it to be a virus activated by measles. Because a similar encephalitis may follow German measles, one would be inclined to believe that some toxic substance of the disease or the organism causing it may involve the brain in certain cases.

ACUTE INFECTIOUS MONONUCLEOSIS

Report of a Case with 42,000 Leukocytes

KENNETH R. McAlpin, M.D., New York City

Assistant Attending Physician, Assistant Professor in Medicine From the Department of Medicine, College of Physicians and Surgeons, Columbia University, and the Presbyterian Hospital

A few months ago I discussed thirtyone cases of acute infectious mononucleosis. After reading this paper, but before it was published, a patient appeared with what proved to be a more severe attack of this disease than any of those reported. This case is recorded with the kind permission of Dr. M. H. Dawson, whose patient he was.

Dr. A. M., age 35, a German biochemist, came to the Presbyterian Hospital complaining of drowsiness, muscle pains, fever and headache, for three days. These symptoms had been preceded by a sore throat for two weeks. He felt that "something must be wrong" as he found it impossible to work. He coughed but raised no sputum.

Family history was not important. He lived a normal life and used tea, coffee, alcohol, and tobacco in moderation. Two years ago weight 180 pounds—he has gradually lost twenty-three pounds, but is not undernourished.

He had scarlet fever and diphtheria as a child with no complications or sequelae. Severely wounded in the war but recovered completely.

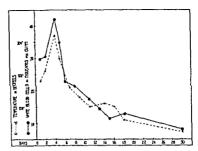

On admission his temperature was 101.2, pulse, eighty-four, respirations twenty, blood pressure 112/70. A well-nourished and developed German who looked rather "washed-out," but not severely ill. No respiratory distress or obvious discomfort. The scars of his wounds were apparent on the head and face. Eyes, ears, and nose

appeared normal. Teeth in good condition except for much repair. Tongue coated. Pharynx red and edematous. There was a tiny spot on the left anterior faucial pillar and a similar one on the right side. neck was not stiff, Glands; there were numerous non-tender nodes felt in the cervical and subclavicular axillary and inguinal region. The largest were about 1/2 x 1 cm. Lungs were resonant throughout with a few fine moist rales at the left base which disappeared after coughing. Heart not en-larged, sounds normal. Abdomen was soft and flat. No tenderness, liver not felt. The edge of the spleen felt four c.c. below the costal margin on deep inspiration.

The first blood count showed 32,000 white cells with eighty per cent lymphocytes. A day or two after admission the blood picture was: Hgb one hundred per cent (100% = 14.9 gm. Hgb.); r.b.c. 5,200,000; w.b.c 30,200; Neut, ten per cent (0-1-9); lymph, forty-one per cent; abnormal lymph. twenty-six per cent; mono, eight per cent; smudges fifteen per cent. The numerous abnormal lymphocytes and monocytes made an impressive picture but the absence of embryonal forms seemed to preclude leukemia. Many of the lymphocytes came in the class described by Downey as "leukocytoid." With hemoglobin and red cells normal we immediately thought of mononucleosis; this was confirmed by the agglutination of sheep red cells by the serum dilution of 1:128.

The Wassermann test was negative. In the throat culture streptococcus viridans predominated and no hemolytic organisms were seen. The temperature, as shown by the chart, continued to rise, and on the fifth day in the hospital reached 104.4. At this time the white blood cells were 42,000. We had never seen anyone so sick with mononucleosis and wondered if we had erred in our diagnosis. Should we expect any complications? Acute nephritis has been reported, but the urine never showed more than a trace of albumin and no casts were found. The temperature remained above 104 for a few hours and the next day, to our relief, reached only 103 and, as shown by the chart, came down steadily. The white cells fell rapidly with little change in differential count. The reduction in leukocytes roughly paralleled the drop in temperature.

The patient remained in the hospital for 20 days and made an uneventful recovery.

When seen three months after discharge he looked perfectly well with no nodes or spleen palpable; the blood count at that time was w.b.c. 10,000; neut. 53; eos. 12; baso. 1; lymph. 30; monos. 4.

It is hard to account for the presence of twelve per cent eosinophiles. So many are, I think, unusual after an attack of mononucleosis. We have no records that go over six per cent. This count was checked in a month and the differential remained practically the same except that the eosinophiles had dropped to six per cent. The rise in cosinophiles is hard to explain but at least it appears to have been only temporary.

Comment

In the paper mentioned above,1 I called attention to the fact that diagnosis was often puzzling. This certainly was true in this instance because when Dr. M. had a temparture of 104 and 42,000 white cells we were none too sanguine about our ability as diagnosticians. None of our other thirty-one patients had more than 25,000 white blood cells.

Summary

- 1. A case of infectious mononucleosis with a blood count of 42,000 is reported.
- The temperature reached 104.4F.
 The patient made a complete and
- uneventful recovery. 622 W. 168 St.

EDITORIALS

The Legislature Adjourns

In spite of the intense partisanship of an election year, the 1936 State Legislature forebore to inject politics to any great extent into its deliberations on medical questions. While a number of deserving measures favored by the profession failed of enactment, there is cause for deep satisfaction in the failure of any of the important bills opposed by organized medicine even to reach the floor. Compulsory health insurance, chiropractic, and the anti-vivisection act were all rejected in committee.

The defeat administered to several of the bills sponsored by the profession is not to be considered final or a rejection on principle. The lien bill protecting doctor and nurse as well as hospitals is an outstanding example. Although it enjoyed strong support, technical considerations barred its enactment. There is good reason to believe that next session will amend the hospital lien law to correct the present discrimination against physicians.

In the field of medical jurisprudence the 1936 Legislature has a distinct achievement to its credit. A long-standing evil promises to be eradicated—or at least lessened considerably—as a result of two enactments pertaining to psychiatric evidence. One attacks abuse of the insanity plea in criminal cases by providing for determination of the mental condition of questionable defendants by the court before or during trial. The other ensures genuinely expert opinion by setting up a panel of qualified alienists. If these statutes are honestly enforced, they should go far to answer the severe criticisms which the present system of psychiatric testimony has brought down upon both medicine and the law.

With election in view, most members of the State Legislature have returned home, where they will be busy with political fence mending until the fall. This is an excellent opportunity for physicians to establish personal contact with their legislators, with a view to determining their understanding of the profession's point of view and willingness to represent it faithfully.

"Truth in Advertising"

The twenty-fifth anniversary of the Truth-in-Advertising Movement sees many reasons for self-congratulation among publishers and advertising agencies. They are, nevertheless, so far from

anything remotely approaching their goal that the most optimistic must realize the need for stronger measures if their slogan is ever to become a fact.

While many of the grosser frauds of twenty-five years ago have been banished from reputable media, it is a regretable fact that there is still very little truth in medical advertising to the laity. The best that can be said for many of the "ads" that appear in newspapers, magazines, and over the radio is that they are merely exaggerated and will waste the money of the consumer without doing him physical harm. At worst they are definitely dangerous, whether due to the nature of the product they sell or because they delay necessary treatment—sometimes for both reasons.

It is possible to turn the pages of many large urban newspapers and find the advertisements of quacks who, in tricky phrases, imply that they possess quick cures for cancer, tuberculosis, and incurable diseases of the heart and kidneys. Leading radio stations broadcast exaggerated claims for laxatives and lend their influence to the sale of diathermy machines that are worthless or dangerous in the hands of laymen. It's still a long way to. "Truth-in-Advertising"!

Agencies and media must change their policies in two important respects before they can hope to wipe out fraudulent advertising practices. The criterion of truth must be positive and exacting, instead of including everything that is not an outright lie. In the evaluation of technical claims, as for drugs and cosmetics, expert counsel should be sought instead of accepting the assertions of manufacturers and distributors at their face value.

Organized medicine in all its branches stands ready to assist in this work of clarification and appraisal. The elimination of exaggerated and misleading medical advertising would be one of the greatest boons to public health that this country has known.

The Broken Needle

Every physician, regardless of which branch of medicine he practices, uses a hypodermic needle for the administration of drugs, and during the performance of certain surgical procedures. In addition, this instrument is used by nurses and interns presumably under the direction of the doctor. Despite all precautions, occasions do arise where a portion of the needle will break off and lodge in the tissues. This mishap has furnished the basis for many lawsuits charging malpractice on the part of the physician.

In New York State, where the number of such cases has been many, it seems unusual that in only two instances have opinions on the law been expressed by our courts.1 These, in the main, hold that where the customary (not unusual) skill has been employed, no malpractice exists provided that the patient has been told of the accident within a reasonable time and an effort made by a competent surgeon to remove the fragment except where such procedure would constitute a danger to the well-being of the patient. Where possible, the broken part should be extracted immediately but where this is not possible, the primary operation should be completed if its performance is in accord with good medical judgment. An endeavor to locate the needle should be made by means of the x-ray without undue delay. When the accident has occurred to a general practitioner, he should seek the services of a "skillful surgeon," Not to do this subjects the general practitioner to a charge of incompetency in addition to malpractice.

All physicians should familiarize themselves with the essential legal requirements pertaining to the accidental breaking of a needle introduced into the tissues. Even more important is the instruction of nurses and interns immediately to inform the doctor in charge when such an accident happens to them,

Benson vs. Dean, 232 N. Y. 52. Mandelbaum vs. Weil, 208 App. Div. 409.

He is responsible legally for their actions and they should be made to understand that any attempt on their part to conceal this accident places the physician in financial jeopardy.

The Outlook for Arrested Tuberculosis

A patient in whom pulmonary tuberculosis is considered as having reached the arrested stage must be symptom free, have a negative sputum, and present roentgenological evidence of regressive changes in the pulmonary lesion. This type of individual is considered fit to return to society and in many instances is able to resume an active status in the community. It is surprising, therefore, that so little information is at hand concerning the future of these arrested cases after they leave the supervision afforded by institutional care.

The report of Lawrence¹ included only thirty-two cases of pulmonary phthisis which were classified as arrested. the end of three years, three per cent of these had died and nineteen per cent suffered a relapse of the disease. more recent investigation conducted by Spector² is probably the first to confine itself solely to the fate of the arrested The study comprised a period of eleven years and embraced 289 cases. In general, seventy-six per cent of all were alive and remained well. Upon closer analysis of his statistics, however, the percentage of patients who remained fully recovered decreased considerably with the lapse of time following discharge from the hospital.

Of course many factors besides the disease itself must enter into the determination of whether or not an arrested case will suffer a relapse. These, while important, do not overshadow the influence of rest

and collapse therapy in the treatment of this disease. They have proven their value. Insofar as the prognosis for longevity is concerned, the earlier the disease is discovered and the sooner treatment is instituted, the greater is the chance for ultimate recovery.

CURRENT COMMENT

Writing of the Wagner Housing Bill pending before Congress, the editors of The New York Sun, under date of May 29, claim that: "The bill was cleverly designed to meet some objections of those who wish to keep Washington bureaucrats out of the real estate business. But the hazard of Federal regulation for housing is not simply a business matter. The record of governmental attempts to replace slums with better dwellings has already demonstrated that years may pass before any considerable number of slum families are housed in suitable buildings if Federal bureaus must do the job."

"The hospital, like the whole country, is facing an economic crisis which, even at the risk of retarded growth, it must survive unscarred, safeguarding its traditions.

"The dangers of extreme economic retrenchment are many and serious, but they are not as perilous as are the unbecoming ways of acquiring seemingly easy money for the purpose of increasing the hospital's income, through methods which tend to weaken the hospital's fabric. Specifically, hospitals should not enter into any profit yielding enterprise; trustees and administrators should be satisfied to heal the sick at a loss rather than to serve the well at a gain."—Dr. J. J. Golub writing of "The 'Business' of a Hospital" in The Modern Hospital of May, 1936.

"A BARE SUBSISTENCE WAGE, whether sponsored by some governmental agency or a private industry, certainly does not make for good health and cannot care for sickness for very obvious reasons. The medical profession shares with all other professions in requiring constant effort to maintain it to the highest degree of efficiency in the presence of changing conditions but this cannot be accomplished by placing its destiny in the hands of a bureaucracy, and making two jobs where only one formerly existed."—Excerpts from

^{1.} Lawrence, W. F.: What Happens to Patients Discharged from Tuberculosis Sanatoria. N. Y. Tuberculosis Association, Jan. 1933.

^{2.} Spector, H. I.: Prognosis in Arrested Tubercular Disease of the Chest, Vol. 2, No. 5, p. 22, May, 1936.

"The Social Aspects of Sickness" in The Weekly Roster and Medical Digest

"To come at the various agencies which have already shown their faces under the guise of Health Insurance, State Medicine, etc., this inevitable trend will require all the resources of the various medical bodies, both state and national. It has been noted that all the remedies applicable to the curing of economic ills are national in scope, therefore, our approach to these problems must be national in extent.

"Medicine cannot continue to flourish or advance or even remain in a healthy state if the medical men divide themselves * * * It is, therefore, absolutely essential that each qualified practicing physician enroll into organized medicine. It is also neces sary for each and every physician not only to join his County Society but to attend its meetings and participate in the adoption and the execution of promulgated ideas and suggestions * * * "—From the Bulletin of the Central Medical Council of Brooklyn

"Medical economics and the needs of patients both require the young doctor to give up the idea of specialization and de vote himself to general practice." Dr. Mil ton C. Winternitz of Yale University declared in an address to the graduates of the Long Island College of Medicine on June 2. We quote at some length from The New York Times' report of his address of "Dr. Winternitz, Anthony Brady Professor of Pathology in the Yale Medical School, discussed the relations of main as an entity and medicine as an entity and ways of 'combining both for their mutual benefit."

"'Man is not only a physical and psychic being' he said, 'but also a member of society These three phases are insep arable, each influences his conditioned re flexes. In the last ten years or so the principle of his individuality has been rather lost sight of We have built great hospitals, and medicine has been split into many small, specialized groups

"The doctor of the past—the general practitioner, the family doctor—has almost disappeared And with him the entity of the individual has disappeared."

"Dr Winternitz said that great medical institutions should not be confused with medicine itself, since they were merely 'implements' to aid medicine. Specialization, he asserted, had made it impossible for any one to know all of medicine today, to attain anything more than a 'broad view' of the field. Specialization had left many physicians knowing little of their profession as a whole, he added. 'Tractions of knowledge do not make for medical success,' he went on. Medicine's aim is to keep you well. It can only succeed in this only by unity in the field of medicine.'"

We quote in part from an article on "Propaganda of State Medicine" "The recent building of government hospitals for hospitalization and treatment of World War veteruns has even now proven to be an economic waste and of doubtful scientific value and procedure. This is state medicine and state medicine accepted with protest and without beneficial results. There is no question but that, try as the Army and Navy may, politics manages to stir up entirely too big a disturbance when it comes to control of these institutions for which the taxpayers pay plentifully and the veterans do not receive any unusual care By the very nature of things they cannot The government hospital situation is one of the best demonstrations of the burdens of state medicine Incompetency is not laid it the doors of these institutions but that is more because of the efficient medical service in the United States Army and Navy and Marine Medical Corps than because the government is running the hospital"-Dr Harry R Litchfield in the Bulletin of the Central Medical Council of Brooklyn

MISCHIEF WHERE LEAST EXPECTED

Some interesting cases of food allergy were related by Dr Walter Alvarez, of the Mayo Clinic, at the recent meeting of the American Gastro Enterological Association at Atlantic City He told of a business man who had attacks of drowsiness at his office or at the wheel of his car They were finally found due to the cream in his coffee An-

other mm going insane, and under psychiatric treatment recovered when put on a duet for hives A college student suffering from pain, apathy and dullness, became eiger and bright when he gave up eggs for breakfist Dr Alvarez confessed himself to have an abnormal sensitiveness to chicken Since he stopped cating it, 'life has been much easier'"

HOUSE OF DELEGATES

MINUTES OF THE ANNUAL MEETING

April 27 and 28, 1936

The 130th Annual Meeting of the House of Delegates of the Medical Society of the State of New York was held at the Hotel Waldorf-Astoria, New York, on Monday, April 27, 1936, at 10 A.M.

Dr. Samuel J. Kopetzky, Speaker; Dr. Daniel S. Dougherty, Secretary.

The House of Delegates THE SPEAKER: will rlease come to order.

1. Committee on Credentials

THE SPEAKER: The first order of business is

the report of the Committee on Credentials.

The Secretary: The Committee on Credentials finds no disputed delegations, and all those whose names are on our roll are entitled to vote.

THE STEAKER: The next order of business

is calling the roll.

THE ASSISTANT SECRETARY called the roll

by Counties.

THE SPEAKER: A quorum being present we will proceed with the business of the House.

2. Approval of the Minutes

THE SPIAKER: The first order of business is the reading of the Minutes of the previous

meeting.

THE SECRETARY: As these Minutes have been published, I move the reading be dispensed with and that they be adopted as published in the June 15, 1935, issue of the New York State Journal of Medicine.

Motion seconded and carried.

THE SPEAKER: I am going to ask Dr. Madill and Dr. Booth to escort a very eminent gentleman to the platform. This House of Delegates is honored in having as its distinguished guest, the Right Honorable Lord Horder.

His Lordship is going to speak to us formally upon other occasions and I simply want the pleasure of having him here and extending

to him the courtesy and greeting of this House.

LORD HORDER: Mr. President and gentlemen: I greatly appreciate your welcome this morning and I am very glad to be your guest. Although I have traveled further than most of you to this meeting, I have no speech to make as I am an honorary member of it, and not an official one, except that I would like to

wish you all success of your meeting.
The Speaker: Will Dr. Gordon Heyd escort the President to the platform? It is a great pleasure for me to greet here officially a man with whom I have worked and served for many years. I wanted him on the platform, but if the President will permit, before he makes whatever remarks he wishes to attach to his official report which is in print, I am going to ask the Secretary to announce the Reference Committees.

3. Reference Committees

Dr. Dougherty, Secretary: The Assistant Secretary will read them, Mr. Speaker.

Dr. Irving, Assistant Secretary: The Refence Committees are as follows:

Reference Committee on Report of the President: Chas, Gordon Heyd, Chairman, New York William W. Street, Onondaga Warren Wooden, Monroe Herbert H. Bauckus, Erie Guy S. Carpenter, Tioga

Reference Committee on Reports of Secretary, Council, Censors and Councilors: James R. Reuling, Jr., Chairman, Queens Albert E. Payne, Suffolk Richard H. Sherwood, Niagara Albert A. Gartner, Eric Henry Joachim, Kings

Reference Committee on Reports of Treasurer and Trustees: Terry M. Townsend, Chairman, New York William Klein, Bronx James H. Donnelly, Erie Walter D. Ludlum, Kings Marion K. G. Colle, Green

Reference Committee on Report of Legal Counsel:

George A. Leitner, Chairman, Rockland Willard H. Veeder, Monroe Clement J. Handron, Rensselaer George S. Towne, Saratoga Edward M. Wellbery, Seneca

Reference Committee on Report of Committee on Public Relations: Frederic W. Holcomb, Chairman, Ulster Robert B. Hammond, Westchester

Louis A. Friedman, Bronx Thomas M. Brennan, Kings Edgar A. Vander Veer, Albany

Reference Committee on Report of Committee on Public Health and Medical Education:

James H. Borrell, Chairman, Erie Alec N. Thomson, Kings Albert H. Aldridge, New York Robert L. Crockett, Madison Robert J. Reynolds, St. Lawrence

Reference Committee on Report of Committee on Legislation:

John J. Masterson, Chairman, Kings Louis H. Bauer, Nassau

Joseph C. O'Gorman, Erie Adolph G. DeSanctis, New York John J. Buettner, Onondaga

Reference Committee on Reports of Committees on Scientific Work and Arrangements: Arthur F. Heyl, Chairman, Westchester Oscar L. Levin, New York Daniel C. Munro, Essex Clarence V. Costello, Monroe David W. Beard, Schoharie

Reference Commutee on Report of Commutee on Economics James F Rooney, Charman, Albuny Charles C Trembley, Franklin

Daniel S Dougherty, Chairman, New York
Peter Irving, New York

THE SPEAKER The President has the floor

4 Address of the President

Section 81

Dr. Frederic E Sondern, President We welcome you to this 130th Annu'l Meeting We have prepared for you an attractive program and we hope you will enjoy it. This gives me another opportunity to thank you for the honor that you have done me We have made our report of stewardship and my hope is that the outcome of your deliberations and your actions will be such as are in the interests of the public and of the profession

I, and the officers whom I represent, wish to thank you for your courtesy throughout the year, for which we are indeed grateful. I have nothing to add to my report which is before you in the handbook I thank you again for your courtesy

THE SPEAKER Will Dr Kosmak and Dr Borrell escort the President Elect to the platform?

5. Address of the President-Elect

THE PRESIDENT-ELECT You have had from the President of the Society a brief discussion of some of the problems that have been before the Society for the past year During the coming year there will be further problems coming up for solution. These may be put under four heads

You will recall that at the last meeting of this House of Delegates provision was made for a Committee on Organization, the purpose of this Committee being first, to investigate the business methods of this Society and make an cedure had been recommended by several of my predecessors The need for such a pro cedure came about through the fact that there was a distinct lack of clear-cut definition as to the duties of the various Standing Com mittees Such a lack of definition led to an overloading of the work of the Committees and to a consequent mefficiency in achieve-ment, and increase of expense. It is to be hoped that as the result of the consideration of the report of this Committee on Organiza-tion, this House of Delegates will be able to take steps that will strengthen the relationship between the various component county societies and the State Society

Second, this Society has a full time Executive Officer, one of whose many duties is to participate in the work of the Legislature at Albany However, while the Legislature is in session all of his time is given up to legislative work, thereby leaving no time for field work among the members of the Society One of the vital needs of this Society today is to strengthen the contact between the ordinary, every-day practicing physician and the officers and the committee of the Society.

Third, one of the duties of the Council of this Society is the appointment of an Executive Committee which functions while the House of Delegates is not in session. I submit for your consideration the fact that the efficiency of this Committee would be greatly increased if an arrangement were made by you whereby the members of the Board of Trustees and the chairmen of the Standing Committee would participate in the deliberations of the Executive Committee, in addition to their formal written reports which are submitted as now

Fourth, one of the major duties of the Society during this past year has been the consideration of the problem existing between the doctor and the hospital. It is obvious that no hospital can exist without doctors. Conversely, it is equally true that the doctor needs the hospital it would, therefore, seem to be for the public good and for the benefit of the hospitals and for the benefit of the hospitals and for the benefit of the doctors if representatives of the hospitals could be called into conference by this organization in an effort to bring about a harmonious solution of these problems

This occasion furnishes me the opportunity of extending to you my appreciation of the honor you conferred upon me in making me the President of this organization I solicit

HOUSE OF DELEGATES

MINUTES OF THE ANNUAL MEETING

April 27 and 28, 1936

The 130th Annual Meeting of the House of Delegates of the Medical Society of the State of New York was held at the Hotel Waldorf-Astoria, New York, on Monday, April 27, 1936, at 10 A.M.

Dr. Samuel J. Kopetzky, Speaker; Dr. Dan-

iel S. Dougherty, Secretary.
The Speaker: The House of Delegates will please come to order.

1. Committee on Credentials

THE SPLAKER: The first order of business is the report of the Committee on Credentials.

THE SECRETARY: The Committee on Credentials finds no disputed delegations, and all those whose names are on our roll are entitled to vote.

THE SFEAKER: The next order of business

is calling the roll.

THE ASSISTANT SECRETARY called the roll

by Counties.

THE SPEAKER: A quorum being present we will proceed with the business of the House.

2. Approval of the Minutes

THE SPIAKER: The first order of business is the reading of the Minutes of the previous

meeting.

The Secretary: As these Minutes have been published, I move the reading be dispensed with and that they be adopted as published in the June 15, 1935, issue of the New York State Journal of Medicine.

Motion seconded and carried.

THE SPEAKER: I am going to ask Dr. Madill and Dr. Booth to escort a very eminent gentleman to the platform. This House of Delegates is honored in having as its distinguished guest, the Right Honorable Lord Horder.

His Lordship is going to speak to us formally upon other occasions and I simply want the pleasure of having him here and extending

to him the courtesy and greeting of this House.

Lord Horder: Mr. President and gentlemen: I greatly appreciate your welcome this morning and I am very glad to be your guest. Although I have traveled further than most of you to this meeting, I have no speech to make as I am an horsest member of its and make as I am an honorary member of it, and not an official one, except that I would like to wish you all success of your meeting.

THE SPEAKER: Will Dr. Gordon Heyd escort the President to the platform? It is a great pleasure for me to greet here officially a man with whom I have worked and served for many years. I wanted him on the platform, but if the President will permit, before he makes whatever remarks he wishes to attach to his official report which is in print, I am going to ask the Secretary to announce the Reference Committees.

3. Reference Committees

Dr. Dougherty, Secretary: The Assistant Secretary will read them, Mr. Speaker.

Daniel S. Dougherty, Chairman, New York Peter Irving, New York

THE SPEAKER: The President has the floor.

4. Address of the President

Section 81

Dr. Frederic E. Sondern, President: We welcome you to this 130th Annual Meeting. We have prepared for you an attractive program and we hope you will enjoy it. This gives me another opportunity to thank you for the honor that you have done me. We have made our report of stewardship and my hope is that the outcome of your deliberations and your actions will be such as are in the interests of the public and of the profession.

I, and the officers whom I represent, wish to thank you for your courtesy throughout the year, for which we are indeed grateful. I have nothing to add to my report which is before you in the handbook. I thank you again for your courtesy.

THE SPEAKER: Will Dr. Kosmak and Dr. Borrell escort the President-Elect to the platform?

5. Address of the President-Elect

THE PRESIDENT-ELECT: You have had from the President of the Society a brief discussion of some of the problems that have been before the Society for the past year. During the coming year there will be further problems coming up for solution. These may be put under four heads.

You will recall that at the last meeting of this House of Delegates provision was made for a Committee on Organization, the purpose of this Committee being: first, to investigate the business methods of this Society and make an effort to improve the same. Such a procedure had been recommended by several of my predecessors. The need for such a procedure came about through the fact that there was a distinct lack of clear-cut definition as to the duties of the various Standing Com-mittees. Such a lack of definition led to an overloading of the work of the Committees and to a consequent inefficiency in achieve-ment, and increase of expense. It is to be hoped that as the result of the consideration of the report of this Committee on Organization, this House of Delegates will be able to take steps that will strengthen the relationship between the various component county societies and the State Society.

Second, this Society has a full-time Executive Officer, one of whose many duties is to participate in the work of the Legislature at Albany. However, while the Legislature is in session all of his time is given up to legislative work, thereby leaving no time for field work among the members of the Society. One of the vital needs of this Society today is to strengthen the contact between the ordinary, every-day practicing physician and the officers and the committee of the Society.

Third, one of the duties of the Council of this Society is the appointment of an Executive Committee which functions while the House of Delegates is not in session. I submit for your consideration the fact that the efficiency of this Committee would be greatly increased if an arrangement were made by you whereby the members of the Board of Trustees and the chairmen of the Standing Committees would participate in the deliberations of the Executive Committee, in addition to their formal written reports which are submitted as now.

Fourth, one of the major duties of the Society during this past year has been the consideration of the problem existing between the doctor and the hospital. It is obvious that no hospital can exist without doctors. Conversely, it is equally true that the doctor needs the hospital. It would, therefore, seem to be for the public good and for the benefit of the hospitals and for the benefit of the doctors if representatives of the hospitals could be called into conference by this organization in an effort to bring about a harmonious solution of these problems.

This occasion furnishes me the opportunity of extending to you my appreciation honor you conferred upon me in the President of this organization.

from the membership of this organization its whole-hearted support during the coming year, which will go far in advancing the interest of the Medical Society of the State of New York.

THE SPEAKER: The remarks that you have just heard are contained in a communication in my hands, and is referred to the Reference Committee on President's Report for action.

You have before you the Reports of the President, the President-Elect, Council, Board of Trustees, Censors, Secretary, Treasurer, Councilors, Counsel, Standing Committees, and Special Committees.

Dr. Dougherty, Secretary: I move that these Reports, inasmuch as they have been printed and published, be sent to the respective reference committees without reading.

Motion seconded and carried.

THE SPEAKER: Are there any of the officers or committeemen who desire to render supplementary reports?

6. Secretary-Emeritus

Dr. Gordon Heyd, New York: Mr. Chairman, members of the House of Delegates:

"WHEREAS: Dr. Daniel S. Dougherty having been secretary of the Medical Society of the State of New York since May 1925, and having since that date sacrificed time, energy, and health for the betterment of the Medical Society of the State of New York; and

"Whereas, we, the members of the House of Delegates, desiring to show our pleasure that his recent improvement in health willagain make his wise counsel available to our organization and as an earnest of our good wishes and an appreciation of his many long years of faithful service already given, hereby

"Resolve, That there be created the position of Emeritus Secretary to the Medical Society of the State of New York and that Dr. Daniel S. Dougherty be made the Emeritus Secretary of the Society to serve it in an advisory capacity with his present salary and membership and vote in the House of Delegates, and we

"Further Resolve, that this title and position shall be continued for as long a time as Dr. Daniel S. Dougherty shall survive and that the said position and title shall cease upon his

demise."

I move that the rules of the House of Delegates be suspended temporarily and that the House act upon this resolution at this time.

Motion seconded and carried. The Chairman announced the rules suspended. There being no discussion the Speaker called for a standing vote. The resolution was adopted unanimously and with acclaim.

Dr. Dougherry: I cannot say anything, boys. It is impossible for me to make my usual fluent speech and be eloquent on an occasion like this. All I want to say is that I thank you from the bottom of my heart and express my warm friendship—yes, my love, for you all.

The Speaker: Before I call for resolutions,

I am going to enlist the services of Drs. Kosmak and Ratnoff to escort to the platform a

very distinguished gentleman. Since we last met the American Medical Association has honored one of us to be the Speaker of its House of Delegates, and it is with some temerity that I preside when Dr. Van Etten is in the room. I ask these gentlemen to bring Dr. Van Etten

to the platform.
DR. VAN ETTEN: Mr. Speaker, I deeply appreciate the honor of being so signally distinguished this morning. After forty-six years in medicine, forty-five of which have been spent in organized medicine, I still have much to learn in the progress and development of medicine in the United States. I have been served continuously by this House since the investiture of President Alexander Lambert, and I forget how many years ago that was. I think I have never missed a session of this House. I have seen this House change a great deal in that time. I have seen the faces change. I have seen many of you grow older and more experienced. But there is one thing that I particularly noticed in this House, and that is the individual intelligence and interest among its members. Formerly most everybody said "aye" to whatever was proposed. Now there are a great many intelligent minorities. Minorities are the spice and health of life. It is very important that you have assumed these active interests in medicine and I am sure that with the desire of the President for better coordination among the county societies this House will still further improve in active interest.

Mr. Speaker, I am really a tyro at presiding and I shall make a special request of you this morning that when we convene in Kansas City you will sit on the front seat immediately in front of me and by a system of preconceived signals give me proper support in my parlia-

mentary procedure.

Тне Speaker: I will be very glad to sit at your feet as I have for many years, but I do not know about signals-I fear they might be

cross-signals.

I am ready to hear resolutions.

7. Malpractice Indemnity Insurance

Sections 18-57

Dr. Gordon Heyd, New York: "Whereas: The Insurance Committee has under consideration for some time the entire question of malpractice indemnity insurance and was served with a notice that the Aetna Insurance Company demanded an increase in the rates, your Insurance Committee was faced with the necessity of making decisions that carried with them possibility of a new agreement with an increased rate, and

"WHEREAS: the time limit had been reached within which notice of change was necessary to be given to the Aetna Company, therefore the Insurance Committee recommended to a Special Meeting of the Executive Committee a transfer of malpractice indemnity insurance to the Yorkshire Insurance Company of New York with the basic rate at \$30, and

"WHEREAS: the Special Meeting of the Ex-ecutive Committee approved of this resolution,

"WHEREAS: The regular meeting of the Executive Committee on September 12 and the Council on December 12 approved of the action of the Special Meeting of the Executive Committee, be it therefore

"Resolved: that the House of Delegates approve of the actions of the Executive Committee and Council, and furthermore

"Be it Resolved; that the House of Delegates commend the present plan and agreement with the Yorkshire Indemnity Company.

Referred to Reference Committee on New Rusiness C.

8. Group Insurance-Booth Plan

Section 77

Dr. Gordon Heyd, New York: "Whereas, in proposition No. 3 of the Booth Report (published in STATE JOURNAL OF MEDICINE, NEW YORK, May 1, 1933) there is a provision which states that subscribers to insurance plans shall have certificates specially stating that the service does not cover the fee of the patient's phy-

"WHEREAS, in the evolution of such and similar plans it would seem wise and timely that there be further elucidation of these findings,

"Be it Resolved, that the following statement of fundamentals be adopted as a guide, a definition and a statement of the attitude of organized medicine in the State of New York, upon

this issue, to wit:

"In every community there are persons and families who maintain a status of self reliance with difficulty, particularly when overtaken by hospital or medical care needs. These people are of the low-salaried classes and others who meet their living expenses from their weekly earnings. It is they who have need for some means through which to spread payments of hospital and medical care expenses by some form of budgeted installments with adjustments of the totals to their respective circumstances.

"The application of the principles and methods of insurance to lessen these burdens is possible. The form of this application is the all-important consideration upon which this Society shall rest its approval or disapproval. Certain so-called insurance plans are in fact nothing more than thinly veiled schemes for a 'contract medical service.' Wherever group insurance contracts to provide for the provision of the care of the sick and injured, administration difficulties, com-plications and irregularities have developed. There the insuring agency intrudes itself into the relationship between the policy holder and those who render the service, and dissatisfaction therefrom arises in the minds of both the public and the profession. Here, also, the quality of the medical care invariably deteriorates.
"Upon such facts the attitude of this Society,

in consideration of the public welfare, is, that of disapproval and opposition to any insurance

plan of such type.

"Therefore, this Society condemns all such insurance schemes which violate the fundamental principles of insurance practices. It will approve only those insurance plans which contract to provide indemnity. In other words, this Society approves only those insurance contracts

which provide the policy holder or member of a 'mutual' with the finances from which to compensate that service which he may require, and this without interceding in a dictatorial position between the policy holder and his physician or the hospital as to the terms or conditions of the service rendered.

"Further, this Society condemns every insurance plan which contracts to provide any form of medical diagnosis and/or treatment. It disapproves of any insurance plan which does not limit the benefits of 'low premium' policies to those persons or families who have only

limited income.

"Further this Society approves the establishment of non-profit or mutual indemnity plans of insurance which do not contract to provide any form of medical or hospital care, which proposes to indemnify the expenses of needed medical and hospital care, and provided that in the organization and administration of such plans there is reasonable and proper representation of the local medical profession (nominated or approved by the local County Medical Society) on the Board of Directors.

"And further, this Society recommends guiding participation in such plans by local county Medical Societies with encouragement for the

development of such enterprises."

Referred to Reference Committee on New Business B.

9. Consolidation of Executive Offices

Section 71

Dr. Gordon Heyd, New York: Mr. Chairman, and members of the House of Delegates: Following last year's meeting your Executive Committee appointed a special committee which has become known as a Committee for Study, Survey, and Consolidation of Executive Offices. A detailed study of our organization indicated that the business of the Society was beyond the capacity of the present organization, and, therefore, we submit to you a report on the consolidation of executive offices. This is a little lengthy but some points are of great im-portance. Throughout the whole of the deliberations was the philosophy that the power of your Society eminates from this House of Delegates and must be deposited therein.

1. In order that there shall be a consolida-tion of function and increased efficiency in the administration of the Medical Society of the State of New York it will be necessary to amend the Constitution and By-laws to permit the adoption of any changes that the House of

Delegates may recommend.

2. The Committee begs leave to submit its report on the measures that are deemed wise in order to accomplish an increased effectiveness and economy of administration.

3. The measures proposed are submitted in general terms and obviously will require a large measure of thought and consideration.

4. The Report is as follows:

A. It is proposed that some units of the old organization be retained with modifications, some abolished, and some new ones added.

1. RECOMMEND: That the present constituted

Council be abolished.

- 2. Recommend: That the present constituted Executive Committee be abolished.
- 3. Recommend: That an Executive Board be set up to function in place of (1) and (2) above mentioned. This Executive Board to be composed of 26 members as follows:
- a. Officers (6 members each elected for one year as follows: President, President-Elect, Secretary, Treasurer, Speaker and Immediate Past-President.)
- b. Members of the Board of Trustees (5 members elected for 5 years).
- c. Members of the Board of Scientific Activities (5 members elected for 5 years).
- d. Members of the Board of Medical Public Relations (10 members elected for 5 years).
- This Executive Board shall have regular meetings at such stated intervals as may be necessary to carry out its functions and at these meetings each of the component groups shall be present in order to report on the activities which are the immediate concern of each group. All such activities, however, shall be subject to the general control and supervision of the combined groups acting as the Executive Board. The allotment of duties to each group shall be as follows:
- a. The Board of Trustees shall be the representative of the Executive Board in concerning itself with all financial activities of the organization in a manner similar to the present set-up except as to any conflict with this proposed set-up. The members of this Board shall be elected one each year by the House of Delegates at the Annual Meeting, after an enabling motion and this recommendation becomes imperative.
- b. The Board of Scientific Activities shall be the representative of the Executive Board in supervising the work now carried on by the following committees:
 - (1) Committee on Scientific Work.
 - (2) Committee on Public Health and Medical Education.
 - (3) Committee on Arrangements.

The members of this Board shall be elected one each year by the House of Delegates at the Annual Meeting after an enabling motion and this recommendation becomes imperative.

- c. The Board of Medical Public Relations shall be the representative of the Executive Board in concerning itself with the following activities:
 - (1) Workmen's Compensation.
 - (2) Defense Insurance.
 - (3) Economics.
 - (4) Journal Management and Publication.
 - (5) Trends, Medical, and Social.
 - (6) Publicity.
 - (7) Health Departments, Welfare Agencies, and Hospitals.
 - (8) Legislation.
 - (9) Cooperative Relationships with Federal and State Governments, Foundations and other Lay Groups in Public Health Work.

The Members of this Board shall be elected two each year by the House of Delegates at the Annual Meeting after an enabling motion and this recommendation becomes imperative.

Any and all of the above groups shall have associated with them legal counsel, insurance

counsel, and publicity counsel.

The changes outlined above will require cancellation of all of the Committees indicated in Chapter 10, page 24 of the By-laws of the Medical Society of the State of New York.

4. RECOMMEND: That the terms of office for the Officers and other members of the Executive Board in the new set-up shall be as follows:

President1 year
President-Elect
Immediate Past-President1 year
First Vice-President1 year
Second Vice-President
Secretary1 year
Assistant Secretary
Treasurer1 year
Assistant Treasurer
Speaker of the House of Delegates1 year
Vice Speaker of the House of
Delegates1 year

Members of the Board of Trustees...5 years Members of the Board of Scientific

5. RECOMMEND: That the Medical Society of the State of New York employ a full time Director of Activities and that his duties shall

- be as follows:

 a. He shall have general management of all of the executive details of the Society subject to the Executive Board.
- b. He shall be the coordinator of all Boards, Bureaus, and Committees that may be constituted from time to time.
- c. He shall act as secretary of the Executive Board, the Board of Trustees, the Board of Scientific Activities, the Board of Medical Public Relations, and the House of Delegates.
- d. He shall be a physician who has been in practice for at least ten years, who has established a reputation for executive ability, and who is desirous of making a career in an executive capacity as Director of Activities of the Medical Society of the State of New York.
- e. The salary for this position is to be determined by and shall be commensurate with the ability of the individual and sufficient to make a career as Director of Activities a permanent and highly desirable one.
- 6. RECOMMEND: The employment of two assistant Directors or Associate Directors of Activities:
- a. One of these to function for the metropolitan area of New York State and the other to function for New York State outside of the metropolitan area.
- b. These Assistant Directors should be physicians who previously have been in practice for at least seven years. They should be of

known executive ability, willing to become career men, and to work under the Director of Activities in special allocated duties.

- c. The salary of these men to be commensurate with the ability of the individuals and the importance of such a career to organized medicine.
- 7. RECOMMEND: That the District Branches be abolished.
 - B. The proposed set-up would be as follows:
- 1. The officers of the Society would be a President, a President-Elect, two Vice-Presidents, a Secretary, an Assistant Secretary, a Treasurer, an Assistant Treasurer, a Speaker, and a Vice-Speaker of the House of Delegates, all with some changes in duties and status needed for purposes of the new set-up.
- The House of Delegates would remain as now constituted, but with certain changes in duties and status needed to conform to the

new set-up.

- 3. The Board of Trustees would remain as now constituted, but with certain changes in duties and status, to permit integration with the Executive Board.
- The Section Officers would remain but their activities would be integrated with and subject to the control of the Board of Scientific Activities.
- 5. The Legal Counsel, the Insurance Counsel, and the Publicity Counsel would be retained.
- The Executive Committee would be abolished.
- 7. The Council would be abolished.
- 8. The Standing Committees and other committees would be abolished.
- The District Branches would be abolished.
 The present position of Executive Officer
- would be abolished.

 11. An entirely new body with twenty-six members, to be known as the Executive Board would be set up. This Board would be com-
- posed as follows:
 Officers (6 in number)
 - To include President, President-Elect, Secretary, Treasury, Speaker, and immediate
 - Past-President.
 - Board of Trustees (5 in number) Board of Scientific Activities (5 in number) Board of Medical Public Relations (10 in
- 12. All twenty-six members of the Executive Board would be elected by the House of Delegates.
- 13. The Legal, Insurance, and Publicity Counsels would be employed by and subject to the general direction of the Executive Board.
- 14. A Director of Activities and two Associate Directors of Activities would be engaged by and subject to the general direction of the Executive Board.
- 15. There would be created to last during the lifetime of Dr. D. S. Dougherty the position of Emeritus Secretary, advisory, with present salary, and to terminate upon the demise of Dr. Dougherty.
 - 16. The function of the Secretary would be

- that of Recording Secretary. He would keep the Minutes of and have the seal of the society.
- 17. The functions of other officers in the new set-up would be as now except where there would be conflict with the provisions of the new set-up.
- 18. The function of the Executive Board composed of six officers, five trustees, five members of the Board of Scientific Activities, and ten members of the Board of Medical Public Relations would be as follows:
- a. It would be charged with the general management, superintendence, and control of the Society and of Society affairs and it would have such general powers as would be necessary therefor.
- b. In it would be centered all of the legislative and executive authority of the organization
- c. It would devise and adopt all organization policies and activities and arrange for their carrying out.
- d. In this Executive Board every activity of the Society would be interlocking.
- e. For this reason the Board would be in control at all times of all Society activities and this would result in economy and efficiency.
- f. In the Executive Board would be vested the power of the organization, therefore it could speak promptly and authoritatively in all situations and emergencies involving the interests of organized medicine.
- g. The Executive Board would largely be composed of long term appointees who would thus become experienced in the problems of their departments as relating to organized medicine, so that this Board would soon become a competent Board of Medical Strategy.
- h. Since every member of this Board would be elected by the House of Delegates and subject to recall by the House of Delegates it would be representative of the interests of all the groups that make up the State Organization.
- 19. The House of Delegates would have power to recall any or all of the members of the Executive Board for serious malconduct in office. This recall should be carefully safeguarded in the Constitution, however, so that unwise and meddlesome interference on the part of radical or discontented groups in temporary power would not occur.
- 20. The administering of the affairs of the Society under the proposed changes indicated above would be carried out with a material saving in costs and a marked increase in effectiveness of purposes of organization.

Business C.

13. Licensing Foreign-Educated Physicians

Sections 17-56-85

Dr. Edgar A. Vanderveer, Albany: "In view of the apparent increase of foreigneducated physicians who are being licensed to practice in New York State it is recommended that the Society go on record as disapproving such procedures and that the Medical Society of the State of New York be requested to take appropriate action insuring the necessary legislation to remedy this situation."

Referred to Reference Committee on New

Business A.

14. Supplementary Report of Committee on Public Health and Medical Education

Section 41

Dr. THOMAS P. FARMER, Onondaga: "A resolution passed by the Medical Society of the County of Westchester on November 19, 1935, recommending that a study be made regarding periodic physicians' examinations as a means of prevention of motor accidents was referred by the Executive Committee to the Committee on Public Health and Medical Education for study.

'At a meeting of the Committee held on

February 20, 1936, the Committee, after considering the matter adopted the following

resolution:

"That inasmuch as a special committee of the Legislature has been appointed to study with the Commissioner of Motor Vehicles of New York State, the matter of changes in the law and procedures of granting drivers' permits, it would be advisable for the Chairman of the Committee on Public Health and Medical Education to confer with the State Commissioner of Motor Vehicles, offering the Committee on Public Health and Medical Education to confer with the State Commissioner of Motor Vehicles, offering the Committee's willings and discuss with him and mittee's willingness to discuss with him, and advise on medical phases of the matter.

"The Chairman has had such a conference with the Commissioner of Motor Vehicles, who has indicated his willingness to confer with the Committee in this regard. In view of the proposed changes and improvements to be made, it would seem advisable at the present time to take no definite action as to the desirability of having physical examinations made on

all applicants for drivers' licenses.

"In regard to the communication from Miss Grace Landon, Specialist, Emergency Nursery Schools, regarding nursery schools for children from teacher. dren from two to four years of age, to be carried on as a work project under the Works Progress Administration, Miss Landon's attention should be called to the fact that day nursery schools in the State of New York are under the inspection and supervision of the State Department of Health. It is advised that any such nursery schools set up by the Works Progress Administration should conform to the same requirements which the State Department of Health now makes for other nursery schools. It would seem advisable that a physician be attached to each one of these nursery schools."

Referred to Reference Committee on Report of Committee on Public Health and Medical

Education.

15. Anesthetics as Practice of Medicine

Section 53

Dr. James H. Borrell, Eric: "At a meeting of the Medical Society of the County of Eric, held April 20, 1936, the following preambles and resolution was adopted:

"WHEREAS, at the 1933 Annual Meeting of the House of Delegates of the Medical Society of the State of New York the following resolu-

tions were passed:

"Resolved, that the Medical Society of the State of New York affirm that the giving of an anesthetic constitutes the practice of medicine and insist on the strict observance of the pro-visions of the Medical Practice Act without subterfuge or evasion.

"Resolved, that if it is the opinion of the Attorney-General that non-medical technicians practicing anesthesia are not violating the law under present conditions, that the proper procedure be instituted to obtain legislation which will include anesthesia in the practice of medicine or limit the administration of anesthesia

to duly licensed dentists or physicians. "Whereas, the Medical Society of the County of Erie has received no information of any action taken purusant to the foregoing resolutions,

therefore,

"Be It Resolved, that the Medical Society of the County of Erie instruct its delegates to present to the House of Delegates at the 1936 Annual Meeting a recommendation that the proper committee of the Medical Society of the State of New York be directed to draft and promote at the 1937 session of the New York State Legislature a Bill to limit the administration of anesthesia to duly licensed physicians and dentists, except in cases of emergency.'

Referred to Reference Committee on New

Business B.

16. Invitation to Hold 1937 Annual Meeting

Sections 59-76

DR. JAMES H. BORRELL, Erie: "At a meeting of the Medical Society of the County of Eric, held April 20, 1936, the Society instructed its delegates to present to the House of Delegates, through the proper committee, a cordial invita-tion to hold the 1937 Annual Meeting of the Medical Society of the State of New York in the City of Buffalo."

Referred to Reference Committee on New

Rusiness C.

17. Licensing Foreign-Educated Physicians

Sections 13-56-85

Dr. DAVID J. KALISKI, New York: "WHEREAS, it has become apparent that the number of physicians obtaining licenses to practice medicine in the State of New York by endorsement of their credentials is increasing inordinately, and

"WHEREAS, a considerable number of physicians, graduates of European medical schools are being licensed by endorsement of their credentials without a professional examination,

"Whereas, graduates of our own medical schools and licensed physicians of many other states are required to pass a professional examination before being licensed to practice in

this state, and

"Whereas, the maintenance of high professional standards and the public health and welfare require that graduate physicians be required to establish their competence by submitting to a thorough examination before being licensed to

reactice the healing art, and "Whereas, some who have been licensed by endorsement could hardly be considered as eminent or unusually distinguished, and

"WHEREAS, the large number of physicians already so licensed by endorsement, if it continues will actually nullify the law which has

been enacted to protect the public,

"Therefore, Be It Resolved, that the Medical Society of the State of New York, in annual meeting assembled, deplores the excessive number licensed by endorsement, and requests the authorities of the Department of Education to cease granting licenses by endorsement, except in very exceptional circumstances, and where the eminence of the applicant is generally unquestioned."

Referred to Reference Committee on New Business A.

18. Malpractice Indemnity Insurance

Sections 7-57

DR. JAMES M. DOBBINS, Queens: "1. WHEREAS: In spite of fourteen years of successful and satisfactory operations with the Aetna Life Insurance Company there has been

effected a change in carrier, and "2. Whereas: There is proof that the facts and figures purporting to indicate why this arrangement should be terminated were not freely discussed by our Insurance Committee with

representatives of the carrier, and
"3. Whereas: Evidence indicates the insurance representative of this Society, who is not an elective officer, was practically permitted to terminate this arrangement and to formulate

a new agreement with the present carrier,
"4. WHEREAS, The Committee exceeded their function by consummating this change before official approval by the House of Delegates or the Executive Committee or Council although no provision of the Constitution or By-Laws clothes any committee with such authority, and

"5. WHIREAS: In the opinion of many delegates the Council and Executive Committee violated Section 5, Chapters IV and V of the By-Laws and exceeded their authority in ordering the change without the approval of the House of Delegates, and

"6. WHEREAS, The new carrier having no experience in underwriting this type of insurance was willing to accept as fact the figures of the previous carrier in order to determine the rate of this insurance, and

"7. WHEREAS: In accepting this risk the present carrier was accepting an increase of fifty percent in the premium business on an untried risk, a fact considered inconsistent with good insurance principles, and

"8. WHEREAS: In our opinion the high cost of this group plan is due to excessive commissions and additional charges made by our insurance representative in order to conduct this business which can be and should be reduced, and

"9. WHEREAS: It is practically impossible for any one representative to personally attend the needs of the insured physicians and that such responsibility should be left the individual doctor to seek aid and assistance from his own broker or agent, and

"10. WHEREAS: The new carrier is a wholly owned subsidiary of a British Corporation, and

"11. WHEREAS: There exists some doubt as to the ability of this Company to properly manage this type of insurance, and

"12. WHEREAS: There is evidence of continued losses by this carrier with a loss of premiums of two hundred and fifty-four thousand eight hundred and seventy-five dollars and twelve cents in 1935

"13. WHEREAS: The Insurance Department of the State of New York has no jurisdiction over the parent company in England and therefore could not force the payment of any debts of its subsidiary, and

"14. WHEREAS: There is sufficient proof that the new insurance policy as submitted by the new carrier is detrimental to the best interests of the assured, and in many respects contrary to the rules and regulations governing group insurance adopted by the House of Delegates on April 3, 1933, and

"15. WHEREAS: There is sufficient proof that the restrictions of this new policy are such as to create the possibility of inadequate and incomplete insurance for the physician, and

"16. WHEREAS: It becomes necessary for all people who might answer or refer 'phone calls to any other doctor to understand some of the restrictions of the new policy, and

"17. WHEREAS: It is the belief of many doctors that our present insurance representative has acted in a manner which will not reflect the welfare or interest of our members, and has caused to be affected suspicion and doubt as to his sincerity of purpose, both in insurance fields and in our own profession, and

"18. Whereas: In order to restore order out of chaos which will possibly result in the deprivation of the benefits of this form of insurance for the doctor except with higher rates as a result of this Society endorsing the new carrier, therefore

"Be It Resolved: That a special committee of seven, representative of all parts of the State be

appointed, and
"Be It Further Resolved: That this committee be authorized to proceed at once in the investigation of all phases of malpractice insurance and be requested to render their report within two months, and

"Be It Further Resolved: That funds for this investigation be appropriated by the State

Medical Society."

THE SPEAKER: Are you aware, Dr. Dobbins, that some of those preambles are an implied criticism of the officers of the State Society? Do you want time to revise them or do you want to hand them in as they are?

Dr. Dobbins: Just as they are. I do not offer any criticism of the elected officers of the State Society. I have made no criticism, Mr. Speaker.

THE SPEAKER: With that understanding, that there is no criticism—because that would imply that we should take immediate action on a vote of censure—the speaker will receive these resolutions and refer them to Reference Committee on New Business C

Referred to Reference Committee on New

19. Permanent County Society Offices

Section 46

Dr. L. H. BAUER, Nassau: "Whereas, several Societies have established County Medical permanent county society offices, and

"WHEREAS, several County Medical Societies

have appointed lay executive secretaries, and "WHEREAS, the failure of the Medical Society of the State of New York to officially recognize these offices and lay secretaries has led to confusion, delay in and interference with the transaction of business and consequent loss of efficiency, therefore,

"Be It Resolved, by the House of Delegates of the Medical Society of the State of New York assembled in New York City on April 27, 1936, that whenever the President of a County Medical Society so requests, all correspondence issuing from the State Medical Society office for that County Society be addressed to the County Society office and not to the office or home address of the secretary, and

"Be It Further Resolved, that the addresses of these County Society offices shall be published in the Medical Directory of the Medical

Society of the State of New York."

Referred to Reference Committee on New Business B.

20. Amendments to Constitution and By-Laws—Associate Members, Auxiliary Members, Etc.

Section 54

Dr. CHARLES E. FARR, New York: WHEREAS, there are medical men in full time scientific service who do not practice medicine for gain; and

"Whereas, such men would be valuable additions to our membership; now, therefore

"Be It Resolved, that the Constitution and By-Laws be so amended that provision be made to create another class of associate members, comprising this full time group, who shall pay yearly dues at a less than normal rate, as shall be determined by the County Society which creates such membership. These shall have both voice and vote and may hold office in the county medical societies; and

"Be It Further Resolved, that if the sense of this resolution meets with approval by the House of Delegates that the subject matter be referred to a Committee on Revision of the Constitution and By-Laws to be incorporated in the revision and presented to the next House

of Delegates for action."

Referred to Reference Committee on New Business A.

Dr. CHARLES E. FARR, New York: "WHEREAS, there are medical men in government service who are frequently shifted to new posts, and while on duty on posts in this state, could benefit by integration with the member-

ship of the State Society; and "Whereas, although they are not engaged in private medical practice for gain, and are not permanent residents in our midst, and therefore should not be taxed, or assessed at the same rates which practicing physicians pay; and

"WHEREAS, they might be valuable additions

to our membership; now, therefore "Be It Resolved, that the Constitution and By-Laws be so amended, that provision be made to create another class of associate members comprising this government employed group. who shall have voice but no vote in component county medical societies, and who shall pay yearly dues at a minimum rate as shall be determined by the County Society which creates such a membership."

Referred to Reference Committee on New

Business A.

York: CHARLES FARR, New Dr.

"Whereas, there are many men who form a special group of medical men, who are graduated from medical schools and are in practice less than five years; and "WHEREAS, these men should be aligned with

organized medicine as soon as possible;

Therefore, Be It Resolved, that Article II of the Constitution be amended by adding d) and associate members. and

"Be It Further Resolved, that the By-Laws be amended by adding between sections 5 and 6

another section which shall read:

Section 5a Associate members shall consist of doctors of medicine in practice for less than five years who shall constitute a list of associate members of each component county medical society, whose dues shall be less than that of active members at a minimum rate of dues fixed by the component county medical society: and

"Be It Further Resolved, that they shall pay

the regular State Society annual assessment."
THE SPEAKER: Dr. Farr, are you presenting this definitely as an amendment to the Constitution or as a resolution whose substance should be first decided upon and then sent to the Committee on Revision of the Constitution?

Dr. FARR: The latter method.

THE SPEAKER: The latter method.

Referred to Reference Committee on New

Business A. DR. CHARLES E. FARR, New York: "WHEREAS, there exists among us, non-medical men, scientists, teachers, public men of dis-tinction who are interested in problems in which the medical profession has a paramount interest;

"Whereas, in creating a mutual understanding of the aims, goal and program for social betterment and social justice in which organized medicine is interested, the association of such a group of public spirited individuals with organized medicine would be mutually advan-

tageous; and WHEREAS, the formation of such a group is not now provided for in our Constitution and By-Laws, and component county medical societies may desire to organize such a group of

auxiliary memberships;

"Now, Therefore, Be It Resolved, that the Constitution and By-Laws be amended to provide such a group of auxiliary members, outline their duties and privileges, and the dues they

shall pay; and "Be It Further Resolved, that a Committee on Revision of the Constitution be appointed to study the various problems presented to this House of Delegates, which having been adopted in principle, shall be written into a revised copy of the Constitution and By-Laws and presented to the next annual meeting of the House of Delegates for adoption."

Referred to Reference Committee on New

Business A.

THE SPEAKER: It is with pleasure that I note that we are honored with the presence of the Secretary of the Board of Trustees of the American Medical Association among our guests, and I will ask Dr. Bedell to escort Dr. Hayden to the platform.

DR. AUSTIN A. HAYDEN: Gentlemen of the Medical Society of the State of New York: I wish to say that I have been so busy looking at your scientific and technical exhibits and incidentally picking up a few samples that my time is very fully occupied this morning. I am very glad to be here. Thank you.

21. Medical Directory

Section 49

DR. R. H. SHERWOOD, Niagara: "The following resolution was adopted by the Medical Society of the County of Niagara at a regular meeting, January 14, 1936.

"WHIREAS, the Directory published each year by the Medical Society of the State of New York costs approximately \$1.15 to prepare and

publish, and

"WHEREAS, it serves no useful purpose to over ninety-five per cent of the state member-

ship, and "Whereas, it is in part a duplication of information already available in the A.M.A. Directory, and

"WHEREAS, we believe this money could be more advantageously expended in enlarging the services the State Society can perform for its

members and the component county societies:

therefore,
"Be It Resolved that the Medical Society of
the County of Niagara requests the State Medical Society to discontinue the publication of the directory for general distribution.

"Be It Further Resolved, that the directory be made available for those who need the same, to be ordered and paid for similar to the procedure of the A.M.A.

"Be It Further Resolved, that a copy of this resolution be sent to each County Medical Society in New York State, and to the Secretary of the State Society"

I move the adoption of the above resolution

by the House of Delegates.

Referred to Reference Committee on New Business B.

22. Medical Legislation

Section 60

Dr. Louis Lewis, New York: "WHEREAS, Matters of vital importance regarding 'Public Health' and the economic future of the Practice of Medicine are often presented before the

Legislature of the State of New York, and "WHEREAS, There are practically no physicians, as members of the Legislature to discuss the genuine merits or faults of proposed medical

legislation, and
"WHEREAS, we believe that the members of the Legislature are earnestly interested in the health of their communities and are anxious to receive correct information regarding any bill

pertaining to health matters, and "WHEREAS, We know that members of the State Medical Society are better equipped to give information for the furtherance of the economic and scientific security which has been achieved so far by the constant vigilance of Organized Medicine, and

"WHEREAS, Practically there exists organized effective method for quick and efficient personal contact with the political powers

of each district, therefore

"Be It Hereby Resolved, That a Committee, composed of seven members, to be known as The Legislative Contacts Committee, be appointed by the President of the Medical Society of the State of New York. This Committee to have the power of forming sub-committees in the various counties of New York State, the duties of which shall be to assist in the passage or prevention of legislation as recommended by the Committee on Legislation of the Medical Society of the State of New York."

Referred to Reference Committee on New

Business C.

23. Executive Offices for District Branches

Dr. Harwood L. Hollis, Oswego: "Whereas, it is common knowledge that there are abroad in this State many organizations and individuals, who, if their activities be an index of their intentions, imperfectly cooperate with or actively oppose the aims of ourselves, the organized medical profession, and

"WHEREAS, it is not possible for the elected or employed State Officers or the elected and employed county officers to give as much time and effort as is necessary to correct these

present or impending abuses,

"WHEREAS, such important duties as correlating the activities of one County Medical Society with its Fellows, and such activities as inspire groups to constructive antagonism against deleterious propaganda, and such obligations as whole-hearted cooperation with the State Society in its constructive efforts, and such efforts as are necessary to properly acquaint every member of the State and County Societies with the helpful activities as well as with the offensive encroachments of the State Health Department are imperfectly conducted or absolutely neglected, and

"WHEREAS, there is no relief from the present conditions without an uneconomic expenditure of local effort, and then only imperfectly, since many of the problems arising require legal training and a wide acquaintance with the various government set-ups now so prevalent, be

it, therefore
"Resolved, that we, the House of Delegates
of the State Medical Society, recommend the appointment of a full-time assistant executive officer for each district branch, whose duty shall include any of the above-mentioned delinquencies and any others as shall seem necessary in the opinion of the State Medical Society through its state officers.

"To facilitate the establishment of these assistant executive officers, it is recommended that for one year they work under the direction of the State Executive Officer; and that final and permanent disposition and allocation of these men shall be made at the meeting of the House of Delegates at the 1937 annual meeting of the State Medical Society

"It is further recommended, that these men be appointed and their remuneration fixed by the Executive Committee of the State Medical

Society; and that these assistant executive officers be paid from the funds of the New York State Medical Society in exactly the same manner as other full-time employees are paid.

"Further be it recommended, that the tenure of office of these assistant executive officers be terminated only by the Executive Committee of the New York State Medical Society; and such replacements as are necessary by discharge or resignation of these assistant executive officers be made by the Executive Committee of the State Society.

24. Hospital Management and Medical Staff

Sections 52-80

Dr. Walter D. Ludlum, Kings: "The following resolution was adopted at the regular stated meeting of the Medical Society of the County of Kings on April 21, 1936.

"WHEREAS, the hospital has become an increasingly important factor in the provision of

medical care, and

"WHEREAS, the authority of management is almost universally in the hands of laymen, and "Whereas, the professional care of the sick

is essentially a medical function, and

"WHEREAS, the public interests will be better served when medical opinion evaluates the professional competency of candidates for appointment or promotion, and

"WHEREAS, changes have been made in the medical staff and medical personnel organization of some hospitals without due consideration of the opinion of the physicians constituting the

medical staff, and

"WHEREAS, changes in staff organization and personnel have been made which were not in the public interest, and often have been in fact acts of injustice to physicians who, by honorable and faithful service, had acquired a moral right to the continuance of such privileges and benefits as flow out of the hospital connection,

"WHEREAS, a correction of such wrongs is possible only through the action of an authoritative body, qualified and constituted to speak

the opinion and will of the medical profession:
"Therefore, Be It Resolved, that hereafter
only those institutions which recognize, acknowledge and observe in practice no change in medical staff or personnel organization without recommendation or approval of its Medical Board, shall be regarded as maintaining approved status, and

Be It Further Resolved, that the President of each County Medical Society be authorized to appoint an impartial committee for the consideration and arbitration of any differences of opinion which may arise between the lay board of any hospital and its Medical Board,

"Be It Further Resolved, that it shall be considered unethical for any physician to accept appointment to fill a vacancy in any hospital staff or medical personnel organization which has been created by the lay administration in disregard of the principles of equity and justice herewith declared, and

"Be It Further Resolved, that a copy of this resolution be addressed to The American College of Surgeons with the request that due

regard be given thereto, and

Be It Further Resolved, that the Delegation representing the Medical Society of the County of Kings in the Annual Meeting of the House of Delegates of the Medical Society of the State of New York be instructed to introduce these resolutions and actively support their adoption in the next session which convenes April 27th, 1936 Referred to Reference Committee on New

26 Mutual Aid Associations Schedule of Fees Sections 66-83

McGoldrick, THOMAS A Kings "WHEREAS, it has come to the knowledge of the Section on Industrial Relations of the Eco nomics Commission of the Medical Society of the County of Kings, through a committee representing the paternalized mutual aid associations of the Consolidated Edison Co., Inc. that hospital service has been engaged for the benefit of their members, and that the medical staffs of such hospitals are accepting a schedule of fees for their professional services which is unfairly competitive, and

"WHEREAS, this schedule of fees is immical to the reasonable economical security of the medical profession of the community at large,

WHEREAS, this form of collective bargaining constitutes competitive exploitation of the medi cal profession and is prejudicial to the public

interest.

Therefore, Be It Resolved, that any institu tion which engages in and encourages or permits by accessary participation such competitive commercialization of medical care or which permits its medical staff members to so engage their professional practice, shall be regarded as operating contrary to the welfare of the public and its medical profession, and that any such in-stitution shall be regarded as tending to lower the professional standards of the community, and

'Be It Resolved that any such hospital so engaged be immediately cited to the American College of Surgeons with a recommendation that approval of such hospital be immediately reconsidered and that the approval of any such

hospital be rescinded and

"Be It Resolved, that it shall be considered unprofessional and unethical for any member or members of the medical staffs of such hospitals to accept remuneration for their professional services extended to such patients based upon a schedule of fees not approved by the Medical Society of the County of Kings,

"Be It Resolved, that any member of the Medical Society of the County of Kings who may engage in such practice shall be cited to

the Censors, and

"Be It Further Resolved, that the Delegation representing the Medical Society of the County of Kings in annual meeting of the House of Delegates of the Medical Society of the State of New York, he instructed to introduce these resolutions and actively support their adoption in the next session which convenes April 27, 1936, and

"Be It Further Resolved, that a copy of these resolutions be published in the Bulletin of the Medical Society of the County of Kings and that a copy be sent to each hospital and samtarium in the County of Kings and to the co-ordinating Council of the five County Medical Societies of Grenter New York with a request that due notice be taken thereof"

Referred to Reference Committee on New

Official Pronouncements of County 27 Societies

Section 51

DR LOUIS A FRILDMAN Bronx 'WHITEAS, the By Laws of the Medical Society of the State of New York, Chapter 5, Section 3, page 15, state that the Executive Committee shall provide for the publication of official pronouncements of the component county societies when requested by such a society, and

"WHEREAS, the Bronx County Medical Society did officially request such a publication

of one of its pronouncements, and "Whereas, the Editor of the State Journal

refused to publish in the STATE JOURNAL such pronouncements,

"Be It Hereby Resolved, that the Executive Committee of the State Society be appraised of this failure of the Editor to honor such requests; and that the Executive Committee of the State Society take the proper steps to remedy such breach of our by-laws."

Referred to Reference Committee on New Business B.

28. Transfer of Membership

Section 48

Dr. G. S. Towne, Saratoga: "Whereas, the Constitution and By-Laws of the Medical Society of the State of New York do not now require for transfer of membership any definite period of residence in the county to which the member wishes to establish residence, and

"WHEREAS, the County to which the Physician transfers has no vote in acceptance of such member, or previous right of investigation, and

"WHEREAS, the said county to which transfer is made is required to accept responsibility for said physician, even though that physician does not reside in said county for only a few days,

"WHEREAS, the Saratoga County, owing to the development of the Mineral Waters and Spa facilities, increased numbers of physicians are coming to our county, who practice here for only a short period (a month to three months), and who have very little contact with our native population and the medical profession, and practice essentially Balneotherapy, and "WHEREAS, members of the Saratoga County

Medical Society strenuously object to accepting such short time practitioners into our membership, who later go to other counties and

states, and
"Whereas, we understand the above said
Constitution and By-Laws of the Medical Society of the State of New York are at the
present time under consideration of revision.

"Therefore, we the members of Saratoga County petition the House of Delegates to consider a by-law, whereby before a transfer is granted to a member of one county to another, the physician shall establish in the county to which he wishes to transfer a legal residence of at least six months, and maintain such residence for a period of six months in each year.

Referred to Reference Committee on New Business B.

A motion to adjourn, duly made and seconded, was carried.

The meeting thereupon adjourned at 12:15 P.M., to reconvene at 2 P.M.

AFTERNOON SESSION

The meeting was called to order by the Speaker at 2 P.M.

THE SPEAKER: The secretary has an announcement to make.

Dr. Peter Irving, New York, assistant secretary:

29. Prize Essays

This is a report from Dr. James Alexander Miller, Chairman of the Committee on Prize Essays, written to Dr. Dougherty in the form of a letter:

"The Committee on Awards of the State Society, consisting of Dr. Burton T. Simpson, Dr. E. G. Whipple and myself has carefully examined four essays which have been submitted to us, two of them for the Merrit H. Cash prize, namely, 'The Problem of Tuberculosis' with identification 'Science Thrives on Revolution' and 'The Neuro-Endocrine Factors in Carbohydrate Metabolism' with the identification of 'A.B.C.'"

It is the unanimous opinion of the Committee that the essay on the Problem of Tuberculosis deserves the Merrit H. Cash Prize and we would recommend its award.

The winner is Dr. Karl Fischel of Saranac

Lake.

"Also we have received two essays for the Lucien Howe Prize, one on 'Choroideremia' and the other on 'Corneal Transplants.'

"In the opinion of the Committee the very beautifully presented essay on 'Choroideremia' is worthy of the Prize and we would recommend the award of the Lucien Howe Prize for this essay."

The winner is Dr. Arthur Joseph Bedell of

Albany.

It was moved, seconded, and carried that the Report be adopted and the Merrit H. Cash Prize be awarded to Dr. Karl Fischel and the Lucien Howe Prize to Dr. Arthur Joseph Bedell.

30. City Charter-Tenure and Compensation of Medical Staff of Public Institutions

Section 70

Dr. Joseph Slavit, Kings: Dr. Van Etten, the distinguished Speaker of the House of Delegates of the American Medical Association, referred this morning in his speech to minorities, and, representing one of these minority opinions in the profession of medicine, I beg leave to

present the following two resolutions:
"Whereas, the charter of the City of New York, including five counties of the State of New York, is in process of revision by a special commission appointed for the purpose and representatives of organized medicine are sitting in and participating in the revision of the said

charter; and

"Whereas, the said charter provides for the maintenance of hospitals and other medical institutions of the City and counties therein and provides further for the compensation for the services of the personnel in these medical institutions, and for the tenure of their positions under civil service protection; and

"WHEREAS, the present charter specifically excludes the medical staffs of these institutions compensation for services and protection of positions, and the appointment and removal of these staffs is subject to no definite civil service control or other statutory protection, irrespective of long and loyal service rendered; and

"WHEREAS, there is no justification, social, economic, ethical, or professional, for such exemptions and discriminations in the case of medical staffs of public institutions and clinics, either in the city of New York or its constituent counties, or in any of such medical institutions in the State of New York,

'Be It Resolved, therefor, that this House of Delegates disapprove of the exclusive chaises herein referred to in the city, county and other charters of the State of New York and approve of the principles of providing proper compensation for medical services rendered in public institutions by medical staffs and for their proper protection of the tenure of positions of such medical staffs."

Referred to Reference Committee on New

Business A

31. Medical Care (Socialization of Medicine)

Section 73

DR JOSHIH SLAVIT Kings 'WHTREAS, the remarkable progress and achievements of modern scientific medicine and modern medical educrition make possible medical facilities and personnel sufficient to provide adequate care in health, illness, and disability for all our

people, and
"VHERLAS, despite this medical science, facilities and personnel, millions of the people still receive inadequate medical care and frequently no such care at all, while, at the same time, tens of thousands of our doctors and associated workers are insufficiently employed in their calling and insufficiently remunerated for

the professional services rendered by them and "Whereas, the fundamental cause of this public and professional state of affairs is the economic barrier between the people and their medical care partly caused by the inability of our people to purchase adequate or any medical care for themselves, and primarily due to the private individual or institutional method of rendering medical care on a commodity or fee-

for service basis, and

'WHEREAS the people's health is essentially the people's concern, not less important than education, property protection or any other public service, and therefore fundamentally is a social or state interest and obligation, no longer to be left to the economic and medical uncertainties of our mercantile methods of securing or providing medical care, with all the evils that necessarily follow therefrom,

"Therefore, Be It Resolved by this House of Delegates that we approve the reorganization of medical care and practice so as to provide all the medical care needed by our people, and so as to realize in full the true functions and purposes of medical science and art, at the same time assuring to the medical profession and the allied workers concerned in medical care with economic security and adequate conditions needed for the proper pursuit of their profes sions, and

"Be it Further Resolved, that we endorse the following attached plan as a suggestive basis

for such medical reorganization and for appro-priate legislation"
"I Adequate medical care of the sick and mjured as a social function, right and duty, and not as a private or public charity Curative and preventive means, measures and agencies to be included

- 2 A socialized system of medical care in health illness, and injury, free of fees (a) Under the auspices and with the subsidy of the state (b) I manced by taxation, similar to the public educational system or other governmental functions (c) Operated and regulated by the organized medical and allied professions, the medical and dental colleges, and the official of the existing public health agencies (d) This the existing public health agencies (d) This system to include all medical, dental, pharma centical mursing and other allied services and personnel
- "3 All hospitals clinics, laboratories, pharmacies etc, to be publicly owned and operated institutions, accessible to the sick free of charge The hospitals and clinics to be the Medical centers for ward and ambulatory cases, and to be properly organized coordinated and geo graphically distributed. House sick calls to be received at these centers and to be assigned to local or neighborhood physicians designated to cover specific local areas
- "4 All equipment, supplies, laboratory and other facilities of a medical, surgical, dental, pharmaceutical, nursing or other nature, to be furnished free by the State
- "5 All medical, dental, pharmaceutical, nursing, and allied education to be furnished free by the State
- "6 All duly licensed or registered physicians. dentists druggists, nurses, etc., to be legally entitled to practice under the system as full time practitioners or workers (a) Subject to established rules and reglations of admission and practice (b) With proper safeguards of their rights and privileges under the system and the law (c) With representation and a voice in the operation of the system
- 7 Compensation to be adequate and on a salaried basis (a) Graded according to time of graduation length of service in the system, rank hold and type of work (b) Salary increases and promotions to higher ranks to be based on similar considerations and to be auto matically enforced (c) Civil service (d) Pensions, sickness, old age and other disability and social insurance to be included and applied
- '8 Hours of work to be assigned, regulated and scheduled so as to provide (a) adequate medical care for the sick and injured at all times, (b) adequate time and opportunity for the physicians and allied workers for rest recreation, vacations and further-professional study—with pay
- '9 Organized cooperative groups and group methods to be employed wherever possible Special provisions to be made for rural and other territories inaccessible to regularly organized medical centers
- "10 Individual private medical practice permissible under the same conditions and regulations as in private education, plus existing licenses and requirements by the state"

Referred to Reference Committee on New Business C.

32. Advertising for Gain by Duly Licensed Physician

Section 68

Dr. Julius Ferber, New York: "Whereas, the Education Law, in relation to the practice of Dentistry was amended by the Streit Bill, Assembly Int. 2083, to the effect that a dentist who advertises for patronage, etc., his or her license may be revoked, suspended, etc., and

"WHEREAS, the Streit Bill which was made into law at the last session of the legislature practically prohibits all advertising for gain,

and

"Whereas, commercial advertising by medical practitioners in this State is an evil much to the detriment of the public being that it misrepresents, and even falsifies the qualities of the advertisers and make exaggerated promises not known to be feasible in the light of our present medical knowledge, therefore be it

"Resolved, that the House of Delegates of the Medical Society of the State of New York express its sentiment in favor of initiating through its proper agencies, legislation to amend the Medical Practice Act to the end of prohibiting advertising for gain by any duly licensed physician in the State of New York."

Referred to Reference Committee on New

Business A.

33. Eight Hour Day Law for Hospital Workers

Section 79

"WHEREAS, the primary interest of the medical profession is the protection of the health of the people and the rendering of the best

possible care and treatment of the sick; and "Whereas, good care and treatment of patients depend entirely upon the efficiency of the hospital personnel, without whose service and cooperation our medical services and orders

would be of little avail; and

"Whereas, we as physicians recognize and constantly preach the importance of sufficient rest and relaxation from arduous duty, and that the efficiency of any worker, and particularly the hospital worker, must depend largely upon

the proper hours and conditions of work; and "WHERLAS, the eight-hour day is universally recognized and practiced in all fields of endeavor, enterprise and industry, and is particularly ad-vantageous in reducing the amount of existent unemployment among nurses and other hospital

Be It, Therefore, Resolved, by this House of Delegates that we favor the principle of the eight-hour day for all hospital workers, includ-

ing nurses and internes."

Referred to Reference Committee on New Business B.

34. Practice of Medicine by Cults

Section 72

Dr. Howard, Broome: This resolution was passed at the fall meeting of the Broome County Medical Society;

"Whereas, because of continued efforts on the part of various individual cults, and groups individuals to procure legislation would allow its members to become licensed to

diagnosis and/or treat sick and ailing individuals which the Broome County Medical Society believes is not for the public good and is unfair to those men who through long training are licensed to diagnose and/or treat sick and ailing individuals; and because the present educational law seems to be inadequate to protect the public against unlicensed individuals and groups who do diagnose and/or treat sick and ailing individuals as demonstrated in Broome County this past year by the arrest of twenty-one such individuals all belonging to one group, by the State Educational Department, and the prosecution by the Attorney General's Office, without one conviction, but with wide advertising for this same group.

"Therefore, the Broome County Medical Society instructed its delegates to offer the

following resolution:

"Resolved: that the New York State Medical Society foster a bill to be introduced in the next legislature, changing, adding to, or taking from, the present educational law, such as would license any individual, cult or group, who desire to diagnose and/or treat sick or ailing individuals provided such individuals or group of individuals have received preliminary education and training such as is required to practice medicine, except in the use of drugs, pharmaceuticals and surgery."

Referred to Reference Committee on New

Business C.

THE SPEAKER: Are any Reference Committees ready to report?

35. Report of Reference Committee on the Report of Committee on Trends

Dr. John E. Wattenberg, Chairman, Cortland:

"We agree with the statement of the purposes for which this Committee was established and desire to commend it on the successful accomplishment within a brief space of time on the tasks imposed by the State Society. It would appear that this is the most practical way in which the varied activities of this Society can be brought so effectively before the lay public, and to impress upon the latter the importance of things medical in their daily lives. This is worthy propaganda, much as one may hesitate to employ this maligned term, and the response from both the press and the public demonstrates the wisdom of your Society in having executed plans for doing a piece of work which should have been inaugurated a long time ago. Great credit is due to the Director of the Public Relations Bureau, Mr. Dwight Anderson, for the effective manner in which he has interpreted and successfully handled the delicate tasks entrusted to him. He has cooperated most effectively with various groups both within and without your Society, and deserves unstinted praise for his efforts to bring the doctors and the public together through the medium of the

lay press and otherwise.

We note that sixteen county societies have cooperated with the Bureau in providing means for reaching prominent persons in their communities. This number should be extended to to include all of our constituent County Societies, and steps should be taken to impress the entire membership of the State Society with the importance of the Bureau to accomplish this end. The graphic display of the work of the Public

Relations Bureau at the present meeting is well worth the attention of the membership and provision should be made for similar exhibitions at all future annual meetings of the Society.

"Your Reference Committee further recommends that all publicity emanating from the official committees, especially those on economics and legislation, be disseminated as far as possible through the medium of the Bureau on Public Relations, and that likewise greater use be made of the official State Journal for this purpose. It is suggested, moreover, that definite working plans be developed for definite cooperation between these interested groups and the Bureau,"

I move the adoption of this report. Motion seconded and carried.

36. Age Limitation in Gainful Occupation

Section 69

Dr. SIMON FRUCHT, Kings: "WHEREAS, the general economic insecurity and the speed-up in all lines of work and endeavor result in unnecessary and unprecedented increase in the morbidity and mortality from cardiovascular and other degenerative disorders, physical and mental: and

"Whereas, the medical profession is essentially interested in the preservation of the

health, life, and comfort of the people;

"Be it Resolved, that this House of Delegates of the Medical Society of the State of New York favor the limitation of gainful occupation to the ages between eighteen and sixty, thus relieving the labor market, both skilled and unskilled, by releasing millions of jobs to those who are unemployed though in the prime of life; and "Be it Further Resolved, that we urge the

creation of a pension system with the grant of adequate pensions to all past sixty years to enable them to spend their declining years of life in decent comfort.

Referred to Reference Committee on New Business A.

37. Child Labor Legislation

Sections 39-50

Dr. Simon Frucht, Kings: I have another

"WHEREAS, the Medical Profession has always prided itself upon its interest in the health and

welfare of children, and
"Whereas, child labor and its existence in
any state of the union is indefensible from every medical as well as social and economic

point of view, and "Whereas, there is pending before the New York State Legislature the submission and adontion of an amendment to the Federal Constitu-

tion prohibiting child labor, be it therefore,
"Resolved, that this House of Delegates of
the New York State Medical Society favor the said federal and state Child Labor Amendments and urge upon the New York State Legislature and the Governor the passage and adoption of the said legislation."

Referred to Reference Committee on New Business B.

38. World Peace

Section 75

DR. SAMUEL S. FISCHOFF, Kings: "WHEREAS, the medical profession from time immemorial has claimed its function and reason for exist-ence to be the service of lumanity in the prevention of disease and death and the preservation of life and health; and

"WHEREAS, the general dangerous world unrest and stress now prevailing, particularly in certain parts of the world, make another and more destructive world war a serious possibility. fraught with the devastation of our entire civilization; and

"WHEREAS, the possibility that the United States may be unwittingly drawn into such a world catastrophe is real and menacing to this land and the welfare of the American people; and

"WHEREAS, war in any form and under all conditions always involves the destruction of life and the maining of body and mind, and all the misery and suffering consequent thereto; and "WHEREAS, we of the medical profession are

called upon to repair the physical and mental damage and ravages suffered by the people at war, and we are therefor in a position to realize the horror and inhumanity of war; and

"WHEREAS, the price paid for any possible medical scientific advance made through war must necessarily be at the incalculable cost of human life and happiness, and is therefore futile as well as contradictory to the claims of medicine;

"Be it Therefore Resolved by this House of Delegates of the Medical Society of the State of New York that we are opposed to war in general and the participation of this country in any war in particular, and "Be it Further Resolved that this Medical Society, its manhage officers and represents."

Society, its members, officers and representatives make all efforts for the preservation of peace, and support all other existing movements and forces working in behalf of peace and the prevention of war.

Referred to Reference Committee on New Business C.

39. Child Labor Legislation

Sections 37-50

Dr. Goodfriend, Bronx. "Whereas, the several states have coped unsuccessfully for over one hundred years with the problem of regulating child labor, and have so far failed to pass

uniform laws affecting regulations, and
"Whereas, child labor, by reason of its
cheapness is a powerful weapon in the struggle for industrial markets and therefore its tolerance in one state jeopardizes such regulations as

may exist in another, and

"WHEREAS, the experience of this country with three previous attempts by the federal government to regulate child labor has proven the feasibility of such legislation as well as its effectiveness and unquestioned superiority over the efforts of individual states, its lack of beaurocracy and interference with individual

liberty, and

"WHEREAS, with the death of the NRA and consequent frustration of the last national attempt to curb child labor, the return of that evil is ever more disturbing and menacing, and

"Whereas, we as physicians are peculiarly fitted to estimate the hazards of industrial employment upon the health and development of growing children. That by reason of this knowledge, we, as physicians, should be remiss in our duties as citizen if we stood aloof and failed to urge a measure which will affect the future health of our nation.

"Be It Resolved, that the New York State Medical Society go on record as favoring the adoption of the Child Labor Amendment to the

Constitution of the United States.

Referred to Reference Committee on New Business A.

40. Report of Reference Committee on Report of Legal Counsel

Dr. George A. Leitner, Rockland, Chairman: "The Reference Committee on the Report of Legal Counsel, has carefully examined the very excellent and comprehensive report submitted by Mr. Lorenz J. Brosnan, and highly commend him on the monumental work he and his associates have performed and the results they have achieved.

We feel that the Medical Society of the State of New York is to be congratulated on the

personnel of our Legal Organization.

The question box, the editorial work, the assistance to the members of our Society on special inquiries, have been of immense value to our Society.

It was moved that the report be adopted.

Motion seconded and carried.

41. Report of Reference Committee on Report of Committee on Public Health and Medical Education

Section 14

DR. JAMES H. BORRELL, Erie: "Your Reference Committee believes that the Medical Society of the State of New York is to be congratulated on the continued excellent work of the Committee on Public Health and Medical Education. Your Reference Committee invites attention to the continuance by the Committee on Public Health and Medical Education of its work in graduate education and of its activities through-subcommittees in the field of public health, and of its advance during the year into the realm of syphilis control. We note with satisfaction that the Committee has constantly worked in the solving of health problems by bringing the practicing physician into the field of preventive medicine.

"In view of the excellent work of the Committee on Public Health and Medical Education, your Reference Committee regrets to note a degree of support and cooperation by County Societies not commensurate with that deserved

by the Committee.

Your Reference Committee received the supplementary report of the Committee on

Public Health and Medical Education covering the pneumonia control program.

Your Reference Committee recommends that: the Committee on Public Health and Medical Education be instructed to edit this report for immediate publication as a matter of interest and record showing the accomplishments of the Medical Society of the State of New York in pneumonia control.

Your Reference Committee recommends that: the JOURNAL Management Committee be instructed to print the report upon its receipt from the Committee on Public Health and

Medical Education."

I move the adoption of this report. Seconded and carried.

42. Report of Reference Committee on Report of Committee on Scientific Work and on Report of Committee on Arrangements

Dr. Arthur F. Heyl: "Your Reference Committee on the Report of The Committee on Scientific Work and the Report of the Committee on Arrangements, approves their reports as presented.
"Your Reference Committee especially en-

dorses:

"1. 'Reasonable publicity on medical matters through official channels,' and the open forum

type of program for one evening.

2. The recommendation of Dr. William A. Groat that the 'extra day' program be continued and that its character be suited to the particular facilities of the city where the meeting is to be held and to be arranged by a local committee with the approval of the Committee on Scientific Work.

"3. The Clinical Program as arranged for the

Extra Day' this year.

"4. The Scientific Exhibits, and recommends that they remain placed and open until noon of the extra day.

"5. The unique arrangements made for continuous Theatre Motion Picture Demonstrations.

"Your Reference Committee feels that to report further would be mere repetition of what has already been expressed by Drs. William A. Groat and Gordon Heyd for their Committees, in explanation of the manner in which they so admirably have arranged such an excellent program."

I move that the report be adopted.

Seconded and carried.

43. Clinics for Relief Clients

Section 93

F. HEYL, Westchester: Arthur Dr. "WHEREAS, the regular use of voluntary hospital clinics for routine care and treatment of persons who are public charges, constitutes an unfair burden upon and exploitation of both the private physician and the voluntary hospital and places the attending staffs of the hospitals in competition with themselves and with the

medical profession generally, be it
"Resolved, by the Medical Society of the
County of Westchester that the Medical Society
of the State of New York be hereby requested

to declare it the sense of the State Medical Society that the routine use by public welfare agencies of hospital clinics attended gratuitously by private physicians is contrary to sound social, economic and medical policy, and be it

further

"Resolved, that the Medical Society of the State of New York should undertake through appropriate channels to bring about a change of policy in respect to the use of hospital clinics by welfares agencies throughout the state, substituting therefor the use of private physicians' services in their offices at fee rates mutually determined to be fair and equitable"

Referred to Reference Committee on New

Business B

44. Fees for Medical Services for Welfare Patients

Section 74

HFYL, Westchester ARTHUR "WHEREAS, the problem of relief is in transition from an emergency status to a permanent func-

"WHEREAS, it is desirable that medical and surgical fee schedules that are justifiable only because of emergency conditions should be revised at once, in the light of permanent needs,

therefore, be it

"Resolved, by the Medical Society of the County of Westchester that the Medical Society of the State of New York be hereby requested, through appropriate committees, to undertake immediate negotiations with the proper state agencies looking to the abolition of a state wide schedule of reimbursable fees, and the adoption of a new policy by these agencies enabling and requiring the payment of local welfare officers of medical fees that are in accordance with the prevailing minimum fees in their localities, as determined in each locality by conference between the local welfare officers and the county medical society"

Referred to Reference Committee on New

Business C

45. Physical Education Director

Section 65

DR. ARTHUR F. HEYL, Westchester "WHEREAS, the appointment of a physical education director to the directorship of the Division of Health and Physical Education of the State Department of Education has resulted in the supervision of medical functions by a non medical administrator, and

"WHEREAS, the health of the school child necessarily involves medical considerations even

more fundamentally than considerations of physical education, therefore be it "Resolucit, by the Medical Society of the County of Westchester that the appointment of a layman as Director of the Division of Health and Physical Education of the State Education Department is hereby condemned and protested as unwise from the standpoint of public welfare, and be it further

"Resolved, that the Medical Society of the County of Westchester hereby memorialize the Medical Society of the State of New York to

the effect of the foregoing resolution and recommends that the Medical Society of the State of New York take such steps and sponsor such legislation as may be deemed necessary to require the appointment henceforth of a duly qualified physician to the aforementioned directorship

Referred to Reference Committee on New

Business A

46. Permanent County Society Offices

Section 19

McGoldrick, Kings THOMAS Α "WHEREAS, several County Medical Societies have established permanent county society offices, and

"WHERFAS, several County Medical Societies have appointed lay executive secretaries, and

"WHEREAS, the failure of the Medical Society of the State of New York officially to recognize these offices and lay secretaries has led to confusion delay in the interference with the transaction of business, and consequent loss of

efficiency, therefore,
"Be It Resolved by the House of Delegates of the Medical Society of the State of New York assembled in New York City on April 27, 1936, that whenever the president of the County Medical Society so requests, all correspondence issuing from the State Medical Society office for that County Society be addressed to the County Society office and not to the office or home address of the secretary, and

"Be It Further Resolved that the address of these County Society offices shall be published in the Medical Directory of the Medical Society

of the State of New York"

The resolution as introduced is approved by the Reference Committee and I move its adoption

Seconded and carried

47. Finances of the Society

Sections 10-78

THOMAS Α McGoldrick, Kings "WHEREAS, there exists a state of greatly disturbed financial conditions, it is hereby

Resolved, that the Trustees by a vote of the

House of Delegates be permitted to invest a portion of the funds of the Society in equities."

The Report of the Reference Committee is that a portion of the funds not exceeding forty

per cent be permitted for investment by the Board of Trustees Recommitted to the Reference Committee

48. Transfer of Membership

Section 28

THOMAS McGoldrick, Kings Α This is on the resolution introduced by Dr G S

Towne, Saratoga.

"WHIREAS, the Constitution and By-Laws of the Medical Society of the State of New York do not require for transfer of membership any definite period of residence in the County to which the member wishes to establish residence,

"Whereas, the County to which the Physician transfers has no vote in acceptance of such member, or previous right of investigation, and

"Whereas, the said County to which transfer is made is required to accept responsibility for said physician, even though that physician does not reside in said county for only a few days, and

"Whereas, in Saratoga County, owing to the development of the Mineral Waters and Spa facilities, increased numbers of physicians are coming to our county who practice here for only a short period (a month to three months), and who have very little contact with our native population and the medical profession, and practice essentially Balneotherapy, and

"WHEREAS, members of the Saratoga County Medical Society strenuously object to accepting such short time practitioners into our membership, who later go to other counties and states,

and

"Whereas, we understand the above said Constitution and By-Laws of the Medical Society of the State of New York are at the present time under consideration of revision.

"Therefore, we the members of Saratoga County petition the House of Delegates to consider a By-Law, whereby before a transfer is granted to a member of one County to another, the physician shall establish in the county to which he wishes to transfer a legal residence of at least six months, and maintain such residence for a period of six months in each year."

Your Reference Committee recommends that it be amended that provision be made whereby a member of one county society shall not be permitted to transfer to membership in another county society until he has established a legal residence in the county to which he desires

transfer.

I move its adoption. Seconded and carried.

49. Medical Directory

Section 21

Dr. Thomas A. McGoldrick, Kings: The following resolution was introduced by Dr. Sherwood, Niagara County Society:

"The following resolution was adopted by the Medical Society of the County of Niagara at a regular meeting January 14, 1936.

"Whereas, the Directory published each year by the Medical Society of the State of New York costs approximately \$1.15 to prepare and publish, and

"Whereas, it serves no useful purpose to over ninety-five per cent of the State membership, and

"Whereas, it is in part a duplication of information already available in the A.M.A. Directory, and

"WHEREAS, we believe this money could be more advantageously expended in enlarging the services the State Society can perform for its members and the component County Societies; therefore,

therefore,
"Be it Resolved that the Medical Society
of the County of Niagara requests the State

Medical Society to discontinue the publication of the directory for general distribution,

"Be it Further Resolved that the directory be made available for those who have need of same, to be ordered and paid for similar to the procedure of the A.M.A.

"Be it Further Resolved that a copy of this resolution be sent to each County Medical Society in New York State, and to the Secretary of the State Society."

Your Reference Committee disapproves of the resolution. I move the adoption of this report.

Seconded and carried.

50. Child Labor Legislation

Sections 37-39

DR. THOMAS A. McGOLDRICK, Kings: This is a resolution introduced by Dr. Simon Frucht of Kings County:

"Whereas, the medical profession has always prided itself upon its interest in the health

and welfare of children; and

"WHERLAS, child labor and its existence in any State of the union are indefensible from every medical as well as social and economic point of view; and

"WHIREAS, there is pending before the New York State Legislature for confirmation and adoption an amendment to the federal constitu-

tion prohibiting child labor;

"Be it Therefore Resolved, by this House of Delegates of the State Medical Society that we favor the said federal and state child labor amendment, and urge upon the New York State Legislature and the governor the passage and adoption of the said legislation."

Your Reference Committee reports and recommends that there is not sufficient evidence before the House of Delegates to warrant action and recommends that action on this resolution be therefore postponed.

Dr. Joseph Slavit, Kings: I can't quite agree with the chairman of the Committee that there is not sufficient evidence to warrant the passage of this resolution. The fact remains that there is an amendment to the Federal Constitution prohibiting child labor, and it is before the several states of the Union. The fact remains that it is before New York State, and the fact remains that we as the medical profession ought to support such an amendment and see that such an amendment is carried by New York State so as to make it effective as a national policy.

DR. FREDERIC E. SONDERN, New York: We are living through a period that distresses some of us perhaps more than others. Some of us, and I hope a majority, still favor state rights. New York is perfectly competent to make any child-labor laws it wants, and, thank God, it can enforce them, too. Now, if Florida or Mexico does not, it is just too bad; but child-labor laws in New York City from a point of justice should be very different from child-labor laws in the State of Kansas. They have a situation in Kansas where for six weeks it is a good thing to employ children and it does them no harm during their school holiday. This is another instance of where our federal Govern-

ment of today is attempting to rob the state

of its rights, and I am against it

After free discussion by Doctors Harry Aranow, New York, Samuel S Fischof, Kings, and Thomas A McGoldrick, Kings, a motion to vote on the question was carried. It was moved seconded, and carried that the report of the Reference Committee be adopted

51 Official Pronouncements of County Societies

Section 27

DR THOMAS A McGoldrick, Kings We have a resolution presented from the Medical

Society of the Bronx

WHEREAS, the by-laws of the Medical Society of the State of New York, Chapter 5-Section 3-page 15, state that the Executive Committee shall provide for the publication of official pronouncements of the component county societies when requested by such a society, and

WHERFAS, the Bronx County Medical Society did officially request such a publica

tion of one of its pronouncements, and

WHEREAS the Editor of the STATE JOURNAL refused to publish in the STATE JOURNAL such

pronouncement.

"Be It Hereby Resolved that the Executive Committee of the State Society be apprised of this failure of the Editor to honor such requests, and that the Executive Committee of the State Society take the proper steps to remedy such

breach of our by laws"

Your Reference Committee is informed by the Assistant Secretary, Dr Peter Irving, that the matter introduced in the resolution was re ferred to the Executive Committee of the State Society and the action taken was upon the authority of that committee and the Bronx County Medical Society was so informed Since this is a matter of administrative policy, the Reference Committee advises no reason to recommend any action thereon

I move the adoption of that report

Seconded and carried

52 Hospital Management and Medical Staff

Sections 24-80

DR. THOMAS A. McGoldrick, Kings The following resolution was adopted at the regular stated meeting of the Medical Society of the County of Kings on April 21, 1936

WHEREAS, the hospital has become an in creasingly important factor in the provision of

medical care, and 'Whereas the authority of management is almost universally in the hands of laymen, and "WHEREAS, the professional care of the sick is essentially a medical function and

WHEREAS, the public interests will be better served when medical opinion evaluates the professional competency of candidates for appoint-

ment or promotion and

'WHEREAS, changes have been made on the medical staff and medical personnel organization of some hospitals without due consideration of the opinion of the physician constituting the medical staff, and

WHERLAS, changes in staff organization and personnel have been made which were not in the public interest, and often have been in fact acts of injustice to physicians who, by honorable and faithful service, had acquired a moral right to the continuance of such privileges and benefits as flow out of the hospital connec

tion, and 'Whereas a correction of such wrongs is possible only through the action of an authorita tive body, qualified and constituted to speak the opinion and will of the medical profession

Therefore, Be It Resolved, that hereafter only those institutions which recognize, acknowledge and observe in practice no change in medical staff or personnel organization without recommendation or approval of its Medical Board shall be regarded as maintaining ap proved status and

Be It Further Resolved that the President of each County Medical Society be authorized to appoint an impartial committee for the consideration and arbitration of any differences of opinion which may arise between the lay board of any hospital and its Medical Board and

Be It Further Resolved, that it shall be considered unethical for any physician to accept appointment to fill a vacancy in any hospital staff or medical personnel organization which has been created by the lay administration in disregard of the principles of equity and justice herewith declared and

Be It Further Resolved, that a copy of this resolution be addressed to The American College of Surgeons with the request that due re

gard be given thereto, and

Be It Further Resolved, that the Delegation representing the Medical Society of the County of Kings in the annual meeting of the House of Delegates of the Medical Society of the State of New York be instructed to introduce these resolutions and actively support their adoption in the next session which convenes April 27, 1936"

Your Committee reports concerning the reso

lution of the Medical Society of the County of Kings, presented by Dr Joseph Raphael, Secre-It approves the adoption of the first five clauses of the preamble and recommends the elimination of the sixth and seventh, and the adoption of the following resolution in heu of those presented in connection with the preamble as approved Let me say that the sixth and seventh represented that changes have been made against the public interest and that a correction of such conditions is possible only through the action of an authoritative body

In place thereof the Committee recommends

Therefore, Be It Resolved that the Medical Society of the State of New York records its disapproval of the above practices and recommends that the final authority in hospital management introduce changes in medical per sonnel or general professional policies only after due consultation with a Medical Board or other constituted professional authority of the hospital

I move the adoption of that resolution

THE SPEAKER The Reference Committee's

substitute resolution is before the House. Is there any discussion?

Dr. NATHAN RATNOFF, New York: If I were the delegates I would rather destroy entirely the resolution than adopt the one recommended by the Reference Committee, because the Reference Committee recommends only consultation with the Medical Board. I assure you after you consult them very often they will disregard you more often. Now, let us be entirely frank. Do you want the resolution, that the Board of Directors who have power to appoint men who are approved by the Medical Boards of the Hospital or men that you don't want? But simply asking them to consult ussure, they will be eager to consult us but you won't find the consultation very profitable.

Dr. FARMER: I would like to say in favor of the original resolution that it is about time that the medical men spoke up on this question of hospitalization. We know that the Board of Directors, the lay Board that controls our hospitals, contributes about seven per cent of the income to an institution. The City provides them sixty per cent at the present time. The fees gotten through ward patients and private cases provides the rest. Here is, then, a governing body that contributes about seven per cent controlling one hundred per cent of the hospital appointments. It is about time that we speak up.

THE SPEAKER: Is there any further discussion?

Dr. Louis Lewis, New York: I am heartily in favor of either adopting the resolution as phrased or not adopting anything at all for the simple reason that it is about high time that we physicians show the powers that be, the financial powers that be, who control our actions as physicians in the hospital,—we must show them that we are not to be pussy-footed with; that we are just as valuable to the hospital as they are. It is about time to show them that we are a power. If you are going to kowtow to them you may just as well give up every bit of freedom, and I think the resolution should be adopted as presented.

Dr. Charles H. Goodrich, Brooklyn: The resolutions that were submitted by the Medical Society of the County of Kings seem to me to have been emasculated. I believe the resolutions were very broad and very belligerent in note. Some men in the County of Kings thought it was very necessary to have that note put in, but I can tell you from experience in hospital administration and hospital work that the word "consultation" is very, very indefinite and were that put into the hands of some hospital executives they would consult and never accept the recommendation of the Medical Board. I would therefore, recommend the recommitting of this report so that there will be a more definite instruction to the hospital superintendent and lay boards of what we believe would be the ideal procedure.

THE SPEAKER: The motion to recommit is before the House for the reason stated. Those in favor of recommitting this for consideration further by the Reference Committee will kindly say "aye"; those opposed, "no." It is so ordered.

53. Anesthetics as Practice of Medicine

Section 15

Dr. Thomas A. McGoldrick, Kings: I have another resolution from Erie on the subject of otherwise, anesthetists, technicians or licensed to practice medicine:

"At a meeting of the Medical Society of the County of Erie, held April 20, 1936, the following preambles and resolution was adopted:

"WHEREAS, at the 1933 annual meeting of the House of Delegates of the Medical Society of the State of New York the following resolutions were passed:

"Resolved, that the Medical Society of the State of New York affirm that the giving of an anesthetic constitutes the practice of medicine and insist on the strict observance of the provisions of the Medical Practice Act without subterfuge or evasion.

"Resolved, that if it is the opinion of the Attorney-General that non-medical technicians practicing anesthesia are not violating the law under present conditions, that the proper procedure be instituted to obtain legislation which will include anesthesia in the practice of medicine or limit the administration of anesthesia to duly licensed dentists or physicians.

"WHEREAS, the Medical Society of the County Erie has received no information of any action taken pursuant to the foregoing resolutions, therefore be it

"Resolved, that the Medical Society of the County of Erie instruct its Delegates to present to the House of Delegates at the 1936 Annual Meeting a recommendation that the proper committee of the Medical Society of the State of New York be directed to draft and promote at the 1937 session of the New York State Legislature a bill to limit the administration of anesthesia to duly licensed physicians and dentists, except in cases of emergency.

Your Committee reports that it is of the opinion that the number of physicians qualified as anesthetists at the present time is not sufficient to take over the work now being done by trained non-medical anesthetists throughout the state, and, therefore, cannot approve the resolu-

tion for immediate enactment.

We further recommend that the matter of training physicians as fully qualified anesthetists be referred to the Committee on Medical Education of the Medical Society of the State of New York for action.

I move the adoption of this report.

Dr. HARRY ARANOW, Bronx: I just want to point out that a year or two ago when my Committee introduced a bill in Albany to make it illegal for nurses to give anesthesia, we received hundreds and hundreds of protests from medical boards and surgeons throughout the

THE SPEAKER: Are you ready for the question? Those in favor of my putting the question will kindly say "aye"; those opposed, "no. Carried. The question is before the House:

Shall the report of the Reference Committee with its recommendations be adopted? Those in favor will kindly say "aye"; those opposed "no". The report is lost.

The original resolution is before you. What is your pleasure?
DR. THOMAS A. McGoldrick, Kings: The

original resolutions are as follows:

"At a meeting of the Medical Society of the County of Erie, held April 20, 1936, the following preambles and resolution was adopted:

"WHEREAS, at the 1933 annual meeting of the House of Delegates of the Medical Society of the State of New York the following

resolutions were passed:

"Resolved, that the Medical Society of the State of New York affirm that the giving of an anesthetic constitutes the practice of medicine and insist on the strict observance of the provisions of the Medical Practice Act without subterfuge or evasion.

"Resolved, that if it is the opinion of the Attorney-General that non-medical technicians practicing anesthesia are not violating the law under present conditions, that the proper procedure be instituted to obtain legislation which will include anesthesia in the practice of medicine or limit the administration of anesthesia to duly licensed dentists or physicians."
"Whereas, the Medical Society of the County

of Erie has received no information of any action taken pursuant to the foregoing resolu-

tions, therefore be it

"Resolved, that the Medical Society of the County of Eric instruct its Delegates to present to the House of Delegates at the 1936 annual meeting a recommendation that the proper committee of the Medical Society of the State of New York be directed to draft and promote at the 1937 session of the New York State Legislature a bill to limit the administration of anesthesia to duly licensed physicians and dentists, except in cases of emergency."

THE SPEAKER: The resolutions are before you

now for adoption or rejection at your will. Those in favor of the adoption of the resolutions say "aye"; those opposed, "no". Carried.

54. Amendments to Constitution and By-Laws-Associate Members, Auxiliary Members, Etc.

Section 20

DR. E. C. Podvin, Chairman: In relation to amendments to Constitution and By-Laws in regard to various classes of membership, under this heading, your Committee has considered four resolutions introduced by Dr. Farr of New York referring to special classifications of membership for

- (a) Medical men in full time positions not in practice;
- (b) Recent graduates in medicine;
- (c) Medical men in Government services; and
- (d) Non-medical scientific men interested in some way in medical problems.

We believe that under the Constitution of the Medical Society of the State of New York, the latter group could not in any sense be entitled to membership and therefore recom-mend the disapproval of this resolution.

In reference to the three groups of physicians referred to in the resolutions, your Committee feels that these physicians, if they are desirous of becoming members of the New York State Medical Society must pay the annual dues, but that the payment of local dues to the County Society is entirely within the jurisdiction of the County Society to which

they apply.
We therefore recommend that all four of these resolutions be disapproved, but further recommend that the matter of special arrangements for membership for full time physicians not in practice, for recent graduates and for medical men in Government positions be taken under consideration by the Committee on Revision of Constitution and By-Laws.

I move the adoption of the report of the Reference Committee.

Seconded and carried.

DR. GORDON HEYD, New York: I move you that the Council be directed to appoint a committee on revision of the Constitution and By-Laws.

Seconded and carried.

55. Physiotherapy

Section 25

DR. E. C. Popvin: Your committee after consideration of the resolution submitted by Dr. Kovacs of New York County recommending that the granting of further physiotherapy licenses be discontinued, finds that the present law is acting as an effective barrier to the entrance of non-medical physiotherapists into practice. The State Board of Regents is powerless to make any effective change in its method under the present law. To effect the changes asked for in the resolution would require a change in the law.

We deem it unwise to open up this matter on the floors of the Legislature and therefore recommend that the resolution be disapproved.

I move the adoption of that report. Seconded and carried.

56. Licensing Foreign-Educated Physicians Sections 13-17-85

Dr. E. C. Popvin: Your Committee has considered two resolutions introduced with the object of recommending a reduction in the number of licenses issued by the State Department

of Education by endorsement.

It is evident that the reason for the increase in licenses so issued has been the influx of physicians who have been forced out of their countries, particularly Germany, since 1933. We have ascertained that the Board of Regents issues licenses without examination only to graduates of schools whose standards comply with the requirements of the New York State Board of Regents as regards pre-medical as well as medical education. In the period 1917 to November 1934 inclusive, 264 were so licensed from foreign countries, and 246 from Canada. The greatest increase has come since 1933 and is reflected in the licensing of 180 German physicians from November 1, 1934 to March 20, 1936. Naturally most of these physicians stay in the larger cities, near the ports of entry, par-ticularly in the City of New York. There can be no question that this does disturb the economic situation to some extent.

We must not forget that medicine is a profession which should be open to all who can satisfy the professional requirements for its practice. On the other hand, it has been intimated that in certain instances the examination into the credentials and experience of applicants for licenses without examination has not been sufficiently thorough and has resulted in some applicants gaining a license to practice in this manner who had not the professional experience to warrant it.

It was a realization of these facts which led to the enactment of Section 51 of the Educa-

tion Law.

We have therefore taken the resolution introduced by Dr. Kaliski and made certain changes in order that it may conform with this thought.

"WHEREAS, it has become apparent that the number of physicians obtaining licenses to practice medicine in the State of New York by endorsement of their credentials and without requiring the candidates to undergo a professional examination is increasing at a great rate; and "Whereas, the maintenance of high profes-

sional standards and public health and welfare require that physicians be required to establish their competence by submitting to a thorough examination before being licensed to practice

medicine; and

"WHEREAS, there has arisen doubt in the minds of some physicians who have been associated in professional work with some of the foreign educated physicians so licensed by endorsement only, as to the professional attainment of such physicians and whether they deserve licensing without a professional examination,

"Therefore, Be it Resolved, that the Medical Society of the State of New York deplores the condition which seems to necessitate the granting of licenses by endorsement in large numbers and requests the authorities of the Department of Education of the State of New York to use the utmost discretion in the granting

of such licenses."

I move the adoption of the report.

THE SPEAKER: You have heard the resolution. Dr. HARRY ARANOW, Bronx: It seems to me that the Reference Committee has emasculated the resolution. I want to inform the House of Delegates that the Legislative Committee in your behalf introduced a bill which is now in the Legislature, which would prohibit except in a few instances the practicing of medicine without a license. The bill is now in the Assembly Rules Committee, and if the House wants to have it passed it would be a good idea to support it. But to merely depend on the courtesy or the good will of the Regents is not a very safe proposition.

I move that the House of Delegates go on record in favor of the Bill number 1163 which would prohibit the foreign physician practicing here without an examination, with a few exceptions satisfactory to the Department of

Education.

Motion seconded.

THE SPEAKER: A motion to substitute for the resolution of the Reference Committee has been made. You have heard it. Are you prepared to receive the substitute? Those in favor of receiving and discussing the substitute kindly

say "aye"; those opposed "no".

Carried. The substitute is before the House.

What is your pleasure?

Dr. Frederic E. Sondern, New York: I believe before we can conscientiously vote on this substitute motion we should know the contents of this bill.

Dr. David J. Kaliski, New York: I heartily agree with what Dr. Sondern has said. There is nothing contradictory or antithetical before the House in the bill that has been introduced in the Legislature. I think that we should call attention of the State Department of Education to the scandalous condition that is permitting so many men to get a license without a proper examination. That has nothing whatsoever to do with the bill that has been introduced making an examination a necessity. I believe that the resolution should be passed. We should also endorse the bill, if it is a proper bill, that has been introduced in the Legislature.

THE SPEAKER: The question before the house

is on the substitute motion.

Dr. ARTHUR J. BEDELL, Albany: May we have our legislative agent, our executive officer, Dr. Lawrence, come before the House and explain it so that we may all understand that upon which we are to vote? I make that as a motion.

Seconded and carried.

Dr. LAWRENCE, Albany: The bill that is before the Legislature at the present time requires that any person who graduates from a foreign institution, whether he be foreign or not, must take the examination, the same State Board examination that is exacted of the student who studies medicine in New York at the present time, before being granted a license, with these exceptions: that where we have established reciprocity-and I believe there are two institutions that are registered with our Board of Regents—graduates from institutions registered with the Board of Regents may have their license endorsed in this state at the discretion of the Board of Regents. That is the reciprocity which, of course, we enjoy with Canada.

A question was asked as to whether an American student completing his education in Paris, for instance, would be able to secure a license in New York State. Yes, provided he takes a State Board examination that is required of any other person. The object of section 51 of the Education Law which gives the Regents the privilege of granting a license to persons of eminence, a matter in their discretion, has not been interfered with; but this bill does very definitely make it necessary for persons coming into this state and seeking a license to take the State Board examination required of any

other citizen of the State.
DR. E. C. PODVIN, Bronx: It was the understanding of your committee that this resolution had reference only to Rule 51, or that rule which allows physicians of eminence and of standing to be registered without examination, and it was in reference to the alleged laxity on the part of the Department of Education in opening too wide this gate, and not examining sufficiently into the standing of the men so admitted, that the recommendations were made.

THE SPEAKER: Nevertheless, the motion

before the House is on the substitute. Are you ready for the question? The substitute was made by Dr. Aranow, not as a member of the delegation from the Bronx, but as the chairman of the Committee on Legislation.

Those in favor of this substitute will rise; those opposed will rise. The substitute motion is adopted and is so ordered by the House.

57. Malpractice Indemnity Insurance

Sections 7-18

DR. B. WALLACE HAMILTON, Chairman, New York: Your Reference Committee approves of the resolution introduced by the Insurance Committee relating to the change of the majoractice indemnity insurance to the Yorkshire Indemnity Company. Your Committee has given this matter detail study and approves the action taken by the Council, the Executive Committee, the Insurance Committee, and the Counsel of the Medical Society of the State of New York. I move its adoption.

DR. JAMES M. DOBBINS, Queens: As chairman of the delegation of the County of Queens, I am instructed by my Society to oppose this

change in the insurance carrier.

THE SPEAKER: Dr. Dobbins, there is no resolution before the House about change. There

is a recommendation.

Dr. Dobunns: I am making that statement. As an individual I am criticising and I should like to offer my criticism of the change in carrier. In the first place I believe that the resolutions as passed by the House of Delegates on April 3, 1933 contained facts which were lost sight of or forgotten about in the promulgation of the new insuring clause. The new form of policy seems to be in some respects contrary to the resolutions approved by this House of Delegates in April of 1933. The insuring clause in the Yorkshire definitely uses the word in the first insuring clause—first personally seen. The doctor must first personally see the case. In the resolutions approved by the House of Delegates the word "first" is not used. The insurance clause of the Yorkshire further goes on and says—exceptions; if there is a promise made the insurance company, the Yorkshire, are not liable. If there is a claim made for fraud or deceit the insuring company are not liable. There are additional exceptions in this insuring clause.

The Yorkshire Indemnity Company by their own statement indicate that they have had a continued underwriting loss beginning in 1928 and running through to 1934, an ever increasing amount, from \$82,293.00 to \$237,073.00 in 1934.

The Yorkshire Company by their own statement as of December 1935 over the signature of the president indicate that they have had a further decrease in premiums of over a quarter of a million dollars. They have had a decrease in trade loss of over \$69,370, and a consequent decrease in reserves of over \$68,000.

The contract is very well-worded. It definitely states that there can be no misinterpretation on the verbiage. I should like to call attention to the fact that the English language is very well defined when it comes to court, and that the case of Preston vs. the Aetna Insurance Company, 193 New York, Volume 144, in which the word "claimed" was used in the contract,

and by subterfuge they tried to get around that, the court ruled that the commonsense language used in a contract must be interpreted. Likewise in a case against the North American Insurance Company, 269 New York, Volume 90, the same thing stood an interpretation. The court ruled that the verbiage used in the contract must stand as is. More could be said in reference to the verbiage of the contract, but as financial matters stand today, they indicate in my opinion that we are possibly behind the eighth ball in this matter. We are insuring in a company that has had a continued loss for eight years. What are you going to do, give them \$350,000 worth of business now, an untried business, something we know nothing about, that we are personally not acquainted with? Nor are they equipped by virtue of their offices to do the proper investigating work. They probably will eventually develop that, but at

the present writing they are not.

It has been represented that one of the insurance rating companies has given it an A plus rating. That is true, but that on a 1934 basis. We are doing business in 1936. Much can have changed during that time. A ratings were given to plenty of other companies which subsequently

have fallen by the wayside.

There has been room for doubt as to whether this matter was handled in the proper form. The constitution of the State Society definitely states that no Standing or Special Committee shall incur or initiate any policy or commit the Society to any policy unless the same has been expressly approved by the House of Delegates or the Council or the Executive Committee. Letters circularizing the county would indicate that this matter was consummated before it was officially approved. True, there was a meeting of the Executive Committee, a special meeting on July 19 for the express purpose of terminating the arrangements with the Aetna. That was done. Likewise the Insurance Committee was empowered or given authority to act with power. It went ahead, It consummated the deal, as evidenced by a letter that was sent on July 25, a few days after the meeting, ten days later, stating that the contract or the agreement, rather, between the two parties was terminated. There is no record to indicate that the Council or the Executive Committee officially approved of the Insurance Committee's activities until along some time in December. It is true enough that the Society has been circularized with a letter from the parent organization in England, stating that all liabilities as far as they exist in the same way will be taken care of by the parent company. That is equivocal in its meaning and possibly may be said to be of no legal value or standing in this country.

I think it is about time that this large body, with such a vital issue at stake, should look into this matter. Eight thousand doctors certainly have control of a matter that is as vitally im-

portant as this is to their welfare.

THE SPEAKER: The motion before the House is on the adoption of the Reference Committee's report. The Reference Committee approves the resolution introduced by the Insurance Committee relating to a change of the malpractice indemnity insurance to the Yorkshire Company. The Reference Committe has given this matter

detailed study and approves the action taken by the Council, Executive Committee, Insurance Committee and the Counsel of the Medical Society of the State of New York.

That is the question before the House. Shall that be adopted? Is there further discussion?

Dr. ARTHUR J. BEDELL, Albany: Is it permissible to postpone action on this until we hear all of the details connected with this insurance problem?

THE SPEAKER: Everything is permissible that the House of Delegates vote. The necessity for it ought to be explained since the matter has been before a Committee. However, I am ready to hear any motion you wish to make.

Dr. Arthur J. Bedell, Albany: I move you, sir, a postponement of the receipt and action on this Committee's report until we have heard the other reports relating to insurance work. Dr. Milton J. Goodfriend, Bronx:

second it.

THE SPEAKER: The motion is postponed until such time as we have heard the reports on the other resolutions that have been referred to this Committee. Are you ready for the question? Those in favor kindly say "aye"; those opposed, "no." There is a divided House. Those in favor

kindly rise, those opposed kindly rise.

Those in favor of postponement have it, and it is so ordered. The matter is postponed until the other matter on this insurance question has been reported upon by the Reference Committee.

Dr. Milton J. Goodfriend, Bronx: Mr. Speaker and gentlemen: In taking care of any system of group malpractice insurance, the prime requisite should be adequate and proper coverage at the lowest possible rate. The reason for bringing this matter before you is that in our opinion these two matters have not been sufficiently cared for in the new contract of the present carrier. It is possible at the present time in various sections of the state and in New York City to obtain similar malpractice insurance at rates lower than those charged by our present carrier. It is also possible at the present time to obtain coverage greater than the present carrier gives to us. When this change was consummated and when the present insurance representative of the State Medical Society was invited to appear before a committee of the Bronx County Medical Society investigating the matter of insurance, his statement was that we couldn't go out and sell this insurance, and, therefore, we grabbed the first one that was offered that we thought was good. There was no attempt to solicit other companies and find out whether this particular type of policy should be obtained or could be obtained at rates lower than those at present quoted, or quoted previously by the Aetna Insurance Company.

Moreover, the Aetna Insurance Company had written this particular policy for ten years and apparently had written it satisfactorily to the membership of this Society, states that no attempt was made at any time by any members of our Insurance Committee to meet with them, other than the insurance representative, to discuss with them rates or terms of policy, and that they were willing and are at present will-

ing to discuss these terms.

As far as proper coverage is concerned, Dr. Dobbins has called your attention to several facts, but possibly two instances might tell you how improperly covered we are in the present contract. If you do not personally see and diagnose a case, but if your office at a time when you are occupied elsewhere should send somebody to see that patient, and if in the course of treatment by this substitute, even though you may have seen that patient before but did not diagnose the condition at that time, and if a malpractice suit is instituted against you, according to the terms of this policy, you would not be covered.

If you were to operate on a patient in an emergency and subsequently it was claimed that you had not been given consent for this operation, that would be a claimed assault, and according to the terms of your policy you

would not be covered.

Now, in reference to how the cost of this policy was obtained, according to our insurance representative this policy is to be written on a cost plus basis; it was to be the actual cost as figured by the insurance company plus two and a half per cent underwriting profit. According to Mr. Wanvig and the Actna, they have never been able to waive this two and a half per cent profit yet one of the large factors introduced in bringing the cost to a point which the present Insurance Committee felt was too high and as a result of which the contract with the Aetna was ended is a tremendous charge, an annual charge for the writing of your policy plus its renewal, running between seventeen and a half and twenty per cent, in addition to which there is a monthly stipend paid to our insurance representative for taking care of part of the work.

We feel that in order that proper coverage at lower rates may be given the members of this Society, a Committee of Seven as recommended in our resolution should be appointed by the President to look into this matter and to report

back.

Dr. Gordon Heyd, New York: Mr. Chair. man and members of the House of Delegates: There are no facts that the adversary of this plan can have that your Insurance Committee could not have had. Certain facts are open to differences in interpretation and certain facts can be willfully suppressed. I now propose to tell you, with your indulgence, briefly the story of malpractice indemnity insurance.

Your Insurance Committee, of which I have been a member, for 11 years with the exception of one year, have not been satisfied with the Aetna policy, because in making the application for the insurance, you sign an order blank which unequivocally binds you to certain conditions, and four or five years later if you have a malpractice case you find that under your original warranty or order, you could not

be indemnified.

Your Insurance Committee met in the latter part of May and determined what a good policy should be; that it should be controlled by the Medical Society of the State of New York and all moneys received should be utilized in computing the cost. The Aetna never allowed your Society to benefit by excess premium; for example I pay \$80 for a hundred thousand dollars malpractice insurance, \$30 for the basic policy—5000—15000 and \$50 additional for the excess limits. The difference between \$30 and \$80 is not utilized by the Aetna in reducing the cost of our base rate.

We felt that the indemnity insurance of this Society should be the major interest of the carrier; there should be no agency for insurance except that constituted by your Society; that every restriction should be in the policy, not in an order blank; that the detail work should be done by the Insurance Committee and the insurance representative with legal counsel; that your insurance representative could employ local agents and local counselit it is highly desirable in certain counties to have a local attorney; that there be set up a triplicate voucher system so that at the end of the year we would know what our insurance

It is true that we never met with the representatives of the Aetna Insurance Company. There was never any need of it. We had an insurance representative who did that for us.

You have a better policy today under the Yorkshire than under the Aetna because half the members were never protected under the Aetna. When they went away on Wednesday afternoon and played golf and left two other doctors to look after their business, they were not protected; because the specific all-covering clause in the Aetna was a "patient personally seen by the physician." Whether it is previously seen or not, is immaterial.

Under the new policy with an additional premium of one-sixth, it allows you to have a temporary unnamed assistant take care of your business for sixty days in any calendar year, and you are absolutely protected if somebody calls up your office and asks the name of the

doctor.

The next thing is, everything should be in the policy. Now, let us break up this insurance dollar. This is a unique insurance scheme, gentlemen, in that the company no matter who it is, whether it is good or whether it is bad, gets two and a half per cent profit. Imagine what happens to one insurance dollar. and a half cents goes to the Aetna as profit. Under expenses is where the loading can take The difference between the profit plus expense means how much out of each dollar is there to protect you. Now, then, the profit is two and a half per cent. That is fixed. expense ratio proposed by the Aetna last May was thirty-five per cent, leaving sixty-two and was unity-nee per cent, tearing sixty-two and a half per cent out of each dollar to protect you. With the Yorkshire it leaves sixty-six cents; with the United States Casualty fifty-four; with Glens Falls fifty-five; with Hartford sixty-one, and with the New Amsterdam In other words, for your dollar fifty-nine. you have a greater protection in the Yorkshire than in any of the other companies.

Now, four times the Aetna have come to us with a demand for an increase in rates, and when justified we have always recommended the increase. The Aetna proposed to go back to 1928 and reduce our coverage the difference between sixty-six cents on each dollar to sixty-

two and a half cents.

At no time has there been the slightest jeopardy for your indemnity; because out of 2,380 suits disposed of the Actna estimated the cost at \$1,671,000. The total cost, however, was \$1,027,000. There was overloading of the reserves to the extent of \$643,000, and in May Mr. Wanvig got that reduced by \$156,000, which reduced the cost of your policy \$3.

The insurance committe on July 19 met with Mr. Brosnan and Mr. Wanvig. We came to the conclusion that the increase proposed by the Actna of \$7, subsequently reduced to \$4, was not called for under the conditions of the business. Action had to be taken. We had to serve six months' notice on the Actna. If we did not we could not serve notice on them until the first of July 1936 and would have been obligated to accept the raise of \$4. We, therefore, asked the President to call a special meeting of the Executive Committee and made our recommendations to the Executive Committee.

The adversaries of the new carrier point to the fact that in ten years the combined loss and expense ratio of the Yorkshire Indemnity Company has always been above the hundred, and that is correct. But they did not tell you that the Aetna in the same ten years was under the hundred line only twice, and that their ten years' loss and expense ratio was 102,4. The Fidelity and Casualty was under the line only twice with an average of 105.4, and so with Glens Falls, Great American, Maryland, New Amsterdam, Travelers, and the U. S. Casualty. Now, those figures of loss and ex-pense ratio are not the all-important factor in this insurance business. It only shows that in the loss and expense ratio item all the companies were losing money. No mention was made of the income that the company derived from their investment policy.

At the regular meeting of the Executive Committee the minutes of the Special Meeting were approved. The Council Meeting on the second Thursday in December received the report of the Executive Committee which had approved of the action of the Special Committee, which in turn approved of the recommendation of the Insurance Committee—and yet it is said that the Council exceeded its authority.

Dr. FREDERIC E. SONDERN, New York: Mr. Speaker, gentlemen: I stood on this platform years ago and presented to you the insurance scheme which you adopted. I have had a fatherly interest in it since. I regret it has occurred. I would like to call to your attention two things: first, it has been stated that the business policy, so-called, of the Aetna, took the same place as this additional policy issued by the Yorkshire. That is not so. The additional policy of the Yorkshire gives you the privilege of a temporary assistant without naming him; in other words, anybody that you want at any moment, by telephone or otherwise, is authorized under your Yorkshire policy to practice for you, and you are indemnified against any action. Under the business policy of the Actna-and I know because I hold one and I have held one for years-you have got to specify your assistants and you are not covered unless the work in question is done by the specified assistants.

Those who have sat in the Councils of the Society during the years from the beginning to the present know that on many occasions I have appeared before the Council to plead for or to object to certain action in this insurance matter. I cite that only because I am jealous of this thing, having been one of the original sponsors. I have gone through this controversy during the last year. It has been during my presidency. You have heard many details. I hope you have trusted me during the period that I have served you. I am not going into details, but I can assure you, with my best intention and with my best purpose, which have always been in the interests of the Society, that what has been done relative to the increase. what has been done relative to the insurance matter has in my opinion been well done.

After free discussion by Drs. Arthur J. Bedell, Albany; William D. Johnson, Batavia; Charles H. Goodrich, Brooklyn; Harry Aranow, New York; Milton J. Goodfriend, Bronx, the question was put before the House of Dele-

gates by the Speaker as follows:

THE SPEAKER: Are you ready for the question? The question before the House is the adoption of the Reference Committee's report, to wit: "Your Reference Committee has given detailed study to the resolutions introduced by Dr. Dobbins of the County of Queens in relation to the change in malpractice indemnity insurance to the Yorkshire Company, and the Reference Committee disapproves thereof. The Reference Committee believes that the change was given careful study by the Council, Executive Committee and Counsel of the Medical Society of the State of New York."

Those in favor of the question being voted upon say, yes; those opposed, no. Carried.
We shall vote on it. Those in favor say "aye"; those opposed, "no."

The resolution of the Reference Committee is carried. The adoption is called for. Those in favor will kindly rise; those opposed will kindly

The speaker again says the resolution is

carried.

Dr. B. Wallace Hamilton, New York: I would move the approval of the original recommendation of the Reference Committee.

Motion seconded.

THE SPEAKER: There has been a motion seconded during the afternoon to postpone action upon the report of the Reference Committee until this had been disposed of. Motion is now made bringing it before you, and it is before you for vote. Are you ready for the question? The question is called for. The question is on the original recommendation presented by the Reference Committee on a resolution introduced from the Insurance Committee; to wit:

"Your Reference Committee approves of the resolution introduced by the Insurance Committee, relating to the change of the Malpractice Indemnity Insurance to the Yorkshire Indemnity Company. Your Committee has given this matter detail study and approves the action taken by the Council, the Executive Committee, the Insurance Committee and the Council of the Medical Society of the State of New York."

On the one hand you have just voted to

adopt the resolution which states the same thing negatively, and this is an affirmative action.

Those in favor of this resolution of the Reference Committee kindly say "aye"; those opposed, "no." It is carried.

Full Time Employment and Private Practice

Section 12
DR. WALLACE HAMILTON: Your Reference Committee begs to approve the resolution introduced by Dr. Edgar A. Vander Veer of the County of Albany, in reference to the practice of full time employed physicians by the State engaged in private practice for profit.

I move the adoption of this report.

Seconded and carried.

59. Invitation to Hold 1937 Annual Meeting

Sections 16-76

Dr. B. Wallace Hamilton, New York: The Committee approves the invitation extended to the Medical Society of the State of New York by the Erie County Medical Society to hold the state convention in Buffalo in 1937.

I move its approval.

Dr. ARTHUR J. BEDELL, Albany: I move as a substitute that it follow the usual course; namely, that it be referred to the Council for final action.

Seconded and carried.

60. Medical Legislation

Section 22

Dr. B. WALLACE HAMILTON, New York: Your Reference Committee recommends the disapproval of the resolution introduced by Dr. Louis Lewis of New York County, regarding a proposed legislative contact committee of seven to be appointed by the President. Your Committee feels that while Doctor Lewis' idea is commendable in principle, it would serve to be confusing to the existing Legislative Committee throughout the State.

I move its approval

After discussion by Dr. Louis Lewis and Dr. Harry Aranow, New York, chairman of the Legislative Committee, the report of the Reference Committee was adopted.

DR. B. WALLACE HAMILTON, New York: I move the acceptance of the report of the Ref-

erence Committee as a whole.

Seconded and carried.

61. Report of Reference Committee on Report of Secretary, Council, Censors and Councilors

Dr. James R. Reuling, Queens: The Reference Committee offers its report under the paragraphs as published. Under the sub-headings. "The Society," "The Society's Offices," "Financial Department" and "Legal Department," the Committee has no comment to offer.

Under the paragraph "District Branches," we are inclined to agree with the implication that the scientific programs of the branches are secondary to their social aspects and therefore

serve no great useful purpose.

Under the additional sub-headings of the Secretary's report, "Committees" and "General," there is no comment.

The Reference Committee feels that it cannot let this occasion pass, and that it is indeed honored in being privileged to renort on the last report to be made to this House by a man who has been so carnest, hard-working and conscientious and who has for many, many years dedicated his services with untiring zeal, faithfulness and devotion to the welfare of medicine and to this Society in particular, Dr. Daniel S. Dougherty, secretary, secretary extraordinary, secretary emeritus.

On the Report of the Council, the Reference Committee agree most heartily with the resolutions presented by the Special Committee appointed to "investigate the appointment of a layman as a director of the Departments of Health and Physical Education in the State Department of Education."

Under the Report of the Committee on Insurance, and, in view of the fact that several resolutions have been introduced in this House, your Reference Committee makes no comment on this portion of the Report of the Council.

That portion of the report dealing with the JOURNAL Management Committee's "recommendation regarding the papers read by invited guests" is approved by the Reference Committee, and your Committee moves "that papers read by invited guests become the property of

the Society."

Your Reference Committee feels that, under the published tables showing the comparative increase in number of pages of text and advertising, that it would be of value to the House of Delegates to have an additional table showing the comparative increase in revenue from advertising.

The recommendation that "all Committee news, all statements having a news value from officials, be published in the JOURNAL after editing to conform with the policies of the Society" is approved,—and your Reference Committee would place special emphasis on that part of the recommendation which deals with editing.

Regarding the "Directory," the Reference Committee feels that the opinion "that the book would be improved by printing full details under the name of each physician in New Jersey and Connecticut just as is done for New York Doctors" would be of value to the members of our Society, and recommend that this be done, provided that such additional information would not increase the cost to our Society.

On the report of the Councilors, the Reference Committee has no comment to make.

I move the adoption of the report.

Seconded and carried.

62. Report of Reference Committee on the Reports of the Treasurer and Trustees

DR. TERRY M. TOWNSEND, New York: Your Reference Committee on the reports of the Treasurer and Trustees have carefully examined the Treasurer's report and find:

1. The expenditures of all Committees, District Branches and all other expenses have been within or below the amounts allocated by the Budget Committee.

2. All emergent and unusual expenditures as

authorized by the Executive Committee are within reasonable limits.

Certain non-recurring expenses have been met which may be correctly credited to capital

4. The fixed overhead charges are not materially increased, despite a greater amount of

work and activity.

It is the sincere hope of your Committee that one or two more years will show our JOURNAL to be self-supporting and even a source of income.

The general condition of our treasury is healthy. The Treasurer verbally informs your Committee that the market value of our securities is gradually increasing and at this date have appreciated approximately six thousand

dollars since his last report.

Our Society is to be congratulated on the care and attention given to its financial affairs by their Board of Trustees. The Investment Committee of the Board in conjunction with the Treasurer deserves special thanks for the solidity of our investments and their foresight in reinvestments, which compare most favorably with similar organizations.

Your Committee is unanimous in favoring the resolution introduced authorizing the Trustees to invest not more than one-fourth of our funds

in non-legal securities.

I move the adoption of the report. Seconded and carried.

63. Report of Reference Committee Report of Committee on Legislation

Dr. John Masterson, Kings: The legislature is still in session, so that the Committee on Legislation is unable to submit its final report.

Ninety-seven bills affecting our profession have been introduced in the Senate and ninetynine in the Assembly. The work of the Legislative Committee becomes more onerous each year and the many bills introduced require the constant attendance in Albany of our Executive Officer while the legislature is in session.

Most of the bills detrimental to the public and our profession have been killed and a number of bills which we favor have passed both houses. The Committee state that they have had unusual cooperation from the various County Medical Societies. The Advisory Committee of Ten on Legislation has been of valuable assistance to the Committee,

The Chiropractic Bill, many times amended, is still before the legislature. The Hospital-Officers Lien Bill has passed the Senate. A bill requir-ing foreign physicians to take the State Board examinations before being admitted to practice has also been introduced.

We recommend:

1. That the Chairman of the Legislative Committee, with the approval of the Council, be given authority to appoint an Advisory Committee of Ten.

2. That the Bulletin of the Legislative Committee be again sent to the members of the Legislative Committee of all the County Societies.

3. That the County Chairman of each Legislative Committee establish a closer relationship with their Congressman than they have in the

past so that we may assist the American Medical Association in influencing Federal legisla-

tion if need occurs.

4. That the Committee request the House of Delegates to express to the Governor and the Legislature its appreciation of their sympathetic consideration of the activities of your Committee on matters of public health and welfare.

We cannot conclude this report without expressing our deep appreciation to Dr. Harry Aranow and the members of his Committee. The excellent work during the legislative session of our Executive officer, Dr. Joseph Lawrence, merits our approval.

I move the adoption of the report.

Seconded and carried.

Upon motion made and seconded the House of Delegates adjourned to 8 o'clock P. M.

EVENING SESSION April 27, 1936, 8 P.M.

THE SPEAKER: I have a telegram here that

I will ask the Secretary to read:

DR. PETER IRVING, Assistant Secretary, New York: This is addressed to "Dr. Sam Kopetzky, Speaker, House of Delegates, Medical Society of the State of New York: Waldorf-Astoria. Your delegate seating arrangement comfortably at tables finest I have ever seen, would appreciate pictures from front and rear of hall for use A.M.A. movie as an example perfect setup. Many thanks introduction and reception by House this morning. Regret necessity returning Chicago immediately. Austin A. Hayden."
THE SPEAKER: With the House's permis-

sion I will refer that to the Chairman of Com-

mittee on Arrangements for compliance.

64. Report of Reference Committee on the Report of the Committee on Workmen's Compensation

Dr. A. G. Swift, Onondaga: Your Reference Committee has reviewed the Report of the Committee on Workmen's Compensation and think we realize the large amount of time they have given to their duties and take pleasure in commending the zeal and thoroughness with

which they have done their work.

We approve of their report as a whole, with the exception which follows, and merely wish to emphasize some of their recommendations which impress us as of much importance.

With reference to covering the expense of carrying out the provisions of the law, we do not approve of a state-wide annual fee to be collected from all physicians registered to practice under the law, fees so collected to be pooled and redistributed to the county societies on a per capita basis.

We recommend that the several county societies be separately responsible for the expense of carrying out the provisions of the law in

the counties.

1. The fee schedule for the Metropolitan We recommend that the schedule be adopted by the other counties of the State for at least one year, in order to give it a satisfactory trial.

2. Since the present law makes it necessary

for a physician to bring a civil action to recover for services to the employee of a non-insured employer, we also strongly recommend sub-mission to the legislature of New York State of an amendment to the existing law which will empower the Industrial Board to assess the costs of medical care and compensation against a non-insured employer.

3. The last recommendation is based on consideration of the necessity of having a permanent committee to deal with Workmen's Compensation and firmly agree with the recommendations of the Compensation Committee that such a Standing Committee on Workmen's Compensation be appointed and that the State Society provide for the services of one mem-ber of this Committee to act as executive

director on a full or part time basis.

The Speaker: You have heard the recommendation of the Reference Committee.

I recommend the adoption.

Seconded and carried.

Dr. Albert G. Swift, Onondaga: We merely wish to emphasize the following three parts of their report: first, the fee schedule as adopted for the metropolitan district. We recommend that the schedule be adopted by the other counties of the state for at least one year in order to give it a satisfactory trial.

THE SPEAKER: Recommendation is made that the fee schedule which was submitted for the Metropolitan district be tried in the other County Societies for one year, to be given a fair trial. You have heard the recommendation.

Seconded and carried.

Dr. Albert G. Swift, Onondaga: Secondly, since the present law makes it necessary for a physician to bring a civil action to recover for services to the employee of a non-insured employer, we strongly recommend submission to the legislature of New York State of an amendment to the existing law which will empower the Industrial Board to assess the costs of medical care and compensation against a non-insured employer,

THE SPEAKER: The recommendation of the Reference Committee that such a law be introduced is before the House. What is your

pleasure-

Moved and seconded that the recommendation

be adopted.

Dr. Arthur J. Bedell, Albany: ask what the resolution means? information.

THE SPEAKER: What do you mean?

Dr. Arthur J. Bedell, Albany: Just exactly what the resolution means. What does the resolution mean?

THE SPEAKER: Will you be kind enough to

read your recommendation again.

Dr. Albert G. Swift, Onondaga: We strongly recommend submission to the legislature of New York State of an amendment to the existing law which will empower the Industrial Board to assess the costs of medical care and compensation against a non-insured employer.

THE SPEAKER: Is there any discussion?

Dr. Arthur J. Bedell, Albany: Discussing the point, Mr. Speaker, if I am credibly informed, many amendments are contemplated in this act. I see Dr. Kaliski at the end of the table. I was looking around for him. May I through you ask Dr. Kaliski to inform us if that is not the case?

THE SPEAKER: I think we will grant that there will be many amendments to the Work-

men's Compensation Act.

Dr. ARTHUR J. BEDELL, Albany: May I ask through you that Dr. Kaliski answer the question?

THE SPEAKER: Will there be amendments introduced in the Legislature to the Workmen's

Compensation Act

DR. DAVID J. KALISKI, New York: It is not contemplated that very many amendments will be introduced on the Workmen's Com-pensation Act at this time. It is contemplated that this amendment will be passed by this Legislature because it is necessary. Under the old law the Industrial Board had the power to assess the costs against a non-insured employer, which meant that a doctor's bill would be paid and the employee of a non-insured employer would get compensation for disa-bility. Unfortunately, under the new law this protection pertains only to out-of-state workers. It is necessary that the Industrial Board have this power in order to protect the physician treating the employees of non-insured employers. At the present time the Department of Labor only has the power to pro-ceed under the Penal Code against such noninsured employers, but owing to some defect in the law has not got the right which the Reference Committee believes it should have. I believe the bill has already been introduced and I believe we should support it.

THE SPEAKER: Is there any further discussion of the Reference Committee's recommendation that such an amendment be introduced?

A Voici: Point of information. There are thousands upon thousands of employers who employ one single individual and, therefore, he does not come under the compensation law. Does this amendment apply to an individual who is not insured because he does not have to be insured under the Compensation Law?

THE SPEAKER: Can you answer the ques-

tion, Dr. Kaliski?

Dr. David J. Kaliski, New York: does not contemplate weakening the provisions of the Workmen's Compensation Law. It only pertains to those individuals who should be insured under the present law.

THE SPEAKER: Are you ready for the question? Those in favor of the recommendation of the Reference Committee will kindly say "aye"; those opposed, "no."

y "aye"; those opposed, "no." Carried.

Dr. Albert G. Swift, Onondaga: and last recommendation is based on consideration of the necessity of having a permanent committee to deal with Workmen's Compensation and firmly agree with the recommendations of the Compensation Committee that such a Standing Committee on Workmen's Com-pensation be appointed and that the State Society provide for the services of one mem-ber of this Committee to act as executive director on a full- or part-time basis.

THE SPEAKER: You have heard the recommendation of the Reference Committee. What is your pleasure?

It was moved, seconded and carried that the

recommendation be adopted.

Dr. ARTHUR J. BEDELL, Albany: Again, sir, a question of information: just what is contemplated by the Committee or the Reference Committee that this one man be a "head man," a "first man," or what? Under what committee would be function and what would be some of his duties?

Dr. Albert G. Swift, Onondaga: Well, our recommendation is simply that in consideration of this committee which has arduously worked for several months, some sort of mechanism be established by which the doctors of the State could properly be guarded in compensation cases. We believe that no man in the State Society should be expected by the Society to give as much time to this matter without compensation as these men who have participated in these activities have given. Therefore, we recommend that the Society consider the advisability of compensating some executive director of a committee which shall be a Standing Committee appointed by the Society to take care of this particular matter.

Dr. Arthur J. Bedell, Albany: Mr. Speaker, through you another question: Is this a wish of the chairman of the Compensation Com-

THE SPEAKER: I do not know.

DR. ALBERT G. SWIFT, Onondaga: That is his recommendation

Dr. Arthur J. Bedell, Albany: I am asking specifically and particularly if it is the Chairman's wish. There is a big difference in my mind between a committee report and a personal

thing. DR. DAVID J. KALISKI, New York: Well, Mr. Speaker, if I am called upon to answer that question, I want to say it is a very embarrassing question for me to answer. I realize that there should be a more or less continuing committee in charge of this work. I further realize that whoever has charge of the work cannot in the future devote as much time to this work as is necessary to carry it out properly and efficiently without practically sac-rificing all other work. I feel that in my recommendations in my report the members of my Committee, Dr. Elliott and Dr. Hamilton and myself, felt that from the experience of the past year and forecasting what would happen in ensuing years, it would probably be neces-sary to have a committee familiar with the Workmen's Compensation, and of that committee all the members, or at least one of the members should be paid an adequate amount

for services rendered to the State Society. THE SPEAKER: How does that come in in the scheme of things as outlined in the new

set-up? How does it fit in?

Dr. Albert G. Swift, Onondaga: That I cannot tell you.

DR. DAVID J. KALISKI, New York: Are you asking me that question?
THE SPEAKER: I am.

Dr. Kaliski: I have not been consulted as to the new set-up. I have only heard it men-tioned here in Dr. Heyd's report. I should HOUSE OF DELEGATES

think that it would very well fit in in the contemplated report. I think, however, that there is a wide expanse of time. Perhaps a year will ensue before the report of Dr. Heyd's recommendations can be made.

THE SPEAKER: Right,
Dr. KALISKI: The Committee has already worked for nearly one year and another year will ensue before there will be a report or action on Dr. Heyd's report.

THE SPEAKER: It will take a year before

there is final action on the other set-up. Is there any further discussion?

DR. DANIIL S. DOUGHERTY, Secretary: call attention to the fact that this report said a Standing Committee. We can't establish a Standing Committee without an amendment to the By-Laws.

Dr. Walter D. Ludlum, Kings: I make the substitute motion that the matter be referred to the Council with the recommendation that the substance of the recommendation be carried out so far as possible under existing

conditions.

THE SPEAKER: The motion is made that the Report of the Reference Committee be referred to the Council to be carried out as far as it is possible to do so with the existing machinery. Any discussion? Those in favor kindly say "aye"; those opposed, "no". Carried. It is so referred.

Dr. Albert G. Swift, Onondaga: I recommend the adoption of the report as a whole.

THE SPEAKER: Motion is made for the adoption of the Report as amended as a whole.

Seconded and carried.

65. Physical Education Director

Section 45

"WHEREAS, the appointment of a Physical Education Director to the directorship of the Division of Health and Physical Education of the State Department of Education has resulted in the supervision of medical functions by a non-medical administrator, and "WHEREAS, the health of the school child

necessarily involves medical considerations even more fundamentally than considerations of phy-

sical education, therefore, be it

"Resolved, by the Medical Society of the County of Westchester that the appointment of a layman as Director of the Division of Health and Physical Education of the State Education Department is hereby condemned and protested as unwise from the standpoint

of public welfare and be it further "Resolved, that the Medical Society of the County of Westchester hereby memorialize the Medical Society of the State of New York to the effect of the foregoing resolution and recommends that the Medical Society of the State of New York take such steps and sponsor such legislation as may be deemed necessary to require the appointment henceforth of a duly qualified physician to the aforementioned directorship.

This matter has already received attention by the Executive Committee of the State Society. In the final analysis it becomes apparent that the trouble lies fundamentally in that part of the educational law which deals with the constituted personnel of this division. There can be no question as to the advisability of having a function of this importance directed by a physician, and the most effective solution would be a change in the educational law. Your Committee approves heartily of this resolution and recommends its adoption.

I move the adoption.

Dr. Arthur J. Blotll, Albany: With your permission, I call the attention of the members of the House to their Journal. If they read their Journal carefully they will find that a special committee was appointed by the Executive Committee, consisting of Dr. Thomas H. Cunningham and myself, and we went into some of that detail. You will find a short summary of our conclusions. I most heartily endorse the project. We are saddled with the present Director, but I think if you take one further look into the depth of it you will find that it comes to the question of Civil Service, and it is along that line that the Executive Committee was acting this year. It leads you into an adjoining county where they had a similar situation, and the situation is this: that the Board of Regents-and I believe I am correct, Dr. Madill-designates an examiner, a single examiner; that that examiner carries forth the recommendation-a single examiner. It is rather important that you get the background to avoid misunderstanding. The examiner appointed to examine the applicants for this position regarding which the resolution speaks was a former teacher of that applicant, and that applicant when he got his Ph.D. degree got it upon recommendation of the work that he did by said teacher. Draw your own conclusion. Four men were rated. The man who was serving temporarily in the same position was rated fourth, and if I am correctly informed, the Commissioner is required by law to take from the first three. Therefore, the man who had been temporarily in charge of the work, a physician, was not eligible for appointment. Certainly it looked like a personal proposition.

Now, in the adjoining county a similar situation arose, and if I am correctly informed, they have decided to follow Civil Service, follow the suggestion of the State Society that more than one examiner take hold. I think the man holding that position was way down the line.

What was he, Dr. Madill, 34? Dr. Grant C. Madill, Ogdensburg: Four-

Dr. Arthur J. Bedell, Albany: Fourteenth. And this was the man holding the position. Now, with the cooperation of Civil Service we will not have Boards consisting of one, but Boards consisting of three.

I certainly hope that you will adopt this resolution and that the State Society will do

all in its power to establish a proper system.

DR. GRANT C. MADILL, Ogdensburg: I just wish to say that we had selected a medical man. We tentatively had appointed a man to take the place of the officer who had occupied that position before and it seemed to us that there would be no question about the selection of this eminent man. We took considerable pains. As a matter of fact I was very much interested in it and we succeeded in persuading the pres-

ident of one of the large universities of the State to give us this young man. We expected that he would receive the appointment. He was eminent in the study of public health. I do not think there was anything wrong about the selec-tion of the Civil Service Examiner. As a matter of fact, I do not think any one man in the Education Department had anything to do with the selection at the time. That is a Civil Service function. But much to our despair, to the des-pair of those who were interested in seeing a medical man made the head of this division, he ran fourth and we had to take the man who was first. Now, that is the situation. As far as the school physician's work is concerned, I really do not see that it is going to make very much difference. We still have connected with the division a medical man. Now, we had very strong opposition to the appointment of a medical man because we had the physical educator, who has a strong organization, and that is an important part of the function of the school, and it was a question of which would succeed; and while I personally would like to see a medical man at the head of this division, I do not think that the medical service to the school is going to suffer.

After further discussion by Dr. Augustus J. Hambrook of Trov. and Dr. James F. Rooney of Albany, upon motion made and seconded, the report of the Reference Committee was

adopted.

66. Mutual Aid Associations-Schedule of

DR. EDWARD C. PODVIN, Bronx: resolution is in reference to contracts tween the Mutual Aid Associations of the Consolidated Edison Company, Hospitals and Physicians, referring particularly to certain schedules of fees which are claimed to be unfairly competitive, inimical to the reasonable economic security of the medical profession and of the community at large. It asks that any institution which encourages or permits com-petitive commercialization of medical care be regarded as operating contrary to the welfare of the public and the medical profession, and as tending to lower professional standards in the community, and further that it be con-sidered unprofessional and unethical for members of the medical staffs of hospitals to accept remuneration for services on a schedule not approved by the Medical Society.

Your Committee feels that it would not be wise for the Medical Society of the State of New York to adopt this resolution in its present form since the grievance expressed therein is solely on the basis of competition for fees. Such a matter is within the province of each County Medical Society to act upon. Your Committee, however, feels that the question brought up is part of a larger question upon which it may be advisable for the Medical Society of the State of New York to definitely take a stand. The past year has seen the passage of laws in relation to workmen's compensation that embody certain principles of free choice of physician and fair remuneration for which organized medicine has been fighting for

The situation in Kings County as vears. brought out by the resolution referred to could well come under similar principles. We therefore offer the following recommendation: "Resolved, that the Medical Society of the

State of New York recommends that the principles of free choice of physician and fair re-muneration as expressed in the present Workmen's Compensation Law should govern all contracts with mutual aid and similar organizations."

I move its adoption.

Motion seconded.

Dr. WILLIAM KLEIN, Bronx: Mr. Chairman and gentlemen: I think we have been dillydallying with this question entirely too long. It has been creeping upon us and every year we have some kind of lukewarm resolution and let it go at that. It cannot be left to the county. I am sorry to disagree with the Ref-erence Committee. One county is so near to the other that one physician in one county cannot pay attention to what is done by physicians in the next county. We have members of one county who want to do it and members in the nearby county come right in and take those jobs. We have the Edison Company, and the Foundry Company, and so forth. Those people should pay their doctor. Instead of that they make a contract with one or two men who usurp all the work at a definite stipend, and this business of having a free choice of physicians for the employee is a subterfuge. They either take the physician appointed or they either take the physician appointed or they lose their job. It is very plainly told by all the foremen and I have had occasion to investigate this matter very many times. The foremen tells the employee "Now, you go to Dr. So and So." The employee says, "Well, I would like to go to my own doctor." The foreman says: "Well, go ahead; but I tell you to go to this physician. You go do as you please about it." It is immediately understood that he will lose his position if he goes to this private physician. I am sorry to say that many private physician. I am sorry to say that many of the physicians who take these jobs have some sort of subterranean connection with somebody who is in authority, who see that these patients go to that particular doctor. It has cut in on the practice of the general prac-titioner tremenduously, and of the specialist, too, if you please. Unless the Medical Society takes a stand against the practice, this stand that the resolution has recommended of free choice of physicians, the poor workman has no choice. He either takes the doctor he is told to take or loses his job. Unless the State Society can tell this doctor not to take any con-tract practice, we might just as well stop talking about it.

DR. THOMAS A. McGoldrick, Kings: Mr. Speaker, these questions arise from practical experience in some of this work:

First, while the resolution for the purpose of being specific mentioned the Consolidated Edison Companies of Greater New York with their forty-five to fifty thousand employees, there are some ten or twelve other corporations waiting to see what action will be taken by the County and State Societies before they put some plans of private contract medicine into effect. Whatever their privileges may be they will surely exercise them. The Workmen's Compensation met with that same situation so that the bill which was introduced and passed became known in the legislative circles and to the employers and insurance companies as "The Medical Abuses Act." So many abuses developed under that act that it was necessary to enact the present law, and the State Authorities, Legislature and Governor, recognized that necessity after their several investigating commissions agreed upon and passed the present act.

Now, to be specific, under that Act the insurance carriers and a great many employers recognized this one point that I am going to mention-this competitive bidding or underbidding, and they agreed to a schedule of fees voluntarily with the Medical Society. And what happened? After a great deal of discussion and many conferences a fee was set in accordance with the law which required that the fees be those paid in that community by people with that standard of living, for those services; and when that was agreed on one of those items, for illustration, was a hernia operation, and it was agreed that \$75 was a fair price, including aftercare and operation, for such work. Within a few days a number of doctors sent in word to the insurance companies that they would do it for fifty; a few days later several more sent in word they would do it for twenty-five, and before the two weeks were up a number had sent in word that they would do it for nothing provided they were given some other business by the insurance carrier.

Now, under this very system which has been introduced the hospitals tried to arrange some schedule with this corporation. At first the schedule of fees was that the doctor be paid nothing; that the hospital would be paid a certain rate per day, four dollars, and that would include everything for the patient or employee receiving \$55 a week and no dependents, and that the average payment to the employee would be \$32.50 a week. was no restriction on the employees entering these mutual associations. A vice-president of the company receiving a salary of thousands of dollars a year was eligible for membership and eligible for these medical benefits which would follow. Now, an agreement was being made by the hospital for some remuneration for the services rendered. Let me say these are not indigent people. This is an insurance plan. A hundred people paying for the seven or eight who go sick for the year, backed with a gratuity of say eight thousand dollars, the equivalent of three hundred people paying for the seven or eight or nine who go sick in the year. And while this was being discussed, the hospital staff in one instance agreed that they would take no fees until the matter was settled; and immediately one of the members, a surgeon went around by circuitous routes and saw the people and sent in his bills for the services that he rendered patients that came under his care and was receiving the checks while the rest of the staff was honestly making an effort to remedy a situation which had in years gone by proved disastrous for the people that were sick, much more so than for the doctors.

Again, another department of a hospital that had made arrangements for tonsil operations had a fee agreeable to both the corporation representative, the mutual benefit organizations and the hospitals, agreed upon a fee, and that the three assistants in the department would rotate on the cases and receive the fee, and one of them slipped around and made a private deal for three and a half less per cent and agreed to send them to another place, a private place, and the operation would be done.

Now, that is the burden of the resolution. What can you do about it? The committee says, and very wisely and splendidly, what they feel can be done—to use the same standards as the Workmen's Compensation Act. Under that act a man doing these things may have his registration revoked. There is nothing that the Society can do directly. This resolution resolves that it shall be regarded as unprofessional and unethical conduct, and in that way make him subject to action by the censors of his Society, and the resolution is for the Medical Society of the State to approve of that stand—that men who by competitive bidding or underbidding exploit the practice of medicine and the people who are sick, are doing things that are inimical to the interests of the profession and damaging to the individual who is sick. For that reason the resolution has been proposed.

Dr. Otto H. Leber, New York: I should be the last one indeed to wish to exploit the medical profession or have anything to do in the way of competition in any community under such a plan as this; but I think there are two items in this plan that we should be cognizant of. First of all, that these individuals who are contemplated to receive medical services under this plan were not patients in your office or mine. By agreement ninety per cent of them were to be in the sub-normal income group who are now getting service in the dispensaries of the city, for which neither you nor I receive one cent; nor do the hospitals receive adequate compensation if anything; secondly, that this specific company of which we are speaking now came voluntarily to the County Society, was willing amicably to come to some conclusion fair to the physician, fair to the hospital, and fair to the employee. These employees were receiving unsatisfactory medical service in the dispensaries, according to the employee and according to the company. The physicians were serving these people for nothing. The company—perfectly selfishly, I agree—in order to better the condition of their employees, to reduce the amount of time lost, was willing to contribute a certain proportion of the income of these individuals in order to receive better service and have them lose less time in their To do this they were willing employment. to come to the County Society, to agree with them on a compromise, and have a fair fee for the physicians and for the hospitals for the service involved. For such service the physicians could not be expected to receive

the ordinary fees, they could not be expected to receive the ordinary office or house visit fee such as is custominy in the community, but they should and it would naturally be expected that they would be willing to make a com promise, to receive something for which they now receive nothing whatsoever. It was esti mated that for this one particular plant \$150 000 to \$200 000 would come into the hands of the physicians of New York City which they were These people are in the not now receiving sub normal income group about ninety five per cent of them and I believe the company was willing to make a maximum income of \$45 which would only include about two or three per cent of the entire number

THE STEAKER The Speaker very much regrets to interrupt I apologize to you for the interruption but I want to say that this discussion is wandering off the topic that the discussion before this House is on the substi The discussion has nothing tute resolution to do with any specific proposition anywhere, has nothing to do with sub normal or abnormal or super normal groups. The question before the House is shall or shall not the substitute

resolution prevail

DR OTTO H LEBIR New York make my speech clear by seconding the motion

of the Committee?

DR. DAVID J KALISKI, New York Speaker, I did not wish to enter into this dis cussion but since Dr Leber has spoken and since I was the chairman of the Committee that met with the representatives of the par ticular company and it has a bearing on the resolution I must say that the facts concerning the willingness of the company to pay a fair fee are not as represented by the previous speaker, not that the previous speaker's facts are not correct but the facts as elicited by our Committee were of a different nature. I want to say that we are confronted with a very serious situation We have on the one hand an organization employing a certain number of thousands of individuals asking for prefer ential rates for the treatment of patients when they are sick and the same company paying for the same individuals when they are injured a fee that represents a living wage to the We would be stultifying ourselves by permitting any scheme such as the scheme that is the basis of this resolution getting any sup port from any county society or from the State Society, unless such scheme were based upon the principles of the American Medical Asso ciation or of the Booth report of the Medical Society of the State of New York

THE SPEAKER Gentlemen the Reference Committee reported that the question at issue of discipline is a matter for the County So ciety, and it presented a substitute resolution which read that the Medical Society of the State of New York recommends that the prin ciples of free choice of physician and fair remuneration as expressed in the present Work men's Compensation Law should govern all contracts with mutual aid and similar organi That and that only is before the zations House

regard to this resolution. I would say that portion of the resolution should certainly adopted but it is my opinion that the retion should be referred back to the commi for further consideration of the other princ mvolved

THE SPEAKER You have within you means to accomplish your will, if you can it through the House of Delegates

DR ELLIOTT I move that we refer back to the Committee for further considera Motion seconded and carried

67 Definition of Good Standing

Section 11 DR EDWARD C PODVIN Bronx Now the definition of good standing this motion presented by Dr Heyd It presents a spe definition of good standing based upon pay of dues together with a statement as to relation of malpractice defense and insurant good standing

These matters are at present either on entirely or stated indefinitely in the By The present motion is in no sense in coi with the By laws but merely acts as a cla We therefore, approve ing regulation motion and further recommend that the m be taken under consideration by the Comm that undertakes revision of the By laws incorporation in a more definite form in new By laws

I move the adoption of this report Motion seconded and carried

68 Advertising for Gain by Duly Lice. Physician

Section 32 Dr Edward C Podvin, Bronx This is Reference Committee's report on the matter amending the Medical Practice Act to pro

advertising by physicians
The State Medical Society during the legislative session has sponsored legislation ering essentially that which is asked for in resolution It is, therefore deemed unneces for the House of Delegates to pass this retion and we recommend that it be not ado I move the adoption of this report

mittee's report Seconded and carried

70 City Charters-Tenure and Compe tion of Medical Staff of Public Institut

Section 30 DR EDWARD C PODVIN, Bronx This retion requests that this House of Delegates abnrove of certain clauses --

State of New York and approve of the principle of providing proper compensation for medical services rendered in public institutions by medical staffs, and protection of tenure of office

in positions on such medical staffs.

While the request is in principle a reasonable one, it is presented to the House of Delegates by an individual physician. We feel that matters of this kind should be dealt with first in the local medical societies, and that any request for the approval of a principle should come to the State Society only as an official request from a county medical society. For this reason we recommend this resolution be not adopted.

Motion seconded.

Dr. CHARLES H. GOODRICH, Brooklyn: I move you that this matter be referred to the Committee on Economics for early report to the Executive Committee

Motion seconded and carried.

71. Consolidation of Executive Offices

Section 9

Dr. Edward C. Podvin, Bronx: This report proposes some radical changes in the administrative set-up of the Society which will require a considerable change in the Constitution and By-Laws. The changes proposed are so great that it would not be feasible in the time available for your Reference Committee to make a sufficiently thorough study to be able to present definite recommendations in detail. We do, however, thoroughly agree with the conclusion of the Committee as embodied in the report, and realizing that amendments to the Constitution must be presented at one annual meeting to be acted upon at a succeeding meeting, we recommend as follows:

- 1. The report be turned over to Committee on Revision of the Constitution and By-Laws;
- 2. That adoption of report of Reference Committee be considered a notice of proposed amendments to the Constitution and By-Laws of the Medical Society of the State of New York comprising in a general form the points enumerated in their report;
- 3. That the Committee on Revision of the Constitution and By-Laws be instructed to inform the members of the State Society, through the Journal, of the amendments proposed with the reasons therefor, in time for such matter to be considered by the component County Medical Societies; that the Committee invite suggestions and comments, and, if necessary, be empowered to hold hearings in the various districts of the State upon the proposed amendments, so that when published as required, at least one month before the next annual meeting, all who so desire will have had a chance to have become familiar with the subject.

I move the adoption of the Reference Committee's report.

Seconded and carried.

THE SPEAKER: The Committee on Constitution and By-Laws are instructed by this House of Delegates—this being construed as a notice of amendment-to prepare and present prior to the meeting in time for your reading and your preparation for discussion, these amendments.

72. Practice of Medicine by Cults

Section 34

Dr. B. WALLACE HAMILTON, New York: Your Committee considered a resolution introduced by the Medical Society of the County of Broome, with reference to persons licensed to diagnose and treat sick individuals with inadequate training, namely, chiropractors.

While the Committee is in accord with the principle presented in the resolution that no one should be allowed to practice the healing art with less than the minimum requirements, as stated in the Medical Practice Act of 1926, we are not in accord with any proposed changes in the Medical Practice Act at the present

We feel that the fault in the experiences in the County of Broome lies with the jury system and the civil authorities.

I move the adoption of the Report of the Reference Committee.

THE SPEAKER: The recommendation, I take it, is that the resolution be not approved. Are you ready for the question? Those in favor say "aye"; those opposed, "no." The recommendation of the Reference Committee is adopted. The resolution is defeated.

73. Medical Care (Socialization of Medicine)

Section 31

Dr. B. WALLACE HAMILTON, New York: Your Reference Committee considered a resolution introduced by Dr. Joseph Slavit of the Medical Society of the County of Kings regarding a proposed plan for the socialization of the practice of medicine. As in previous years, your Committee disapproves of the proposed plan as presented.

I move the adoption of this report.

Motion seconded.

Dr. Joseph Slavit, Kings: Mr. Speaker and members of this House of Delegates: while we did not expect that you would adopt the plan that was presented in this resolution, we did expect that you would give any plan that is presented to the Society, that aims to reorient ourselves on the question of medical care and the economic condition of the Medical Profession, a decent and proper attention. If these matters do not concern us, then these resolutions should not appear at all within this body; but inasmuch as these resolutions are allowed and accepted and considered by committees, I think that it is at least due to yourselves, your own interests, not to mention the public interest, that these matters be carefully thought over, or, at least, that a hearing be given. Something happened only ten or fifteen minutes ago which clearly illustrates the maze that we as a profession are in. We were discussing the Consolidated Gas Company and the Edison Company, and corporate practice, and we saw the chairman of the Committee that reported on that—he showed you himself conclusively that we are in a maze with regard to that matter. He showed you that we are dealing with corporations-

THE SPEAKER: I wish you would stick to your subject; because it is a big one, and you will need all the time I am going to give you.

Dr. Joseph Slavit, Kings: I am just going

to speak five or seven minutes and no more. He showed you himself what the situation leads to -competition amongst ourselves, ruinous competition, competition which spells the breakdown of the medical practice and, besides that, medical practice which yields to corporation practice, and in the last analysis a complete destruction of the very basis of our practice as we supposed we were practicing in the past Just a year or two ago, why there was no problem at all before us Now we are beginning to con sider corporate practice, we are beginning to consider even voluntary insurance. It is quite evident that we cannot solve this problem by the methods by which we have been seeking to solve it It is quite evident that this whole question of fees and regulation of fees, and under mining of fees, and underbidding and all that is mante in the very method by which we are pursuing medical practice today I believe that this question is of such vital importance, that it is going to become so much more important whether we resolve against it or not, that the question of reorganizing medicine on socialized lines is becoming so important—infact it is already creeping in upon us under our very noses-that we ought to at least do something about it in the way of an earnest and honest study of the problem without prejudice or bias even if it were only for our own selfish interests, not to mention the general public interest, we should do that I believe that instead of ruling against a resolution like this, the least that the Committee could have done would be to have referred it for a complete study and report at the next House of Delegates meeting and to have advocates of the socialization of medicine upon such a committee so that matters could be threshed out pro and con, in a fair and proper way Simply to disapprove the resolution because we took certain action a year ago is not sound, is not scientific for scientific men We should realize that we are likely to change our viewpoints from year to year We change our viewpoints from year to year have done it already in the past year. We are going to do it still more as time goes on, because conditions are shaping themselves so as to demand a change in our present methods of providing medical care for the people, and a change in our present methods of practice, and I really feel there are plenty of men in the profession who so believe

I believe the time has come when we should take that question in hand and thoroughly study it, for, as I said before, whether you like it or not, this thing is creeping in on us, anyway Only a few weeks ago the Commissioner of Health reported that fifty per cent of the people in New York City are now receiving their medical care from public institutions. The emergency relief is giving another third of medical care at public expense. The neighborhood health centers developing will give still more and now you are putting the rest of the medical practice on a corporation base Where will private practice be left? Private practice is disappearing whether we realize it or not, and it is time that we sat up and took notice and began to plan in accordance with the changes and the trends of the times, and the Committee on Trends should seriously undertake a proper study of this subject and report to us in the near future

A motion made by Dr James F Rooney of Albany, to limit the debate to five minutes was

seconded and carried, and after free discussion by Dr Rooney, Albany, Dr Samuel S Fischoff of Brooklyn, Dr Arthur J Bedell, Albany, the motion to adopt the recommendation of the Reference Committee was carried, and the Speaker declared the resolutions lost

74 Fees for Medical Services for Welfare Patients

Section 44

B WALLACE HAMILTON, New York Your Committee considered a resolution intro-duced by Dr A I' Heyl of the Medical Society of the County of Westchester regarding fees for medical services rendered to welfare patients Your Committee recommends that this matter be referred to the Council for appropriate action in cooperation with the Medical Society of the County of Westchester

I move the adoption of this report

Seconded and carried

75 World Peace

Section 38

WALLACE HAMILTON, New York Your Committee considered the resolution presented by Dr Samuel S Fischoff of the Medical Society of the County of Kings regarding the preservation of peace

Your Committee feels that the preservation of peace has the sincere endorsement of all men of good will and therefore this resolution needs

no specific action on our part
_ I move the adoption of the report of the

Reference Committee Seconded and carried

76 Invitation to Hold 1937 Annual Meeting

Sections 16-59 DR B WALLACE HAMILTON, New York Your Committee was given for consideration two letters asking our approval that the next meeting of the Medical Society of the State of New York be held in Rochester

Your Committee is in hearty accord with the selection of this city for our next meeting and

take pleasure in recommendation to the Council mendation to the Council This is a motion that was before the House for the usual course, depending upon a number of factors which have not yet been determined by this House Those in favor kindly say "aye", those opposed, 'no " Carried

77. Group Insurance-Booth Plan

Section 8

DR THOMAS A MCGOLDRICK, Kings Resolution introduced by Dr Gordon Heyd, with reference to the Booth Report of May 1, 1933, on Group Insurance

The Reference Committee B recommends that in the second paragraph of the preamble, the words further elucidation' be changed to "reaffirmation,' and further, that the resolution as introduced be referred to the Council with a recommendation that a sub-committee be ap pointed for further study and report on the entire matter of medical insurance plans

I move the adoption of that recommendation

Seconded and carried

78. Finances of the Society

Sections 10-47

DR. THOMAS A. McGoldrick, Kings: Resolution submitted to the House of Delegates on the subject of the finances of the Society and recommitted to the Reference Committee. Your Committee has recommended that a portion of the funds not exceeding forty per cent be permitted for investment by the trustees. It now recommends that the trustees be permitted to invest a portion of the funds of the Society, this portion not to exceed twenty-five per cent in equities.

I move the adoption of the Report.

Seconded and carried.

79. Eight Hour Day Law for Hospital Workers

Section 33

DR. THOMAS A. McGoldrick, Kings: Resolution introduced by Dr. Benjamin Davidson of Kings County, referring to the eight-hour day law. Your Reference Committee B. finds the time not appropriate for the pushing of such legislation.

I move the adoption of this report.

Seconded and carried.

80. Hospital Management and Medical Staff

Sections 24-52
DR. McGoldrick, Kings: The Resolution proposed by the Medical Society of the County of Kings on the relations of hospitals and the members of its staff was recommitted to this Committee. The Reference Committee has made but little change and is ready to submit to the action of the House of Delegates at Large. You will recall that the question of disagreement was under these sections.

"Whereas changes in staff organization and personnel have been made which were not in the public interest, and often have been in fact acts of injustice to physicians who by honorable and faithful service, had acquired a moral right to the continuance of such privileges and benefits as flow out of the hospital connection, and

"WHEREAS, a correction of such wrongs is possible only through the action of an authoritative body, qualified and constituted to speak the opinion and will of the medical profession."

The Reference Committee concerning that resolution approves the adoption of the first five clauses of the preamble and recommends the elimination of those two I have just read, and in place thereof the following resolution:

"Be It Resolved, That the Medical Society of the State of New York record its disapproval of the above practices and recommends that the final authority in hospital management introduce changes in medical personnel or general professional policies only after formal consultation with a representative from the Medical Board or other constituted professional authority of the hospital."

The changes have been just in wording. I

move the adoption of that.

Mr. Speaker: You have heard the motion, moving adoption of the Reference Committee's

DR. CHARLES H. GOODRICH, Kings: I move to amend this by elimination of the word "consultation."

THE SPEAKER: What are you substituting therefor?

Dr. Goodrich: Nothing.

THE SPEAKER: An amendment has been proposed. The resolution reads as follows:

"That the Medical Society of the State of New York record its disapproval of the above practices and recommends that the final authority in hospital management introduce changes in medical personnel and general professional policies only after formal consultation with—"
That has been amended to leave out the word "consultation" so that it should read:

"-records its disapproval of the above practices and recommends that the final authority in hospital management introduce changes in medical personnel or general professional policies only after formal with", etc.

Is that the way you want your amendment? Dr. Goodrich: "Only after formal recom-

mendation.'

THE SPEAKER: You are substituting the word "recommendation" for "consultation"?

Dr. Goodrich: No; there is another word.

The Speaker: The Speaker is trying to be helpful but we do not know how to help you.

DR. GOODRICH: Only with recommendation from the Medical Board; in other words, the sense of it should be this—the recommendation should come from the Board as a whole, not after consultation with three or four selected members of the staff.

THE SPEAKER: It does not say anything

about selected members of the staff.

Dr. Goodrich: No; but that is the way it is understood.

Dr. McGoldrick: Say after formal consultation with and recommendation from the Medical Board.

Dr. Goodrich: I should like to see the word "consultation" eliminated; in other words, the recommendation should originate with the Medical Board.

THE SPEAKER: With the permission of the House, since this seems to be a matter of verbiage, I suggest that the Reference Committee Chairman go in consultation with those who would amend the resolution and bring it to me in form so that we can intelligently act on it.

Dr. McGoldrick: The Reference Committee again took up that section referred to them for

a rewording and they now report:

It approves the adoption of the first five clauses of the preamble, recommends the elimination of the sixth and seventh which were read, and recommends the following resolution.

"Therefore, Be It Resolved, That the Medical Society of the State of New York record its disapproval of the above practices and recommends that the final authority in hospital management introduce changes in medical personnel or general professional policies only after formal recommendation of the Medical Board enacted in regular or special session, and where no Medical Board exists such other constituted professional authority acting in its

I move the adoption of that. The motion was seconded and carried.

Dr. HILLMAN: I move the reconsideration of the vote on Dr. Rooney's amendment to Dr. Kaliski's resolution in regard to foreign physicians being allowed to practice here without examination. If the law that we approve of is not passed, why, we will be taking no action in the matter at all and some of us who voted in favor of Dr. Rooney's substitute resolution feel that is not sufficient and we would like to have that vote reconsidered.

DR. DAVID KALISKI, New York: Would it be in order to refer the matter back to the Reference Committee for further consideration

and report to the House?
THE SPEAKER: It would be in order if the

House so vote.

DR DAVID I. KALISKI, New York: May I so

Dr. David J. Kaliski, New York: May I so move, Mr. Speaker?

Motion seconded.

THE SPEAKER: It is moved and seconded that the original resolution, also the Reference Committee's report, be recommitted to the Reference Committee for subsequent report to this House.

Seconded and carried.

81. Report of Reference Committee on the Report of the President

Section 4

DR. GORDON HEYD, New York: The report of the President contains no recommendation and your Committee is pleased to record that the analysis of the work of the Society, during the past year, has been praiseworthy and in keeping with the traditions of the Society.

The various activities of all of the officers and committees have been praiseworthy.

It is moved that the report of the President be filed as a testimonial to the successful work of the year.

I move the adoption of the Reference Com-

mittee report.

Seconded and carried.

82. Report of Reference Committee on Report of Committee on Public Relations

DR. F. W. HOLCOMB, Chairman: I know that this subject matter has been touched upon by some resolutions that have been introduced today. However, your Reference Committee wishes to submit the following report on the report of the Committee on Public Relations. This Committee has studied carefully the report that the Committee on Public Relations has no recommendations to make in regard to the care and examination of school children with defective eyesight. We would call attention to the fact that this Committee feels that a change in the law would be advisable by the following amendments: that any child whose central visual acuity cannot be corrected better than 20/30 by lenses shall be referred to his physician for examination and treatment.

We recommend the adoption of this resolu-

tion. Seconded.

Dr. ARTHUR J. BEDELL, Albany: Another question of information: may I ask what that

DR. F. W. HOLCOME: That means, Dr. Bedell, that the Committee feels it advisable to make it compulsory to refer to physicians for examination and treatment children whose eyesight cannot be corrected better than 20/30, in order to perhaps avoid the early disease. A great

many of these children we feel are going to be examined anyway by optometrists, and we feel that this resolution would help in this matter.

DR. ARTHUR J. BEDELL, Albany: Mr. Speaker and gentlemen: It seems to me that if you place that interpretation upon this Act you are thereby acknowledging the ability of optometrists to do certain things that we who are ophthalmologists believe they are not capable of doing, and it brings back the question whether we as physicians recognize the need of medical care for all children in that field or in other fields. I believe it would be a mistake to pass this in the form of the present resolution and I sincerely trust that it will be disapproved and referred back to the next year's Committee for further study and report before this House sets its stamp of approval upon such action. I so move.

Dr. Joseph C. O'GORMAN, Erie: I understand the Committee on Public Relations reported no recommendation on this serious subject as to the eye examination and care of school children. For years and years it has been the subject of controversy. As I take it, the amendment offered by the committee states that anyone whose visual acuity cannot be corrected beyond 20/30 with lenses shall be referred to a physician for examination and treatment. Now, that will apply to ophthalmologists, optometrists, or anyone who provides glasses. The principle is sound and I do not see why we should wait another year to endorse it. To make myself clear, visual acuity is the only thing that is considered by law in the active vision. We are all aware that it does not comprise field and depth perception, which may make up this visual acuity. The optometrist wants to be doctor and ophthalmologist; the chiropractor wants to be a doctor and everybody wants to be a doctor. Now, they have gone to the legislature and gotten laws across. They promulgated and propagandized until they obtained the legal status of going into the schools and examining our school children. If this amendment can be enacted into law so that anyone who cannot correct vision beyond 20/30 shall refer that child to its physician for examination and care-we all know that every ophthalmologist knows-he sees it repeatedly -neglected cases come into his office, so I feel that this recommendation should be adopted, and I believe it is sound in principle and I think the Committee is to be commended for turning in such a recommendation and it should be enacted into law.

A Voice: Not being an ophthalmologist I am a little bit confused. As I understood Dr. Bedell's point it was that by the action recommended we were approving optometrists, which group are now legally entitled to do certain types of work. I take it that Dr. O'Gorman's point is that we should control them further. It would seem to me that we should control them and should not approve them. Therefore, it looks as if we should study the matter still further.

THE SPEAKER: The motion to recommit is before you.

Seconded and carried. The motion is carried and it is referred back to the Committee

for further study and report at the next House

of Delegates.

Dr. F. W. Holcomb: With respect to the second matter of the report, the Committee would concur that it would not be practical or informative for insane or tubercular hospitals to report, at stated intervals, to the family physician on the condition of their patients.

In regard to the third resolution, we also heartily concur in the recommendation of the Committee that Community Health-Relations Councils should be organized in each county whose functions would be such as defined in

the report.

We, therefore, recommend that the House of Delegates go on record as being in favor of such Councils, and request the Committee on Public Relations to take such steps as may be necessary to set up such Community Health-Relations Councils in each County Society.

I move the adoption of this recommendation.

Seconded and carried.

Dr. F. W. Holcomb: Your Committee would heartily endorse the recommendation at a closer relationship between the Grievance Committee and the Legal Division be maintained in order to coordinate the information obtained by both Committees regarding the unethical conduct on the part of physicians and other matters of similar nature and that such information should be sent to the Chairman of the Public Relations Committee of the County Societies and that this information in turn be relayed to the individual members of these County Societies.

This Committee, therefore, is in hearty accord with the Committee on Public Relations and recommends that their recommendation,

namely,

1. That closer relationship between the Public Relations Committee, Grievance Committee,

and Legal Division, be established.

2. That after a study of the causes of these cases is made, such information, in general form, be presented to the Chairman of the Public Relations Committee of each County Society when and if such communication receives the endorsement of the House of Delegates, the Council and/or the Executive Committee.

3. Regarding Hospital Interns: In regard to this matter, while agreeing with the Committee that this matter may require further study, we are still of the opinion that all interns should be compelled to be licensed in the State of

New York.

I move the adoption of this recommendation.

Seconded.

Dr. Arthur J. Bedell, Albany: I see no reason in the world why interns should be required to be licensed in the State of New York. Interns are neither hospital agents nor agents of the attending physicians and surgeons. We can use interns anywhere. It is part of their training. I do not think that we should require that interns be licensed in the State of New York.

Dr. Kevin, Kings: This question has been a mooted one with the State Board of Social Welfare. It is a question that is rather delicate to deal with. If you pass this resolution it will prevent those southern men, those western men,

those eastern men outside of the State of New York from being eligible to membership as an intern in any hospital in the State of New York. You have got to think of the reaction of such action by the State Society. Already our Board has established some rules regarding the intern and I am sorry that Dr. Warren of the Long Island Medical College, who is vitally interested in this subject, is not here to place the position of the hospital before you on this question.

I move you, sir, that this matter be referred back to the Committee and a report made next year.

Seconded and carried.

Dr. F. W. Holcomb, Chairman: The question regarding foreign physicians has been gone into so thoroughly tonight that I think we can omit our report on that.

THE SPEAKER: It is before a reference committee now.

DR. F. W. HOLCOMB: Regarding the Legal Profession: your Reference Committee feels that closer cooperation between the legal and medical professions, is certainly desirable and the Committee recommends that a joint meeting of the two professions be held by the County Associates at least once a year.

I move the adoption of this recommendation. Seconded and carried.

Dr. F. W. Holcomb: Concerning the examination of school children by the State Department of Education, this matter has also been under a great deal of discussion and I believe that it has been referred back for further study.

Dr. F. W. Holcomb: Your Reference Committee heartily endorses the work of the Sub-Committee on the Deaf and Hard of Hearing. We recommend that the study and work be continued and "that the Governor of the State of New York be petitioned to appoint a committee which is to include members of the Medical Society of the State of New York, to thoroughly investigate the problem of the care of the deaf and hard of hearing children of the State.

I move the adoption of this recommendation. Seconded and carried.

Dr. F. W. Holcomb: In conclusion we wish to congratulate the Committee on Public Relations on the vast amount of constructive work which they have accomplished in the past year, and move the adoption of this report as a whole as amended.

Seconded and carried.

83. Mutual Aid Associations—Schedule of Fees

Sections 26-66

DR. EDWARD C. PODVIN, Bronx: On the resolution presented by Dr. McGoldrick of Kings concerning the Consolidated Edison Company matter, our previous recommendation was:

"Resolved, that the Medical Society of the State of New York recommend that the principles of free choice of physicians and fair remuneration as expressed in the present Workmen's Compensation Law should govern

all contracts with mutual aid and similar organizations."

Now we have added:

"Resolved, that it shall be considered unprofessional and unethical for any physician to make or enter into any contract, written or oral, in violation of this principle. Be it further

"Resolved, that any institution which engages in, encourages or permits by accessory participation any contract in violation of this principle shall be regarded as operating contrary to the public welfare and the interests of the medical profession, and as tending to lower professional standards in the community.

I move the adoption of this report.

Seconded and carried.

84. Report of Reference Committee on the Report of the Committee on Economics

DR. JAMES F. ROONEY, Albany: The brevity of the report of the Committee on Economics does not in any way indicate the vast amount of work which it has done.

The report of the Committee contains but one recommendation in respect to which your Reference Committee reports as follows:

We endorse the recommendation of the Committee on Economics as presented in its report that the Society formulate within the framework of the principles of the American Medical Association and of the Booth Report of the Medical Society of the State of New York, a program of medical care applicable to different communities. All features of such a medical program, demonstrated by experience to be sound and suitable to local conditions and in accordance with the above principles may then be adopted as a plan for medical care in any given locality.

I move you the adoption of that recommendation.

Seconded and carried.

Dr. James F. Rooney, Albany: There has been some question about the overlapping of committee work and your committee desires to make this statement: that any committee under the direction of a Chairman with dynamic personality and great energy, may unwittingly overlap in the work of other committees. This seems to be due to a lack of coordination and correlation of the work of committees between whose boundaries, as set by the By-Laws, there is a twilight zone of indefinite limitation, the invasion of which by either committee alone, without the cooperation of both, may lead to hazardous results. Your committee merely wishes to state this, as I think has been brought clearly before your notice in the last half hour with relation to the work of some other committees. It does not want to engender criticism which is undeserved. This would not happen if there were closer work, closer correlation of the chairmen of the various committees. Your Reference Committee further desires to express its great appreciation of the extremely valuable work that has been done and is being done and will be done by the Committee on Economics of this Society.

I move the adoption of our report as a whole.

Seconded and carried.

85. Licensing Foreign-Educated Physicians Sections 13-17-56

DR. EDWARD C. PODVIN, Bronx: This is the final resolution presented to Reference Committee on New Business A, I will simply read to you the resolution as presented by Dr. Kaliski with some changes:

We, therefore, recommend the resolutions as introduced by Dr. Kaliski slightly amended and

reading as follows:

"WHEREAS, it has become apparent that the number of physicians obtaining licenses to prac-tice medicine in the State of New York by endorsement of their credentials is increasing inordinately, and

"Whereas, a considerable number of physicians, graduates of European medical schools. are being licensed by endorsement of their credentials without a professional examination, and

"WHEREAS, graduates of our own medical schools and licensed physicians of many other states are required to pass a professional examination before being licensed to practice in this state, and

"WHEREAS, the maintenance of high professional standards and public health and welfare require that graduate physicians be required to establish their competence by submitting to a thorough examination before being licensed to practice the healing art, and,
"Whereas, some who have been licensed by

endorsement could hardly be considered as eminent or unusually distinguished; therefore, be it

"Resolved, that the Medical Society of the State of New York in annual meeting assembled deplores the excessive number of licenses by endorsement and requests the authorities of the Department of Education to cease granting licenses by endorsement except in very excep-tional circumstances and where the eminence of the applicant is generally unquestioned. Be it further

Resolved, that we approve the passage of bills introduced in the legislature looking

towards these ends."

move the adoption of the resolution.

Motion seconded.

Dr. EDWARD PODVIN, Bronx: After free discussion by Drs. Harry Aranow of New York, Grant C. Madill of Ogdensburg, James F. Rooney of Albany, and David J. Kaliski of New York, the question was put to a vote by the Speaker as follows:

THE SPEAKER: Are you ready for the question? The question before the House is the report and recommendation of the Reference Committee in the form of a resolution. Those in favor of the adoption of the Reference Committee's report kindly say "aye"; those opposed, "no." It is carried.

86. Radio Broadcasting Section 94

.Dr. James F. Rooney, Albany: I would like to present the following resolution:

"That the House of Delegates approve the policy of this Society in sponsoring newspaper and radio programs and authorize the Committee on Trends to utilize the radio stations for the broadcasting of programs, the details of which shall be effected under the direction of the Committee with full power to act."

THE SPEAKER: This is a supplemental report of the Committee on Trends and the Chairman of the Reference Committee on Trends will take care of it. It is referred to the Reference Committee on Trends.

87. Lien Bill Section 92

Dr. Arthur F. Heyl, Westchester: "WHEREAS, the physician and nurse are equally entitled, with hospital, to the protection of the lien law, and

"WHERAS, there is no reasonable assurance that the enactment of a lien bill for hospitals only would or could be followed by subsequent enactment of liens for physicians and nurses,

therefore, be it

"Resolved, that the Medical Society of the State of New York should henceforth refrain from supporting, under any circumstances, any lien bill which does not include protection for

physicians and nurses, and be it further "Resolved, that the State Medical Society instruct its Legislative Committee to endeavor to reach an agreement with the State Hospital Association, mutually pledging both groups to the support of a lien bill including hospitals, physicians and nurses."

THE SPEAKER: Referred to Reference Com-

mittee on New Business C.

88. Prevention of Asphyxial Death Section 99

DR. J. LEWIS AMSTER, Bronx: "WHEREAS, the aims and purposes of the Society for the Prevention of Asphyxial Death were approved by the Medical Society of the State of New

York, May 14, 1934.
"Whereas, these aims and purposes were later approved by the House of Delegates, of the American Medical Association, June 12,

"WHEREAS, the Society for the Prevention of Asphyxial Death was invited by the Section on Scientific Exhibits of the American Medical Association, to prepare an Exhibit for the regular meeting of the American Medical Association, which was held at Atlantic City in June,

1935.
"Whereas, the Scientific Exhibit of the for eight booths on the Prevention of Asphyxial

Death at this Exhibit.

"Whereas, a favorable impression was created by this Exhibit, and the need for an organized movement to prevent Asphyxial Death was

emphasized.
"Whereas, it has been satisfactorily established that asphyxiation constitutes a major medical problem, representing a mortality of at

least 50,000 deaths a year.

"WHEREAS, a National Committee on Hospitals has been established by the S. P. A. D., consisting of 300 hospital superintendents from forty-five states, as well as a National Committee on Anesthesia, representing more than fifty per cent of the physicians registered as anes-thetists in the 1934 directory of the American Medical Association, therefore,

"Be It Resolved, that the House of Delegates of the American Medical Association, at the Kansas City meeting to be held in May, 1936, be petitioned to create a Committee on Asphyxia for the further study of this problem."

THE SPEAKER: Referred to Reference Com-

mittee on New Business A.

89. Regional and General Anesthesia Section 100

Dr. J. Lewis Amster, Bronx: "Whereas, in recent years the study and application of regional and general anesthesia has become a highly specialized division of surgery, and

"WHEREAS, experimental and clinical studies have been carried out in these fields and great advances in the administration of anesthetics have been made, which have materially helped to reduce the morbidity and the mortality rate of poor surgical risks, and

"WHEREAS, a special committee of the American Medical Association has recommended the recognition of anesthesia as a specialty by component groups of the American Medical

Association,

"Therefore, Be It Resolved, that a one-day session on regional and general anesthesia be established as a regular part of the surgical section of the Medical Society of the State of New York at its annual meeting.

THE SPEAKER: Referred to Reference Committee on New Business A.

The House of Delegates thereupon adjourned to reconvene at 9:30 A. M. April 28, 1936.

ADJOURNED SESSION OF THE HOUSE OF DELEGATES

Tuesday, April 28, 1936, 9:30 A.M.

The Speaker called the meeting to order at

The Assistant Secretary called the roll, and

in the hands of the Reference Committees and

those reports are ready now

92. Lien Bill Section 87

DR B WALLACE HAMILTON New York Dr Heyl of the County of Westchester in troduced the following resolution

WHEREAS the physician and nurse are equally entitled, with hospital, to the protec-

tion of the Lien Law, and

'WHEREAS there is no reasonable assurance that the enactment of a Lien Bill for hospitals only would or could be followed by subsequent enactment of liens for physicians and nurses, therefore be it

"Resolved, that the Medical Society of the State of New York should henceforth refram from supporting, under any circumstances, any hen bill which does not include protection for

the physicians and nurses, and be it further "Resolved, that the State Medical Society instruct its Legislative Committee to endeavor to reach an agreement with the State Hospital Association, mutually pledging both group to the support of a Lien Bill including hospitals, physicians and nurses."

Your Reference Committee C approves the resolution in re Lien Bill introduced by Dr. A. F. Heyl of the County of Westchester and recommends that the Committee on Legislation be so advised.

I move its adoption.

Motion seconded and carried.

93. Clinics for Relief Clients Section 43

DR. THOMAS A. McGOLDRICK, Kings: The following resolution, introduced by Dr. A. F. Heyl of the Westchester County Society, was referred to Reference Committee B:

"Whereas, the regular use of voluntary hospital clinics for routine care and treatment of persons who are public charges, constitutes an unfair burden upon and exploitation of both the private physician and the voluntary hospital, and places the attending staff of the hospitals in competition with themselves and with the Medical Profession generally, be it

"Resolved by the Medical Society of the County of Westchester that the Medical Society of the State of New York be hereby requested to declare it the sense of the State Medical Society that the routine use by public welfare agencies of hospital clinics attended gratuitously by private physicians is contrary to sound social, economic and medical policy, and be it further

"Resolved that the Medical Society of the State of New York should undertake through appropriate channels to bring about a change of policy in respect to the use of hospital clinics by welfare agencies throughout the State, substituting therefor the use of private physicians' services in their offices at fee rates mutually determined to be fair and equitable."

Reference Committee B approves the resolution and I move its adoption.

Motion seconded and carried.

94. Radio Broadcasting

Section 86

Dr. John E. Wattenberg, Cortland: Reporting on the resolution introduced by Dr. Rooney which reads as follows:

"Resolution proposed by the Committee on Trends in accordance with instruction of the Executive Committee.

"That the House of Delegates approve the policy of this Society taking part in sponsored or unsponsored radio programs and authorize the Committee on Trends to arrange with radio stations for the broadcasting of these programs, details of which shall be formulated under the direction of that committee with full power to act."

Your Reference Committee approves the resolution and I move its adoption.

Seconded and carried.

95. Bureau of Publicity

Section 96

THE SPEAKER: Under new business we have this resolution introduced by Dr. Colie of the County of New York:

"Whereas, a resolution was introduced and approved by the House of Delegates for improving the administrative functions of the Society.

"Therefore, Be It Resolved that the Bureau of Publicity be placed under the direct control of the Executive Committee."

This will be referred to Reference Committee C.

96. Bureau of Publicity

Section 95

Dr. B. Wallace Hamilton, New York: Your Committee begs to report on the resolution under new business introduced by Dr. Colic of the County of New York regarding the placing of the Bureau of Publicity under the control of the Executive Committee, and recommends its approval by the House of Delegates.

I so move. Seconded.

DR. ROONEY, Albany: I move a substitute for the motion of the Reference Committee Chairman that this recommendation be laid on the table.

Motion seconded and carried.

97. National Museum of Hygiene and Health at George Washington World's Fair

Section 98

Dr. James R. Reuling, Jr., Queens: The Medical Society of the County of Queens pre-

sents the following resolution:

"Whereas, the president was empowered by the Counsel to appoint a committee of three to represent the State Society in cooperating with committees from the County Medical Societies from the metropolitan area to make a survey and to take preliminary steps for the proper representation of organized medicine at the George Washington World's Fair in 1939,

"Therefore, Be It Resolved, that the Committee be appointed during this session and instructed by this House of Delegates to proceed forthwith to take measures looking towards a permanent National Museum of Hygiene and Health at the George Washington World's Fair."

THE SPEAKER: This resolution will be referred to Committee C.

98. National Museum of Hygiene and Health at George Washington World's Fair

Section 97

Dr. B. Wallace Hamilton, New York: Your Committee C considered the resolution introduced by Dr. Reuling of the County of Queens in reference to the appointment of a Committee by the President in re the National Museum of Hygiene and Health of the George Washington World's Fair, and approves thereof. I so move.

Motion seconded and carried.

THE SPEAKER: Any further reports?

99 Prevention of Asphyxial Death Section 88

DR EDWARD C PODVIN, Bronx Your Ref erence Committee A reports on the resolution introduced by Dr J Lewis Amster of the Bronx County Medical Society on the subject of "Pre-vention of Asphyxial Death" which reads as

WHEREAS the aims and purposes of the Society for the Prevention of Asphyxial Death Society for the Prevention of Asphy data Bath, were approved by the Medical Society of the State of New York, May 14, 1934,
"Whereas these aims and purposes were

Inter approved by the House of Delegates of the American Medical Association, June 12

1934, WHEREAS, the Society for the Prevention of Asphyxial Death was invited by the Section on Scientific Exhibits of the American Medical Association to prepare an exhibit for the regu lar meeting of the American Medical Asso-ciation which was held at Atlantic City in June 1935,

"WHERFAS the scientific exhibit of the American Medical Association subsidized space for eight booths on the Prevention of Asphy virl

Death at this exhibit

'WHEREAS, a favorable impression was cre ated by this exhibit, and the need for an organ ized movement to prevent asphyxial death was emphasized

WHEREAS, it has been satisfactorily established that asphyxiation constitutes a major medical problem representing a mortality of

at least 50 000 deaths a year,

WHEREAS a National Committee on Hos pitals has been established by the SPAD, consisting of 300 hospital superintendents from forty five states as well as a National Committee on Anesthesia, representing more than fifty per cent of the physicians registered as An esthetists in the 1934 Directory of the American Medical Association,

Therefore, Be It Resolved, that the House of Delegates of the American Medical Associa tion at the Kansas City meeting to be held in May, 1936, he petitioned to create a Com mittee on Asphyxia for the further study of

this problem

You were informed yesterday that this matter is agreeable to the AMA and therefore your

Committee approves the resolutions

Be It Resolved that the House of Delegates of the American Medical Association, at the Kansas City meeting to be held in May, 1936, be petitioned to create a Committee on Asphyxia for the further study of this problem" I move its adoption

Motion seconded and carried

100 Regional and General Anesthesia Section 89

DR EDWARD C PODVIN, Bronx Your Committee A has a report on the resolution intro duced by Dr J Lewis Amster, of the Bronx County Medical Society on the subject of Regional and General Anesthesia

This resolution is as follows

WHEREAS in recent years the study and application of regional and general anesthesia has become a highly specialized division of surgery, and

WHERLAS, experimental and clinical studies have been carried out in these fields and great advances in the administration of anesthetics have been made, which have materially helped to reduce the morbidity and the mortality rate of poor surgical risks, and

'WHEREAS, a special committee of the American Medical Association has recommended the recognition of anesthesia as a specialty by com ponent groups of the American Medical Association,

"Therefore Be It Resolved, that one session on regional and general anesthesia be fixed as a part of the program of the Medical Society of the State of New York at the annual meeting in 1937

Your Committee recommends that this be referred to the Council for consideration and

I move the adoption of the report

Motion seconded and carried

THE SPEAKER I have a communication here signed by Dr Bedell Dr Sondern, and Dr Winslow, which reads

"We, the undersigned propose for Honorary Membership of the Medical Society of the State of New York, the Right Honorable Lord Horder '

Dr. Arthur J Bedell Albany I move you sir, that the By-laws be suspended so that we may proceed to action instead of holding it over, as would be necessary if we followed the strict letter, for another year

Motion seconded and carried

Dr. Bedfill I move you now, sir, that hon orary membership be extended to the Right Honorable Lord Horder

Motion seconded and carried

THE SPEAKER His Lordship is now an hon orary member of the Medical Society of the State of New York

101 Retired Members

Now see how much better a FILTERED SMOKE

tastes!

The filter tip of this fine new cigarette holds back the things no smoker wants. No tobacco crumbs in mouth or teeth. The usual throat-irritants checked. A bettertasting smoke because the filter reveals the fine, true tobacco flavor for your greater enjoyment. A choicer tobacco blend plus a filter...that's all.

...your smoke comes clean

FOR YOU: If you'd hae to try Viceroys, we'll gladly mail two packages with our compliments A note on your office stationery brings them. Brown & Williamson Tobacco Corporation, P O Box 599, Louisville, Kentucky,

THE TRUTH

ABOUT CIGARETTE IRRITATION

TE are constantly emphasizing the fact that Philip Morris cigarettes are milder, i.e., less irritating than other cigarettes.

Only after competent medical authorities had proved* that diethylene glycol treated cigarettes (Philip Morris) are less irritating than those treated with glycerine, the hygroscopic agent used in ordinary cigarettes, did we submit the findings to the medical profession. In Philip Morris cigarettes only diethylene glycol is used as the hygroscopic agent.

A Guide to Select Schools

Schools of refinement selected particularly for a high rating in efficiency and culture

MILITARY ACADEMY

FOR little BOYS

In a class by itself. First to eighth grades. Modern fire-proof buildings, acres of play grounds, sports facilities. Unex-celled faculty, Twenty-eighth year. Resident or day pupils admitted any time. For catalogue, etc., write Major R. A. Gibbs, 1249 So. Cochran Ave., Los Angeles, Calif.

LABORATORY TECHNIQUE

An uncrowded profession offering steady, dignified, highly remunerative employment. Complete course including clinical laboratory technique and basal metabolism in six months. Small classes with personal supervision. A splendid course for post graduate work. Student dormitory maintained. For information write for estalogue. for catalogue.

Eastern Academy of Laboratory Technique, 1709 Genesee St., Utica, N. Y.

MEH AND WOMEN

NORTHWEST INSTITUTE

Offering thorough course in clinical laboratory technique, including Basal Metabolism, in 9 months. Also X-Ray and Physiotherapy in 3 months. Unusually high graduate placement.

WRITE FOR CATALOG. \$422 E. Lake St. • MINNEAPOLIS, MINN.

Doctors and Schools

Physicians are frequently asked by parents to recommend private schools for their boys and girls, and the medical man will find it advantageous to acquaint himself with various schools in order to be able to recommend the right one for each case. Schools advertised in these pages are always glad to send literature on request describing their special advantages. The custom of sending boys and girls away to school is growing as parents see how it helps the little men and women to prepare themselves to meet the problems of real life.

In the first place, every private school picks the most healthful location it can find as its primary consideration; hence it is more than likely that the pupil will live in more salutary surroundings than at home or in the local public school. The private school is usually surrounded by many acres of its own, with ample playgrounds for outdoor sports that give strength and health. Its playing fields are not crowded by a miscellaneous throng; its gym

and pool are used only by its own little student family, under constant supervision as regards health and cleanliness. The school table, too, is generally supervised by an expert dietician, with the result that the boys and girls will enjoy a vigor and vim far better than they knew under the unscientific regime at home that was lacking, perhaps, in proper balance.

We are coming now to realize, too, that many boys and girls are under psychological conditions at home unfavorable to their best development. It may be nobody's fault, but it is a misfortune that may mar the child's future. A new environment is needed. Life under school discipline in the little school family may be the right solution. In the private school every child has the special attention required to develop its qualities to the best advantage. Investigation of various institutions will reveal which one is the one for each child.

Emergency Treatment of Wounds

When an individual is wounded, two things that demand prompt attention are pain and the danger of infection If at that time one could apply locally r preparation that is both anesthetic and antiseptic these needs would be met. It is desirable that the local anesthetic and the antiseptic both be incor porated in the same vehicle because the contami nated tissue is likely to be included in the painful It is also desirable that the vehicle be water soluble so that it may be washed away easily in case the surgeon desires to use some other local application which might be incompatible. For this purpose a water soluble jelly would seem preferable to an ountment base 'Metycaine' (Gan

(Gamma (2 methyl piperidino) pro pyl Benzoate Hydrochloride Lilly) is stated to belong to the group of substituted piperidino alkyl benzoates prepared by Dr S M McElvain Its anesthetic effects are obtained, according to Eli Lilly and Company, either by infiltration or by topical application to mucous surfaces. In painful ulcerations of the skin and in some open wounds the pain may be locally controlled by it thus reduc ing or avoiding the use of systemically effective analgesics

Merthiolate' (Sodium Ethyl Mercuri Thiosalicylate, Lilly) is claimed by these manufacturers to

SMA. Widely Available

Wherever parents may travel they can obtain S MA if they need it By taking only a small supply of S MA with them, they can obtain more as they go because S MA is widely distributed

Almost every wholesale drug house in the United States and most retail drug stores from coast to coast carry SMA in stock at all times SMA is also available in many foreign countries

Because physicians agree that breast milk is best for the human infant, S M A is made to resemble breast milk in many ways. When physicians prescribe SMA for infants deprived of breast milk they know that S M A may be obtained in all parts of the country and may be prepared and fed anywhere that boiled water is obtainable -Adv

be a superior germicide, which is distinctive for its tissue compatibility

The problem of supplying both of these agents in a suitable water soluble jelly was solved, according to report, in the Lilly Research Laboratories A preparation of this sort might well be a part of the first aid kit of the ambulance, the hospital, and the physician -Adv

Fiestas Attract Summer Tourists

The republics of South America's west coast celebrate during the summer months fiestas both sacred and profane, which in their colorful and distinctive manifestations are furnishing North American travelers on Grace Line and Pan American Grace Airways with more and more interesting overtones to their vacation cruises.

On June 29th, the fiesta of Saint Peter and Saint Paul is celebrated in Ecuador's great tropical river port of Guayaquil. The suburb of Sabana Grande is glorified for the occasion with every type of bunting and flowery festoon available. The fascinating native "venta" displays articles and foodstuffs for sale for a song, and livestock from up and down the jungle-fringed Guayas are on show.

Even more interesting is the Fiesta de la Raza on October 12. This, as the name indicates, feats the virtues and characteristics of the race and extends over several days. A temporary village is erected around the "Estero Salado," a salt water arm of the Pacific, and here native customs, dances, music, games, and

exercises provide a most unique spectacle.

Further south in Peru, the Fiesta of Santa Rosa de Lima is celebrated on August 20th with mixture of piety and joy. "Dear Little Santa Rosa," the western hemisphere's first canonized saint, is one of the most beloved religious figures, and on her feast day her silver image is carried in veneration through Lima's streets, while everyone kneels in prayer and ladies scatter rose

leaves on the procession from ancient balconies. For two days the capital resounds to music

and laughter.

Still further south, in Chile, fiestas that celebrate the nation's equestrian prowess take place in September. Here the ranchmen from the great "Fundos" or properties, engage in South American versions of our familiar rodeo which prove the Chilean "huaso" to be peer of his northern brother cowboy and the Argentine gaucho. Chile, too, has its Fiesta de la Raza when "La Cueca," the national dance, is énthusiastically performed and the annual pilgrimage to the Virgin of Andocollo, a little

WILLIAM HAMILTON, Managing Director

PRESCRIBE the nearby Maritimes—New Brunswick and Nova Scotia-for cool northern air with the tang of the sea and aroma of balsam and pine. Here is restful relaxation—romantic atmosphere—no hay fever. The Algonquin Hotel at St. Andrews-bythe-Sea, overlooks isle-dotted Passamaquoddy Bay. Its spacious accommodations with unexcelled cuisine and service attract delightful, discriminating people, year after year. Likewise the famous Algonquin Golf Course, bathing in Katy's Cove, yachting, boating, trout or bass fishing and the gay Casino.

Or suggest a short sea trip to old Nova Scotia. At Yarmouth is the new Lakeside Inn—only a short motor ride from Lobster Bay-angler's paradise for tuna and deep sea fishing. At quaint Digby is the Pines Hotel, overlooking broad Digby Basin. Excellent golf, a glass-screened, salt water swimming pool, fishing, boating, motoring. At Kentville, the Cornwallis Inn is convenient to Evangeline's Acadia and Grand Pré. Hotel rates are attractively low-priced.

Rates — American Plan — Lakeside Inn, June 29 — Sept. 7 and Cornwallis Inn (all year), Single, \$6 up; double, \$5 person. Pines Hotel, June 27—Sept. 9, Single, \$7 up; double, \$6 person. Algonquin Hotel, June 27—Sept. 7, Single, \$8 up; double, \$7 person. Steamship Service—New York-Boston to Yarmouth. Or by rail to St. Andrews—Saint John. Ferry Service—Saint John, N. B. to Digby, N.S. Dominion Atlantic Railway trains meet all ships. See your Travel Agent or any Canadian Pacific office including 344 Madison Ave., New York; and 22 Court Street, Buffalo.

Large Gain in Travel to Canadian West Seen

Summer travel to the Canadian West is due tor a notable increase this season

This is far from being an ordinary prediction It is based on an actual survey of one who is recognized for his accurate and conservative forecasts on the trend of tourist traffic Mr H F Mathews, manager of the Canadian Pacific's chain of hotels, speaks authoritatively about the encouraging increase in advance rail and hotel bookings for the Banff-Lake Louise area, for the Vancouver Jubilee, and for his company's Alaska steamship service.

"I shall be disappointed," said Mr Mathews, 'if we do not show a gain of 20 to 25 per cent over last summer's traffic in our Rockies and Pacific coast business From all indications I (Continued on page xxix)

XXIX

(Continued from page xxvii)
think we can expect at least that much improvement. And remember, 25 per cent is something very substantial. It may of course be
greater, but for the moment I feel safe in

taking that as a minimum."

Mr. Mathews believes the Canadian West is this year a stronger attraction than usual to the American traveler. "The pioneer instinct," he added, "is planted deep in Americans and Canadians alike. And as this summer marks the fiftieth year of rail travel in Canada, it is natural that the vacationist should be eager to see the Canadian Rockies. These vast mountains remained a barrier until the completion of the C.P.R. turned them into the playground they have since become. That is what adds interest to Vancouver's jubilee, for this city has become great and prosperous as the Pacific terminus of the railway."

German Rail Traffic Increased

With passenger mileage one-third higher than for all our class-one roads, German Railroads last year had a record of fifteen hundred million passengers riding over twenty-four billion passenger miles.

The German Railroad Company, with 33,957 miles of tracks, is still by far the world's largest single railroad enterprise. An addition of 286.4 miles to the trackage in 1935 was due to the return of the Saar railroads to the Reich. The railroad owns and operates 21,656 locomotives, 1,561 Diesel-electric cars of the typo of the famous Flying Hamburger, 60,341 passenger cars, and 596,598 freight cars. The personnel of the railroad reached 656,200 at the end of 1935.

The German Railroad Company has the

fastest individual trains and the fastest all around passenger service. When it introduced streamlined Diesel-electric trains two years before any other road had streamlined rolling stock, the "Flying Hamburger" made 99.42 m.p.h. The improved types now have 125 miles an hour sustained speed on straight stretches.

Americans attending the Olympics will experience traveling extremely fast and so smoothly that the movement of the train is discernible only by viewing the fast slipping by of the beautiful landscape.

CRAWFORD NOTCH-NEW HAMPSHIRE

The summer sessions at the Austrian schools all provide arrangements whereby their students may combine formal class study with a wide variety of educational and recreational excursions both into the Austrian Alps and to the various cultural centers.

June 22nd Is Atlantic City Day

Although one can hardly say that Atlantic City differs outwardly at any time of the year, June 22nd does mark a particular change in

the "World's Playground"

On this day it opens officially for the summer season which is then in full sway until the 22nd of September. The bathing beaches are dotted with bathers in place of the previous sprinkling of equestrians. The board-walk takes on a garden atmosphere with colorful summer fashions on men and women. Features of entertainment are enlarged and improved through attracting the most popular talent from the warm cities. The hotels begin to turn people away for want of room, even though there are few places that can compare with Atlantic City's facilities for accommodating guests.
